The real answer is that both ties and grading have a life as long as that of the railroad. If the railroad is abandoned, what is more worthless than an abandoned grade? We all know that cuts and fills wash and slide and that as constant maintenance must be expended on the grade as on the track. Certainly the life of a service structure as a whole is the true measure, not the estimated lives of parts of it. Who knows the life of a railroad, or an electric power property, or glass, or grading, or a great dam?

We must establish a new set of concepts in valuation. We must abolish guess and substitute fact. The application of the formula of the Bureau of Valuation means a deduction, based on an arbitrary set of rules, of from 20 per cent to 25 per cent of invested values in the railroads. Say four to five billions of dollars. Doubtless in some cases of small properties of low earnings there is considerable true depreciation, but in the case of the great majority of the railroads of the country the formula results in confiscation.

Thus far I have discussed the valuation or engineering concept of depreciation.

THE ACCOUNTING CONCEPT

The accounting concept is no less important. It seems to me that the use of the word "depreciation" in connection with reserve accounting is a misnomer and ought to be abolished.

There can be no disagreement as to the desirability of establishing accounting reserves to spread the costs of retirement or replacement over a reasonable period of years, in the case of some properties and some parts of other properties. There is, however, great disagreement when it comes to a universal requirement of reserve accounting.

The great railroad, with thousands of miles of road and thousands of cars and locomotives, may find its maintenance of way and structures or maintenance of equipment total expenditures so uniform year after year as not only not to require the establishment of reserves, but as to make it highly undesirable, because of the introduction of estimates.

What is true for the great railroad may not apply at all in the case of the small road. It appears to the speaker that whether or not reserve accounting shall be used, and if so the extent of property that shall be covered is largely if not wholly a question of policy to be decided by the management subject to the approval of the regulating body, and not a matter to be disposed of by the formulas of some bureau of control.

The question may be asked, are such reserves, if they are established, to be based on a percentage of property cost, or on costs per unit of service? But is not this wholly a matter of convenience in accounting and of securing enough money for the purpose?

When these reserves were first established it is easy to see that a good supporting argument for them was that there was a depreciation in the property over and beyond maintenance and renewals. Indeed, that is very true as to many kinds of property today, but does it apply in the case of the utility of continuing life?

Take the case of the New York Central Railroad, for example. Is it not getting better and larger and

Digitized by Google

stronger each year of its history? Is it possible to go back and find this fantasm of depreciation and add up in dollars what it now amounts to? I think not. The life of the New York Central and the other great railroads is, so far as we can now see, indefinite if not infinite.

Transportation, public transportation in cities, electric power, public water supply, communication by telephone or telegraph are public services that must continue in some form.

We know that great changes have taken place and will take place. New inventions involve constant changes of equipment, but we have well established the principle that the wearing out of the old is part of the cost of service and the cost of the old must be charged to operating expense. In the case of the continuing, going concern property any reserves raised to cover this cost are not depreciation reserves, although they may properly be such in the case of the obsolescent and dying property. My plea to you men in accounting is to find another name which will cause less of confusion and be more truly descriptive.

Deduction of Reserves to Determine Value

Finally, I would raise this question, Should the amount of accumulated operating expense reserves be deducted from the capital account to find true value?

The Supreme Court, in the Knoxville case, says that it is the duty of the owner to keep his investment intact.

This can be done in two ways on different properties. One may so fully keep up current repairs, replacements and renewals that at any given time little or no depreciation ought to be found. Another, unable to do this by direct charges to operating expense, may elect to create reserves, and through a series of years just as fully maintain the integrity of the investment. Should he be penalized by deducting these reserves from capital?

Would it not be more proper, in this second case, to say that failure to establish proper reserves is failure to keep the investment intact, and that such failure should be penalized?

This whole subject of reserve accounting is, like engineering valuation, a new development. The subject is far from being a fixed and settled science, and the accounting question needs just as much study as that of the proper deduction to be made in valuation.

The definite use, and the clear meaning of the word depreciation, loss of value, in valuation, and the clear-cut order of the courts to find it when it exists and deduct it, seems to make it very essential that the accountants get down to exact terminology and find a name that shall be truly descriptive.

Rail Corrugation Studies to Continue

PLANS for the continuation during the coming year of the work of the committee on rail corrugation were made at a meeting held Oct. 6 in the Engineering Room of the Auditorium. Methods of using the corrugraph were discussed and arrangements made for metallurgical analyses of sections of corrugated rail.

This subject has been one that has baffled engineers for many years and it is to be expected that with the approach to this problem along scientific lines that the cause or causes resulting in corrugation will be discovered.

Purchasing Agents Meet

Many Details of the Best Way to Handle Their Work Were Discussed by Both Railway Men and Manufacturers

FOR the third consecutive year, the purchasing agents and stores committee of the Engineering Association held a separate session at Cleveland on Oct. 5 to consider its report to the Engineering Association and, at the same time, to hear addresses from prominent men on the subject pertinent to the committee's work. After the address of welcome by Charles R. Harte, president of the American Engineering Association, Frank R. Coates, president of the American Electric Railway Association, gave a talk on the value of the purchasing agent to the entire railway organization.

P. F. McCall, chairman of the committee, read the formal report which was presented Thursday morning to the Engineering Association. Other committee reports were read and approved.

The principal paper scheduled on the program was "Co-ordination of Operating Budget with Purchases of Material." It was presented by Dr. Charles Reitell, head of the department of accounting and industry, University of Pittsburgh. According to him, the budget of requirements should be worked out by forecast, plus experience and adjustments. Estimates should be made for the month, and the various items tabulated on a budget sheet which can be laid out to accommodate as many divisions of the work as are required. The big underlying principle of budgeting is the psychological effect it has on the purchasing department. Abnormal expenditures which are not included in the budget should be passed upon by a group of officers of the company which may be authorized to draw upon a contingent fund to meet the emergency requirements.

What Constitutes a Valuable Employee

Four factors characterized a valuable electric railway employee, according to W. E. Wood, vice-president and general manager of the Virginia Electric & Power Company. These are general knowledge of the company's business, specific knowledge of the detail work of his department, a desire to carry out the policies of the company and co-operation on his part with other departments.

Time can be saved in filling orders if the proper description is given the manufacturer so that his order department may successfully interpret the company's order. Henry S. Day, manager transportation division, Westinghouse Electric & Manufacturing Company, in his paper enlarged upon this statement and, in addition, said that his company had had considerable success in filling orders from catalog descriptions. According to Mr. Day, some railway purchasing departments permit an order to go through in rather incomplete form.

This is not good practice. Attention must be paid to details, in order that the material shipped on the order will be correct. It is up to the manufacturer to keep the purchaser supplied with new catalogs. However, it is also necessary for the manufacturer to maintain a file of back catalogs because orders may come in which an old catalog description is given. Ordering by unit quantity packages speeds the shipments. This practice is economical and facilitates the work of the purchasing department.

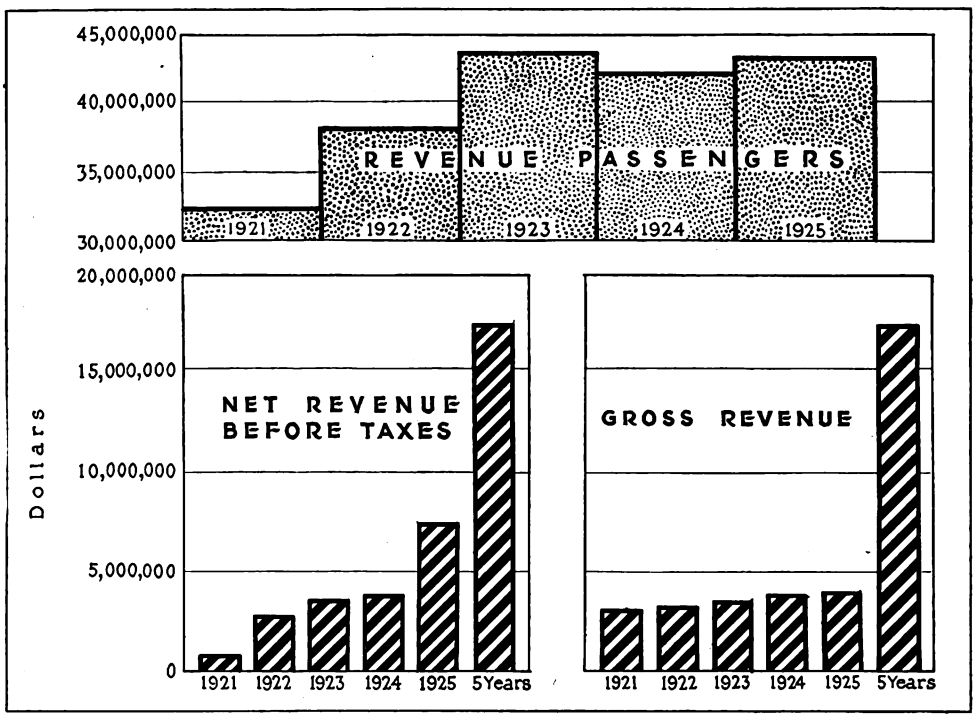
Penn-Ohio Electric Company Wins Coffin Award

An Aggressive Campaign of Physical Improvement and Co-ordination of Rail Lines and Buses, Combined with Intensive Merchandising Effort, Earn National Recognition for Moderate Size Combination Property

REHABILITATION of its railway property with a view to building up a character of service which could successfully compete for traffic under modern conditions was a large factor in winning for the Pennsylvania-Ohio Electric Company, the 1926 Charles A. Coffin medal. The award was made on the basis of the value of the accomplishments by this property to the public and to the electric railway industry as a whole. Concrete evidence of this company's intention to provide a complete modern service and of a constant effort to improve facilities, which in turn won the co-operation of the public and a resultant considerate attitude in franchise matters, assessments, etc., was cited as among the important accomplishments.



The committee in making its report also cited the action of this company in pioneering the operation of de luxe buses in an industrial territory while at the same time avoiding the temptation to hold bus fares below the cost of giving service. In addition, mention was made of the effort by the company to give a different character of service with de luxe buses than on the railway. Establishment of the precedent that the bus fare under such conditions should be higher than the rail rate was recognized as an important accomplishment.

In the judgment of the committee, the winning company has shown by experience that there is no permanent "rubber urge," but that the public is ready to buy what it considers the greatest value for its money in transportation regardless of the motive power. While building its bus service this company brought its rail lines up to a state of performance which permitted the proper field for each to be determined. Having gone through a complete cycle of shifting traffic between cars and buses, it established the fact that the latter may be used to attract new business to a transportation system as a whole, while improved cars and service simultaneously build up the riding on the rail lines alone. It demonstrated that when the bus is operated under conditions for which the car is better fitted, improvements can be made in the rail service which draw traffic away from buses of even the most luxurious type. It found that when both bus and car service are intensively developed in comfort, speed and convenience, and are operated at rates of fare proportionate to the cost of giving service, neither vehicle threatens to supplant the other; that the field of each is fixed by the nature of the territory, location of lines and other similar factors.

The Pennsylvania-Ohio Electric Company operates both city and interurban service by cars and buses. The one management operates the Youngstown Municipal Railway and the lines serving Newcastle and Sharon, Pa., Niles and Warren, Ohio. Five years ago buses and private motor car competition had the company with its back against the wall. It had to choose between admitting defeat or putting more money into its property and adopting more aggressive sales methods. Choosing the latter, it has emerged triumphant after five years of vigorous fighting. This property is controlled by the Republic Railway & Light Company of Jersey City. C. C. MacCalla is general manager and R. N. Graham is manager of railways and directly in charge of rail and bus operation.

American Committee Reports Record of Year's Progress

The Subjects Considered This Year Included National Relations, Management and Operation, Insurance, Education, Rapid Transit and Publicity—Useful Research Work Accomplished

BEGINNING with the convention last year the presentation of committee reports from the platform was discontinued by the American Association. The same plan was followed this year. Instead of reading the reports from the platform as in previous years, each chairman gave a brief oral résumé of the subjects presented. These topics were printed in pamphlet form by the association and distributed to the members before the meeting, allowing them to become conversant with the subject matter and enabling them to bring up questions for discussion after hearing the preliminary remarks by the chairman. Abstracts of the various reports follow.

National Relations

THE current year has furnished many things for consideration by the committee. At the hearings on the railway labor bill before the Senate

HARRY REID
Chairman

and House committees, Mr. Henry and other representatives of the association argued for the exemption of street and interurban electric railways, and this exemption was secured by the Richberg amendment. A statement setting forth the views of the association with reference to the railroad consolidation bill, introduced by Senator Cummins of Iowa, was filed with the committee. This bill was still in the Senate at the time of adjournment. Mr. Henry and other representatives of the association have also closely followed or have spoken at hearings on the so-called "venue bill," a bill relating to railway mail cars, the use of steel cars in trains, excise taxes on automobile buses and parts, and the regulation of interstate buses and trucks. The association has also been represented at various hearings held by the Interstate Commerce Commission in different cities this summer on the question of the regulation of such interstate buses and trucks. Mr. Henry also spoke at a hearing of the House committee on interstate and foreign commerce on a number of bills proposing to amend the interstate commerce act.

The committee on national relations has also filed with the Interstate Commerce Commission a petition, so far as its members were concerned, in regard to an order relating to the inspection and testing of railroad locomotives other than steam. It was also represented at the National Conference on Street and Highway Safety in Washington, and Mr. Henry is a member of the conference committee to draw up a suggested uniform vehicle code. It is the intention to have this code adopted in the various states.

During the year a large number of Congressional bills, resolutions and amendments were mailed to Messrs. Storrs, Henry and Welsh, as well as to others on request, as were also many copies of Interstate Commerce Commission orders, notices of hearings, etc., and six decisions of the United States Supreme Court and district courts. Many requests sent to the Washington office for information, etc., were filled, and the committee points out that this is a service which its Washington office is able to give association members. It also points out that all electric railway companies doing an interstate business and therefore required to appoint statutory agents in Washington, upon whom the commission may serve notices and other papers for such companies, can appoint as such an agent Mr. Henry, who has supervision of the Washington office. He will see that these notices are sent to the various companies and they need appoint no other statutory agent.

The report contains resolutions on the death of W. H. Maltbie, who had been retained as counsel in the preparation of the association's case on the subject of depreciation as well as of its presentation before the Interstate Commerce Commission. Mr. Nash has taken over the work which Mr. Maltbie was doing for the sub-committee on depreciation, and all the data which have been assembled have been turned over to him for analysis.

The report was signed by E. J. Bechtel, R. R. Bradley, A. W. Brady, C. D. Cass, S. F. Curwen, J. H. Hanna, G. H. Harries, C. L. Henry, Frank Karr, T. O. Kennedy, H. A. Mitchell, L. R. Nash, Frank Silliman, Jr., D. W. Snyder, Jr., F. H. Wilson and Harry Reid, chairman.

Rapid Transit

COMPILATION of opinions and statements from authoritative sources as to methods of financing rapid transit, distribution of benefits, and advantages to be obtained from rapid tran-

G. A. RICHARDSON
Chairman

sit in its various forms to suit different conditions constituted the work of this year's rapid transit committee. Data were compiled to indicate the amount of the toll charges to the passengers using existing structures and the possibilities of improvements in service or reduction in fare if the fixed charges were distributed according to benefits received. Other data show the relative costs of providing transportation capacity by subways or streets in the different cities.

Specific conclusions as to methods of financing or types of construction were not made, since local circumstances and requirements of law or precedent determine the detail of the plans that would be applicable or desirable.

Development of plans and proposals for rapid transit has received much attention in recent years, due to the great need for additional street space and for more freedom of communication. Projects for immediate construction are

Digitized by Google

being discussed in six cities, although actual work is in progress in but two.

Such questions as the desirability of concentration of the business district, the effect of rapid transit on a city plan or vice versa, the ultimate condition to be attained in transportation and in the city plan are vital when considering such very large, present and future expenditures involved.

The body of the report consists entirely of excerpts from and comments on rapid transit reports submitted in a number of cities. The report is divided in sections as follows: (1) Opinions and practices regarding financing; (2) effect of fixed charges on fare and service; (3) comparative costs and capacities of streets and rapid transit lines; (4) arguments for rapid transit and for special designs.

The report was signed by J. H. Alexander, H. L. Andrews, W. B. Bennett, Edward Dana, S. E. Emmons, B. J. Fallon, R. F. Kelker, Jr., E. J. McIlraith, W. S. Menden, F. R. Phillips, F. H. Shepard, C. E. Smith, J. B. Stewart, Jr., D. L. Turner, James Walker and G. A. Richardson, chairman.

Publicity

THE outstanding accomplishment of this section has been the compilation and issuance of a loose-leaf advertising book containing samples of more than 2,500 ads and posters dealing with the following subjects: Courtesy; Safety; Weekly Pass; Taxes—Paving; Parking; Motorists; Franchises; Intercity; Buses; Merchandising Transportation.

This is the largest book of its kind ever issued by any industry, and represents effort extending over practically the entire year. It is believed that this book will be of invaluable assistance to advertising men by way of offering suggestions for copy.

An entire section of the book is devoted to a reproduction of advertising material prepared by the association, and still available through the advertising section, for the use of companies. This material, which can be had in poster or newspaper mat form, or both, covers a wide range of subjects, including safety, traffic congestion, and paving tax relief, three of the outstanding problems now before the industry. The size of the material, prices charged and all other details for ordering it are plainly set forth in the book.

The industry is particularly urged not only to make use of the material now on hand, but to send suggestions for other material to the advertising director. The committee will gladly consider any suggestions.

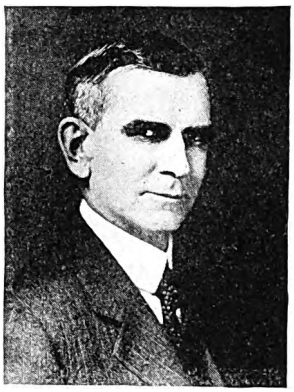
Two of the latest series shown in the association material section deal with advertising supplemental coach service and obtaining paving relief.

The coach advertising material comes in mat form for two-column newspaper ads. The text suggests using the company's coaches when it is impossible to use its street cars. Sales arguments for using the coaches for sightseeing, special parties, etc., are included.

The new paving poster series deals with instances in nine states where companies have been relieved of paving charges. They not only give the facts about the relief, but also carry illustrations designed to impress the reader with the unfairness of imposing a paving charge now that the horse no longer is used in street car service. These posters come in two colors, red and black, in the regular window poster size, supplemented with suggested newspaper ads, also shown in the association section, and should be very helpful to any companies launching a paving tax relief campaign.

The book also contains an introduction by the advertising director embracing a general discussion of the best advertising methods. It deals extensively with the use of type and the utilization of newspaper space.

A survey, which was noted in a full-page story in the *Editor and Publisher*,



PAUL SHOUP
Chairman

the outstanding newspaper man's magazine of the United States, showed that between $4,500,000 and $5,000,000 was spent this year for electric railway advertising.

The section also was active in aiding in the inauguration of the speakers service. The director prepared, printed and distributed seven standard addresses throughout the industry. These addresses dealt with the following subjects: Tax Situation; The A.B.C.'s of Operation; Municipal Ownership; State vs. Municipal Ownership; Coordinated Transportation; Transportation History; Future Transportation.

The addresses were prepared under the direction of Britton I. Budd, chairman of the speakers committee, and were compiled in such handy form that they might be delivered by the most inexperienced public speaker without difficulty. This new feature of the section's work will be continued through the coming year in co-operation with the speakers committee.

The managing director's office has furnished much material which has been helpful in obtaining publicity. Speeches and statements delivered by the managing director have been broadcast through the regular publicity channels. A standard size booklet has been adopted for the managing director's statements and it is available through the association at all times. Addresses by the president have been handled similarly.

The committee recommends that the advertising section, and the industry, during the next year do its utmost to familiarize the public with and encourage the putting into effect of the fundamentals as set forth in the Advisory Council's report.

Subjects which should be stressed most are traffic congestion relief, tax adjustments and safety. Of these three, traffic congestion relief should be given particular attention in posters and advertising material.

The work of the speakers committee of the association is most important and should be given generous support by the advertising section. Additional addresses, along the lines of the seven prepared this year, should be prepared during the coming year and given the widest possible distribution among executives.

The industry as a whole should spend more money for advertising, and put more concrete sales talk, and not so much good will material, into its copy.

More attention should be paid to good art work by local companies. Good illustrations help sell rides. Poor ones do not. Be at least as careful in the selection of a man to do your advertising art work as you would in the selection of a man to decorate your cars.

The report was signed by F. L. Blanchard, J. S. Bleecker, V. H. Cartmell, H. O. Crews, Robert Dougan, P. H. Gadsden, L. E. Gould, J. P. Griffin, W. V. Hill, W. H. Hodge, H. M. Lytle, J. C. McQuiston, M. P. Rice, W. P. Strandborg, P. L. Thomson, R. G. Tucker, A. C. Watt, E. F. Wickwire, Barron Collier, vice-chairman, and Paul Shoup, chairman.

Management and Operation

NOTEWORTHY work was done by the committee on management and operation during the past year. Its report, abstracted below at considerable length, indicates the character of its activities. In addition to the main report, each of the regional directors submitted a report giving in greater detail the accomplishments of the year in his territory. These reports indicate that interstate bus competition is a major problem, although the bus in general has been accepted as one of the common parts of the service of many railways. The majority of these regional reports contain a great deal of information gathered from personal visits to the various properties.

When the 1925 committee on management and operation presented its report, it was recommended that the work be discontinued during the present year. The association, discussing the report at the 1925 convention, decided that it would be desirable for the committee to continue its work as originally assigned, but devoting more time to the dissemination of information collected in previous years. That information was classified by last year's committee and was edited and published early in this year in the form of a "Handbook of Modern Methods and Practices."

The handbook is a bound volume of 319 pages, divided into twelve general subjects covering important phases of management and operation of transportation companies. It contains the best of the information collected during the past two years and its purpose, as

Digitized by Google

stated in the foreword, is to spread the gospel of modernization, efficiency and public accommodation to the electric railway industry. More than 900 copies of this book have been purchased by the industry.

In addition to the dissemination of information already collected by previous committees, the members made a special effort to acquaint not only executives but department heads regarding activities at association headquarters. A pamphlet was prepared, and distributed by committee members, describing these activities and showing how the association renders valuable assistance to member companies.

The committee co-operated with the committee on education and distributed in pamphlet form some very interesting information prepared by the latter committee. Executives of the properties visited were urged to inaugurate some form of employee educational work.

Members emphasized the value of the state public utility information bureaus, and urged executives of the properties visited to make greater use of those facilities. Information prepared by Mr. St. Clair, outlining the activities of these bureaus, was distributed.

The returns from the regional directors indicated that approximately 125 companies were visited during the year. Reports have been received from the committee members outlining various interesting practices in use on the properties visited and indicating that progress in modernization is being made. This detailed information has been forwarded to association headquarters, where it is being reviewed and classified. There does not appear to be a sufficient volume of data to justify at this time the publication of a supplement to the "Handbook of Modern Methods and Practices." The committee therefore has decided to hold the material at association headquarters, where valuable use can be made of it by the association's bureau of information and service. Should the work of this committee be continued at some future time, the information will be available for publication if found desirable.

Improved Conditions Found on Properties Visited

Although the competition from the private automobile continues to be a major problem of the industry, this year's survey indicates that electric railway companies have a keener appreciation of the methods which must be employed to regain the traffic which has been diverted from the public transportation systems. The motor bus, though still a competitor in some places, does not present the serious problem that it did in the past. This is due largely to the fact that electric railway companies are steadily making increased use of motor buses to supplement and round out their own service. A lack of proper regulation of interstate motor bus carriers has caused serious competition in some districts. This condition has been recognized by the Interstate Commerce Commission, with the result that a series of hearings have been held for the purpose of determining what legislation should be recommended for enactment by Congress to provide reasonable and adequate regulations.

R. F. CARBUTT
Chairman

Reports from the various districts indicate that those companies that have purchased new equipment recently are beginning to reap the benefits in increased patronage revenues and improved public relations. Many of the properties visited are contemplating the purchase of new rolling stock and are carefully studying the latest developments in car design with a view to making their equipment more attractive and comfortable. On some properties where capital has not been available for the purchase of new equipment, extensive rehabilitation of old equipment has been undertaken, with the result that there is general improvement in the appearance of rolling stock throughout the industry.

Reports indicate that there is a keen realization on the part of managements that transportation can and must be sold, which is evidenced by the inauguration of commercial departments and the adoption of merchandising practices. Individual reports indicate the development of many merchandising methods which have been found effective in attracting riders and increasing revenues. Good service with modern, attractive equipment forms the basis for effective publicity and advertising to bring about better public relations. The reports made by members indicate that those companies which have modernized their methods and improved the service had not only reaped the benefits in better public relations, but had laid the foundation for increased business and adequate returns on the investment.

Operating Economies Not Neglected

On practically every property visited there was evidence of improved operating and maintenance methods designed to reduce operating costs. The use of modern labor-saving machinery is becoming more extensive in all departments and more attention is being paid to the development of efficient means for handling material and routing work through shops. Naturally, new equipment has fewer failures in service, so that the volume of maintenance work required on it is less than on the older equipment it replaced. The more modern cars also are better designed for accessibility of parts requiring inspection and maintenance. Power saving through the use of light-weight equipment, and labor-saving by the use of cars designed for operation by either one or two men is increasing throughout the industry.

All companies visited have been giving especial attention to accident prevention work, with the result that during the year there has been a substantial reduction in the number of electric railway accidents of all classes, even though vehicular traffic has greatly increased. This effective work is being accomplished through greater co-operation on the part of civic authorities.

A. LE ROY HODGES
New York State

Surveys in a number of cities which have been reported by members of the committee show that a great deal of traffic congestion is due to the unnecessary parking of automobiles on business streets. These reports indicate that more effort should be concentrated on the elimination of parking on main streets where street cars operate. In those cities where parking has been controlled, the cars have been speeded up materially, thus aiding the large mass of people using public transportation facilities to travel more quickly.

FREIGHT BUSINESS INCREASING

Reports from the central territory record substantial progress in building up freight business through improved schedules, better equipment and intensive solicitation. In some instances pick-up and delivery systems are being experimented with, but it is yet too early to report definite results from this form of service. Plans looking toward further development of freight business are under consideration by practically all interurban companies in the central territory and it is believed that this business will be the means of materially improving their earnings.

The foregoing outlines briefly the activities of the committee and the observations of the regional directors, which are given in greater detail following the report. The spirit of optimism which was noted last year is even stronger this year. Many companies find revenues increasing and although the percentage increase is small in most cases, it is, nevertheless, gratifying. The committee believes that the original purposes for which it was organized have largely been accomplished and that, therefore, no useful purpose will be served by continuing the committee activities during the coming year. It may be, however, that after a suspension of this work for a year or two it will be found advisable to resume it.

The committee, therefore, recommend that for the coming year, at least, its activities be suspended. It stated that it believes that much good comes from the interchange of views on managerial and operating problems and, therefore, recommends and urges the practice of sending certain employees, especially the department heads, on frequent trips to various railways, that they may observe the methods used on other properties and

D. E. BLAIR
Canada

discuss their problems with others engaged in the same branch of the business.

The report was signed by Regional Directors J. K. Punderford, W. H. Boyce, Samuel Riddle, L. M. Brown, D. W. Snyder, Jr., W. H. Burke, D. W. Pontius, A. L. Hodges, D. E. Blair, and Members A. J. Boardman, J. B. Crawford, E. J. Dickson, F. D. Gordon, H. H. Norris, L. D. Pellissier, Alfred Sweeney, H. R. Whitney, C. F. Crane, S. E. Emmons, D. J. Locke, A. C. Spurr, J. E. Wayne, R. J. Lockwood, G. I. Plummer, G. B. Treat, V. W. Berry, F. L. Butler, Stuart Cooper, E. W. Ford, J. P. Ingle, G. H. Harris, W. V. Hill, W. H. Lines, E. H. Maggard, S. E. Mason, E. A. West, L. J. DeLamarter, J. F. Johnson, W. S. Rodger, R. R. Smith, H. E. Gough, R. R. Hadsell, J. N. Jones, R. E. McDougall, H. C. Stanton, Judson Zimmer, J. S. Hyatt, R. H. Pinkley, C. J. Griffith, W. W. Holden, S. B. Irelan, F. D. Burke, D. W. Harvey, W. G. Murrin, J. E. Watkins, Claude L. Van Auken, Morris Buck, G. C. Hecker, secretary; R. B. Stearns, vice-chairman, and R. F. Carbutt, chairman.

Education

ACCOMPLISHMENTS of the committee on education differ somewhat from other committee reports in that the principal work done by the committee has been presented to the industry from time to time during the year. This committee is not only the central clearing house for all educational activities, but it has promulgated definite plans, many of which have been put into practice by many companies during the course of the year.

The report of this committee, therefore, is more a review or summary of accomplishments than the development of any specific problems and the presentation of the conclusions reached.

In its report the committee states that the outstanding feature of the work has been the working co-operation with the committee on management and operation in promulgating educational programs. Specifically, the work of the committee has been built around the foremen's conference, this feature of utility education having been extensively developed on the Boston Elevated.

Two demonstrations have been given during the year. These were actual conferences conducted by foremen, under the guidance and leadership of H. H. Norris, educational adviser of the Boston Elevated. The first conference was given last fall in Boston before the New England Railroad Club, meeting coincidentally with the committee on education. The second demonstration was given in Indianapolis at the meeting of the committee on management and operation in January of this year. It is also planned to have a demonstration at the Cleveland convention. The idea back of these demonstrations is to carry specifically the idea of how to conduct such a conference and at the same time to indicate the value that can be derived from such meetings.

During the year the committee has prepared and issued four booklets on "Industrial Education on Electric Railways," "Starting an Educational Program," "How to Conduct Foreman Conferences," "How to Conduct Group Conferences." The text of each of these booklets is given in the appendices Nos. 1 to 4 inclusive of the committee report.

The report further states that the committee has concentrated this year on general plans for a series of conferences but not on the details of one type of conference.

Among the courses on the subject of economics has been one prepared by the Pennsylvania State College which was extensively used by properties in Pennsylvania. While the committee is not prepared to recommend the adoption of this or any other course on economics, it considers this fact of sufficient importance to include it in its report as a matter of information to

Digitized by Google

the industry. The Pennsylvania State College has also in preparation a course for trainmen, the text of which is to be edited by Daniel Durie. It is expected that copies will soon be in readiness.

The report concludes by stating that the best results will be secured on any property by careful selection of the type or types of educational work to be done and by attempting only as much at a time as promises to be useful. The report further recommends that the committee be continued next year as there is a growing interest in foreman conferences, interest in which can be maintained, to the end that the results may be capitalized for the benefit of the industry.

EDWARD DANA
Chairman

The report was signed by H. O. Allison, G. B. Anderson, V. W. Berry, H. Bigelow, J. A. Dewhurst, B. W. Duncan, W. J. Edmunds, J. A. Greenland, C. J. Griffith, J. S. Hyatt, M. B. Lambert, R. J. Lockwood, M. McCants, H. H. Norris, A. B. Paterson, Samuel Riddle, A. J. Rowland, J. V. Sullivan, S. L. Vaughan, E. M. Walker and Edward Dana, chairman.

Insurance

THE work this year was confined to the collection of the experience of the industry and a study of it. Both members and non-members were reached, and replies were received from companies representing two-thirds of the capitalization invested in electric railways in the country. In the table on fire insurance experience in 1925 and 1924, included in the report, the companies are divided into two classes. Class I includes those companies which allocate their insurance according to the type of property covered; Class II, those companies reporting only total insurance carried. Only 17 of the companies reporting carried insurance in Mutuals during 1925 and 1924. In 1925 the amount of insurance so carried by these seventeen companies was $31,535,366, the premium $32,132; the rate per $100, $0.102; the amount recovered $4,856; and the ratio of amount recovered to premium 15.11 per cent.

MOTOR BUS INSURANCE

Of the 304 companies replying to the questionnaire, 114 operated motor buses in 1925, and of these 74 gave information about the bus insurance carried by them. All but three carried fire insurance and 53 carried liability insurance in addition. Property damage was carried by 28 and collision insurance by five.

The amount of the fire insurance carried by the 61 companies reporting both amount and premium was $6,435,871 and their average rate was 60.5 cents per $100. In 1924 the average rate for the 33 companies reporting both amount and premium was 66.4 cents per $100. As the rate paid on the other classes of insurance was on all sorts of bases, such as a flat rate per unit of equipment, rate per mile and percentage of gross earnings, the average rate could not fairly be computed.

Sixty-four companies reported carrying group insurance to cover accidents, deaths, etc., of their employees, and the report gives details of each case. Under the head "Unusual Insurance," the following were reported as in force by individual companies: (1) Use and occupancy insurance on carhouses and shops; (2) riot, strike and civil commotion insurance; (3) insurance on merchandise, freight and baggage when on cars, platforms or company's right-of-way; (4) catastrophe accident insurance. Brief descriptions of unusual fire prevention methods are also given in the report.

P. E. WILSON
Chairman

In conclusion, the committee points out that the newness of the bus has prevented standardization of its insurance treatment, but the opinion is expressed that the rates for fire insurance for buses, on the average, are excessive.

The report was signed by O. H. Bernd, G. H. Bourne, C. E. Brown, N. H. Daniels, F. M. Hamilton, A. D. Knox, J. H. Moran, F. J. Petura, B. L. Tomes and P. E. Wilson, chairman.

THE officials of the A.E.R.A. and the editors of the journals devoted to the upbuilding of the industry are in an infinitely better position to analyze and demonstrate facts regarding our problems than any small group of men whose activities are localized in a comparatively insignificant part of the whole industry. It seems to be incontrovertible that the answer to the fundamentals underlying our local problems must come from men whose vision embraces the whole field. We as local men should supply them freely with whatever pertinent information we may have for the purpose of bringing out in a scientific way all of the available facts regarding cause and effect.

—THOMAS FITZGERALD.

Engineering Committees Make Progress

Through Numerous Vital Reports, Knowledge Is Advanced in the Departments of Way and Structures Equipment and Power

AS IN the past, the work of the Engineering Association during this last year is represented largely by the work of its committees. The reports this year are of great interest, and the discussions at the convention centered around them. Not all the technical problems being studied by the various committees have yet been solved, but conclusive evidence of progress may be seen. Good reason exists for hoping that continued work along the lines now being followed will result in important accomplishments. The reports abstracted below are not only statements of what the committees have done, but in many cases they are permanent contributions to the fund of literature on these subjects.

C. R. HARTE
President Engineering Association

Way and Structures

FUNCTIONING this year for the first time under a new plan, the way and structures committee held no meetings, but discussed by correspondence all matters referred to it and made its decisions by letter ballot. It was not thought necessary to include in the general report of this committee the recommendations embodied in the reports of the special committees. Exceptions were made in the case of those matters not handled directly under the auspices of the A.E.R.A.

The way and structures committee approved the reports of the Division of Simplified Practice, Department of Commerce, on the conference of shovel manufacturers limiting the number of grades to three instead of four. In the case of the report under the same auspices on steel spiral rods, the conclusion was reached that three of the seven sizes now used as cores for reinforced cement columns could be eliminated.

H. H. GEORGE
Chairman

Specifications for railroad cross and switch ties were approved as recommended at a joint conference with the American Engineering Standards Committee and the American Railway Engineering Association. Three designs for 7-in. plain girder rail were tentatively adopted as American standard as the result of the work of the A.E.S.C. sectional committeee.

Progress reports only were submitted to the way and structures committee by special committee No. 2 on standardization of switch tongues and hard centers for special trackwork, special committee No. 3 on welded rail joints and special committee No. 6 on arc welding processes and repairs to rails and manganese steel. Special committee No. 7 on substitute ties was discontinued by action of the executive committee on Jan. 27, 1926, and therefore made no report.

The report was signed by C. A. Alden, E. B. Entwisle, W. G. Hulbert, E. J. McIlraith, J. R. McKay, H. F. Merker, C. A. Smith, A. T. Spencer, H. M. Steward, W. W. Wysor, E. M. T. Ryder and H. H. George, chairman.

Steam and Electric Railway Crossings

A DESIGN for manganese steel insert crossings for angles below 45 deg. to 30 deg. inclusive was recommended for adoption by way and structures special committee No. 5 on design of steam and electric railway crossings. With the addition of this design to those previously adopted, the series of designs will comprise the following:

Solid manganese steel crossings, angles 90 deg. to 60 deg. inclusive.

Solid manganese steel crossings, angles below 60 deg. to 40 deg. inclusive.

Bolted rail crossings, angles 90 deg. to 50 deg. inclusive.

Bolted rail crossings, angles below 50 deg. to 30 deg. inclusive.

Manganese steel insert crossings, angles below 45 deg. to 30 deg. inclusive.

The committee concurs in the recommendation of the A.R.E.A. track committee that crossings of steam railroad over electric railway below 30 deg. of angle, particularly for narrow treads and shallow flanges of the electric railway car equipment, should be avoided. It further shares in the general opinion that the insert type of crossings does not lend itself well for angles above 45 deg. and would not present any practical or economic advantages over the solid type in the higher angles.

In the opinion of the committee, after the adoption of the design herewith submitted, the series of recommended designs for crossings of steam railroad over electric railway will adequately cover the requirements under various conditions of traffic where electric railways cross steam railroad tracks laid with standard tee-rail. Recommendation is made that no further designs for other types be considered at this time and that the committee be discharged.

The report was signed by J. U. Bragg, James Budd, E. B. Entwisle, M. W. Johnston, E. P. Roundey, and V. Angerer, *chairman.

Buildings for Maintenance, Storage and Operation of Buses

WHILE way and structures special committee No. 9 was assigned two subjects—(1) design of buildings for maintenance, storage and operation of buses, and (2) design of joint railway and bus terminals—attention was concentrated largely on the first of these.

In garage design the salient points which the committee felt should be emphasized are:

1. Washing facilities.
2. Overhaul and repair pit facilities.
3. Lighting, heating and ventilating systems.
4. Fire insurance and protection requirements.

*Deceased May 5, 1926.

Digitized by Google

It is desirable that there be a decentralization of washing facilities. It should be possible to wash and clean a bus at whatever point in the garage the same may be stored. Practically all recently constructed garages embody this feature, retaining at the same time the central washing plant.

Pits are used almost universally except where prohibited by city or state laws. In such places, racks or hoists serve in their place. Overhaul and repair pits should be heated, lighted, ventilated and drained so as to assure comfort and safety to workmen. It is desirable that pits be communicating when arranged in batteries. This is possible through connecting tunnels or by open end pits. An excellent illustration of an open end pit is to be found in the February, 1926, issue of *Bus Transportation*, page 102, the report states.

Any design should afford a maximum amount of light. Artificial illumination is costly. Side windows should extend to the floor as far as possible to light the under side of buses. Lights in pits should be equipped with vapor-proof globes.

J. R. McKAY
Chairman

Next to light in importance of design is ventilation. Gas and carbon monoxide vapors affect efficiency of workers. However, their removal because of fire hazard is equally important. While large side windows with ventilators assist in their removal, there should be forced draft and roof exhaust sufficiently large to care for ventilation aside from any windows inasmuch as in inclement weather such means are rendered useless. It is also very essential to provide pit ventilation.

There are many types of heating and ventilating systems. The type most in use for heating is the low pressure vacuum system with direct radiation. Unit type heaters are also being more and more widely used. Hot air systems in which heat is distributed through underground and overhead ducts by a blower fan are also in use. There may be some objection to these systems due to the fact that air, which is recirculated, may be gas charged and thus dangerous from the standpoint of health as well as fire risk.

The tendency in design has been to increase floor areas until there are now in existence garages of almost gigantic proportions. While it is true that lack of floor space is costly, it is equally true that insurance rates covering large areas are bound to rise to uneconomical limits due to increased fire hazards. The committee therefore feels that it should at least sound a note of warning to the industry to the end that floor areas shall be kept as small as possible and still permit efficient operation. In any event large areas should be subdivided with walls separating various operations, such as forge, inspection, battery, tire vulcanizing, etc. Gas pockets should be well drained and, as far as possible, fire hazard reduced to a minimum.

Buses, because of the fine interior finish, draperies and uphostering, gasoline, oils and greases, create serious fire risks. It is very probable, the report states, that the National Fire Protective Association will formulate rules and regulations governing points in the design of bus storage, bus terminals or bus operating houses and in this event there will be surcharges on insurance rates for buildings designed contrary to such requirements.

Sprinkler systems are not designed for large areas and have in certain instances actually failed to work at a point of immediate need. Ten sprinkler heads delivering twenty or more gallons per minute should handle an ordinary fire. When more than ten heads have been called into play, it has been a serious fire, in practically every instance with a high loss. Records of the National Fire Protective Association substantiate this fact. Sprinkler systems will not materially lessen insurance rates for very large areas.

Storage of gasoline as required by code — 30 ft. from any structure and underground—offers no serious fire hazard and from an insurance standpoint is not of such grave importance. In many instances city and state ordinances control the quantity which may be stored, also the manner of control, whether remote or otherwise.

As an addenda to the report of the committee is given a report made by W. W. Wise of a detailed inspection, from the standpoint of fire risks and prevention, of the bus garage of the Fifth Avenue Coach Company, New York.

Comprehensive descriptions are given of the Fifteenth and Cumberland Streets garage of the Philadelphia Rural Transit Company, the 41st and Haverford Avenue garage of the same company, the Union Square garage of the Boston Elevated Railway, and the Waukegan garage of the Chicago, North Shore & Milwaukee Railroad.

Concerning the design of joint railway and bus terminals, the committee does not find any new developments save that by the Philadelphia Rapid Transit Company of parking areas for motorists. At the 69th Street and Bridge Street terminals and also at 31st and Market Street this company has provided parking space where motorists may park their cars and use the suburban and elevated systems as a rapid means of transit. The fee charged for parking includes a round trip fare to the city.

Recommendations made by the committee are:

(1) That the study of the design of buildings for maintenance, storage and operation of buses be continued; (2) that a study be made of the effect of design upon fire insurance rates in co-operation with other interested organizations, and (3) that the study of design of joint railway and bus terminals be assigned to a separate committee.

The report was signed by A. J. Blackburn, G. H. Halderman, L. F. Parlette, W. W. Wise, Judson Zimmer, J. R. McKay, chairman.

Surface Hardening of Rails

PROGRESS of this committee in 1926 was confined to the tracing of wear tests and the mileage and production of treated rail. The committee's information is that in American equipment for treating rails by the Sandberg sorbitic process has been installed at only one mill. Because of the time taken to apply the treatment to each rail, it is difficult to arrange rollings so as to fill large contracts. Shipments of sorbitic rail from this plant in 1923 were 4,279 tons, in 1924, 4,968 tons, and in 1925, 2,772 tons.

A. T. SPENCER
Chairman

The committee believes that the decrease in tonnage shipped in 1925 has been due to the difficulty in arranging rollings rather than to a loss of confidence on the part of the industry in the wearing qualities of the treated rail.

No additional mileage of track has been treated on this continent with the *In-situ* process since the applications on the system of the Toronto Transportation Commission in Toronto in 1922 and 1923. During the past year it has been found that the scalings referred to in previous reports have damaged the rail in certain sections to such an extent that it has been replaced after some three years of service. These defects have in practically all cases occurred where high-pressure blowpipes were used in heating the rail and where the rail itself was well worn after eight to ten years service. As noted in 1924 and 1925 reports the lower-pressure blowpipes were used chiefly on rail which had less than one year of service, and it is on these sections that comparative wear data will eventually be most reliable.

Information received from foreign systems shows the mileage treated or untreated up to February, 1926, to include original orders of 74.48 miles single track and repeat orders of 220.36

Digitized by Google

miles, single track, a total of 294.84 miles. The committee was also informed that the Ministry of Transport in England has looked favorably upon the *In-situ* treatment to the extent that it is granting authority to tramways to raise loans for this purpose.

The following table has been prepared from information submitted, showing comparative wear of treated and untreated rail in England:

System	Period of Treatment Yr.	Mo.	Cars Carried	Wear of Rails, In. Untreated	Treated
West Bromwick.	2	3	Unknown	0.118	0.038
Birkenhead.....	4	8	379,800	0.081	0.042
Blackpool.....	2	4	220,700	0.042	0.019
South Shields...	2	11	382,500	0.050	0.022
Wallasy.....	3	3	828,600	0.044	0.025
Wallasy.....	2	9	242,550	0.042	0.021
Swansea.....		11	162,000	0.031	0.015
Met. Electric...	3	1	145,660	0.034	0.020
Met. Electric...	3	1	289,615	0.049	0.024
Paris.....	3	6	1,050,000	0.105	0.504

Rail profiles taken in Toronto by the committee were inconclusive but indicate that the hardened rail has shown considerably less wear than the unhardened rail under similar conditions of traffic. The committee is convinced that the Toronto experiment should run over a longer period before a definite pronouncement should be made regarding the merits of the *In-situ* process under American conditions.

The recommendations of the committee were that this subject be discontinued for one year pending development of further data.

The report was signed by C. L. Hawkins, B. P. Legare and A. T. Spencer, chairman.

Wood Preservation

ECONOMIES attained by the use of treated timber were discussed at considerable length in the report of the committee on wood preservation. It is said that in view of the overwhelming evidence from the steam railroads and larger communication companies it is nothing short of gross negligence on the part of electric railways not to fall in line to effect economies which they badly need, and to do their share in connection with national conservation of timber.

Illustrated descriptions with tables of characteristic applications of wood preservation are grouped under the captions of Ties, Poles, Bridges and Culverts, Piling, Building Material, Floors and Paving, Posts, Cars, and Miscellaneous Uses.

Information showing the extent of the use of treated timber on electric railway properties is given in a number of tables compiled from replies to a short questionnaire sent to about 140 properties. About 60 per cent of the properties replied, the greater number of which showed treated timber used in various quantities. Their figures show unquestionably that greater life is being received as the result of treating, but the period of use is too short to make definite comparisons. From a small number of replies of a selected list of properties, the committee feels that the criticism is sustained that the electric railways as a whole are not doing their part in effecting economies along the line of wood preservation.

A few outstanding examples of timber treatment are mentioned. In 1923 the steam railroads used 210 treated ties per mile, whereas the electric railways used only 13. The life of poles can be increased from two to three times by treating. During the unusual sleet storm of December, 1924, covering a strip about 100 miles wide from

A. P. WAY
Chairman

southern Michigan to Texas about 60,000 untreated poles went down, whereas less than 100 creosoted yellow pine poles were lost. When treated, posts will last two to four times as long as untreated, and less durable timber can be used. Parts of cars that decay in two to eight years can have their life tripled when treated.

Cost per tie per year, including pavement replacement, on electric railways was found by a questionnaire to be as follows:

	Untreated	Treated
Bituminous macadam paving...	$0.59	$0.57
Asphalt paving.....	1.08	0.90
Granite block paving.....	1.64	1.38
Open track.....	0.37	0.28

Savings on bridge timber were found to be $0.49 per year per thousand board-feet. On 30-ft. poles the saving per pole per year is $0.06, and on cross-arms $0.02 per year.

Material in the 1923 edition of the Engineering Manual under the subject of Wood Preservation, although revised and added to by annual supplements, was compiled a number of years ago, and in a number of instances does not apply today. It has been thought for some time that the specifications should be regrouped in a more logical order for easy reference and revised in a number of cases. The committee submitted recommendations for changes which it is felt will meet such need.

The report discusses at considerable length the development of methods of treating poles in place. Ways to increase the life of timber by means other than the application of preservatives were studied and various suggestions to this end made in the report.

Study of forms for keeping continuous records of treated timber has not been brought to the status which the committee set out to accomplish, principally on account of being unable to collect sufficient forms in use by operating companies upon which worthwhile recommendations could be made. Two forms of record cards are submitted for information, one for ties and structural timber and the other for poles. On one side, information of kind and method is to be filled out by the persons doing the treating and then returned to the purchaser. On the other side space is provided to show date and location of installation and periodical service record. A plan for marking poles is also submitted.

Wood preservatives other than creosote and allied products and zinc chloride were considered thoroughly last year and are reported on very briefly this year, because no new preservatives have been put on the market. Mention is made of the fact that some companies use water soluble salts with sodium fluoride base for structural timber, where creosote would be objectionable. At least one company is using poles so treated in city districts where poles are to be painted. Such preservatives have not, however, been used in this country long enough to determine definite results.

Four appendices are submitted with the report. Of these, three give results of various installations of treated timber, while the fourth is a glossary of principal terms pertaining to the subject of wood preservation.

The report was signed by E. H. Berry, M. J. Curtin, T. H. David, J. L. Fritsch, W. H. Fulweiler, E. F. Hartman, W. L. Harwood, L. P. Scanlan, C. A. Smith, W. F. Graves, and A. P. Way, chairman.

Rail Corrugation

ORGANIZATION of its work so that a volume of important data covering an extended period of time might be accumulated has been the principal accomplishment of the committee during the past year. At present, nineteen electric railways are gathering data on forms which were recommended by the committee last year. Each of these companies has purchased an instrument which for want of a better name is called the "Corrugraph." With these instruments they are now securing graphs of corrugation on selected sections of track.

Dimensions of some of the corrugation inspected by the committee on its trip during the summer of 1925 are presented in an appendix to the report. The wave lengths listed are irregular, ranging from 1½ to 10 in., lengths between 3 and 4 in. being the most common.

In the belief that the nature and magnitude of the forces or loads to which the rail is subjected have much to do with corrugation, a sub-committee on vibration was appointed. Preliminary tests made on track at Pittsburgh indicate a promising field for future work. More extended vibration tests and studies will be made during the coming year. Wave lengths for several different car speeds and frequencies of vibration have been computed and are shown in another appendix.

Obviously there is a close relation between track structure, vibrations and noise. Some tests of track noises made at Toledo by H. S. Williams of the committee on reduction of noise in car operation were witnessed by representatives of the corrugation committee.

Digitized by Google

These tests showed that the noise and therefore the magnitude and duration of track vibration may be radically different with different types of track structure. More specific data relative to these tests are presented in the report of the committee on noise reduction.

Figures of a number of hardness tests are presented in an appendix. Economic data relative to corrugation have been included in the same place.

Some consideration has been given by the committee to corrugation in other forms of engineering structures, particularly streets and highways. In these structures corrugation phenomena have come prominently to the attention of engineers only since the use of the automobile has become widespread. As with the electric railway, a radical change in the type of rolling stock brought with it troubles that were previously unknown. Because highway structures are ordinarily not so complex as railway track structures, and because the corrugations are larger and

W. W. WYSOR
Chairman

develop very rapidly, the difficulties in the way of studying them are not so great as in the case of steel rails.

Corrugation in highway structures seems to be limited largely to gravel roads and asphalt pavements, although it is sometimes found on tar-bound stone roads. In asphalt paving the displacement of the surface is ordinarily assumed to be due to shoving. This phenomenon was familiar to engineers before the advent of the automobile. To minimize shoving in modern pavements the tendency seems to be to use the harder grades of asphalt and a relatively lower percentage of asphalt than was used some years ago.

The bureau of public roads of the United States Department of Agriculture has made an extensive study over hundreds of miles of highways in many states. From its report it appears that corrugations do not form if the traffic is only 200 to 300 automobiles per day. With traffic above 400 automobiles per day, corrugations may give serious trouble, and where the rate of increase of traffic is well known, officials can predict almost to a day when corrugation will begin to develop.

Two methods of formation are described; first by the kick back of surface materials arising from the spin of one or both of the rear wheels of an automobile as they descend after a bounce over some obstacle or depression, and second, whenever the clay bond in a gravel road is sufficient in quantity and has sufficient moisture to give the aggregate plasticity, series of corrugation develop from the squeezing of the plastic mass. While rail steel and gravel mixed with clay binder are not similar, it is noted that the principle involved in the second cause given for gravel road corrugation has some bearing in the case of rail corrugation.

In conclusion, the report says that the whole problem of rail corrugation causes and elimination is a complex and difficult one and the committee believes that it will be necessary to spend some years in accumulating data and in study of different types of track and rolling stock construction before it will be possible to draw a definite conclusion as to the best manner of minimizing this trouble. In addition to the work of collecting data which is now under way, the committee believes that the work on rail, track and equipment vibration tests and studies should be carried on in an earnest and systematic manner, and that laboratory studies, including chemical, physical and photo-micrographic tests should be made on selected specimens of corrugated and non-corrugated sections of rail.

The report is signed by E. B. Entwisle, E. L. Lockman, R. B. Fehr, T. J. Lavan, C. R. Kinnear, H. Jackson Tippet, C. H. Clark, A. M. Hardini, C. L. Van Auken, H. Fort Flowers, J. Ormondroyd, H. S. Williams, D. D. Ewing and W. W. Wysor, chairman.

Equipment

EXISTING standards and specifications referring to equipment which are included in the Manual and in the 1924 and 1925 Supplements were reviewed and revisions and additions were recommended in the following items:

E1-25 — Design of Brake Shoes, Brake Shoe Heads, Brake Shoe Keys and Gages.

E2-25—Standard Journal Boxes and Contained Parts.

E12-25—Standard Gages for Journal Bearings and Wedges.

E3-25—Design of Axles for Electric Railway Motors. L

E211-24—Rules for Inspection of Car Axles.

E103-25 — Specifications for Case-Hardened Forged Steel Gears.

E104-25—Specifications for Quenched and Tempered Forged Carbon Steel Gears.

E105-23—Specifications for Case-Hardened Forged Steel Pinions.

E106-23—Specifications for Quenched and Tempered Forged Carbon Steel Pinions.

E208-24—Miscellaneous Method and Practice on Lubrication of Car Equipment.

A progress report was presented on foundation and hand-brake rigging which included air-brake installation. Portions of the miscellaneous methods and practice designated as E212-25 were arranged as a recommended standard.

A progress report was included on car painting which included a study of cars painted by various methods. A large number of cars were inspected by the committee during the year, particularly at Detroit and Pittsburgh, and notes were made of the condition of cars after they had been in service for a period of years. The report gives conclusions reached by the committee from these studies, which were that all undercoating should be of the same general color as the finished coat in order that scratches or scrapes will not appear unsightly. This also makes the finishing coat cover more easily. All metal on cars when cleaned off for the application of new paint should have all rust removed so that new material will take a firm hold. Sand blasting was recommended as the best method of cleaning of material for the application of paint.

The color and varnish system was recommended for application to wooden interior finish of cars using spar varnish for window sash, window sills, arm rests and seats. Enamel and cellulose lacquer were recommended for application to the steel interior finish of cars such as seat framing, stanchions and

P. V. C. SEE
Chairman

wainscoting. The enamel system was recommended particularly for application to ceilings and head linings.

The color and varnish system and enamel system were recommended for application to the body of wooden or wood and steel cars. The use of acid cleaners was considered inadvisable.

The three principal systems which include color and varnish, enamel and cellulose lacquer were recommended for application to the body of steel cars and a mixture of lead and oil or a long oil enamel was recommended for application to canvas roofs.

In connection with the study of motor coach design and maintenance methods, this year's committee was unable to hold any joint meetings with the Society of Automotive Engineers as that society had no meeting of its standing committee. A study was made of various maintenance inspection methods and a sample inspection system was included in the report. The committee recommended that the subject of developing a standard bus design be discontinued for the present, but that a committee work in conjunction with the standards committee of the Society of Automotive Engineers to take up for standardization of design, location or operation such items as operation of gear shift levers, location of hand brake, question as to whether hand

Digitized by Google

brake should be pushed or pulled to operation, distance of foot pedals from driver's seat, location of starter buttons, relative position of spark and gas levers and the location of horn buttons.

The subject of gearing was again studied this year, but the work was limited to consideration of tooth forms and to providing limit of wear gages. These were given in the appendix of the report and the committee recommended that the gages for determining the scrapping point of gears and pinions be adopted as a recommended standard.

The committee took up with the boiler code committee of the American Society of Mechanical Engineers certain points in the boiler code which were felt to conflict with best electric railway practice. The secretary of the boiler code committee advised that certain matters would be considered for revision. These include a lifting device for safety valves and the requirement of daily testing of safety valves.

A study of the standardization of car equipment and car construction with special reference to appearance, comfort and convenience of passengers, together with a study of car lighting, formed a large part of the report. The principal item was that of easy-riding cars. To produce this requires smooth track, properly designed springs, freedom of nosing and body jars. The importance of freedom from vibration may be appreciated when attention is called to tests conducted by the Bureau of Standards, which proved that vibration of an amplitude of 1,000th in. might be very uncomfortable to a passenger.

There is a tendency on the part of equipment engineers to specify a seat height of 17 in. and 17½ in., instead of the old standard of 19 in. This lower seat may have been influenced by the low automobile seats, but it is generally admitted that the lower seat is the more comfortable.

Seat spacing is also an item that requires attention, it being assumed that every one agrees that the maximum spacing possible will produce the greatest comfort. This spacing usually must conform to the body post centers, which on the standard car is 29¾ in. If thick seat backs and backs with greater incline than customary are used this will require greater allowance for seat spacing to produce equal comfort. It is possible that in this case as great a seat spacing as 31 in. will be necessary.

Under the classification of providing convenience for passengers perhaps the most important feature is car speed. The committee felt that no other single feature offers such great possibilities for popularization of service as this one.

Much has been accomplished to speed up the handling of passengers by the use of the door-operating treadle, particularly in one-man cars. This has permitted the use of a rear door which tends to keep the riders from crowding about the forward door. Also where conditions are favorable this door may be opened by a street fare-taker and passengers loaded through it.

Much confusion exists due to the use of front, center and rear-entrance cars. A standardization would correct this, though it is difficult of accomplishment.

Car signs should be given much study. Clearly, the signs should be of high visibility both day and night, and they should be sufficiently explicit to serve as a good guide. The route number is a very valuable adjunct to the sign system if properly worked out and is recommended for city service.

The committee suggests that the car painting scheme should be changed sufficiently to be noticeable to the public at least once every three years. The exterior of steel cars which are painted in light colors can be improved by the use of countersunk rivet heads.

Car interiors may be bettered as to appearance by the removal of unsightly bell cords where used on older cars and the substitution of electric signals.

The committee made a careful study of car lighting and conducted some tests, results of which were given in the appendix of the report.

The report was signed by W. S. Adams, W. C. Bolt, A. L. Broe, W. W. Brown, R. S. Bull, A. T. Clark, R. W. Cost, M. R. Hanna, J. M. Hipple, J. H. Lucas, W. H. McAloney, Joseph C. McCune, J. S. McWhirter, A. D. McWhorter, E. S. Sawtelle, R. B. Smyth, C. W. Squier, J. P. Staples, H. S. Williams, J. M. Yount, Daniel Durie, sponsor, and P. V. C. See, chairman.

American Engineering Standards

AT PRESENT, 32 projects, several of great importance, have been undertaken, according to the report of representatives on the main committee of the American Engineering Standards Committee. Revision of the National Electrical Safety Code is now under way by letter ballot. If accepted this should end the series of arguments and experience hearings on various often conflicting state rules on overhead construction. An electrical advisory committee has been organized. This has great promise, the report states, as a board of arbitration to adjust differences of opinion in the electrical field. The American Electric Railway Association has recognized the value of the work by taking out a second voting membership, R. H. Dalgleish filling this position. The association has been honored by having the main committee vice-chairmanship.

The report was signed by C. R. Harte and R. H. Dalgleish, representatives.

Heavy Electric Traction

OUTSTANDING in the work of this year's committee on heavy electric traction was the study of track and third rail bonds for heavy traction work. This is a new subject so far as this association is concerned. Four subjects were selected by the sub-committee for consideration, namely, a tabulation of present practice, the effect of heat of welded bonds on track rails, development of a standard basis for measurement of bond resistance and preparation of data covering results of tests of current-carrying capacity of bonds.

Information regarding current practice with track rail bonds was obtained from 25 roads, of which nineteen were electrified steam railroads and six were heavy electric lines. Of the 29 installations included nineteen were mechanically applied and the remaining ten heat applied. On third rail bonds thirteen companies, seven of which were electrified steam roads and six heavy electric lines, showed fifteen installations. Eight were mechanically applied and seven heat applied.

The mechanically applied bond is stated to be the oldest type in general use and hence the most widely adopted. It is used in sizes ranging from No. 0 A.W.G. to 500,000 circ.mil, and varying in length from 9 in. to 53.25 in. The pin-expanded terminal predominates, probably because this type can be installed and maintained very easily

H. F. BROWN
Chairman

under traffic and without requiring the use of cumbersome or expensive tool equipment. The advantages claimed for the mechanically applied bond are summed up as follows: Easy to install; wide range in choice of length of bond and flexibility of design to suit rail joint; low labor cost of application and replacement; only small and inexpensive tool equipment required for installation. Its disadvantages are: High first cost; necessity of being designed to fit the rail joints, length being fixed by splice bar and bolt hole spacing; larger capacity than otherwise necessary when long lengths are required; uncertainty of securing and maintaining uniform and low contact resistance.

Heat applied bonds, particularly the welded type, have reached a successful stage of their development only within the past few years, with the consequence that this type is not as yet in sufficiently wide use under heavy traffic conditions to permit drawing definite conclusions as to its comparative merits. The sizes range from No. 0 A.W.G. to 250,000 circ.mil, while their length varies from 7 in. to 15.5 in. Gas weld bonds are being used in 70 per cent of the installations. Advantages claimed for the welded type of bonds are: Low resistance due to its short length and character of contact; use of small capacity bonds, all being 250,000 circ.mil or less; easily inspected; uniformity of design; permanence of contact and consequently permanence of contact resistance providing the weld holds. Its disadvantages are: Skilled operators are required for its installation; special and more or less cumbersome tool equip-

Digitized by Google

ment is necessary; bond is exposed to mechanical injury and theft; limited to rail head application.

Comparatively little opportunity exists for standardization of third rail bonding because of the widely differing types of third rail construction.

Effects of heat in welding in changing the structure of rail were considered and references are given to earlier reports. It is hoped to continue the study during the next year.

The development of a standard basis for measurement of rail bond resistance was given attention. A comprehensive set of tables and charts giving resistances of rails with and without bonds is included. Field testing methods, by means of which the actual bond resistance may be obtained as a check on the calculations, or for purposes of ascertaining the excellence of bonds in service, are detailed.

Other subjects considered by the committee were the bibliography of heavy electric traction, branch line electrification and self-propelled cars, articulated train operation and revision of data on electric locomotives, multiple-unit cars and trains. Diagrams of recent articulated trains are given, and a comprehensive tabulation of electric locomotive and multiple-unit train data are included.

The report was signed by A. H. Armstrong, H. W. Cope, A. H. Daus, J. C. Davidson, J. H. Davis, J. V. B. Duer, J. T. Hamilton, E. C. Johnson, Norman Litchfield, J. O. Madison, M. W. Manz, L. S. Wells, A. H. Woollen, C. R. Harte, sponsor; Morris Buck, secretary; J. M. Bosenbury, vice-chairman, and H. F. Brown, chairman.

Noise Reduction

WORK of the committee on reduction of noise in car operation during this year was devoted largely to scientific study and analysis of some of the principal noise producing elements. The report states that it is necessary in order properly to study noises, to set up accurate comparative sound values, and to have a calibrated ear capable of placing a definite value upon sound, one which will register the same value on successive tests, and in which the personal or human equation is entirely eliminated. Acting upon the recommendations of the previous committee, the executive committee made an appropriation of $500 for the purpose of securing such an apparatus.

The practical use of the apparatus is to be able to demonstrate convincingly the relative value of changes made in elements of equipment to reduce the amount of sound generated. For example, it is desired to reduce the inherent noise in a car gear and the suggestion is made to bolt to the gear, pads of various materials to produce this result. In such a case an instrument of this character will tell the value of the proposed change in practice and will allow experimenters to arrive at the best material, shape and method of attachment. Such procedure is vastly better than trying to accomplish the same thing by the sense of hearing, because it has been shown that a man cannot always be depended upon to place the same value on noise; that fatigue, mental and physical condition, etc., influence his judgment and make it untrustworthy.

After considerable study, a device was decided upon which uses a type of transmitter similar to the familiar loud-speaker of radio reception connected through radio amplication equipment to a microammeter. Thus the noise gives a deflection of the needle

H. S. WILLIAMS
Chairman

which is almost directly proportional to the intensity of the sound. A device of this character was not available in the market as a unit, so it was necessary to have the apparatus constructed especially to meet the requirements encountered.

The sound measuring mechanism employed by the committee represents only the first step in the contemplated noise study and attention is directed to the fact that the measurements give the proportionate amplitude of vibration of the noises analyzed. Items of pitch and effect upon the human ear are reserved for future consideration.

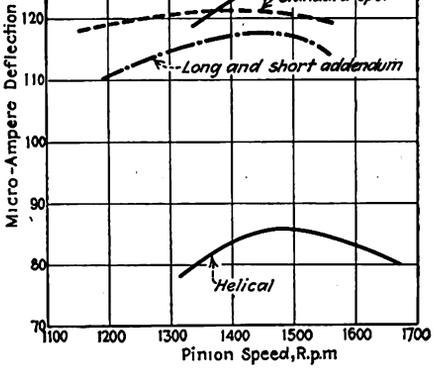
One of the chief sources of noise in car operation is that produced by the gearing. Attention was called in last year's report to the possibilities of noise reduction through higher standards of maintenance by keeping bearings well fitted, and renewing gearing before the teeth are worn to the breaking point and thus decreasing noise due to back-lash. It was one of the aims of the present investigation to prove this point by test, to place a definite comparative noise value upon the standard spur, long and short addendum spur, helical, and standard spur gear with the so-called wisdom tooth pinion and also to determine the value of silencing pads bolted to the gear. Gear noise in cars is combined with a multitude of other noises, one masking the other, so that it is difficult to measure the sound from the gearing on a car under operating conditions. However, it is entirely feasible to set up car gearing in such a way as to eliminate all sound except that produced by the gears and in this manner gearing may be subjected to experimentation and not only its condition as to noise determined but the value of proposed sound improvement evaluated. This committee with the co-operation of the Department of Street Railways of Detroit had the necessary mechanism set up to conduct tests on gears along the lines mentioned.

The first set of tests was run with the object of determining the comparative quietness of standard spur, long and short addendum spur, helical and wisdom tooth gears. Heretofore, this has been a vigorously debated question, but opinions have always been based upon personal opinion, which is never convincing. The committee felt that it would render a real service to the industry if it could settle this question. The necessary equipment is at the committee's command and it only remains to conduct check tests to dispose of this question finally. However, the care exercised in selection of gearing and running of tests was sufficiently painstaking and the results of the tests seem so conclusive that the committee feels warranted in reporting the results of their first experiment.

Briefly summarized, the helical gear shows up best in respect to quietness, followed in order by the long and short addendum spur, the standard spur tooth and the wisdom or drop tooth gearing. Accompanying curves show the results of several tests of gears of the various types taken under as nearly identical conditions as possible.

In order to arrive at as nearly accurate results as possible, gearing of the same manufacture and treatment were measured. These were furnished through the courtesy of the Cincinnati Tool Steel Gear & Pinion Company. Care was exercised to secure gears with accurately cut teeth and with minimum warpage and eccentricity.

In the first set of curves shown the micro-ampere readings are proportional to the volume of sound; that is, the higher the micro-ampere reading, the greater the sound. As the gearing was of the same number of teeth in each case, the pitch of the sound at each



Results of Tests on Gears of Various Types to Determine Relative Quietness—Gears Not Lubricated—Gears Operated on Pitch Line — 14.5 Hp. Transmitted

speed was approximately the same. Consequently the micro-ampere deflection is a true comparison.

Attention is called to the character of the curves shown in that instead of increasing uniformly as the speed throughout the range of the tests they drop off at the higher speeds. This inconsistency may be due to the higher

Digitized by Google

frequency vibrations being out of the efficient range of the amplification apparatus. At the time of submission of this report, calibration of the apparatus had not been made, so a definite reason could not be assigned.

Gears Tested with Silencing Pads

Tests were run to determine the value of resilient pads bolted to the gears. The results of these experiments proved beyond doubt the value of a silencing pad. To complete this phase of the work it will be necessary to try out various sizes, shapes and compositions of the cushioning pads.

To show the possibilities of reduction of noise by applying a cushioning medium to the rail in track construction, a series of tests were made by the use of the apparatus previously mentioned. Through the courtesy of P. J. O'Neill, railway engineer Community Traction Company, Toledo, Ohio, means were made available to conduct the test. Two sections of adjoining track were selected in which the structure is nearly identical except that a cushion about the rail is used in one case and not in the other. The tests were conducted between the hours of 1 and 2 a.m. to insure freedom from interfering street noise and to permit the special car which was used to move as desired. In making the tests the car was run at a uniform speed and coasted past the sound pick-up device so as to eliminate as far as possible the noise from the gearing. The results of several tests on each section of track show that the cushioned track is approximately 25 per cent quieter than the same track without the cushion.

Economic Side of Noise Reduction

The necessity for noise reduction extends further than a question of an unpleasant sensation which it is desirable to eliminate in order to make street car rides more salable and to reduce the complaints of residents, although that is the chief consideration which actuates the present movement. There is the economic side which is very important, for noise is occasioned by vibration of the physical structure and that vibration means a destructive force which ultimately will cause a breakdown.

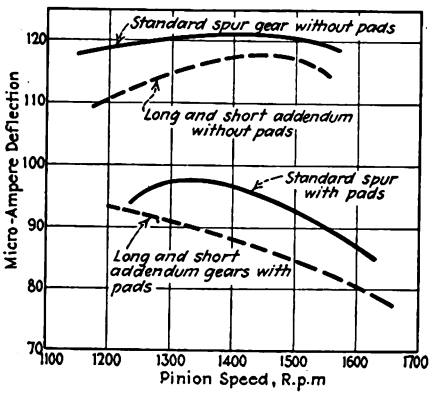
The committee found that the sources of noise in the order of their importance are:

1. Wheel and track vibration caused by wheel impact.
2. Gearing and motor noise due to gear tooth impact.
3. Noise of loose parts which are secondary vibrations due principally to the transmission of wheel impact vibration.

The remedies recommended in principle are:

1. Higher standards of maintenance.
2. Improved design, including cushioning and reduction of unsprung weight.

Much has been written relative to higher maintenance standards and the committee emphasizes this and the importance of discarding gearing with badly worn teeth. The equipment committee this year has recommended a gear discard gage which will do much



Noise Comparison of Standard Spur and Long and Short Addendum Gears with and without Cushion Pads

to help this condition. Bearings should be tightly fitted and renewed before the wear becomes great. Individual fitting of axle bearings is strongly recommended.

In design, attention is called to the principle that any loose part or any part not rigidly supported will vibrate so it becomes necessary to cushion these parts, or brace them rigidly or to isolate the elemental parts by cushions. In some cases vibration may be reduced by so changing parts that their natural vibration periods will be materially different from the frequencies set up by wheel impact or gear vibration. It is possible also in the case of elliptic springs to break up synchronous vibration by throwing the spring seat off the center of the spring, thus making unequal ends.

Brake shoes are prolific sources of noise and there is great need for improvement of this item.

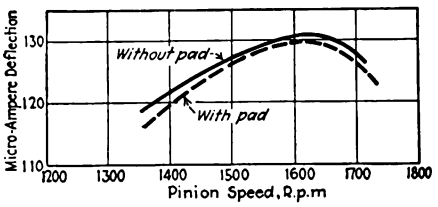
Where possible, gear ratios may be so designed as to give pleasing vibrations rather than the reverse. For example the following gear and pinion ratios combine to form harmonious musical pitches:

Ratio 5:6 produces a minor third.
Ratio 4:5 produces a major third.
Ratio 2:3 produces a perfect fifth.
Ratio 2:1 produces an octave.

Gear cases may become sounding boards due to their large flat surfaces unless means are used to overcome this tendency.

In conclusion the report states that to conquer the noise condition in car operation or at least to bring it to the irreducible minimum, further study, research and analysis will be necessary.

It may be argued that if a noise cannot be reduced sufficiently to detect it or to determine its value by ear its elimination should not be attempted and that scientific study such as is being attempted by this committee is impractical.



Noise Comparison of Wisdom-Tooth Pinion and Standard Spur Gear with and without Pads

Such a contention cannot be well supported, because the ear is too unreliable as a sound measurer, and the ear method is susceptible to too much personal element and is inconclusive. Then, too, this noise problem is composed of so many small elements whose summation makes a disagreeable condition. Neglecting bad maintenance noises which are apparent and need no expert diagnosis, the problem is to cut the sound of all the possible noise-producing elements—a little here, and a little there—and the aggregate will amount to a real accomplishment. The problem is comparable to that of reduction of weight in car design. If it is desired to reduce the weight of a car, say, 5,000 lb. it is patent that this weight cannot be taken out of any one item, but if a little is taken from the wheels and axles, a little from the motors, etc., the sum total will mean a substantial weight reduction. Therefore the committee feels that it is on the right track and that measurement, analysis and experimentation will bring success.

The report is signed by W. S. Adams, H. E. Bean, E. H. Berry, C. Bethel, W. W. Brown, L. J. Davis, M. Guynes, F. L. Hinman, G. H. McKelway and H. S. Williams, chairman.

Wheel-Flange Gages

THE duty of providing necessary wheel gages had previously been assigned to the equipment committee with instructions to co-operate with the way committee. At present the association has standards for a wheel mounting gage and limit of wear gages for the steel wheel contours designated as A, B, C and D. There is no wheel checking gage for these flange contours, however, and no gages have been provided for the two American Railway Association's contours, which were adopted as standards of the American Electric Railway Engineering Association in 1923 and which are shown at present on page 499 of the Manual.

Designating Letters on Drawings Desirable

In making up the drawings of various gages for wheel flange contours the committee found it of particular convenience to have designating letters for each of the wheel contours. At present the letters A, B, C and D, together with various numerical suffixes, are used to designate the association's standard tread and flange contours for steel and chilled iron wheels. The two A.R.A. wheel contours which were adopted as standards of the American Electric Railway Engineering Association in 1923 and which appear on page 499 of the Manual have no designating letters.

To provide designating letters for these two latter contours the committee recommended that the letters E and F be assigned to them; that contour E be used for the contour of chilled iron wheels as standardized by the American Railway Association in 1909 and as adopted by the American Electric Railway Engineering Association in 1923, and that letter F be used to designate the contour for steel and steel-tired wheels as standardized by

Digitized by Google

the American Railway Association in 1920 and as adopted by the American Electric Railway Engineering Association in 1923.

NEW GAGE FOR WHEEL MOUNTING

At present the association has a standard wheel mounting gage for steel and chilled iron wheels which appears on page 122 of the 1925 supplement to the Engineering Manual. This design of gage is for mounting wheels with contours A-3, A-3½, B-2½, B-3, C-2½, C-3, D-2½ and D-3 only. There is no wheel mounting gage for the two A.R.A. contours which the committee designated as contours E and F. To provide a wheel mounting gage for these contours the committee recommended the adoption of a new gage. This gage is the same as the standard A.R.A. mounting and check gage as shown in section B, page 42 of the A.R.A. Manual (Mechanical Section) except that the gage is provided with a center point similar to that used in the A.E.R.E.A. standard wheel mounting gage.

This gage is also to be used as a check gage for wheel contours E and F.

The 1925 equipment committee attempted to develop a wheel checking gage that would apply to all wheel contours, but it was found necessary to refer the proposed design back for further revision. The committee this year, therefore, considered this subject and decided to resubmit the gage proposed by the 1925 equipment committee and which appears on page 291 of the 1925 Engineering Proceedings, with all references to contours E and F omitted and with the thickness of the material specified as ⅜-in. spring steel.

The committee considered the subject of limit of wear gages and recommended that the present standard limit of wear gages for the American Electric Railway Engineering Association as adopted in 1916 and revised in 1923 and 1925, and which appear in the 1925 supplement to the Engineering Manual on pages 118 and 119 have the following additions to the captions for Figs. 1 and 2 which appear on page 118:

"Gages as shown are for use with rolled steel wheels only. The same general dimensions apply to gages for use with cast-iron wheels except that the part which projects down the back of the wheel should be cut off in line with the tread face."

The committee also considered it desirable to provide limit of wear gages for determining high and low flanges and such a gage was presented.

The committee considered it desirable to provide standard tapes for measuring the circumference of wheels. The American Railway Association has such a tape which was adopted in 1893 and modified in 1919. This tape was recommended to be used for the two A.R.A. wheel contours which were adopted as standards of the American Electric Railway Engineering Association in 1923 and which appear on page 499 of the Manual.

The committee also considered it desirable to provide a new standard circumference measuring tape for steel and chilled iron wheels with contours A, B, C and D. Investigation showed that such a tape has been in use for a number of years by the various steel companies who manufacture rolled steel wheels to these contours.

The committee recommended that the wheel circumference measuring tape for standard tread and flange contours A, B, C and D of steel and chilled iron wheels, as shown in Fig. 2, be adopted as a recommended standard.

The report was signed by W. S. Adams, C. A. Alden, W. C. Bolt, J. H. Haylow, Hugh Savage and C. W. Squier, chairman.

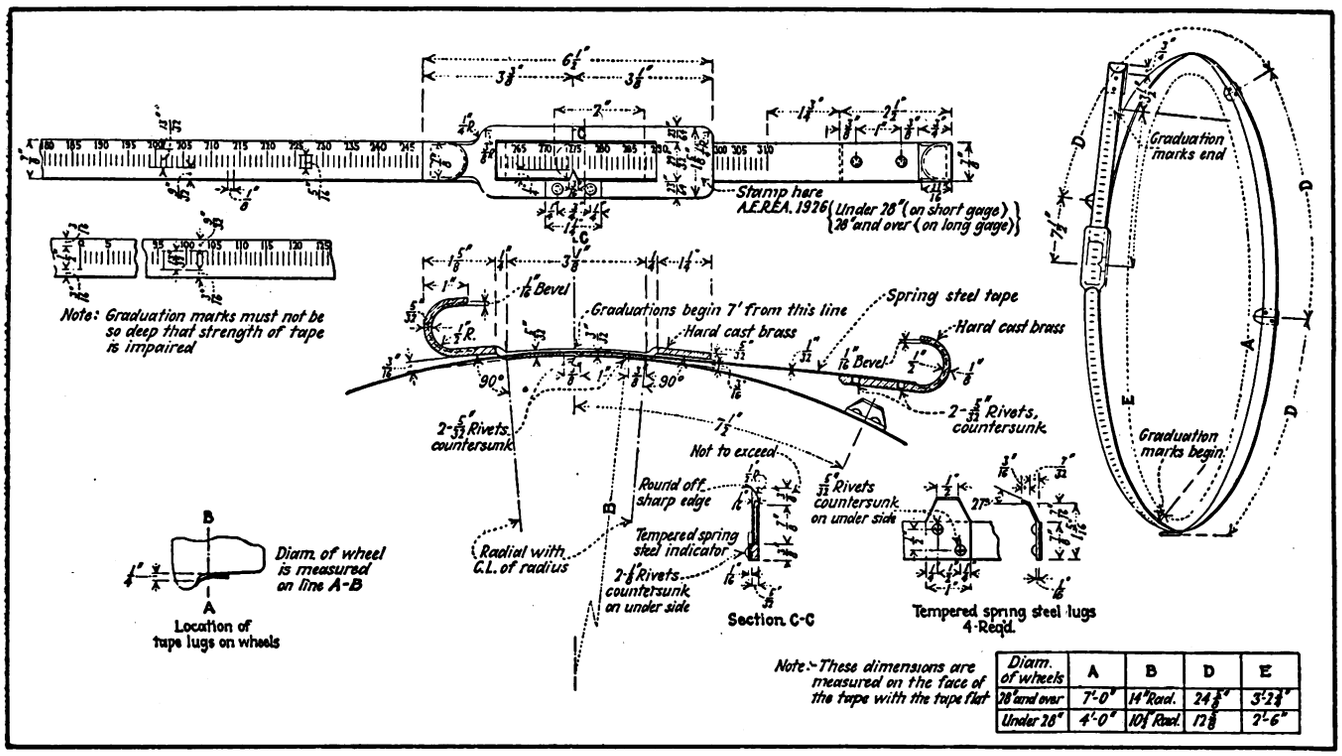
Co-operation with Department of Commerce

STANDARDIZATION of sizes and simplification of specifications for many articles used by electric railways were considered by the committee appointed to co-operate with the United States Department of Commerce. Approval was given to the recommendation for simplification of grinding wheels. A change was approved in the sizes of tacks so that their lengths should vary by ⅛ in. instead of by 1/16 in. The subject of simplification of glass sidewalks and roof lights was carefully considered and it developed that the present practice of manufacturing this material is in accordance with the recommendation of the Department of Commerce.

Specifications covering iron and steel scrap for use by blast furnaces, steel plants, foundries, etc., were approved. At the same time, the contract for the purchase of scrap was submitted. The committee felt that this was a contract prepared by the purchasers of the material and did not indorse it.

Other subjects considered by the committee included: simplification of self-opening die heads, new billet steel bars for reinforcing concrete, simplification of sizes of steel reinforcing bars, advisability of showing weights of castings on blue prints, simplification of carbon brushes, simplification of wrought iron and wrought steel, pipe, valves and fittings and simplification of shovels, spades and scoops.

Attention is called to the work now being done by the Department of Commerce in the Simplified Practice Division. The association is represented at the conferences and is endeavoring to take care of the interest of its members. In all cases, the recommendations are approved for one year, and at the end of the year changes may be made



Diam. of wheels	A	B	D	E
28" and over	7'-0"	14" Rad.	24⅜"	3'-2⅞"
Under 28"	4'-0"	10" Rad.	12⅜"	2'-6"

Wheel Circumference Measuring Tape for Contours A, B, C and D

Digitized by Google

in the recommendation if there is sufficient demand. If members of the association find difficulty in securing the proper material due to the recommendations of the Department of Commerce, notification should be sent to the executive secretary of the association in order that the committee may be able to correct any difficulties. It is possible that in the case of simplification the practice might be carried too far for satisfactory results, and in such cases, the committee would be glad to take up the matter and have the objectionable features eliminated.

The report is signed by R. H. Dalgleish, chairman.

Engineering Symbols

ALL of the material which had been prepared and partially completed by the committee of the preceding year was reviewed by this year's committee. To keep the cost of the report within reasonable limits, as well as to concentrate the efforts of the committee on types of symbols most generally used by electric railways the work was limited to the following classifications: Topographical, electrical equipment of buildings, miscellaneous electrical, railroad, and railroad signal symbols. Drawings were made and cuts prepared of all the symbols which the committee felt should be included in the report.

H. W. CODDING
Chairman

During the year the subject of symbols for engineering and mathematical work has received active attention from a number of different organizations. With this in mind, the committee felt that it should confine its activities to those subjects most intimately connected with electric railways in order to complete a report that would include symbols most essential for electric railways to have considered in any general standardization work. Symbols concerning architecture, heating and ventilating, mathematics and mechanics were considered but were omitted, as other organizations are better equipped to formulate them. Some additional power distribution symbols were considered, but as there was no general agreement in the symbols studied they have been omitted.

The chairman of the committee, as a representative of the American Electric Railway Engineering Association, attended a conference called by the American Engineering Standards Committee on drawings and drafting room practices and also attended the organization meeting of the sub-committee on electrotechnical symbols and abbreviations, including radio, of the A.E.S.C. sectional committee on scientific and engineering symbols and abbreviations. This sectional committee has now undertaken the standardization of symbols, but as the work of the sectional committee will, by virtue of its organization, move slowly, the committee decided to complete its report.

The symbols submitted are classified as follows: Topographical, Figs. 1, 2 and 3; electrical equipment of buildings, Figs. 4 and 5; miscellaneous electrical, Figs. 6, 7 and 8; railroad, Figs. 9 to 18 inclusive; railroad signals, Figs. 19 to 31 inclusive.

Where possible, topographical symbols should be printed in the colors given with the symbols.

The symbols for batteries and instruments included with railroad signals (Figs. 19 to 28 inclusive and Fig. 31) are of the same general form as shown under miscellaneous electrical symbols, but vary in minor details in order to keep them the same as those adopted by the signal section of the American Railway Association. The symbols for transformers, reactors and resistors (Figs. 29 and 30), however, are identical in both groups submitted. These differ from the corresponding symbols of the signal section of the American Railway Association, which conflict with those generally used in most branches of the electrical industry.

Since a sectional committee of the American Engineering Standards Committee has now undertaken general standardization of symbols and as their work will be connected closely with the attempt of the International Electrotechnical Commission to prepare international standards, the symbols submitted in this report will be of assistance in having symbols acceptable to the electric railway industry considered by the sectional committee. In the period intervening before the A.E.S.C. can adopt standards, these symbols should be of particular value to electric railways. The committee recommended (1) that the symbols submitted in this report be adopted as a recommended standard; (2) that the committee be continued to co-operate with the sectional committee of the American Engineering Standards Committee.

The report was signed by M. M. Johnston, J. D. Kent, G. H. McKelway, W. F. Graves, sponsor; C. W. Squier, vice-chairman, and H. W. Codding, chairman.

Review of Engineering Manual

WORK of way and structures special committee No. 1 on review of buildings and structures and way sections of the Engineering Manual consisted largely of carrying forward the recommendations of last year's committee and studying various suggestions submitted. A few minor changes in the Engineering Manual were recommended. The report was signed by T. H. David, D. J. Graham, J. S. Mahan, D. H. Walker and W. R. Dunham, Jr., chairman.

Unification of Car Design

THE question of car design was considered in a joint session with the committee on essential features of modern cars, appointed by the president of the American Electric Railway Association. Designs were prepared covering proposed city type, double-end and single-end cars; also, double-end and single-end interurban cars. After detailed consideration, the committee found that the designs of the city type of car corresponded with the recommendations made in previous reports. Consequently, it approved the proposed designs. The question of limiting stresses to be used in the design of cars of these types was considered and the following is recommended:

1. The car body should be designed to carry under service conditions the maximum live load for which it is intended in addition to its own dead weight.

2. The direct stress in the body bolsters, platform arms, and side frame girder, due to maximum static load, must not exceed 12,000 lb. per square inch of either tension or compression.

H. H. ADAMS
Chairman

3. The combined stress in the body bolster, due to carried load plus the stress due to the tractive pull of the truck and application of the brakes, must not exceed 16,000 lb.

4. All connections should be designed for the maximum load to which the member connected may be subject. The secondary stresses in any members caused by eccentric loads should be combined with the direct stresses in such members. The fiber stresses (except in body bolster, referred to in paragraph 3) may be taken at 20 per cent greater than those given in paragraph 2, but the direct stresses, considered alone, must not exceed the 12,000 lb. above stated.

5. The report of the committee on unification of car design of 1922, Fig. 2, gives the typical stress analysis of a car body. Proper provision must be made in the side girder to prevent buckling over the bolster.

6. The permissible stresses above given are predicted on steel having the characteristics called for in A.S.T.M. specification No. A-11-24, Structural Steel for Cars. Where other materials are used, they should bear the same proportion to the ultimate strength of material used.

It was recommended that the commit-

Digitized by Google

tee be continued to act in the same capacity for another year.

The report was signed by C. A. Alden, J. A. Brooks, L. J. Davis, H. F. Flowers, C. Gordon, J. A. Greig, J. W. Hulme, A. P. Jenks, G. L. Kippenberger, J. Lindall, Victor Willoughby, W. F. Graves, sponsor, and H. H. Adams, chairman.

Stores Accounting

ENLARGEMENT of the present classification of materials and supplies to include a classification of bus material was recommended in the joint report of the committee on purchases and stores of the Engineering Association and the committee on stores and accounting of the Accountants' Association.

It was pointed out that whereas certain companies operating buses were carrying stocks of considerable size, while other companies were able to operate without any stock, being able to

P. F. McCALL
Chairman

make satisfactory arrangements with local dealers for immediate deliveries of required parts, the proposed classification was not only well constructed but, in the opinion of the committee, covered present and future needs.

Methods for handling freight and express bills were recommended following a detailed study of this subject made by means of questionnaires sent to 25 representative electric railways. The subject of co-ordination of materials and supplies with the operating budget was also considered by the committee.

Regarding the disposal of unused inactive material, the committee had prepared a questionnaire dealing with the desirability of establishing a clearing house for such material and containing a number of alternative propositions for carrying out this plan. These questionnaires had been submitted to company members and it was hoped to have the replies tabulated and analyzed in time for presentation at the October meeting.

The following subjects were recommended for consideration by the committee on purchases and stores for 1927:

1. Study and make recommendations regarding the disposal of unused inactive material.

2. Make a further study of routine methods to be followed in the purchasing and stores departments, recommending that report be made on uniform method of distributing materials by supply trains or trucks.

3. Recommend that a uniform practice of testing or inspecting material by testing or inspecting materials on receipt or at factory be adopted.

The report was signed by the following:

For the Engineering Association—J. Y. Bayliss, A. S. Duncan, J. Fleming, B. W. Forkner, C. A. Harris, A. E. Hatton, F. A. Jordan, A. A. Ordway, C. W. Stocks, C. Thorburn, W. J. Walker, R. H. Dalgleish, sponsor; F. L. Wheaton, secretary, and P. F. McCall, co-chairman.

For the Accountants' Association—G. H. Caskey, W. S. Stackpole, F. E. Wilkin and R. A. Weston, co-chairman.

Power Generation and Conversion

EXISTING Manual sections were gone over to determine revisions desirable. In the section containing specifications and contract for the purchase of fuel the committee recommended further study. Since the prime movers committee of the National Electric Light Association has not been active on this subject during the past year the committee was unable to make desired progress.

In regard to specification for high-tensile strength bolts for use on superheated steam pipe lines, which was submitted at the 1925 convention, the committee found that a proposed specification on this subject, as drawn by the American Society for Testing Materials, was accepted as a recommended standard by the American Electric Railway Association. This specification has since undergone a slight revision and has been accepted by the American Society for Testing Materials as a recommended standard, subject to the outcome of a letter ballot. The committee recommended that no further action be taken regarding the acceptance of this specification at this time.

The application of various types of equipment to automatic substations and the subject of remote supervisory control have been rather thoroughly covered in past reports of the association. Efforts of this year's committee were concentrated upon the compilation of data pertaining to operating phases of this type of station, including consideration of the cost of operation and maintenance. For the purpose of collecting information questionnaires were sent out. Replies were received from 44 companies which have a total capacity of 745,955 kw. of conversion equipment, practically all of which is in the form of synchronous converters. The information received was analyzed and tabulated to show the distribution of equipment as divided between manually operated, full automatic and semi-automatic apparatus, also a classification of converters according to service. A number of questions were included relative to the frequency of inspection, type of men used, methods devoted to inspection and maintenance cost. Further tables were compiled to show inspection practice used and comparative cost of inspection and maintenance labor.

The committee attempted to determine the extent to which supervisory control or some form of distant indication is being used. Companies operating approximately one-third of all automatic equipment employ supervisory control either for all or part of their equipment. Seven companies rely on lamp signals near the tracks and four companies on lamp signals in adjacent manual stations. Nineteen companies provide no special indication of any sort in case of a lockout, depending presumably upon reports of low voltage.

Regardless of the method used, it appears from the report that it is advisable to provide some means for prompt notification in case of station trouble. A station may lock out during a time of light load and if voltage indications alone are depended upon the trouble will not be remedied and

LAWRENCE D. BALE
Chairman

service may be seriously affected when the heavy load comes on. If supervisory control is not warranted some simple and inexpensive means can usually be found for providing definite indications at the time of the trouble.

A study was made of the application, characteristics and present status of the mercury arc power rectifier for electric railway service. The report included a discussion of the characteristics and application of the mercury arc power rectifier compared with the synchronous converter. The matters of efficiency, power factor, regulation, operation, maintenance, building requirements and cost were included. Due to the limited experience with the rectifier in this country most of the data obtained were from foreign sources.

Difficulty was experienced by the committee in comparing the application of the rectifier with the synchronous converter on account of the inherently different characteristics of the two types of equipment, with particular reference to sustained overload capacities. This was partially overcome by limiting the considerations as to applications to two general classes of systems, as referred to in the report, having widely different characteristics regarding momentary and average load demands.

The availability of American standards of rating for the rectifier com-

Digitized by Google

pared with those of the present A.I.E.E. standards for the synchronous converter is, without question, of great importance, particularly at this time in view of the advent of the rectifier in the American field. The committee considers that steps should be taken to bring the necessity of American standards for the mercury arc power rectifier to the attention of the proper engineering standards body, and to that end it recommended that the study be continued.

A large part of the report related to information obtained through a study of ventilation and reduction of noise in the operation of automatic substations. The information tabulated brings to a conclusion a series of studies which has extended over a period of four years; these studies were reported on in 1924 and 1925. The activities of the committee for the past two years have been centered on obtaining data in regard to the subject of ventilation. This was collected from tests made by the committee on representative automatic substations in actual operation.

The conclusions of the committee were that heat dissipation by means other than ventilation is of sufficient magnitude to affect the dissipation required of the ventilating air. For an ordinary substation building having 13 in. exposed brick walls, 6 in. concrete floor and 4 in. cinder concrete roof with weatherproofing it averages ⅓ watt per square foot per degree Centigrade difference in indoor and outdoor temperatures, but considerably less for thicker walls and for soundproof building construction. Wind and rain will temporarily raise dissipation by means other than ventilation in isolated buildings.

Rotating machines have well-defined suction and discharge areas. Air is drawn into the revolving element along its shaft, overbearings, commutators, collector rings, etc., and is discharged from the largest cylindrical surface, through or over the edge of the stationary element or both, the performance being similar to that of a fan with concentric housing and sides removed. The intensity and extent of these suction and discharge areas are such that the machine will circulate a sufficient amount of air to dissipate the losses at full-rated load with from 4 deg. C. to 7 deg. C. rise, 7.2 deg. F. to 12.6 deg. F., corresponding to from 475 to 270 c.f.m. It follows that if recirculation of the heated air is prevented no overheating will result either of the machines themselves or of the room air.

Recirculation can be almost entirely eliminated and natural or self-ventilation relied upon to dissipate the losses in installations of greater concentration in kilowatts of rated capacity per square foot of floor area or cubic foot of building space that now appears to be general practice for automatic substations in railway service.

The following arrangement of inlets and outlets appears to be quite effective in supplying proper ventilation for automatic substations where it is permissible to locate openings of sufficient areas in the walls of the structure at will. This arrangement is also suggested as a means of preventing recirculation of ventilating air to the greatest extent:

(a) Locating inlets just above the floor level, but within the effective range of the machine suction, not more than 5 ft. from the ends of the machine. All inlets should be on same elevation.

(b) Connecting inlets to floor openings at the pedestal ends of the machines. These openings can in most cases be extended a short distance inside the base casting.

(c) Providing hoods over the floor openings at the ends of the machines to guide the air directly into the suction areas.

For outgoing heated air:

(m) Confining the downward heated air discharge to an inner pit, extended on that side of the machine toward which the lower part of the armature revolves, to a floor opening or outdoors.

(n) Locating outlets in the pressure zone of the station so as to take advantage of the pressure created by the machine in ejecting the air.

(o) Providing a volute housing over the discharge area to collect the heated air and ducts to conduct it outdoors.

(p) Aggregate air inlet areas should at least equal the aggregate outlet areas and preferably should be 1½ to two times as large.

Means of forced ventilation need only be resorted to in cases where additional resistance against the natural flow of air is introduced, such as air filters or washers, soundproof building construction, or as insurance against shutdowns from overheated apparatus other than rotating machines.

Where insurance against overheating arising from unfavorable size and location of building or the restriction of free air flow by adjacent buildings, as well as liability to prolong overload during extremely hot weather, forced ventilation has been employed with effective results.

So far as effective cooling of the machines is concerned exhausters or blowers appear to serve the purpose equally well, but the room temperature becomes more comfortable if the heated air is exhausted than if the cool air is forced in, presumably because in the latter case more cool air bypasses the machine directly to the outlet and a greater quantity of cooler air is discharged to the atmosphere, leaving the room warm. With the exhauster an equal quantity of warmer air can be discharged, leaving the room at a more comfortable temperature.

As in the case of natural ventilation, it is essential for effective cooling that recirculation be avoided and the same means can be employed to avoid it.

The report was signed by C. E. Bennett, C. A. Butcher, H. W. Codding, H. A. Kidder, N. R. Love, F. W. Peters, G. W. Saathoff, L. J. Turley, G. I. Wright, E. H. Scofield, sponsor; W. E. Bryan, vice-chairman, and L. D. Bale, chairman.

Power Transmission and Distribution

EXISTING Manual sections were reviewed and recommendations for revision were made in certain ones. Others cover specifications which are now being actively studied by sectional committees of the American Engineering Standards Committee, and while there is some need for revision of existing Manual sections, it was recommended that these be withheld until the A.E.S.C. has taken final action.

The committee prepared specifications for a number of items of material used in catenary construction and recommended that these be included in Manual Section "D." These included pole bracket arm assembly, messenger insulator pin, messenger insulator, catenary hangers, cross-span steady, pole-bracket steady, catenary messenger anchor clamp, trolley splicer, flexible pullover, feeder connector, catenary trolley sectional insulators and trolley frog and crossovers. It was recommended that the specifications covering material for catenary construction as presented be adopted as a supplement to the specifications for overhead line material for 750-volt direct-current suspension, serial designation D102-21.

The committee carried on studies of trolley wire breaks and submitted an analysis of results obtained by companies which have co-operated in these tests. The recommendation of the committee was that these studies be carried on by next year's committee.

Arrangements have been made with a number of railway companies to install test sections of trolley wire in order to determine the relation of life of trolley wire to the number of twists it will stand under test. These tests will require several years to complete and next year's committee should keep in touch with them.

A number of minor modifications were made in the specification for hard-drawn copper trolley wire. This specification was originally prepared in conjunction with the American Society for Testing Materials. The committee recommended that the work in conjunction with the American Society for Testing Materials be continued in an endeavor to bring the high-strength, low-conductivity trolley wire specifications of the two associations into complete conformity.

No work was done by this year's committee in regard to inductive coordination, except to keep in touch with the American committee on this subject. The recommendations of the committee were that this subject be continued next year and that the American Electric Railway Engineering Association be ready to furnish information that the American committee may desire.

The committee continued its study of interference to radio reception caused by the presence of electric railway facilities. Tests and experiments were made further to determine the nature of the interference to radio reception and the various sources from which such interference may emanate. The report included a series of tests conducted at Lafayette, Ind., and another made in New York City. From the tests and study made by the committee regarding this subject, it appeared that trolley car operation may be responsible for interference to radio reception for a distance up to 200 ft. or even more from the trolley cars,

Digitized by Google

wires and feeders. The distance at which interference may become a detriment to radio reception depends to quite an extent upon the receiving set used and the location of the set with respect to broadcasting stations. Thus, sets which are being operated in cities where there are a number of good-sized broadcasting stations and where the sets are being operated at a rather low degree of amplification may not be bothered by trolley car interference where such sets are located 50 ft. or more from trolley lines.

On the other hand, sets which are being operated at a considerable distance from broadcasting stations and where the degree of amplification is large in order to get loud speaker reception from a distant station may experience serious interference where such sets are located 200 ft. or possibly more from a trolley line.

Interference originating on a trolley line may be transferred to parallel lines, such as light and power lines, telephone or telegraph lines, and be distributed by them, thereby causing interference to receivers located at remote points from the trolley line. Trolley lines may also pick up interference originating at sources foreign to the trolley line and distribute it, thereby causing interference for which the trolley lines may be blamed, but for which they cannot, in any way, be held responsible.

Considerable unnecessary interference may be eliminated on trolley lines by the simple expedient of locating the sources and correcting the trouble. Much of the interference is of such a nature that it probably cannot be eliminated, although it may, to some extent, be lessened by methods as suggested in the report.

A review was made of specifications for 600-volt direct-current overhead trolley suspension and it was found that certain changes were desirable. These were included in the committee's report with the recommendation that actual revision of the existing Manual section be deferred until the American Engineering Standards Committee has completed its work on the national safety code in connection with line material specifications. After this has been accomplished it was the opinion of the committee that the specifications might require further revision.

A code of principles to be followed in drawing up joint pole use agreement was submitted. This includes sections on advantages of joint use of poles, disadvantages of joint ownership of poles, principles of joint use, and practices of joint use. The report also included an appendix with suggestions for desirable changes in the specifications for direct suspension trolley construction, the idea being to incorporate these for use of future committees.

The report was signed by J. W. Allen, S. H. Anderson, W. H. Bassett, M. W. Cooke, J. H. Drew, D. D. Ewing, C. L. Hancock, C. J. Hixson, A. J. Klatte, H. S. Murphy, J. F. Neild, W. J. Quinn, W. Schaake, A. Schlessinger, George F. Wennagel, M. B. Rosevear, sponsor; F. McVittie, vice-chairman, and Charles H. Jones, chairman.

Economics of Automatic Substations

THERE were two points developed in connection with automatic substation application during the past two years which influenced the nature of this report so that it might be of practical value to the railway engineer.

First, the economies and other advantages of the automatic substation have been proved in practice in a sufficiently large number of cases to make the desirability of this type station a fact accepted by nearly all railway engineers. During the past two years almost all new substations (approximately 80 per cent) installed for railway companies have been automatic. When manual substation equipment was installed there was usually some peculiar condition that made its use seem desirable.

Second, it is advisable to make the study immediately on the somewhat laborious but more accurate "cut and try" method. The principal difference between the "cut and try" and the "analytical" methods is that in the former the layout of the changes in the distribution system must be prepared before estimating the costs. But it has been found the feeder layout has a larger influence on the economics of the problem than had been expected. Also the study of the proposed feeder layout is very helpful in arriving at the final conclusion.

It seems now to be the general consensus of opinion that the automatic railway substation should be used for new installations in practically all cases and in many cases manual stations should be replaced by this type. Its advantages are as follows: Economic savings will result. The service will be as reliable or more reliable. Service will be restored quicker after high-tension interruptions and with less chance of error.

The committee concludes that any engineer or management contemplating additional substation equipment should decide at once that the new station would probably be automatic, unless some unusual condition was involved. In many cases, it should even pay to remove converters from existing manual stations and install them in new locations as automatic substations, provided the converters are of a sufficiently modern type.

The electrical engineer can choose the size of automatic substation which from his experience he feels might best suit the portion of the system under consideration for use in determining its economics compared with a manual station layout. Judging from past practice, there will be very few cases where larger than 2,000-kw. synchronous converters will be used for automatic substations for surface operation. The engineer will then know that the estimated costs obtained will be slightly less for a larger size converter or slightly more for a smaller size converter.

The report then reviews the "cut and try" method, referring to the detailed instructions contained in the 1922 report of the special committee on automatic substations. A review of the past committee reports is also given fully, with comments and data from installations recently made.

E. H. Scofield developed an analytical method of determining substation layout based on general assumptions that would give the comparative annual cost for any desired number of automatic substations planned. This analytical method for estimating the economical number of automatic substations was contained in the 1923 Proceedings. Ralph H. Rice of the Board of Supervising Engineers of Chicago suggested at that time that it should be possible to present the analytical method in the form of a formula and in the following two years proceeded to work out such a formula. The committee considers that this is an interesting and valuable contribution to the subject and submits this formula, with its complete mathematical derivation, in the report for 1926.

The committee further states: "In view of the fact that this formula has not been applied to a specific problem, little can be said one way or the other commenting on its practicability for solving automatic substation studies." In general, the same comment would apply to the "analytical" method, as noted in the 1923 Proceedings. This formula, like the analytical method, is intended merely as a preliminary study, but is probably superior to the analytical method. It should give an approximation of the most economical number of stations for any area and can be solved for an approximate cost.

There are seven appendices to this report, five of which develop mathematically five of the variables in the working formula referred to above. Appendix F is a mathematical determination of the average feeding distance for any number of substations and Appendix G gives definitions of the terms "load factor" and "line loss factor" as used in the calculations.

In conclusion, the report states that the automatic substation has been proved and accepted as the most economical and advantageous way of converting and distributing energy for street railway systems, both urban and interurban. With the summary contained in this report and the information of the preceding report of the special committees on automatic substations the method of determining the most economical substation plan and estimating its cost has been described in sufficient detail so that any railway engineer can apply the solutions to his own particular problems.

Future developments in this field can be properly and logically followed for the two standing committees on power generation and conversion and on power transmission and distribution.

For this reason this committee recommends that the special committee on automatic substations be discontinued and the problem of determining the proper design of the distribution and layout for automatic substations be referred to the two committees above mentioned.

The report was signed by L. D. Bale, W. E. Bryan, C. A. Butcher, C. H. Jones, F. W. Peters, R. H. Rice, L. R. Wagner, E. H. Scofield sponsor, and Adrian Hughes, Jr., chairman.

T. & T. Committees Have Been Active

Investigations This Year Directed Along Lines of Merchandising Transportation, Traffic Congestion, Accident Prevention and Bus Operation Have Resulted in Reports that Are Replete with Valuable Suggestions

BESIDES one joint committee with the Claims Association this year, there were but three technical committees of the Transportation & Traffic Association. Each, however, was on a vital topic and covered its subject in a very broad way. Thus, bus operation was treated under fifteen different heads and merchandising transportation under six. All reports of the association are conspicuous in the absence of statistics. This year the committees chose to record a consensus of opinion on policy methods and proper procedure. The reports taken as a whole are a veritable textbook of best practices; they form valuable reading and should produce worth-while results if put into action. Abstracts of all Transportation & Traffic reports follow.

G. H. CLIFFORD
President T. & T. Association

Merchandising Transportation

GENERAL policies or principles governing operation of street railways are not laid down by the committee nor has it cataloged individual operating practices that might result in increase of riders or revenues, except where these are of so general application as to afford a guide for the entire industry.

The report is under six general headings that relate directly to the subject assigned and reported on by selected sub-committees.

COURTESY, SALESMANSHIP AND APPEARANCE OF TRANSPORTATION EMPLOYEES

The street car operators, motormen or conductors, and all bus drivers are the salesmen of the industry. They must compare more favorably in selling ability with salesmen in other lines of business. Greater attention must be given to the training of these employees in a specific and detailed manner with a view to bringing about a standard of courtesy, personal appearance and sales practice notably high.

Courtesy, appearance and salesmanship standards attained will be in proportion to the effort used by the management in promoting these matters. This effort will not be successful until the transportation employee realizes that he is in a competitive business; that the success of this business depends upon his individual effort; that it is in his power to attract customers or to alienate them; that this competition is not temporary but permanent, and that in all cases his own prosperity, and often his job, is contingent upon his own thoughtfulness in presenting the best personal appearance, using attractive methods and co-operating in the teamwork that will produce a service satisfactory to the public.

It is not sufficient simply that the trainman listen to talks dealing with these subjects or read pamphlets on them. He must be made to understand, indorse and then demonstrate what has been taught with respect to appearance, courtesy and salesmanship. If he is too stupid to understand or is reluctant to co-operate in these practices, his service should be dispensed with. In most cases the principal part of the work is to inculcate a complete understanding of the necessity for these practices, and the part the individual must play in them.

A great many companies might well give more particular attention to the character of uniform worn by trainmen. This consists not only of insisting upon clean and well-pressed uniforms (to secure which cleaning and pressing stations have been provided on many properties), but also a complete change in uniform. Practically ever since the beginning the standard uniform has been a blue serge with more or less shapeless cut. For the purpose of offering a better front door to the

R. N. GRAHAM
Chairman

business, the selection of gray whipcord uniform with military cut is suggested. It is felt that the gray whipcord uniform is more practical than blue serge and that there is a psychological value to the change.

Whenever a new uniform is adopted, the opportunity exists for a complete standardization of every detail of the uniform, so that the employee becomes identified with the company to such an extent that his appearance forms an advertisement of its service.

Since courteous treatment bulks so large in the attitude of the public toward our industry, there is a tendency to raise the age limit of men employed. Some companies now insist that the new employee must be at least 25 years of age. This higher age requirement will tend to stabilize the transportation organization, reduce turnover and add to the prestige of men and company. In this connection, the pamphlet written by George Baker Anderson, manager of transportation Los Angeles Railway, entitled "Salesmanship," covers the general field of instruction of new men so completely that this booklet is recommended to the attention of the industry.

Trainmen should be kept informed as to their accomplishments, such as accident prevention, curtailment of delays, power saving, unusual acts of courtesy, personal appearance, and, in general, the manner of acting as the company's direct representative. Bulletin boards, company publications or trainmen's meetings may be used in doing this. Trainmen should receive, when possible, information of new company plans, policies or problems. Advertising plans, policies or problems of sufficient importance could be explained, if necessary, by competent instructors.

Digitized by Google

This will enable trainmen to discuss these matters intelligently with their patrons and friends.

Some companies use selected trainmen to adjust complaints. The written or phoned complaint is given to the trainman just as it is received from the patron. This may be a real or fancied offense. The proper method of approaching the complainant, the adjustment of complaint and the closing up of the interview are explained. The trainman then interviews the complainant. In this way the trainman gets the patron's view of his fellow-workman's lack of duty or tact in handling the public. In other words, the trainman is liable to see himself as others see him.

Special Classes of Service and Rates of Fare

Special rates of fare and special classes of service are designed to augment the revenue received from the ordinary and routine transportation of passengers. But it should be borne in mind that specialties cannot make up losses from regular operation if the fundamental rate of fare is too low. There is some danger of using special rates and special classes of service to make up deficient revenues. Main consideration should be given to the development of such a standard of regular transportation service in the community as to form the basis in public favor of securing a rate of fare adequate to bring a fair return. With this condition established, then special types of service, with special rates of fare, may be expected to promote interest in and add to the number of users of the regular service, as well as to return a profit in themselves.

A number of transportation companies, both city and interurban, are experimenting with special rates of fare and special types of service designed to attract:

1. The rider who desires a superior service and is willing to pay the relatively high fare required to furnish it. Such service compares with that offered on the extra fare trains operated by the steam railroads.

2. The rider who will not pay a higher fare for superior service, but will become a customer and pay regular rates for an improved service.

3. The rider who will use the service at times of light traffic because the transportation company can then afford to sell its surplus capacity at a relatively low rate of fare.

In the first class are included parlor car service, dining and buffet cars, sleeping cars, special theater service, etc., operated by a number of interurban companies. Under this head may also be included the de luxe motor coach service which a few companies are operating to high-class residential districts.

An example of service of the second class is the "Ceramic Flyer" of the tween Steubenville, Ohio, and Beaver, Valley Traction Company operating between Steubenville, Ohio, and Beaver, Pa. This is a parlor-car limited service making only five stops in the 40-mile run, with a running time 30 minutes less than the regular service and with no extra charge.

The third class includes the use of the weekly pass, the monthly ticket, the Sunday and holiday pass, and other similar methods of attracting business during periods of light riding.

The experience of member companies along these new selling lines is as yet more or less limited, but would seem to indicate that these methods offer good possibilities of popularizing transportation service and, at the same time, attracting additional business.

During the last twelve months the Northern Texas Traction Company performed a notable piece of merchandising work in conjunction with the meeting of the American Legion in Fort Worth, Tex. The railway company, through its manager and staff, sold the idea to the American Legion that it should, as a courtesy to delegates, provide the necessary transportation as a part of the entertainment costs. The American Legion did this and also provided free tickets to other events planned for the convention. The railway company printed up small books with the necessary entrance tickets to the various events and also ten tickets of special form, each of which was good for a ride on the local cars of the Northern Texas Traction Company during any one of the four convention days. When the books were used up they could be renewed upon presentation of the old cover. The books were originally issued, as well as the renewals, at the registration desk of the American Legion.

At the end of the convention, the railway company presented the coupons to the Legion treasurer and received nearly $1,500 in payment for the transportation rendered.

Another example is the instance of the Beaver Valley Traction Company selling tickets at the regular rate of fare, but giving with them coupons which were redeemed by the merchants of the community as part payment on cash purchases of $5 or more. The company put up the tickets in books of 40, and sold the books for $2.25 each, giving with each book eight of the coupons, which had a cash value of $2 when applied to the cash purchase of merchandise. The management felt, however, that even better results would have been obtained had the tickets been sold in $1 quantities, without the 25 cents extra charge and with a reduced merchandise purchase requirement.

Several companies have profited by special party service, outings and tours. Some of the larger properties have provided comfortable waiting and lounging rooms, with quarters for the departments handling this special business.

Schools, public and private, all over the country are more and more transporting their pupils by bus. In some instances, groups of parents underwrite the cost. This type of service can usually be handled in off-peak hours and is attractive. For a moderate rate per month, buses can be assigned to school routes, making door-to-door pick up and delivery. With good chauffeurs and well-maintained buses, the service will prove to be an excellent good-will builder.

In some of the large cities, or in places where there are a large number of transients, sightseeing buses can be operated in the off-peak hours at a profit. Special week-end, all-expense tours of one or two days duration have proved popular and profitable in several instances. These tours should be organized by the company and should be well advertised.

Maximum Use of Existing Facilities

Careful attention should be given to car assignment, to the end that maximum possible use be made of good equipment. It is suggested that in many cases, by a careful selection of cars, it will be found possible to make such adjustments as will permit operation of a greater proportion of the service with the higher grade equipment, thus building up public good will, increasing receipts, and at the same time reducing operating expenses.

Sunday and holiday car assignments and, on some properties, Saturday car assignments, should be carefully studied, with the idea in mind that on these days it may be possible to operate a very much greater proportion of the service with the better classes of equipment. Such studies may show also the possibility of utilizing a greater number of one-man cars on Sundays and holidays to the improvement of the service and the decrease of its cost.

The committee urges that special consideration be given to reduction of the number of stops. This can be considered under two divisions:

1. The elimination of stops consistent with the locality will decrease the running time for the service as a whole in many cases.

2. The elimination of stops for the purpose of operating express service. This may be considered with or without co-ordination with coach operation. Interesting and successful experiments along this line have been conducted in both Providence and Baltimore.

The maximum use of existing cars and tracks cannot be had if the average speed is unreasonably low. Slow movement of street cars is also one of the chief causes of their unpopularity in this age of swift-moving automobiles.

There is a possibility of operating on a skip-stop or stagger-stop plan in rush hours and on the ordinary plan at other times. This should be given careful consideration.

In order to equalize the loading between the through cars and the short-routed cars, the through cars could be operated as "limited stop" cars, making no stops to discharge passengers between certain limits in the local territory. These limits could be judiciously selected so that the average loading of all cars would be approximately the same.

General Company Interest in Civic Problems

Every company, in addition to being a good citizen in the communities it serves, should strive to attain the higher plane of being a good neighbor. In being a good neighbor, it will be active in boards of trade, chambers of commerce and the so-called service clubs such as the Rotary, Kiwanis, Lion, American Business, Civic, etc. Such clubs, however, do not contain as large a percentage of the companies'

Digitized by Google

customers as the community improvement associations, Veterans of Foreign Wars, American Legion Posts, etc.

It is important that companies take out individual memberships in such organizations as are identified with the local community interests, such as improvement associations, district and ward clubs, etc., and pay the dues of such memberships.

Every company should be active in the work of the Safety Council, whether this be a part of the national body or a local organization. Where such an organization is not in existence, and there seems to be a need for concerted action in bettering the safety conditions of the community, the company should lend every assistance in the formation of such an organization.

Advertising

As an aid to getting best results from the advertising done by member companies, it is strongly urged that each company send to the director of advertising of the American Electric Railway Association copies of all advertising used in order that he may be a clearing house for such information.

There is no need to expand on the use of the newspaper as an advertising medium unless it be to point out that it should be continuous. It is better to have a brief message in the papers every day or several times a week than to have a full page infrequently.

Newspaper advertising in general should be specific and have a definite sales plan. The most successful newspaper advertising campaigns in the electric railway field have been attempts to increase traffic by suggestions that people ride to the zoo, the museum, the park, or in pushing the sale of a certain type of ticket or freight service. Merely filling your advertising space with generalities about your good service is not enough. Sell something definite.

In addition to the use of paid advertisements in the newspapers, much valuable advertising may be secured by friendly contacts with the reporters in keeping them informed fully as to the company's plans and operations.

Very few companies are using their own advertising mediums to the greatest advantage. One of the best forms of advertising in the world is the street car display.

Care should be taken, however, to obtain brevity in copy for street car posters or signs. Dash posters which are to be read from the outside of the cars should never contain more than sixteen words and it should be possible to read them from a distance of 50 ft., at least. Cards used in the inside of the car should never have more than thirty words.

Company publications distributed through the "Take One" boxes, or sent out to a selected mailing list, can be printed easily and cheaply. If kept short, snappy and interesting, they will get over to the public many of the facts about the street railway. There are many successful house organs of this character.

At the present time the total advertising appropriation of 260 electric railways in the country is between $4,000,000 and $5,000,000, which amounts to about one-half of 1 per cent of their gross income. It is felt that the industry should be spending approximately 1 per cent of its gross income annually for its advertising and merchandising efforts.

Design and Care of Equipment

Future design of both buses and rail cars must be as much the concern of the transportation engineer as the master mechanic. Not that the master mechanic's job is done, but rather that the transportation features demand far more attention than they have received in the past. Both the car and the bus must approach the comfort, appointments and convenience of the private automobile, as this is the largest competitor to common carrier service today.

Economies, important as they are, must not forbid conveniences. The electric car of an antiquated design, poorly maintained, does today suffer from an invidious comparison with the rubber-tired vehicle. Perhaps the best way to establish greater confidence in the electric car is to alter the design, as much to create a different appearance as to improve its operating characteristics.

Opportunity exists, particularly in the design of new equipment, to avoid some of the noise which seems inseparable from the business. Attention in this regard should be given to brake rigging. Improved motor suspension is being studied and results may be forthcoming that will reduce some of the present noise from gears.

Steel against steel is a difficult combination to combat from the noise standpoint. Perhaps the best opportunity lies in better spring construction, and elimination of as much unsprung weight as possible. The springs of a bus receive far more attention and lubrication than the springs of an electric car. Consequently during service they are more resilient and responsive in action than the more rugged, but equally important, springs of an electric car. After all is done some noise will remain. However, by using double floors, insulated side sheathing and headlining on roofs, this inherent noise can be suppressed and lessened for the passengers riding in the car.

The old style car was cluttered up with bell cords, register rods, hand straps, baggage racks, pipes and stanchions. There is no reason why the conductor's bell should not be as inconspicuous as the passenger signal; likewise a less visible arrangement for operating overhead registers is available. An attempt should also be made to make the register less noisy in its operation, and interurban whistles less offensive, and thus relieve the conscious or unconscious strain on the nerves of the passengers.

Old cars can be improved and made more popular by the addition of comfortable seats. Certainly the luxurious, deep, well-formed cushion seats on the better grades of buses are one of the drawing cards to this type of vehicle. Recently the Cleveland Railway fitted out three trains with comfortable upholstered and leather-covered seats of the semi-individual bucket type. This company's telephone lines were busy with calls as to when and where these particular trains were operating. People wanted to ride in these rather than in the older types. It may be difficult to trace a direct return from an expenditure of this kind, but if it pleases the public, the returns must follow.

The question of seat spacing is important. It is of little avail to spend money for high-grade seats if they are crowded so close together that the passengers' knees are wedged against the seat ahead. That is only spending the dollar and destroying the purchase. Even with thin backs the seating spacing should be approximately 30 in., and with thick cushioned backs the spacing should be 32 to 35 in.

Higher schedule speeds is one of the economies that contribute directly to better service. Waste time should, of course, be eliminated, and cars should be built to accelerate as rapidly as is comfortable. To avoid congestion and delays, the rate of acceleration should be equal to or exceed that of automobiles. If the autos accelerate faster than cars after traffic stops, they cut in ahead of the car and usually block the car at the next crossing, often requiring a double stop, which adds to the delay and increases the congestion. To obtain this higher acceleration in city streets, cars must be adequately motored. Gearing may be low, as rapid acceleration is far more important in increasing schedule speeds in service having frequent stops than higher free running speeds.

Keep Up the Appearance

As an industry it should devote more care to keeping up the appearance of equipment. There is too general a tendency to consider the acquisition of new equipment an opportunity to reduce maintenance costs for a year or two, and to neglect mere appearance.

The same considerations that would dictate an unholstered seat compel the resolve to keep this seat clean and the upholstery intact. The benefit of plate glass is not fully realized unless the windows are cleaned and polished. A beautifully lacquered job does not show its real quality unless frequently washed. In industrial communities, the complete washing of cars in regular service twice a week is considered almost a minimum. The desirable point to reach would be a complete washing of the transportation vehicle on a daily basis.

Passenger and service equipment also should be kept up to high standard of appearance.

Bus and car stop signs and standards preferably should be enameled instead of painted, in order that they, in turn, may be kept up to a high standard of appearance.

This committee insists that in order to get the best results in merchandising transportation, the master mechanic and maintenance organization must recognize as keenly the necessity of good appearance as they have always recognized the necessity of efficient mechanical operation.

The report was signed by O. A.

Broten, H. L. Brown, W. H. Burke, J. A. Dewhurst, J. B. Donley, R. W. Emerson, S. E. Emmons, W. W. Holden, J. F. Johnson, E. A. Palmer, C. D. Smith, A. C. Spurr, J. C. Thirlwall, W. E. Wood, R. N. Graham, chairman; W. H. Boyce, sponsor, and E. M. Walker, sponsor.

Accident Prevention

REPORTING jointly, the committees of the Transportation & Traffic and of the Claims Association presented statistics for 1925 and 1924 of companies reporting, the number of companies varying from 87 to 175. The statistics showed improvement during 1925 in accident records, as there was a decrease in the total number of reported accidents and in every classification of those accidents with but few minor exceptions. Even the number of collisions with motor vehicles was less, although the number of vehicles increased. A few of the figures given are contained in the table below.

M. W. BRIDGES
Chairman

The following definite recommendations were made:

1. Co-operation with state, municipal and civic bodies in the work of prevention of traffic accidents on the streets and at railway crossings. Local conditions require local remedies and it is only through the active co-operation of electric railway companies with local bodies that these conditions can be met and accidents reduced.

2. That member companies send their representatives into the schools in their communities in accident prevention work that the younger generation may be educated to the danger of thoughtlessness and carelessness on our streets and around our cars and tracks. Speakers going before civic bodies, women's clubs and parent-teachers' associations with this message will do a great work in spreading the safety education which will result in reduction of the loss of life, limb and property.

3. The work of educating the employees in accident prevention work should be continuous and so arranged as to keep this subject uppermost in their minds and made a part of their every day work. In some of the companies, award and merit systems have been carried on, safety entertainments, dinners and even medals and uniforms awarded to stimulate the work of continuity of effort in the prevention of accidents.

The committee also indorses the value of moving pictures to help reduce accidents, co-operation with the National Safety Council, the adoption of a standard code for vehicles, as considered at the meeting of the National Conference on Street and Highway Safety in Washington, and close relationship between the operating, claims and safety departments of electric railways. The report was signed by the following:

Representing the Claims Associations—Seth Baldwin, B. F. Boynton, N. W. Funk, G. H. Ingles, A. G. Jack, W. H. Moore, T. C. Neilson, V. T. Noonan, E. J. Paige, R. A. Sears, J. J. Sharkey, L. F. Wynn, and H. K. Bennett, co-chairman.

Representing the Transportation & Traffic Association—E. J. Dickson, Arthur Gaboury, Roy R. Hadsell, A. W. Koehler, T. E. Lawrence, M. McCants, G. B. Powell, C. F. Schmidt, Samuel Riddle, sponsor; Edward Dana, sponsor, and M. W. Bridges, co-chairman.

Traffic Congestion

NO OUTSTANDING or single method of relieving traffic congestion was developed during the year, but the so-called Hoover conference reports indicate the method by which lasting relief may be had. If this conference had accomplished nothing more than to center national attention on this problem it would have been a great success.

Believing that the Hoover conference was the event of the year from a traffic standpoint the committee submitted a full analysis. This analysis is confined to that part of the Hoover traffic studies which directly touches the business of transportation. [This report was abstracted in ELECTRIC RAILWAY JOURNAL for April 3, 1926, page 602.]

In addition to this the committee has considered any specific methods of relief of traffic congestion of which it learned, such as prohibition of parking, signals, subways for pedestrians and staggered hours of business.

One of the fundamental factors in determining the best method to pursue in handling the problem of traffic congestion in the downtown area in any large community is to determine first the relative importance of the different modes of transportation.

Promiscuous parking is the greatest contributing cause of congestion and the slowing up of all moving vehicles. This is a very real danger menacing downtown merchants, a danger which many of them fail to see, namely, the danger of decentralization or the driving of business to the outlying and therefore less congested business centers. It follows that street car riding shoppers will be more and more reluctant to shop downtown if their progress is impeded to such extent that their patience and allowable time are exhausted.

A. R. MYERS
Chairman

It also follows that the shopper who drives her own auto dreads the trip downtown more and more as congestion increases and her chances of parking where she wishes to shop become less and less.

If this be true, then the future of our downtown merchants in the larger cities is solely dependent upon the rapidity and convenience with which their patrons can reach them.

In an effort to throw some light on the various phases of this subject the Cleveland Railway proposed an extensive traffic survey. It enlisted and received the co-operation of the Retail Merchants Board of the Chamber of Commerce. The object of the survey was to determine how and in what proportion patrons reached the various stores in downtown Cleveland. Through the Retail Merchants Board consent of 22 stores for the survey was secured. These stores were not only the largest in Cleveland, but represented the greatest diversity in goods which they sold. [This important study and its result were covered by Ralph W. Emerson of this committee in an article in ELECTRIC RAILWAY JOURNAL of July 10, 1926.]

The survey continued three days with the addition on the third day of a large 5 and 10-cent store, which made 23

ELECTRIC RAILWAY ACCIDENT STATISTICS

Accident Statistics	Number of Companies Reporting	1925	1924
Total number of accidents	172	341,423	352,901
Accidents at grade crossings	116	2,162	2,254
Number of persons injured	161	57,836	60,820
Number of fatalities	177	887	874
Total cost of claims	147	*$12,565	*$13,285
Miles of single track	171	19,350	19,370
Car-miles operated	173	*850,576	*866,063
Ratio cost of accidents to gross earnings, per cent	145	3.00	3.12
Ratio amount paid in settlement of claims to total cost of claims, per cent	133	63.72	65.88
Ratio cost of claims department to total cost of claims, per cent	125	23.04	22.23
Total cost of accidents per car-mile, cents	146	1.46	1.54
Number of accidents per 10,000,000 car-miles	168	3,679	3,772
Persons injured per 10,000,000 car-miles	157	690	720

* Last 000's omitted.

Digitized by Google

stores for that day plus a large typical office building.

The employees in the stores conducting the survey voted on the first day only. The distribution of the survey follows:

Shoppers voting			85,657
Employees voting			7,698
Total vote			93,355
	SHOPPERS		
Motor Coach	Street Car	Automobile	Walk
8,910 (10.4 per cent)	53,738 (62.74 per cent)	19,551 (22.82 per cent)	3,458 (4.04 per cent)
	EMPLOYEES		
563 (7.31 per cent)	6,208 (80.64 per cent)	762 (9.9 per cent)	165 (2.15 per cent)
	TOTAL GOING TO STORES		
9,473 (10.15 per cent)	59,946 (64.21 per cent)	20,313 (21.76 per cent)	3,623 (3.88 per cent)

The above figures indicate that only about one shopper in five used a private automobile.

The committee is informed that the city of Detroit has considered and purposes to experiment on a large scale with construction of pedestrian subways from sidewalk to street centers, where loading platforms will be located, the car tracks having been spread at the selected points so as to permit of loading and unloading of cars on the so-called "devil strip" side.

Inasmuch as the plan has been fully described in the daily and technical press it is mentioned here only for the purpose of directing the future committees that they may study and report on the results of this experiment.

Automatic signal light control of vehicular traffic in congested areas is a fairly recent development and little or no engineering study had been made prior to 1925 with respect to the speed at which vehicles moved through the controlled area.

At the request of the Chicago Association of Commerce, E. J. McIlraith, staff engineer of the Chicago Surface Lines, assisted by H. B. Cammack of the same company, began a study in August, 1924, of all existing methods of handling traffic by signal light control, with the object of determining if any improvements could be made. The result of this study was the development and installation of an entirely new system in Chicago which is known there as the "co-ordinated" system. It has speeded up street car movement in the Loop area of Chicago from 25 per cent to 50 per cent on various streets. An installation embodying some of the principles of the Chicago system, but termed the "reciprocal" system (because it was believed that this name was more descriptive of the actual operation of the lights) has been worked out by engineers of the Community Traction Company in Toledo for installation in that city about Aug. 1, 1926. [The Chicago system was described in ELECTRIC RAILWAY JOURNAL March 27, 1926, page 537.]

The committee recommends that careful study be made of each installation of traffic control equipment either operating or to be installed. Continuous movement instead of the less desirable synchronous system is desirable.

This association should continue to study and keep closely in touch with the detail and minutiæ of traffic congestion, but respectfully suggests that if a way could be found to add one or more men from the Engineering Association, and a more direct contact with, and guidance of, the American Association, the work could be better done and the results attained more quickly.

The report was signed by A. W. Brohman, C. H. Evenson, R. W. Emerson, D. L. Fennell, A. J. Fink, Arthur Gaboury, J. A. Gemg, J. E. Heberle, A. L. Hodges, George Kuemmerlein, Jr., F. R. Latta, R. J. Lockwood, J. A. Miller, Jr., J. P. Pope, E. S. Rider, C. D. Smith, W. E. Thompson, J. P. Tretton, E. A. West, P. E. Wilson, sponsor; George B. Anderson, sponsor, and A. R. Myers, chairman.

Bus Operation

DIFFERING somewhat from other years, the committee on bus operation for 1926 decided that this year it would define the policies of member companies on the many features of bus operation rather than concentrate on the obtainment of statistics from member companies.

J. B. STEWART, JR.
Chairman

The committee report is, therefore, divided into sixteen sections covering the following subjects. Fares, both city and interurban; underlying reasons for higher rates of bus fare; taxation during development period; proper agency to operate bus lines in competitive territories; chartered coach and bus operations; terms of franchise, package express delivery, including handling of United States mail; utilizing the motor bus in developing better public relations and more favorable sentiment of financial interest toward electric railways; the problem of supporting non-paying route extensions; tire mileage contracts; liability insurance; double-deck bus operation—when and where it is justified; development cost; and bus accounting.

It is the committee's belief that the question asked during the earlier years of bus experience as to whether electric railway companies should undertake bus operation has been answered by the Code of Principles adopted by the American Association in 1925. The committee has included this code with reference to bus operation in its report. In brief, this section of the code stated that no medium had been developed that could replace the electric railway as a means of conveying masses. The electric railway companies supplying the local transportation should provide and control and operate all of the buses that are needed, as an auxiliary service in the communities they purport to serve. The code further states that buses should be regulated by law as common carriers and that both buses and electric railways should bear proportionate taxes and other public obligations that are fairly chargeable to them as public carriers.

UNDERLYING REASONS FOR HIGHER RATES OF BUS FARE

From a theoretical economic point of view the fare per passenger should be based on the cost of service per passenger. Consequently buses designed for mass transportation which carry large numbers of standing passengers may produce a service where the cost per passenger will be considerably less than the cost per passenger for a service rendered by a de luxe bus, where standing is either not permitted at all or reduced to a comparative minimum. Such a difference in cost should be reflected in the rates charged for the difference in the kind of service rendered. In one case the passenger receives mass transportation at a lower fare and in the other case he obtains greater comfort, probably greater speed and should pay extra for it.

Practically, where buses are coordinated with cars and expected to give a service identical with cars the fare should be approximately the same. If, however, the bus furnishes any element of service which the car does not furnish this added element should provide a logical reason for a higher rate.

The report closes by saying the bus service is still in a state of evolution, and opinions may not be rigidly fixed until the place of this new agency becomes crystallized with respect to existing transportation facilities. As more concrete information is developed, it is believed that succeeding committees will be in a position to set forth more definite data and conclusions on all important phases of bus use.

The report was signed by B. W. Arnold, C. H. Chapman, C. B. Cooke, Jr., E. D. Dreyfus, D. L. Fennell, R. N. Graham, S. W. Greenland, M. L. Harry, R. B. Hill, Adrian Hughes, Jr., D. A. Scanlon, Alexander Shapiro, R. H. Smith, A. T. Warner, J. V. Sullivan, sponsor; V. W. Berry and J. B. Stewart, Jr., chairman.

The News of the Industry

Seattle Mayor Has Report on Transportation Ills

In recommending operating changes for the Seattle Municipal Street Railway, Seattle, Wash., to stem the tide of decreasing revenues and patronage, all of which he says could be put into effect in 30 days, Clark R. Jackson, superintendent of public utilities, in a report filed recently with Mayor Bertha K. Landes, estimates these changes would effect a saving of approximately $800,000 a year. The most sweeping proposal is to eliminate "duplication of service" in the downtown district by turning back all cars around loops, with Pike Street as the dividing line. Under the present system, nearly all car lines traverse virtually the entire length of the retail business district. This change in operation is estimated to result in an annual saving of $612,500. Turning back cars around loops from Pike Street would not abolish the transfer system, as transfers would be issued to south-bound loop cars at Pike Street.

The report was made at the request of the Mayor and represents a month's intensive work. Recommendations for downtown operation call for one-way traffic for street cars and automobiles on First and Third Avenues and dividing the car lines into six groups to go in and out of the business districts over as many loops.

Mr. Jackson cited many advantages of the Loop system. Other features of his report show that the total number of pay passengers on weekdays for the year ended Sept. 1, compared with the calendar year 1921, fell off 4.6 per cent and the number on Sundays 25.3 per cent.

Upon receipt of Mr. Jackson's report, Mayor Landes appointed a committee of citizens prominent in civic life to consult with her on the municipal railway problem.

Seven-Cent Cash Fare in Cleveland

Fares on the lines of the Cleveland Railway, Cleveland, Ohio, will be 7 cents cash, eight tickets for 50 cents, after midnight Oct. 15. The directors of the railway so decided on Oct. 1 to curb the decline of the interest fund, which now shows a deficit of more $75,000, with losses of close to $100,000 monthly at 6-cent fare.

The advance is expected to net about $125,000 a month increase in revenues. If Cleveland Heights, East Cleveland and Lakewood pay a rate a cent higher than Cleveland's at all times, there will be $25,000 a month additional.

The interest fund will not reach "normal" until it touches $300,000 and fares cannot be reduced until it reaches $1,100,000. For many months it has been below $500,000, the point at which fares might have been increased automatically.

Efforts are under way to get the three suburbs to accept franchises with the 1-cent increases. Cleveland Heights City Council has virtually agreed to accept such a franchise in return for extensions on Mayfield, Cedar and Fairmount boulevard.

East Cleveland City Commission is holding off acceptance because it wants the company to supplant the service on the Euclid-Superior extension with through service to Public Square by way of Superior Avenue.

In Lakewood, where a sliding scale franchise on the "same-as-Cleveland" basis was adopted a year ago, fares will go to 7 cents Oct. 15 along with Cleveland's. In Cleveland Heights and East Cleveland 6-cent fares will continue till new franchises are worked out unless increases are accepted voluntarily. Lakewood is expected to make a bitter fight against the 1-cent differential.

Philadelphia Council Favors "L" Extension

A 30-year extension of the present lease of the city-owned Frankford elevated lines to the Philadelphia Rapid Transit Company, Philadelphia, Pa., was approved on Oct. 1 by the City Council by a vote of eighteen to two. The agreement with the Philadelphia Rapid Transit was sought by administration leaders with a view to relieving the borrowing capacity of the city for the amount of the Frankford "L" bonds. With this it is believed it will be possible to borrow the $5,000,000 needed to finance the Sesqui-Centennial.

The bill provides that the Philadelphia Rapid Transit Company in consideration of the extension of the lease of the Frankford "L" for 30 years shall pay $903,000 annually, which is the full interest and sinking fund charges on the $13,421,000 bonds. The amount represented by the bonds would be added to the city's borrowing margin if the Public Service Commission and the Court of Common Pleas give their approval. W. W. Roper, member from Germantown, and Clarence K. Crossan, counselor representing the northeast, voted against adoption of the ordinance. Criticism of the compact came from various sources, dealing chiefly with the "untimeliness" of extending the lease with negotiations for the new Broad Street tube still pending. C. Oscar Beasley, counsel for the United Business Men's Association, announced that a taxpayers' suit was contemplated to upset the granting of the lease. An amendment to the agreement providing for a recapture clause which would allow the city to recover the line upon six months' notice was offered in Council by Mr. Beasley through W. W. Roper, but it was rejected.

The Mayor said he felt the provisions of the agreement were fair and equitable to the city and, unless otherwise convinced, he would go ahead and sign the measure.

Kansas City Ordinance Passed a Second Time

At the meeting of the Kansas City, Mo., City Council on Oct. 4 the ordinance passed the previous week and providing for a twelve-year extension to the existing street railway franchise was again hailed into the Council for another vote. Mayor Beach, who has strenuously opposed the passage of the bill, filed a notice with the city clerk on the preceding Saturday, causing the bill to be sent back to the Council, although that body had unexpectedly passed the measure by a majority vote at the preceding meeting. Despite the Mayor's charges that the bill's passage had been by "arrangement" between the five Democratic Councilmen and William G. Woolfolk, president of the Kansas City Public Service Company, the bill was repassed with the same party vote as in the earlier passage, after a heated discussion.

Following the passage of the bill for the second time, the Council approved the appointment of a committee of five Councilmen, including A. N. Gossett, chairman; Henry L. McCune, C. Jasper Bell and C. A. Burton. This committee was instructed to meet with Mr. Woolfolk at an early date to enter negotiations for a complete new city franchise to replace the extended one now in existence. Mr. McCune expressed the opinion that a new franchise could be worked out within 30 days that would be satisfactory to all concerned.

The appointment of this committee was in accordance with a suggestion of Mr. Woolfolk, from whom the Councilmen and the city manager received letters on Sept. 29, stating that he was ready at any time to negotiate with the Council or other officials for a new franchise. All Councilmen are said to be in favor of such negotiations at as early a date as possible.

The principal objection to the extension is apparently in connection with the valuation set upon the local railways property by the new operating company. The Kansas City Public Service Company purchased the properties from the federal court for a nominal bid of $8,000,000, while the franchise measure passed this week was constructed on a basis of a $34,000.000 valuation. Mayor Beach contends that the valuation should now be cut to a fair value of the bonds used in the purchase of the properties, since the railways had suffered for many years as a result of overvaluation.

Indiana Commission Collects More Than Expenses

Collections made by the Indiana Public Service Commission during the fiscal year just ended total $295,692, or more than twice the expenses of the commission for that period, due to a system of collecting established by Howell Ellis, secretary. In his report, which covers activities of his department from Oct. 1, 1925, until Sept. 30, this year, Mr. Ellis points out that there has been a 100 per cent collection of all fees due the state as a result of formal orders issued by the commission. This has been accomplished through a rule established by Mr. Ellis, with the approval of the commission, that no order promulgated by the commisssion go into effect until the utility pay costs for conducting hearings and investigations.

The report shows that total expenditures of the commission for the year were $144,355, which is $26,644 less than the appropriation for the commission in the state budget. This latter sum will be turned back into the state general fund. Fees collected were $151,607 in excess of the actual operating expense of the department. The fees collected aggregate the largest amount ever collected in one year and expenditures for the year have been the lowest for the last five years.

Improvements Planned for Expediting Service in Tacoma

An active program of improving its tracks and the pavement along its rails, of repainting its cars and otherwise bettering its rolling stock and lines was outlined recently by the Tacoma Railway & Power Company before the City Council of Tacoma, Wash. The company states it will add about 25 men to its maintenance crews and will increase its monthly expenditure to about $23,000. In addition $39,000 will be spent on paving McKinley Avenue, where $35,000 was spent last year.

Plans will also be made at once to speed up service on all street car lines, to reduce operating costs by collecting fares at outlying points both on inbound and outbound trips and to install the skip-stop system. The report issued by the company shows that earnings are still disappointingly low under the new fares in force, but that the first weeks of August showed improvement over July figures. The fact that 60 per cent instead of 40 per cent of riders, as expected, are using tokens is throwing earnings off estimates.

Illinois Cities Denounce Utilities in Move for Home Rule

The growing hostility of many cities and villages of Illinois to state control of public utilities was again evidenced at the second "home rule" conference of the Illinois League of Municipalities, held in Rockford on Sept. 23.

Mayors, attorneys and Aldermen from 30 different cities dennounced the Illinois Commerce Commission as a "body of tyrants" and pledged their support to a finish fight to restore local sovereignty.

City Attorney W. S. Spaulding of Springfield declared that the utility companies "are gradually edging themselves into control of the government, instead of the government controlling them."

The conference adopted a set of resolutions demanding that the public utilities act allowing cities to withdraw from control of the Commerce Commission be amended so that the process could be carried out speedily, and that appeals from decisions on utility questions be made by the courts instead of by the Commerce Commission.

Chicago Transportation Heads and Bankers Disclose Merger

A plan for the consolidation of Chicago's entire traction properties, embracing all the surface lines and the elevated system into a new $250,000,000 corporation, is fast taking shape in the hands of committees representing all the companies.

A general scheme of consolidation with an interchange of transfers between surface lines and possibly motor coach lines, with tentative agreements as to extensions of lines and the use of subways, has already been reached by bankers representing surface line bondholders and executives of the elevated lines. It is based on the belief that the city will be able to secure state legislation permitting the granting of an indeterminate permit and then formulating an ordinance along this line. The general plan will be presented to the City Council committee on local transportation in a short time.

Under the present arrangement the Surface Lines will be taken into the consolidation at about the current purchase price to the city, as fixed in the 1907 ordinances. This is approximately $165,000,000. It is expected that the elevated lines will be taken in at about $80,000,000. The new corporation would have a bonded indebtedness of something like $200,000,000, or sufficient to convert the present outstanding bonds of the various companies. Some of the present junior securities would be converted into stock of the new company.

The plan contemplates that the city shall forego its present share of 55 per cent of net earnings. Just revenues and the increase in earnings expected would be devoted to two purposes: First, extension and improvements to the properties, and, second, amortization of the funded debt of the company over a period of years. It is further suggested that the city shall own the entire system when the bonds are paid off, or that the city may assume ownership at any time by paving off outstanding obligations, which will decrease from year to year. The plan calls for city construction and ownership of the first subway tubes, the cost to be defrayed by the present $45,000,000 traction fund accumulated by the city's division of earnings in the last twenty years. Extensions of subways would be taken care of by earnings or additional security issues.

If the purpose in general is sanctioned by the Council committee it is planned to organize the new corporation without waiting for the present surface lines franchise to expire and the present bonds of the companies become due next January. The bondholders of the Surface Lines will be asked to accept bonds of the new company on an equal basis, with the option of selling their bonds for cash at a discount of probably 10 per cent, which is well above current market prices. Holders of the obligations of the Chicago Rapid Transit Company will be asked to accept new securities of approximately equal value.

The Council sub-committee on local transportation was recently told by traction executives and bankers that if the Aldermen's fight for "home rule" over rates and service on the elevated and Surface Lines systems continues, the city's traction problem will be more chaotic than ever.

Even with both the bankers and traction people willing to have the city control the local utilities, the State Legislature would undoubtedly oppose such a plan and refuse to give the city powers to make it effective.

Certificate for St. Louis-Kansas City Line Denied

Judge Henry Westheus of the Cole County Circuit Court at Jefferson City, Mo., on Sept. 20 sustained the action of the Missouri Public Service Commission in refusing to grant a certificate of convenience and necessity to the St. Louis-Kansas City Short Line Railroad for the construction of an electric railway between St. Louis and Kansas City. The formal entry in the Circuit Court records of the order was delayed to enable counsel for the proposed road to prepare a motion for a new trial and an appeal to the Missouri Supreme Court.

The commission in May, 1925, declined to grant the certificate, which is the equivalent of a franchise, because the promoters of the road had failed to convince the commissioners of their ability to finance the project properly. However, they were given a year in which to present additional evidence of financial stability. Such evidence has not been given to the commission. When the state commission finally decided that the company could not get the desired certificate an appeal was taken to the Circuit Court.

The incorporators were Lee Dunlap, Kansas City, former State Factory Inspector, and several other residents of Kansas City and St. Joseph, Mo.

Made-to-Order Service in Georgia

"Made to Order" is the way the Georgia Railway & Power Company, Atlanta, Ga., characterizes the service it wishes to give its patrons. The company is conducting a campaign among the employees for ideas as to how the service can be improved. The thought suggested to each employee is, if he were an executive of the company, what could he think of to improve the service; in this way changes must be considered from the points of view of both the patron and the company. Any suggestions offered will be put before the officials of the railway and practical and helpful changes will be put into effect.

Insignia of Coffin Medal Applied to Pennsylvania-Ohio Equipment

Quick work on the part of the Pennsylvania-Ohio Electric Company resulted in the fixing of the insignia consisting of reproductions of the Coffin Gold Medal on the side of every car and bus before it rolled out of the barns last Wednesday morning. The award was not formally presented until late Tuesday evening Oct. 5, but the spirit that prompted C. S. MacCalla, R. N. Graham and the employees of the company to win the prize made it possible to rush the job of applying the transfers on to the car panels so that the citizenry of Youngstown and the neighboring communities might know that here was a gold medal road.

Power Project Revived at Kansas City

The engineering firm of Woolfolk & Company, Chicago, and the banking firm of Eastman, Dillon & Company, New York and Chicago, are to be brought actively into the negotiations on the projected Osage River hydro-electric project. It is proposed that the Kansas City Power & Light Company and the Kansas City Public Service Company, the successor to the Kansas City Railways, jointly operate and control the hydro-electric project.

William G. Woolfolk is senior member of the engineering firm. His engineering partner, Frank L. Conrad, vice-president of Woolfolk & Company, will investigate the engineering features.

The suggestion is made that the two Kansas City public utilities take over control of the development, independent of the arrangements for financing its construction. The present proposal provides for the use of the new power as an auxiliary supply for the power and light company and the railways.

Following the failure of the original promoters of the project to arrange the sale to the Kansas City Power & Light Company and the Kansas City Railways, a proposal was advanced to the United Light & Power Company, holding organization of the local power and light company, to finance the development of the project.

After the Kansas City Public Service Company became the tentative owner of the local railways Mr. Woolfolk stated that the hydro-electric project would be considered by his company as a possible power development for the railway, since the present railway plant is considered inadequate.

Mr. Storrs on Vacation

Lucius S. Storrs. accompanied by Mrs. Storrs, sails for Europe on Saturday, Oct. 9, where he will take a brief vacation returning about the middle of November. When asked about his itinerary, he replied that his idea of a vacation was not to have any. He did intimate, however, that he would probably visit points of interest in England, France and Germany. Without doubt he will take occasion to look into the new car designs which have been reported from Paris and Berlin during the last few months.

News Notes

Contributions Sent to Florida by Chicago Men.—Donations of officers and employees of the Chicago Surface Lines, Chicago, Ill., to the Red Cross for Florida relief amount to $13,500. This exceeded by $1,000 the quota fixed by the Chicago Association of Commerce for all utilities in Chicago. Under this quota the Surface Lines was expected to raise only $2,500.

Twenty-eight One-Man Cars Expected.—Announcement has been made by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., that approximately 28 one-man cars will replace the present 23 two-man cars on the Oakland-Delaware line in accordance with an order issued to that effect by the commission on Sept. 14. The change will be made about Nov. 1.

Good Morning—Grand Rapids Welcomes You.—A greeting card is the latest idea of the Grand Rapids Railway, Grand Rapids, Mich. The plan is to send good morning folders to the different hotels of the city from time to time during conventions, and at other times so that guests will have a message from the railway before they have done any sightseeing about the city. The welcome folder with the company's monogram can be kept as a souvenir. It tells about the electric rail coaches, the places of interest en route and the small expense incurred for such de luxe travel.

New Extension Being Operated.—For the first time since the war the Key System Transit Company, Oakland, Cal., has completed and is now operating a new extension. This latter, approximately 1 mile in length, was built along Park Boulevard, crossing Dimond Canyon on the new bridge and providing means of transportation for a recently built up section of Oakland that has previously been inaccessible so far as street car traffic is concerned. The cost was $40,000.

Benefit Association Formed. — A mutual benefit association has been organized by employees of the Northern Ohio Power & Light Company, Akron, Ohio. Benefits are $10 per week, commencing on the eighth day of disability. Dues are $1 per month. F. S. Summy, who has been associated with the company for several years, has been selected secretary-treasurer.

Tramway Refuses to Pave.—The Denver Tramway, Denver, Col., on Oct. 1 notified City Engineer Vickery that it was not disposed to pay for any paving between its tracks on various streets designated by the city engineer as in need of paving. The company took the stand that if it had a perpetual franchise it did not have to pay for the paving.

"E" on Sleeve Means Efficiency.—Thirty members of the transportation department of the Georgia Railway & Power Company, Atlanta, Ga., will wear a coveted "E" on the sleeves of their uniforms as a result of a campaign to promote efficiency of operation. Of the 30, 21 are conductors and nine motormen. These 30 trainmen are the first to meet the requirements specified. The method used by the company in awarding efficiency emblems is to set a "bogie" in power saving for motormen and a similar "bogie" on the Ohmer register for conductors. In order to gain the coveted emblem, this "bogie" must be met for three consecutive months. In order to secure the "E," conductors must work twenty days during each month with an average of 97 per cent or over, making it as difficult an accomplishment for the conductors as for the motormen. The campaign has been under way only three months.

Extends Air Mail Service.—The air mail service provided by the Philadelphia Rapid Transit Company, Philadelphia, Pa., between Philadelphia and Washington will be extended to Norfolk on Oct. 10. The mail will be transported between Philadelphia and Norfolk in 3¼ hours. This new service will place Norfolk in touch with overnight air mail service between Norfolk and Chicago by way of New Brunswick, N. J. Letters mailed in Norfolk at noon with special delivery stamps will be delivered in Washington and Philadelphia the same day.

Uniform Fare Desired.—The Southern Public Utilities Company, Charlotte, N. C., has received numerous requests from its Winston-Salem patrons to provide a uniform fare for all its lines there. At present the fares range from 5 cents to 10 cents. Only one bus line, that to the Union Station, has street car transfer privilege, but patrons of other lines are asking that the same privilege be accorded. Should this rate be established, with transfer privilege, patrons could go from any section of the town to another on only one fare.

Disapproves Traffic Plan.—The citizens' bond issue supervisory committee of St. Louis, Mo., by a vote of twelve to one on Sept. 20 decided against the plan of Director of Streets and Sewers Brooks to place street cars on Olive Street. The plans would put cars in a center parkway on Olive Street when that thoroughfare is widened from 60 ft. to 100 ft. between Twelfth Boulevard and Channing Avenue. Director Brooks' plan has been approved by the Board of Public Service.

Doing a Bit in a Big Way.—The Key System Transit Company of Oakland, Cal., has just "done its bit" to aid the Florida relief fund now being raised in the East Bay cities. A big theater was offered in which to hold the benefit show that began at midnight, Oct. 2, and lasted till 3 o'clock in the morning. Prominent actors and actresses gave their services free. There were ten bands and a big crowd came to enjoy the show. Oakland, however, is without all-night transportation; the cars stop running between 1 and 2 o'clock in the morning. The problem then arose, how to get the crowd home? The Key company solved this problem in a public-spirited way. Cars were sent to the theater where the benefit was held at 3 o'clock in the morning, and those who so desired were transported to their homes free of charge.

Recent Bus Developments

Bus and Interurban to Stone Mountain Memorial

With the completion of a hard-surfaced road from the town of Stone Mountain to the memorial carving on Stone Mountain itself, bus service has been resumed between the interurban terminus and the mountain by the Georgia Railway & Power Company, Atlanta, Ga. In the shuttle service are seventeen passenger buses, painted cream and white, the same combination used on the Morningside and Virginia Avenue buses of the Atlanta Coach Company. The coaches will meet each interurban car as it arrives in Stone Mountain, carrying passengers wishing to see the memorial around the mountain and back in time to catch the next interurban. In case visitors wish to stop over, they can do so, taking the bus back at any time.

A special Sunday service to Stone Mountain has just been started by the Georgia Railway & Power Company which is proving very popular. Stone Mountain interurban cars are dispatched on a 30-minute schedule Sundays instead of the usual one-hour schedule, with a special price of 75 cents for the round trip, including car and bus fare.

Bus Line in Logan, Utah

Permission to abandon its street car line in Logan, Utah, and to substitute a bus line has been granted the Utah-Idaho Central Railroad by the Public Utilities Commission of Utah. The decision allows the company to tear up its tracks and repair the streets where the tracks have been.

Application for permission to abandon the railway was filed by the railroad on Aug. 4. This application declared that for many years the car line had been operated at a loss; that the revenues from such operation had been insufficient to meet the actual operating expenses, much less to pay interest on the capital invested. It was pointed out in the application also that, because of the growth and expansion of the city of Logan, the present street car line was inadequate to serve all the city, and that it was not feasible nor practicable to build other lines to certain sections. The application declared that it would be possible to give the citizens of Logan much better service with a bus line than with an obsolete railway. Permission was asked to operate the motor vehicle line, charging 7 cents for single fares, three fares for 20 cents, and selling twenty school tickets for one dollar.

At the hearing the commission found that a fair value for the 3 miles of track in Logan was $86,400; that the interest upon the fair value, at 8 per cent, would be $6,912. The net income in 1925, excluding interest and maintenance, was $1,599. A franchise to operate as a common carrier by motor vehicle of passengers over the streets, alleys and public places of Logan has already been granted by that city to the company.

Developments Continue in Lincoln Bus Tangle

The Lincoln Traction Company, Lincoln, Neb., a subsidiary of the United Light & Power Company, has made application to the State Railway Commission and the City Council for authority to substitute eleven buses for car service to the state hospital for the insane, the state penitentiary, the state college of agriculture, to Bethany suburb, and for a crosstown line, with the same fare as prevails on street cars, 10 cents cash and four tokens for 30 cents is asked, with 2 cents more beyond certain fare limits.

E. R. Heiny, general superintendent, in a communication to the Council, said that it was doubtful if there was enough business in the city to pay the operating expenses of one company, but that the owners were committed to do whatever was possible to maintain the system. He claimed that for the last two months the net income has been $1,700 each month less than enough to meet fixed charges. In order to avoid the payment of $16,000 paving tax in a newly created district the company has asked the authorities for permission to abandon six blocks of track on the old Epworth lake park line, and at the hearing a petition was presented from property owners asking that the company's tracks be removed and the street improved.

In addition to this situation City Attorney Peterson has advised the City Council that a recent Supreme Court decision places entirely within its hands the question of whether any permits to operate buses are granted. He says that this power also includes the question of how far the substitution of the bus for the street car shall go, whether there shall be free transfers between buses and cars, and the matter of securing bus service for newly developed areas of the city.

C. N. Chubb, general manager of the United Light & Power Company told a group of business men at the Chamber of Commerce that the directors of United Power have agreed to expend $1,300,000, estimated cost of the rehabilitation of the traction company, if the proper co-operation can be secured from the progressive business element of the city.

The discouraging feature of the Lincoln situation, he said, was that out of a clear sky came competition, referring to the request of the Omaha, Lincoln & Beatrice interurban to penetrate the downtown business section, where its rails never entered, with buses. Mr. Chubb said his company was willing to step out if any other company wished to operate the system in this city, where now there is no chance of one making an adequate return on its investment, but if no other company was willing to do that he thought his company should be given full leeway.

Buses Between Hamburg and Buffalo.—The Public Service Commission has issued a certificate of convenience and necessity to John F. Burke, as receiver of the Hamburg Railway, for the operation of bus lines between the village of Hamburg, N. Y., and the city of Buffalo over two distinct routes. It is proposed to operate four buses, with a fare of 40 cents, from Hamburg to Buffalo, divided into four zones, with a 10-cent fare in each, except that the fare on Ridge Road extension will be 5 cents. Local passengers are not to be carried in Athol Springs or between Athol Springs and Woodlawn and from Buffalo, nor in the city of Buffalo.

Would Substitute Bus Line. — The Scranton Railway, Scranton, Pa., has filed application with the Pennsylvania Public Service Commission for permission to abandon the Wilson Creek-Forest City trolley line. This permission is sought on the ground that operation is expensive and also unsafe because of mining conditions. Coincidental with the filing of the application for abandonment the Scranton Bus Company, a subsidiary of the railway, requested permission to operate buses in the same territory. The buses would run from Forest City over the public highway to the city hall and Carbondale. J. J. Coleman, vice-president and general manager of the Scranton Railway, explained that with the bus and trolley schedules to be arranged improved transportation facilities would be furnished.

Riding Into the Past by Motor Coach.—The Fifth Avenue Coach Company has published in leaflet form an account of the engagements during the Revolutionary War on Manhattan Island between Sept. 15 and Nov. 16, 1776. A most interesting feature of the leaflet is an excellent map showing the movement of the American and British troops prior to the battle of Harlem Heights on Sept. 16. The greater part of the district described is now served by coaches of the company.

Buses to Replace Cars on Some Troy Streets.—The Public Service Commission recently approved a declaration of abandonment by the United Traction Company of certain tracks in the city of Troy, N. Y. Simultaneously with such approval a certificate was issued to the Capitol District Transportation Company, Inc., a subsidiary company of the United Traction Company, to operate buses over the same route.

Church Charters Bus for Parishioners.—The Union Federated Church, East St. Louis, Ill., started on Sept. 19 the hiring of a bus from the East St. Louis & Suburban Railway to increase attendance at the Sunday morning services. On that day there was an appreciable increase in the attendance at the church and sunday school services. The plan, which will be tried out for six weeks, originated with the pastor, the Rev. Walter Schlaretski. He interested nine members of the congregation in his idea and they are now paying for the use of the bus. Each Sunday morning the bus starts out on a round of collections, picking up parishioners and their children. It reaches the church at 9:30 a.m.

Financial and Corporate

P.R.T. Stock on Sale to Public

The public is again invited by the Philadelphia Rapid Transit Company, Philadelphia, Pa., to participate in the purchase of the last $5,000,000 of its 7 per cent preferred stock, being the remainder of an issue of $15,000,000 which was authorized by the City Council a year ago. The first $10,000,000 of the issue was purchased by the public some months ago. The stock is offered at par, which is $50 a share. This stock has no voting power, but its dividends are preferred over the common or voting stock. Right is reserved by the company to purchase outstanding stock at any time for $55 a share. Subscriptions can be made by mail to Securities Department, 433 Land Title Building.

It is the desire of the Mitten Management, Inc., that the stock be as widely distributed as possible, and to aid this purpose the stock is offered on the installment plan. The public can purchase the stock at the rate of $1 a week per share.

It is said the company will use a large part of the money in expanding its bus system and the city taxi system and to retiring securities. Approximately $800,000 will be spent in the installation of new service, construction of repair and garage buildings, and $150,000 will be used for bus service equipment. An appropriation of $1,700,000 will be made for extensions and improvements.

Deficit on Mexico Tramways in 1925

The gross earnings of the Mexico Tramways, Mexico City, Mexico, for the year ended Dec. 31, 1925, was $9,997,033 (Mexican currency), compared with $11,692,369 for 1924. The operations resulted in a net deficit of $530,255, after allowing for taxes and depreciation. This is a decrease of $684,834 on the net earnings for 1924. Managing Director Conway in his report, included in the twelfth annual report of the board of directors, said that the situation created by the jitney competition had been itensified owing to the improved organization of the jitney service and the co-operation of the jitney owners throughout the whole of the city and suburban districts. Aside from the question of the jitney competition, the company's gross and net earnings suffered heavily from a serious strike during the first two weeks in March. Apart from the financial loss of the company, the effect of the strike was to destroy for some time all discipline among the men, but during the latter months of the year this discipline was restored, conditions greatly improved, and a harmonious relation re-established between the company's officials and the men.

As a result of explaining the financial situation of the company to the President of the republic and to the Minister of Finance, a decree was published on June 29 which relieved all tramway companies from the 5 per cent tax on gross passenger earnings. Every effort was made during the year to reduce operating expenses to the lowest limit, and during the first few months of the year the staff in the shops was reduced by about 250 employees.

For repairs and maintenance of equipment the sum of $1,766,078 was spent during the year. For the same period $929,978 was expended on the track, overhead lines and buildings. The cost of operation decreased $112,093, and by the abolition of the tax on passenger earnings, already referred to, in the month of June, the amount of taxes over the whole year decreased $279,290. Owing to the continued decrease in gross earnings no improvement in operating expense ratio is reflected by the reduction in expenses.

The total capital expenditure during the year was $661,248. On the other hand, property had been retired against the depreciation account valued at $520,374, making the net amount chargeable to capital, $140,873.

Commission Approves Kansas City Financing

The Public Service Commission of Missouri at Jefferson City on Sept. 29, eliminated the only remaining barrier to the operation and control of the properties of the defunct Kansas City Railways by the new Kansas City Public Service Company when it approved the proposed financing plan of the new company. At the same time the commission approved the transfer of technical control of the property from Powell C. Groner to the Kansas City Public Service Company.

Mr. Groner, who is chief counsel of the new company, bid for the property at the bankruptcy sale held in Kansas City by the federal court, bidding in representation of the first mortgage bondholders. Recently, first mortgage bonds, collateral gold notes and promissory notes to the total value of $24,542,602 were deposited in the vaults of the Federal Reserve Bank in Kansas City by Mr. Groner, who is also a vice-president of the new company. The securities deposited were those issued by the Kansas City Railways and are said to represent approximately 97 per cent of the outstanding indebtedness of that company.

It was said that, after the payment of the damage-suit claims and the preferred bills of the old company, about $3,000,000 or $4,000,000 would remain to be prorated among the holders of the first mortgage bonds of the old company. It was previously announced that such bondholders would receive prorated reimbursement in proportion to the value of bonds held, in cash rather than in securities of the new company.

Upholds Rehabilitation Against Dividend Payments on Bay State

The full bench of the Massachusetts Supreme Court has handed down a decision adverse to L. Sherman Adams in his suit to compel the trustees of the Eastern Massachusetts Street Railway, Boston, Mass., to pay dividends on the common stock and on some of the adjustment shares.

The case has been before the courts a long time and was referred to a master, Judge Frederic H. Chase. Judge Chase's report was in favor of Mr. Adams, but the full bench of the Supreme Court decided in favor of the trustees, appointed by the state, upholding their position in rehabilitating the property instead of paying dividends. The court upheld also the policy of including in the cost of service allowances for depreciation prior to the period of trusteeship, when the property was known as the Bay State Street Railway and was in a run-down condition.

In referring to the powers conferred by the law the court says: "The statute was not intended to deprive the trustees of all discretion in respect to dividends. It was intended that they should act with proper consideration for the interests of the corporation and its creditors as well as for the rights of stockholders, and the Legislature contemplated that the road should continue to be operated as a going concern."

Morgantown Properties Go Over to West Virginia Utilities

The electric railway properties of the Union Traction Company, operating the South Morgantown line through the First and Second Wards of Morgantown, W. Va., has formally passed to the control of the West Virginia Utilities Company. Sale of the Union company's property to the West Virginia Utilities Company was negotiated six weeks ago, subject to a new franchise, under which the latter concern planned to merge the operation of the Sabraton and South Morgantown lines. That franchise was granted by the Council of the city of Morgantown several weeks ago, leaving only the transfer of corporate control as the final step of the sale.

At a meeting of the Union Traction Company and West Virginia Utilities Company officials new officers and directors of the Union Traction Company, which still retains its corporate entity, were elected, all of whom are local officers of the West Virginia Utilities Company. The new officers are: President, R. P. Stacy, vice-president and general manager West Virginia Utilities Company; vice-president, O. L. Eaton, Jr., commercial manager West Virginia Utilities Company; secretary-treasurer, F. M. Burchinal, holding a similar position for the West Virginia Utilities Company, and general manager, Clark Emerson, railway superintendent West Virginia Utilities Company. The four officers, together with Judge Frank Cox, counsel, constitute the new board of directors for the Union Traction Company.

In discussing the transfer of the property, Vice-President Eaton said there would be no changes for the time being in the schedule of cars, although it was possible there will be some betterment of the schedule within a week or ten days. The patience of the public was sought in the plan for combined operation of the Sabraton and South Morgantown lines. At the present time there was much improvement work to be done on the trackage of the South Morgantown line. In all, the company expected to spend $50,000 in track improvements and paving along this line.

As to when the new through service with the new cars and improved schedule would become effective, Mr. Eaton stated that it would all depend upon the rapidity with which the repairs to the South Morgantown line could be made. He felt sure that it would be not later than Jan. 1, 1927.

Seven-Cent Fare in Oakland Results in Slight Increase

Officials of the Key System Transit Company, Oakland, Calif., have revealed that since the 7-cent fare went into effect last January there has been a big slump in patronage. The net loss since Jan. 17 is 3,725,403 on street car lines and 835,862 on the Key division, or a total loss to the company of more than 4,500,000 riders. A loss in traffic was discounted by engineers before the higher rates on cars and ferries went into effect, but it was expected that there would be an increase in revenue amounting to at least $850,000. As a matter of fact, the new rates have produced an increase in revenue of only $152,025, insufficient to equal the amount of wage increase to platform men of $238,429. In addition the company has been compelled to add the sum of $280,000 per year to interest charges in order to finance its improvement program, amounting to $3,698,789.

So disappointing has been the financial return under the new revenues that the company has been forced to abandon a portion of its projected improvement plan. The elevated over Emeryville, to speed up Berkeley traffic to the Mole, will not be built for a while. It is likely, however, that before very much longer the Key System will take steps to run an automobile ferry service to and from San Francisco. Similar service on other lines, notably the Southern Pacific, has proved highly lucrative.

Valuation of Missouri Utilities Increases

The assessed valuation of the public utilities in Missouri for the 1926 taxes was placed at $485,115,754 by the State Tax Commission in a report submitted Sept. 25 to the Missouri Board of Equalization. This is an increase of $27,796,745 over the assessment last year. The valuations recommended by the Tax Commission compared with last year includes street railways, $68,721,741, an increase of $488,641. The United Railways of St. Louis was assessed at $47,144,102 and the Missouri Electric Railroad, a subsidiary, at $782,406, a combined assessment of $47,926,508, a decrease of $55,417. Public utilities will be given an opportunity to appear before the Board of Equalization to protest against their assessments.

Gross in Philadelphia $26,675,935

The Philadelphia Rapid Transit Company, Philadelphia, Pa., has issued the following financial and traffic statement:

INCOME ACCOUNT OF THE PHILADELPHIA RAPID TRANSIT COMPANY

	Six Months Ended June 30, 1926	Three Months Ended June 30, 1926
Operating revenue	$26,675,935	$13,768,010
Operation and taxes	19,585,558	9,961,016
Operating income	7,090,376	3,806,994
Non-operating income	275,105	145,053
	$7,365,482	$3,952,047
Payments to city Sinking fund and Frankford elevated	402,079	201,039
	$6,963,402	$3,751,007
Fixed charges, dividends and management fee	6,947,511	3,742,662
Surplus	$15,890	$8,345

Bonds Offered.—An issue of $1,500,000 Chicago, North Shore & Milwaukee Railroad first and refunding mortgage 5½ per cent bonds, series B, was offered on Oct. 1 by Halsey, Stuart & Company and the National City Company. The bonds mature April 1, 1956, and are priced at 98.50 and interest, yielding about 5.60 per cent. Proceeds of the issue will be used toward reimbursing the company for capital expenditures for additions and betterments to its properties. The company operates from Evanston, Ill., to Milwaukee, with a branch to Mundelein, Ill.

New Directors Elected.—Berry S. Spain, assistant secretary and assistant treasurer of the Nashville Railway & Light Company, Nashville, Tenn., and John C. Guild, vice-president of the Tennessee Electric Power Company, have been elected directors of the Nashville property. They succeed in this capacity H. H. Batchelor and W. R. Cole, resigned.

Receivers Appointed for Missouri Road.—E. Z. Wallower of Harrisburg, Pa., filed a petition in the federal court of Kansas City, Mo., on Sept. 14, asking that receivers be appointed to take charge of the affairs of the Southwestern Missouri Railroad, which operates electric railway lines at Joplin and at Webb City, Mo., and interurban services to Baxter Springs, Kansas, Picher, Okla., and to various other smaller cities in that district. The company, through its attorneys, on the same day filed an answer to the petition, consenting to the requested receivership. Judge Merrill E. Otis subsequently appointed F. C. Wallower and Harrison C. Rogers, both of Joplin, receivers for the company. Mr. Wallower, the petitioner, who is said to own 12,000 shares of stock and $400,000 in bonds of the company, pointed out in the petition that the interest on the bonds had not been paid for a long time and that other creditors of the company had previously threatened legal action.

Will Redeem Bonds.—It is announced that all of the outstanding first mortgage gold bonds of the Kentucky Utilities Company, Louisville, Ky. (series B and E) will be retired. The series B bonds, due 1941, will be paid on Nov. 15 at 107½ and interest and the series E bonds, due 1949, will be redeemed Nov. 1 at 105 and interest. The Kentucky Utilities Company is a subsidiary of the Middle West Utilities Company.

Audit in St. Louis Under Way.—The audit of the books of the United Railways, St. Louis, Mo., to determine whether the company is entitled to an increase in fare from 7 cents to 8 cents was started by auditors of the Missouri Public Service Commission on Sept. 27. The audit was ordered last June following the filing of the application for increased fare by Receiver Rolls Wells.

PASSENGER STATISTICS OF THE PHILADELPHIA RAPID TRANSIT COMPANY

	Six Months Ended June 30, 1926			Three Months Ended June 30, 1926

Digitized by Google

Acquisition Bonds Approved. — The Massachusetts Department of Public Utilities recently approved the issue by the Interstate Street Railway, Attleboro, Mass., of $150,000 first mortgage 6 per cent sinking fund gold bonds dated April 1, 1926, and due April 1, 1951. The proceeds are to be used solely for the payment and cancellation of $50,000 outstanding car trust notes and $100,000 in payment for the property and franchises of the Attleboro Branch Railroad.

Extra Dividend Declared.—Directors of the Pittsburgh Utilities Corporation, New York, N. Y., recently declared an extra dividend of $187,500 as well as the regular semi-annual dividend of $1 a share on the common and 2½ per cent on the preferred. The Pittsburgh Utilities as of Dec. 31, 1925, owned 491,500 shares of common stock of the Philadelphia Company and 25,000 shares of participating 8 per cent preferred stock of the Duquesne Light Company. An important subsidiary of the Philadelphia Company is the Pittsburgh Railways, Pittsburgh, Pa.

Meet on Appraisal Appointments.—A session was held on Sept. 30 by members of the Board of Public Works, Public Utilities Bureau and Mayor A. A. Will for the purpose of selecting engineers to appraise the value of the properties of the Louisville Railway, Louisville, Ky., such appraisal to be used as the basis on which to compute earnings and control fare rates. No appointment has been made as yet. A number of engineering concerns has filed proposals to handle the job.

Book Reviews

Safety Rules for the Operation of Electrical Equipment and Lines

Department of Commerce, Bureau of Standards, Washington, D. C. 64 pages. Price, 15 cents.

This handbook of the Bureau of Standards, No. 8, comprises part four of the fourth edition of the National Electrical Safety Code. The present edition is the result of the revision which has been carried out according to the procedure of the American Engineering Standards Committee and the revised rules have had the approval of a sectional committee organized in conformity with those rules of procedure.

Commerce Yearbook 1925

Department of Commerce, Bureau of Foreign and Domestic Commerce, Washington, D. C. 800 pages. Price, $1.

This publication issued by the governernment gives a complete and authentic record in text and tables of the American trade and industry for 1925 with a view of industrial progress. Its material has been gathered from every available source and carefully digested by experts. The contents include a résumé of production, employment, domestic trade and prices. Besides discussions of transportation, finance, banking and foreign trade there are sections devoted to construction, construction materials, motor vehicles, railway equipment and electrical apparatus.

Personal Items

H. A. Mullett Goes to Minneapolis to Assist Vice-President

A prominent figure in the railway and bus field will become affiliated with the Twin City Rapid Transit Company, Minneapolis, Minn., as assistant to Vice-President T. Julian McGill on Oct. 15. This man is Howard A. Mullett, prominent in Milwaukee and Chicago and also well known in manufacturing circles. Only a little more than a year ago Mr. Mullett resigned as assistant general manager in charge of the railway and bus properties of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., to join the Yellow Cab Company, in Chicago. Early in the present year, after his short service, he was named vice-president of the latter company, which is now a General Motors subsidiary.

His splendid work in Milwaukee and especially the development of the company's bus project under his supervision paved the way for his responsible position with the Yellow Cab Company of Chicago. R. H. Pinkley succeeded Mr. Mullett as assistant general manager at Milwaukee.

H. A. Mullett

In 1904, when Mr. Mullett was graduated from Rose Polytechnic Institute, he became associated with the Westinghouse Electric & Manufacturing Company, at Pittsburgh. Here he remained until 1906, when he left to join the Milwaukee Electric Railway & Light Company, as assistant to the superintendent of equipment. He did not remain assistant long, but assumed the rôle of superintendent from 1911 to 1918. In 1918 he became assistant general manager of the company's city, interurban and bus transportation department, and in 1919 his jurisdiction was extended to cover the company's newly created city and interurban bus division. Here it was that his efforts were crowned with success, for the company's bus project developed into one of the greatest in the country. Some few years ago, when the Milwaukee property acquired control of the Milwaukee Northern Railway, Mr. Mullett was made vice-president and general manager of that property in charge of operations.

Mr. Mullett was born in Louisville, Ky., in 1880. He was educated in the public schools of Kansas City.

Fred G. Buffe Appointed in Kansas City

According to an announcement made on Sept. 30 Fred G. Buffe, general manager of the Kansas City Railways for the receivers, has been named vice-president and general manager of the Kansas City Public Service Company, Kansas City, Mo., and will be in charge of all operations of the local railways when the latter company has formally taken over the property and the present receivership is officially closed. William G. Woolfolk, president of the new company, tendered the offer of the position to Mr. Buffe.

Mr. Buffe was manager of the Kansas City Railways for a number of years prior to the receivership, which has been in progress for about six years, and was retained in that capacity by Fred W. Fleming and Francis M. Wilson, receivers.

During recent years he has become very well known in mid-Western street railway circles, through his activities in the local company during the receivership and through his authoritative work in connection with the electric railway associations.

Harry Engle has been reappointed street railway commissioner of Youngstown, Ohio, by Mayor Scheible for a second term of four years beginning Jan. 16, 1927. The reappointment was approved unanimously by the Council.

Howard R. Stearns, assistant electrical engineer of the Detroit Street Railways, Detroit, Mich., has severed his connections and assumed the position of electrical engineer and statistician with the Miller-Schorn system. He had been with the city department of street railways for the past five years. Mr. Stearns was graduated from the University of Michigan engineering college and gained his shop experience with the Westinghouse Electric & Manufacturing Company. He has had experience with the valuation of electric and railway properties in Michigan and New Jersey.

J. J. Connors, safety supervisor of the transportation department of the Georgia Railway & Power Company, Atlanta, Ga., resigned recently. He has accepted a position with the Nashville Railway & Light Company, Nashville, Tenn., where he will continue his safety work. Mr. Connors spent most of his life in Nashville and was employed by the Nashville property for many years.

Norman F. Titus, San Francisco, Cal., has been appointed chief of the transportation division, United States Department of Commerce.

Obituary

Judge Cicero Lindly, vice-chairman of the Illinois Commerce Commission, died at his home in Greenville, Ill., on Sept. 23. He was 69 years old.

Chester L. Bisbee, for 28 years identified with street railway work, died at his home in Fall River, Mass, on Sept. 26. For the last fourteen years Mr. Bisbee was superintendent of the Fall River division of the Eastern Massachusetts Street Railway. He was born in Middleboro, Mass.

Clermont Harvey Wilcox, president of the New York Insulated Wire Company, and for many years head of the banking and brokerage house of Wilcox & Company, died Oct. 2 in the Fifth Avenue Hospital, New York, N. Y. The New York Insulated Wire Company, of which Mr. Wilcox was the founder, was the first company to make insulated wire in the United States.

Anderson Gilbert Moore associated with the Insull properties, died Sept. 30 in New Albany, Ind. At the time of his death he was industrial agent of the Interstate Public Service Company, Middle West Utilities and the Kentucky Utilities Company. He began work with the Rock Island & Southern Railway in the claims department. Twenty-five years ago he went to New Albany as cashier of the Louisville & Southern Indiana Traction Company and the Louisville & Northern Railway, absorbed by the Interstate Public Service Company fifteen years ago. At that time he became industrial agent of the Interstate in Indiana.

Arthur Holland, prominent street railway organizer and at one time president of the United Railways of San Francisco, Cal., died Oct. 1 at his home in Concord, Mass. His street railway career began in 1901, when he was elected president of the United Railways of San Francisco. He remained as president of this company for several years, and about 1907 became instrumental in the reorganization of the York Street Railways in Pennsylvania. Later he was made president of the Bangor & Aroostook Railroad. He was born in Boston in 1850. He was educated at the Brooks School of that city and Harvard University, being graduated from the latter institution in 1872. Early in life he became prominent as an iron and steel merchant. Mr. Holland established the firm of Holland & Company, Pittsburgh, Pa., in 1894.

Nicholas B. Trist, special wheel engineer with the Carnegie Steel Company. Pittsburgh, Pa., died at his residence in Sewickley, Pa., Sept. 29. As a young man he entered the service of the Pennsylvania Railroad as an apprentice in the Altoona shops and served with this road in various capacities for about 23 years. Through Charles T. Schoen he became connected with the Schoen Steel Wheel Company upon the entrance of that firm into the manufacture of solid wrought steel wheels. Mr. Trist became connected with the Carnegie Steel Company when that company took over the Schoen Steel Wheel Company in 1908. He was born in Savannah, Ga., in 1862.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Pennsylvania Railroad Places Order for Electrical Equipment

In accordance with its program of electrification of the suburban lines entering Philadelphia, the Pennsylvania Railroad has placed an order with the Westinghouse Electric & Manufacturing Company for the electrical equipment for 93 coaches, to be used on the Wilmington Division. The contract also calls for motors and controls for four huge electrical passenger locomotives of the same type ordered from the Westinghouse company last February. The car equipment just ordered is a duplicate of that previously developed by the Westinghouse Electric & Manufacturing Company for application to the Pennsylvania standard multiple-unit coaches. The Pennsylvania Railroad already has 130 of these electric coaches with Westinghouse equipment.

Improvements to Interurban Service in Oklahoma

The Oklahoma Railway has completed a three months program of improvements on its interurban service. About $1,000 has been spent on each interurban car operating out of Oklahoma City to El Reno, Norman and Guthrie and intermediate points. In addition to a general overhauling mechanically the cars have been repainted and reupholstered. Improvements in the interurban service of the Oklahoma Railway have been steady for the past two years beginning with the expenditure of more than $100,000 for substations. These substations have so increased the power available on interurban lines that all the schedules have been materially improved, the running time between stations having been reduced considerably on the Guthrie and Norman lines.

Twenty-two Double-Deckers Put on by Fifth Avenue Company

For the improvement of its service to the public, the Fifth Avenue Coach Company, New York, N. Y., on Sept. 30 put on the streets 22 of a fleet of 45 new double-deck motor coaches. The construction of these vehicles has been carried out in the shops of the company in New York City. It is expected that the last of these coaches will be finished and put into service before the end of October.

The new coaches, while retaining the best features of the company's "L" type covered upper deck vehicles, have many special improvements and are known as the "SL" type. They have a seating capacity of 55 passengers each. All lower decks are upholstered in leather. Five coaches have upper deck seats of a rubberized automobile fabric, five are upholstered in Kemi-Suede, a newly developed material, and 35 coaches have leather seats on the upper deck. Half of the coaches have permanent covered tops and the others have "roll tops."

The engines are of the Yellow sleeve valve type, four cylinders. On the rear platform an automatic electric fare box has been installed to increase the rapidity of loading.

Five Automatic Subs for Indianapolis

The Indianapolis Street Railway, Indianapolis, Ind., placed an order with the Westinghouse Electric & Manufacturing Company a few days ago for equipment for five substations, and the order included nine 1,500-kw., 600-volt converters, 28 transformers and auxiliaries. One substation will contain three units arranged for semi-automatic operation. It will be used as the base station. Two others will have two units and operated automatically while two others having single units will also be automatic. Although supervisory control is not included in the present contract, the stations will all be built to facilitate its application.

Rolling Stock

Birmingham Electric Company, Birmingham, Ala., has placed an order for sixteen new cars with the Cincinnati Car Company. The outlay will cost $250,000.

Key System Transit Company, Oakland, Cal., has ordered eleven new Fageol buses for use on the new Berkeley-Oakland Telegraph Avenue line, service on which will begin in December. The buses will be of steel construction, of the 29-passenger type, 29 ft. 9 in. in length and with a 230-in. wheelbase. This bus line will provide way service to and from the two East Bay cities, trolley cars providing the express service, thus reversing the usual process.

Results of Closer Co-operation in Association Work Are Apparent

SIGHT should not be lost of the fact that President Coates' address at Cleveland was an able presentation of the accomplishments of the year. It was not possible for him to be specific in every instance, but he did bring out forcefully the degree to which co-operation is being achieved in the industry. Progress along these lines has been due to the thorough co-operation of the executive committee, the Advisory Council, the managing director, the headquarters staff, under the guidance of Mr. Welsh; committee chairmen and committee members. The work was all well done. It is a continuing process, however, this co-operative effort, and it should not be permitted to lapse even for a moment.

At first there was a question in some quarters about the possible effect of the discontinuance of the mid-year meeting. Any doubts about the advisability of this action appear to have been dispelled by the accomplishments at the territorial meetings which displaced them. Moreover, the plan of having committee chairmen meet with the members of the executive committee appears to have been productive of good. It has helped to tie in the work to better advantage. Mr. Coates recommended that this plan be continued. That seems advisable. It makes for solidarity of effort.

These are just some of the things that the outgoing president mentioned. There were many more almost equally significant and indicative of progress. As Mr. Coates said, there is need for a closer tie-in between the sectional associations and the American Association. This process was advanced during the year and should be carried still further during the coming year. The sectional associations will gain by an extension of this plan and so will the industry as a whole. There may be some problems that are largely local, but, by and large, all problems are industry problems. As Mr. Coates pointed out, one of the most effective ways of tying in the sectional associations is to invite the president of each sectional association to meet with the executive committee whenever it is in session. This is an excellent plan. It makes for co-ordination of effort. And that is what is needed. Moreover, Mr. Coates had words of praise for the manufacturers. Their part in the recent accomplishments is not lightly to be dismissed. As he so aptly said, the industry is indebted to them for their studies and their development work.

As for the future, the recognition for which the industry has been striving will be found "with the manufacturers working to accomplish the results suggested and the operator studying the situation and carrying out his advanced ideas on the underlying principles of co-ordinated service and an adequate rate of return, and meeting the opposition to the electric railway squarely and fairly." These words are the words of Mr. Coates slightly paraphrased. It was courage that was needed in dealing with the situation in the last few years. And it was courage that was shown. Mr. Coates' review made that plain.

Penn-Ohio Company Finds the Way to Build Traffic Despite Obstacles

COURAGE to take the initiative—to make an aggressive fight for traffic along the very lines where its competitors had been most successful—gained for the Pennsylvania-Ohio Electric Company last year a large increase in its transportation business and the Coffin Prize for 1926. Post-war conditions in the territory served by this company were discouraging. Wages and other operating costs were high. The physical property was run down. Competitors had taken away a large volume of traffic. The company had its back against the wall.

But the management of the P-O system was not content to wage defensive warfare. Excuses and pleas for more liberal treatment were discarded as weak weapons. On the contrary, it was decided that the way to attain supremacy in the local transportation field was to furnish better transportation than did its competitors.

De luxe bus equipment was purchased on the theory that the best was none too good and the fare was made high enough to justify this kind of service. Following this, similarly attractive and comfortable electric railway cars were bought and put in operation. Lost traffic was regained from competitors and the positions of rail and bus service stabilized. This traffic fight was made on a quality rather than a price basis.

The company points to accomplishments under each of the six headings outlined by the Coffin Prize committee. It is significant that the progress made has followed closely in the wake of the improvement in equipment. Public relations have been improved with a resultant increase in earnings. Substantial economies have been effected in operation and maintenance. Construction practice has made steady advances. Accidents have been reduced in number, due in part to a vigorous safety campaign, but also in part to better rolling stock. Employee morale has improved coincident with the improvement in physical property. Financing has become easier as the position of the company has become more firmly established.

Many other noteworthy accomplishments mentioned in the brief presented by the Penn-Ohio Electric Company deserve the thoughtful attention of electric railway men. It is a record of all-around achievement of which the management may well be proud.

Give the Accountant a Chance

IN THESE days of rapidly changing conditions accountants have their problems, equal in importance to those confronting the engineering, mechanical, operating and other departments of the industry.

It is believed that the small number of accountants attending the annual convention is due in no small part to failure of executives and even the accountants themselves to appreciate the benefits to be derived from forming acquaintance and periodically renewing contact with other street railway accountants.

This interchange of ideas stimulates a similar degree of progress in accounting methods to that noticeable in other departments of the industry and has a very definite value in dollars and cents, especially since the income tax and the steadily increasing volume of reports have multiplied the demands upon accounting departments everywhere.

During the past year the officers of the Accountants' Association directed their efforts toward increasing the attendance of accountants at the Cleveland convention, believing that the central location of the meeting justified the hope of larger numbers, with more diversified and profitable discussions.

Letters were sent to executives of member companies urging active co-operation of accountants and others engaged in the accounting departments of such companies, in order that the industry as a whole might benefit from the studies that the association is making constantly through its committees and that individual interest might be stimulated in the progress others are making along the most progressive lines.

While the attendance of accountants at the Cleveland meeting was only normal, the sessions were among the most interesting and profitable in the history of the association. One of the outstanding features was the "get-together" luncheon held Wednesday noon at the Cleveland Athletic Club. Here the accountants apparently felt more free to present and discuss their individual problems than on the convention floor and there was greater opportunity for personal contact.

It is earnestly hoped that next year will see a much larger attendance and a greater number of round-table sessions. Every member company should have its accounting department fully represented, for no similar expenditure of time and money will produce more profitable returns.

Change of Convention Dates Would Aid Attendance of Accountants

REGARDING the date for the annual convention, members of the Accountants' Association attending the Cleveland meeting were particularly interested in some informal discussion. It was brought out that the peak of the accountant's work comes during the first week or ten days of each month. Thus, the present practice of holding the annual convention of the American Electric Railway and affiliated associations during the first week of October places an obstacle in the way of many accountants who would like to attend. Frequently they are prevented from so doing by the pressure of their regular work. To hold the convention a week earlier would be much better so far as the members of this association are concerned, but would be open to objection on the score of difficulty in getting hotel accommodations, October being a better month than September for securing favorable rates. The second or even the third week in October apparently would not be subject to this criticism and would suit the accountants far better than the present arrangement. Probably this change would not inconvenience others as much as it would accommodate the accountants. Advantages and disadvantages of such a plan merit the careful consideration of the association.

Claims Delegates Have Good Meeting

PERHAPS the most interesting feature of this year's Claims convention lay in the extent of the attendance. The opening meeting witnessed not only an unusually large gathering but it reflected to a remarkable degree the representation from all parts of the United States. From the Pacific Coast to the Atlantic, from North to South, had come the delegates. There were many familiar faces of those who have been regular attendants in the past and have been largely responsible for the keen interest of electric railway claims men in the activities of the Claims Association. And the old timers had the great pleasure of welcoming to the meetings much new blood. The newcomers were made to feel thoroughly at home and fell quite naturally into active participation in the convention program. With so favorable a setting and under the able leadership of President "Joe" Handlon, great profit to all resulted from the prepared addresses and from the discussions that followed the delivery of each formal paper.

Freedom of discussion was the rule throughout the meetings. Virtually no limit was placed upon this right of free speech "discussion," and therein lay much of the reason for the marked success attained by the Claims Association this year. Fresh inspiration, clear thought on problems offering difficulties in their solution, new friendships, the cementing of old and friendly ties, all these and much more were obtained by those claims delegates who attended the 45th annual convention.

Light Being Thrown on Bus Accident Liability

BUS operation by electric railway companies introduces as many new problems to the claims department as to any other branch of the railway company's activities. Up to the time that buses were actually operated in considerable numbers by electric railway companies, all sorts of theories were held as to their relative accident liability as compared with trolley cars. The experience of independent operators offered no definite answer to this question. Outside of a very few bus companies in the largest cities of the country, there were practically no bus operators who kept their accident records in the same detail as is customary on electric railway properties. It is only within the last year or so that electric railway companies have been able to compile very much in the way of data on the relative accident liability of these two forms of public carrier vehicles.

Digitized by Google

The best information yet available on this subject is undoubtedly contained in one of the papers at the Cleveland Claims meeting, as this paper treats the topic not only in detail but gives the experience on it of one of the largest bus operators as well as one of the largest trolley car operators in the country. While Mr. Drown's paper presents the results of only one full year's operation of buses by his company, during that time it had in service approximately 800 buses, mostly of modern type, so that the information given is a very valuable contribution to our knowledge of the subject.

Operators of buses in similar service, i.e., city and suburban, will do well to study Mr. Drown's figures and conclusions. They will not be repeated here except to say that liability of buses to cause accidents is probably higher than that of the electric car and that the need for good equipment maintenance is at least as great.

Lack of Interest Fatal to Committee Activities

OUTSIDE conditions may not be all that hamper the progress of the industry. Lack of interest may be a potent cause of some results that today come unsought. One instance that brings this home was the attempted meeting of the special taxation committee during the Cleveland convention.

Although the meeting was well advertised and considerable preparation was made to present the general subject of the gross-net tax with the hope of forming a nucleus for nation-wide action, not one member of the committee appeared! The committee had recently been augmented by one advisory member from each of the 48 states to further the work of tax standardization and possible reduction. Fortunately, twelve of these members were present and some valuable discussion ensued.

Without doubt there lies in this subject a tremendous opportunity for the reduction of costs, at least for many properties. There has been no voice raised against the plan proposed except that many difficulties are seen in the offing. If this be true, it is to be regretted that valuable time was lost at this annual congregation of railway men. Association work deserves better support than this, not because of the association, *per se*, but because the progress of the industry demands such action.

With a moment's reflection on what might be accomplished along the line of tax reduction, it is difficult to justify such complete lack of attention on the part of this committee.

Marked Progress Made in Accident Prevention Last Year

STATISTICS presented in the report of the joint committee on accident prevention show that continued improvement has been made throughout the year just ended. The figures are based on the records of 171 companies operating more than one-third of the total annual electric car mileage of the country. In the light of growing congestion and increased schedule speeds these figures testify forcefully to the effectiveness of the work being done by electric railways to increase the safety of street travel.

A decrease occurred in the total number of reported accidents and in nearly every individual classification of accidents. Although the number of motor vehicles on the streets increased considerably over the preceding year, the number of collisions between electric railway cars and automobiles was reduced. Collisions with vehicles other than automobiles, derailments, boarding and alighting accidents and the number of injuries to pedestrians were materially decreased. In these classifications the reduction ranged from 8 to 22 per cent.

The cost of accidents decreased slightly. In addition to the saving made by actual accident prevention, further economies thus resulted from safety work because the character of the accidents that occurred was less serious.

Co-operation with state, municipal and civic bodies in the work of accident prevention is one of the chief reasons for the improvement shown. The committee recommends that particular attention be paid to such activities in the future. Especially valuable is the educational work done by railway representatives in the schools. At the same time the education of transportation employees in accident prevention should continue without let-up. By following these principles, it is hoped that the record for the coming year may be better even than that for the year just ended.

Too Much Paper Used in Some Committee Reports

BULK rather than informative value was the most impressive feature of a number of the committee reports presented at the convention. Not because they contained too much information are these reports subject to criticism, but because the essential points which the committees wished to bring out were buried under a mass of material of doubtful value.

The purpose of such a report is to tell the association what has been accomplished by the committee during the year. Its value to the industry depends on the number of electric railway men who read it. This year a number of reports were extremely long, containing in at least one case more than 200 printed pages. Probably the number of railway men who will read in its entirety a 200-page report could be numbered on the fingers of one hand. A shorter report that received careful consideration from a large part of the industry would be of infinitely greater value.

Material that is already available in printed form elsewhere has no place in a committee report. Neither should information be included simply because it is more or less interesting. There should be some definite reason for putting it in the report. It should pertain directly to the particular subject under consideration. Inclusion of other material occasions not only a waste of money for printing, but also acts as a deterrent to reading the report. Findings of genuine value may go unnoticed because no one cares to wade through a multitude of pages to discover them.

Information that properly belongs in the report should be presented in the briefest possible manner consistent with clarity. When the matter intended for inclusion in the report is so presented electric railway men will not be able to offer the excuse that they "haven't time to read the reports of committees."

Demonstration of Transportation Progress Won Coffin Prize for 1926

Central Square, Youngstown, the Hub from Which Radiate the Electric Railway and Bus Lines of the Pennsylvania-Ohio System

Pennsylvania-Ohio Brief Tells How Improvement of Railway Rolling Stock and Track and the Establishment of Attractive Co-ordinated Bus Service Have Resulted in the Elimination of Jitney Competition and Have Placed Public Transportation on a Paying Basis Throughout the Territory Served —Modernization and Standardization of Equipment Have Paid Well

CONVERSION of deficits into net earnings on the transportation system operated by the Pennsylvania-Ohio Electric Company, Youngstown, Ohio, has been brought about by the application of modern methods and equipment. Rehabilitation of the railway property and inauguration of bus operation made it possible to provide a service capable of competing successfully for traffic under present conditions. Concrete evidence of the company's intention to give thoroughly up-to-date transportation service and constantly to improve its facilities won the co-operation of the public with a resultant considerate attitude in franchise matters, assessments for bridges, etc. At the same time, jitney competition was eliminated throughout the territory served.

In pioneering with de luxe buses in an industrial territory the company avoided the temptation to hold bus fares below the cost of operation and definitely endeavored to give a type of service with buses different from that given by the railway. It established the precedent that the bus fare under such conditions should be higher than the rail rate. While building up its bus service the company has at the same time brought its rail lines up to a state of excellence which has permitted the proper field for each to be determined. Its experience shows that the bus may be used to attract new business to a transportation system as a whole, while improved cars and service are at the same time increasing the riding on the rail lines. It has demonstrated that when both bus and car services are intensively developed in comfort, speed and convenience, and when rates of fare are proportionate to the cost of operation, neither vehicle threatens to supplant the other, but both prosper together.

Rail, Bus and Combination Routes Operated by the Penn-Ohio Electric Company and Subsidiaries

Substantial economies have been made through the extension of one-man operation to all forms of interurban and city service operated by this company. Bus equipment has been standardized to reduce operating and maintenance costs. Attention to accident prevention has resulted in a decrease in accidents of 46 per cent in suburban territory and 34 per cent in the city of Youngstown. A policy of taking employees into the confidence of the management has brought about effective co-operation. These accomplishments are set forth in detail in the brief which the company presented in the Coffin Prize competition.

P-O System Combines City and Interurban Operation

OPERATIONS of this company cover three distinct fields of public transportation. The Youngstown Municipal Railway exemplifies co-ordinated bus and rail service in a city of 165,000 population. Examples of small city operation are found in Newcastle, Warren and Sharon, having populations of 60,000, 40,000 and 25,000 respectively. Three short interurban lines illustrate still another type of operation.

As a whole, the system comprises seven railway companies and two bus operating units. These are (1) the Youngstown Municipal Railway, operating in the city of Youngstown and suburbs under a service at cost agreement; (2) the Shenango Valley Traction Company, operating in Sharon and Farrell, with lines from these towns to Sharpsville, Wheatland and West Middlesex; (3) the Pennsylvania-Ohio Electric Company, the parent company, furnishing car and bus service in Newcastle; (4) the West End Traction Company, operating a 15-mile line between Youngstown and Warren via Girard and Niles, with shorter lines to Leavittsburg and Mineral Ridge, as well as local bus routes in Warren; (5) the East End Traction Company, running from Youngstown to the Pennsylvania state line, a distance of 5 miles; (6) the Newcastle and Lowell Railway, operating from the Pennsylvania-Ohio state line to Newcastle, a distance of 15 miles; (7) the Pennsylvania-Ohio Power & Light Company, operating a 15-mile railway between Youngstown and Sharon.

Bus service is provided by the Pennsylvania-Ohio Coach Lines, running express coaches at a higher fare to supplement the lower fare local rail service between Youngstown and Sharon. Similar service is given also between Youngstown and Newcastle, 21 miles; between Sharon and Newcastle, 24 miles; between Youngstown and Akron, 52 miles, and between Youngstown and Cleveland, 71 miles. The Pennsylvania-Ohio Tourist Lines run tourist coaches between Youngstown and Meadville, Pa., 54 miles.

Operations are divided into five groups, namely, the Youngstown Municipal district; the Newcastle district, comprising the Penn-Ohio Electric Company, the Newcastle and Lowell Railway and the East End Traction Lines; the Trumbull district, comprising the West End Traction Company and covering all rail operations in Niles, Girard and Warren, as well as the bus operation in the latter city; the Sharon district, comprising the lines of the Pennsylvania-Ohio Power & Light Company, the Shenango Valley Traction Company, the Sharon & Newcastle Street Railway, and an intercity

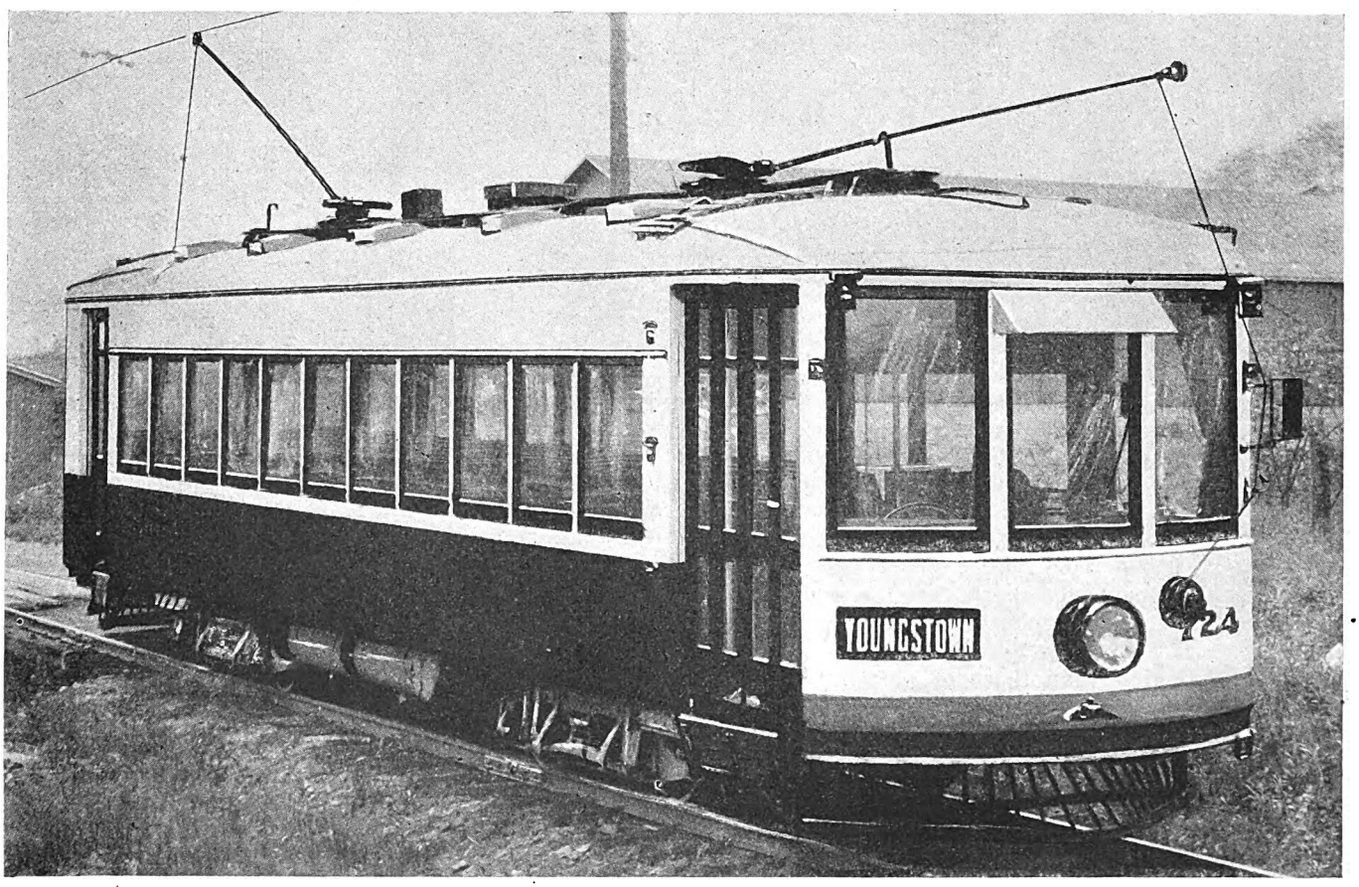
bus division comprising all bus and coach operations exclusive of those of the Youngstown Municipal Railway. The relation of the various rail and bus lines to each other is shown on an accompanying map.

Attractive Equipment Makes P-O Service Popular

FIRST among the achievements set forth in the brief is that of popularizing the service and gaining good will, or, in the words of the invitation sent out by the committee early in the year, "success in gaining public good will as indicated by the initiative, skill and enterprise manifested in popularizing electric railway service —more riders and more revenue."

Particular interest attaches to the experience of this company because the system has had to face the difficult problem of making mass transportation successful in cities where the average length of ride is 1.5 miles or less and also on short interurban railway lines where the right-of-way is inadequate to permit speeds higher than those of express buses.

About 1920 the Penn-Ohio railway business was at its lowest ebb. Competition from jitneys and buses was at its height. Cars, tracks and other facilities of



New Cars Have Been Designed with a View to Attracting Riders. Sun Visor Over Vestibule Window Increases Safety

Digitized by Google

the railway were none too good. The public relations that followed in the wake of such service were not what might be desired. As the result of these conditions the financial results of operation were unsatisfactory.

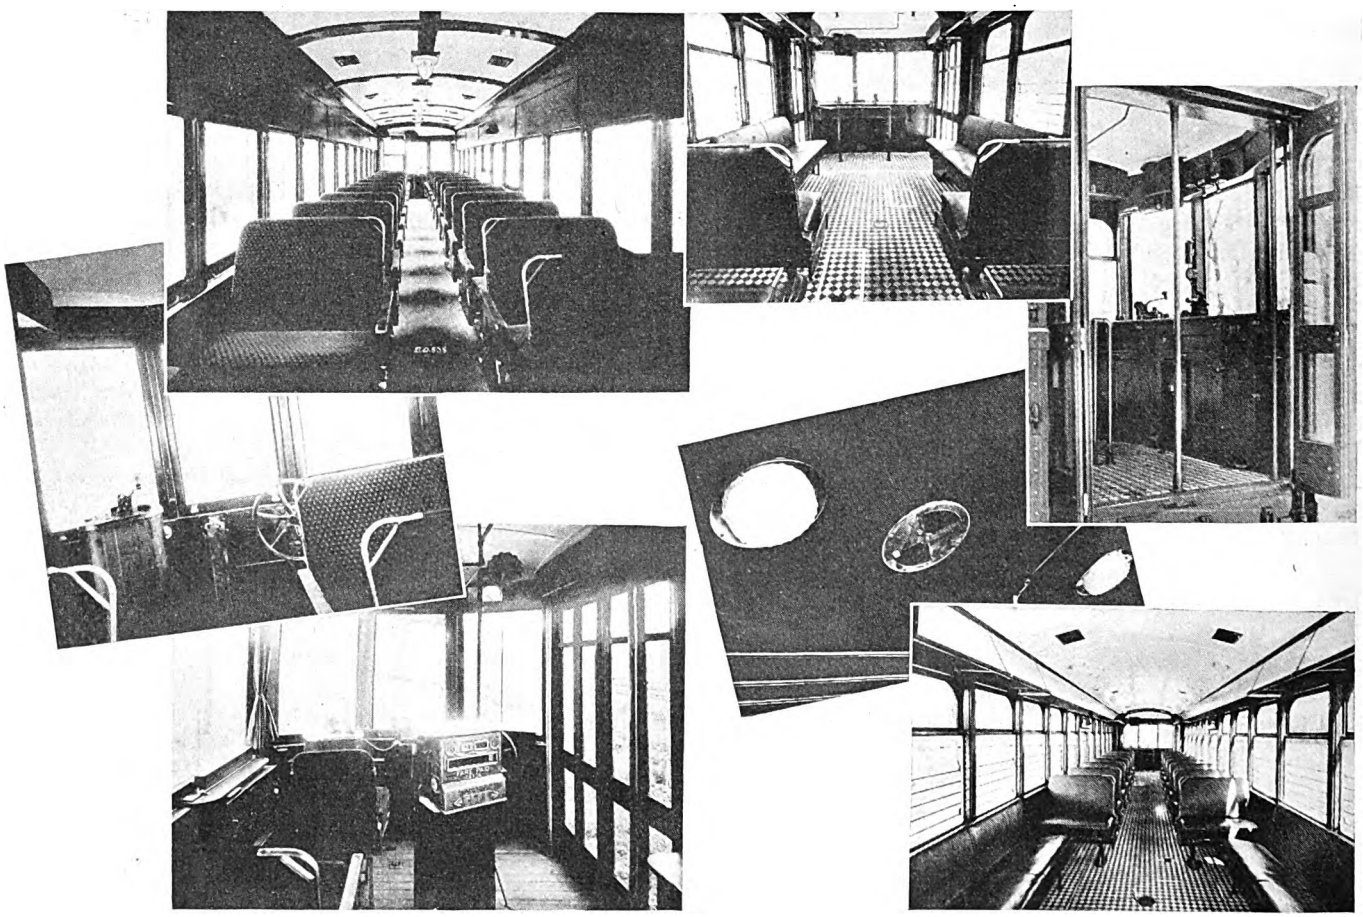
Facing this situation, the management decided that the first problem to be solved was that created by the independent bus operation between Youngstown and Warren and between Youngstown and Sharon. Careful investigation showed that the buses operating in competition with the company's service were faster and more comfortable than the railway's cars. As a result the company determined to meet this competition with bus service more comfortable and attractive than that afforded by its competitors.

When in fulfillment of this plan the Penn-Ohio Coach Lines Company was organized, in August, 1922, there was in the East no precedent by which to be guided. The slogan "the best is none too good" was adopted in designing the new equipment. Independent competition was rapidly conquered. Many operations not very solidly founded financially disappeared in a short time. All others have been purchased at reasonable figures. Despite the fact that coach fares were approximately 50 per cent higher than those of paralleling railway lines, the bus business increased rapidly.

Many people at that time prophesied the passing of the railway. The company, on the other hand, saw in this situation an opportunity to improve its service.

In September, 1923, therefore, the company purchased twelve interurban cars fitted up with the same degree of comfort as the motor coaches, but light in weight, operated by one man and carrying thoroughly modern equipment. In the following years additional cars of the same type were purchased and cars previously purchased were remodeled, so that at present all rail service is on a high plane. The public has a choice of express motor coach service at a higher fare or moderate priced rail service. The latter is growing in popularity.

Where there was a sound basis for bus operation because of a lack of rail facilities in some sections of the community the company has undertaken to provide service. Study has been made of the transportation situation throughout the company's territory and where service can be given better by bus than by railway the company has not hesitated to make the substitution. Every section of every community in which the company operates is now reached either by rail lines or by bus.



Every Effort Has Been Made to Give an Attractive Appearance to the Interiors of the New Youngstown City Cars. All Rods, Pipes and Other Apparatus Are Hidden from View

To bring the Penn-Ohio service up to the desired level of excellence old transportation vehicles have been scrapped and new vehicles acquired. On the railway lines outside of Youngstown, out of a total of 83 cars now in use only seven were in service prior to March 1, 1918. These are used only for tripper or extra service and have been entirely rebuilt for one-man operation. On the Youngstown Municipal Railway the average age of cars is less than seven years. Only the highest standards of maintenance, painting and cleanliness are tolerated. No stone has been left unturned to make the rolling stock attractive.

The appearance of the operating personnel is in conformity with the attractive appearance of the equipment. The old blue serge uniform has disappeared on the Penn-Ohio system. Every operator, inspector and supervisory official is arrayed in a whipcord uniform.

Digitized by Google

Because the company is proud of its property and service an emblem has been designed to mark and distinguish it. Actually the emblems used are four in number—one for the Penn-Ohio system, including railways outside of Youngstown; a second for the P-O Coach Lines; another for the P-O Tourist Lines, and a fourth for the Youngstown Municipal Railway. The emblem is used on the cars, on schedules and other printed matter, on caps of all employees, as zone markers on rural routes, on stations, car and bus stops in the cities and is emblazoned in electric signs on company offices and waiting rooms. No other trademark in the district has been so effectively distributed as that of the Pennsylvania-Ohio Electric Company.

Genuine service is given to the public and newspapers by the department of public relations. When a director of public relations was appointed in 1914, the desirability of dealing intimately and frankly with the public, newspapers and employees was not so widely recognized in the electric railway industry as it is now. The guiding principles of the department's twelve years of work are simple. They are to give the fullest information possible regarding the company's affairs, its plans and its purposes, to supply promptly to all newspapers information regarding accidents, interruptions to service and emergency changes in operation, to give equal, ready service to all newspapers regardless of politics, corporation bias or other considerations. The fruitfulness of this policy is evidenced by the fact that letters of commendation have been received from the publisher or editor of every daily newspaper in the cities in which local transportation service is furnished by the company. A typical letter is reproduced on another page.

Public relations work is carried on throughout the entire organization. Employees are members of every civic organization of standing throughout the territory and are active in every civic movement. Executives and other company representatives are frequent speakers at public functions, either in behalf of state public information committees or their own company.

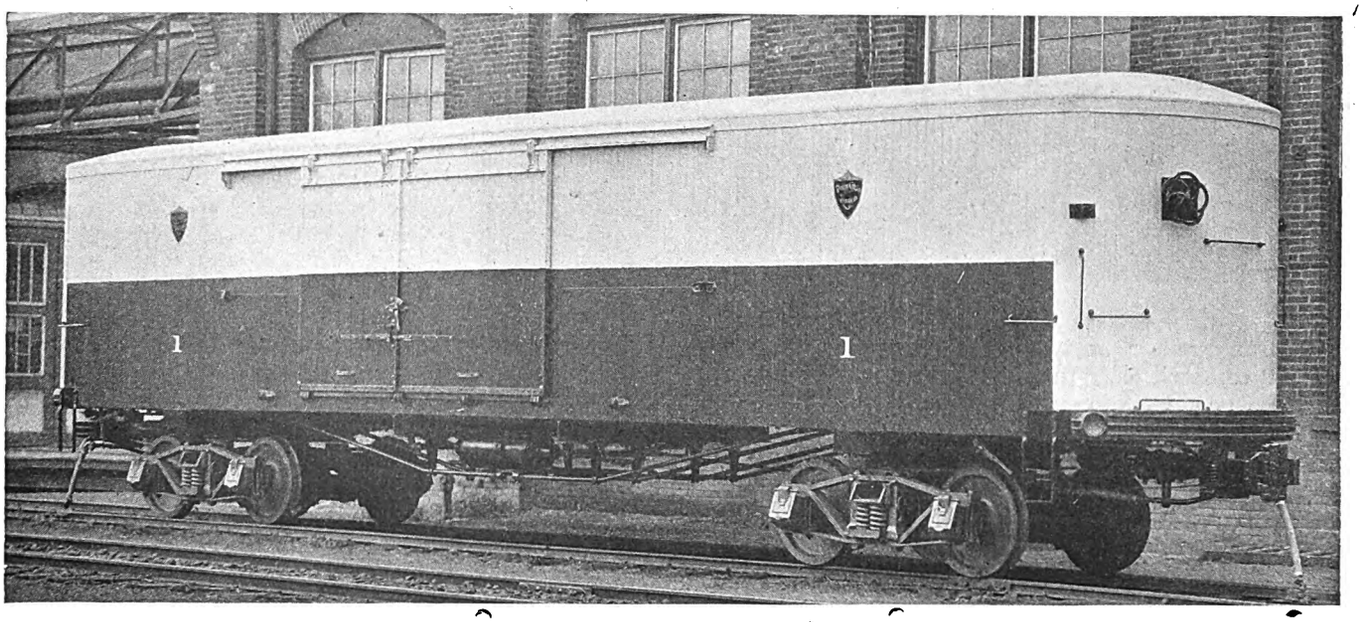
Co-operation is given by the company to many other organizations. For example, the newest and largest garage on the property was placed at the disposal of the Youngstown Automobile Association for its 1925 show.

Advertising done by the company is designed to place before the public full information concerning the service, especially to advise the public in advance of changes in operation or equipment. Aside from such service advertisements, the company has a wide variety of publicity dealing directly with the sale of rides. Paid space in the newspapers, window posters and cards in the cars, calendars in offices, post cards in homes, blotters in hotels, timetables in card and folder form and similar widely distributed reminders are mediums used to push both passenger and freight business.

At hotels and theater box offices attractive framed schedule cards are prominently placed. Outdoors are scores of painted billboards to invite people to travel by coach. Neither a visitor in this territory nor a local resident can pass a day without being faced by some form of Pennsylvania-Ohio publicity.

Indicative of the results of these merchandising efforts is the fact that within the last eight years the company has obtained fourteen new franchises and numerous fare increases depending largely on local consent. When the Youngstown Municipal Railway was formed in 1818 a separate organization was set up because it was deemed necessary to have entirely separate administration and accounting due to the service-at-cost agreement. Late in 1925, however, the management concluded that a merged organization would be more efficient and economical. Despite the fact that there is room for difference of opinion in the allocation of expenses, the city of Youngstown, through its Commissioner of Street Railways, has approved this consolidation. Such willingness to co-operate toward more economical operation may be regarded as strong proof that the city has faith in the railway management.

Communities have shown a considerate attitude in assessments for bridges, viaducts, etc. As the territory is much broken by hills and water courses, relief from paving expense is often secondary to relief from bridge and viaduct costs. Each improvement is a matter of negotiation, but the actual allocation of expense for past work is evidence of the reasonable attitude of the public officials.



Standard C.E.R.A. Freight Car Designed for Use on Connecting Electric Lines. Ten Cars of This Type Were Recently Bought by the P-O Company to Handle Its Growing Freight Business

were carried than in 1921. Figures for the individual years are given in the following table:

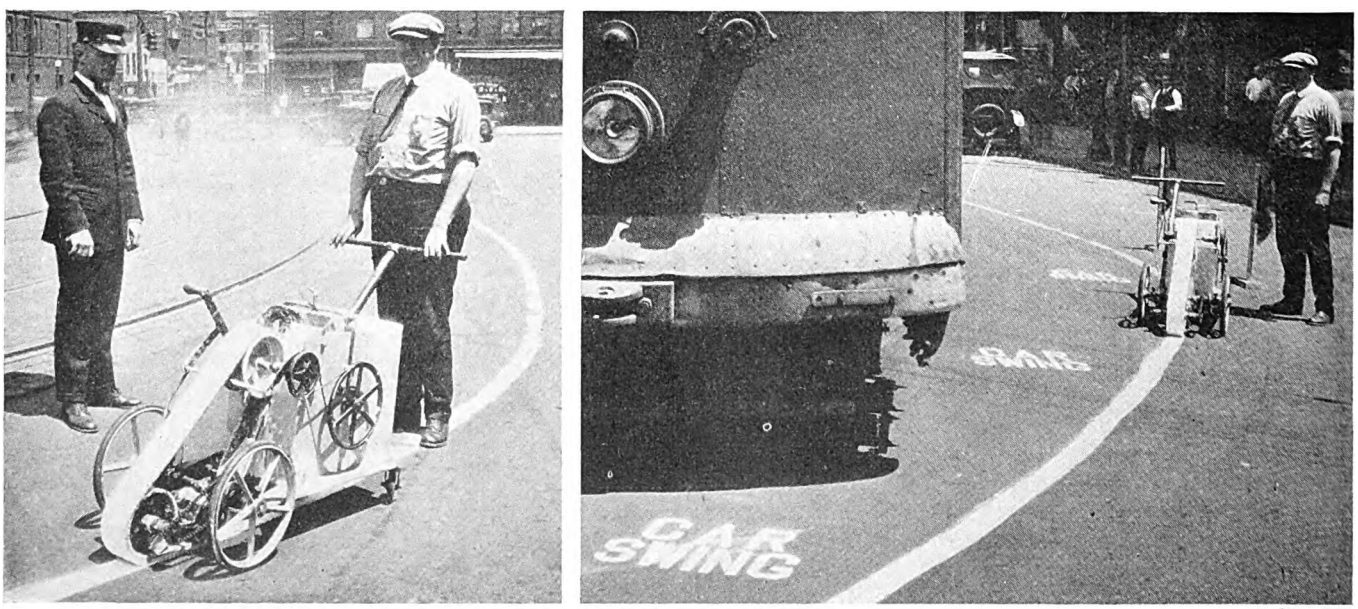
FIVE-YEAR RECORD OF P-O SYSTEM

Year	Gross Earnings	Revenue Passengers
1921	$3,049,269	32,236,873
1922	3,092,014	38,147,270
1923	3,352,312	43,656,226
1924	3,794,510	42,047,120
1925	3,943,324	43,333,133

Of even greater importance has been the elimination of competition. In all the territory served by the Pennsylvania-Ohio system the jitney is dead. This has come about through the appreciation on the part of the public that reliable co-ordinated railway and bus operation is preferable to haphazard service from ever-changing operators. Local ouster legislation was passed wherever required to accomplish this end.

Financial results have been most encouraging. Since the present policies were inaugurated in 1922, the growth of the gross and net earnings has been uninterrupted. Last year, 11,000,000 more revenue passengers

A rapidly growing freight business has been another source of revenue to the company. In 1919 joint tariffs became effective from the Penn-Ohio lines to many points in Ohio, Indiana, Michigan and Pennsylvania. Delivery is made in from one to three nights via the electric lines as compared with steam railroad deliveries varying between three nights and three weeks. This freight service has grown so rapidly that it has already become necessary to plan a Youngstown terminal and warehouse larger than the one built in November, 1924, covering almost an entire city block. Ten new C.E.R.A. standard freight cars were ordered in 1925. Special



White Lines Painted on the Pavement to Indicate the Car Swing on Curves Have Been Helpful in Reducing Accidents

Digitized by Google

pains have been taken in preparing and distributing a "Shippers' Handy Tariff Guide." This is a looseleaf publication with a complete index of the freight stations reached, a map of the line and the classification of commodities and rates.

Substantial Savings Effected

UNDER the heading of "Economies which have been introduced in operation resulting from original ideas as well as the extent to which the company has taken advantage of new developments in operating and maintenance practice and equipment originating with others," the brief submitted by the Pennsylvania-Ohio Electric Company presents an imposing list of accomplishments. The sound merchandising policies which have resulted in more revenue have also made possible material economies. These savings result from the fact that all cars, buses and coaches are one-man operated and that the new cars due to their lighter weight and modern equipment require less power and less maintenance.

One-man operation is now 100 per cent complete on the Pennsylvania-Ohio system. The chronology of the change was as follows:

1919—One-man operation begun in Newcastle city.

1920—Change-over completed in Newcastle and Sharon.

1923—One-man interurban operation begun except on Girard line.

1924—Change-over of interurban operation completed.

1925—One-man operation everywhere except Youngstown.

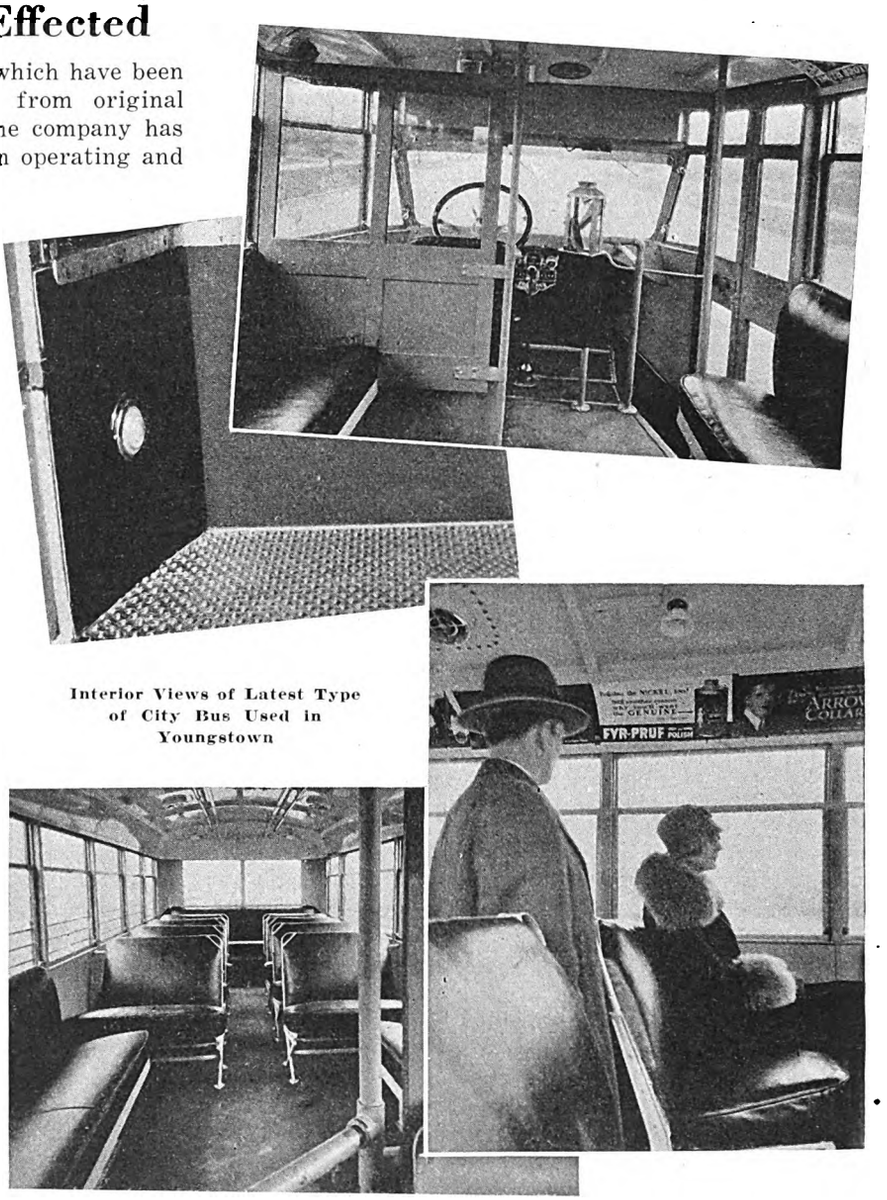
1926—100 per cent one-man operation including Youngstown.

On the railway lines outside of Youngstown the effect of one-man operation has been to reduce the number of trainmen from 228 in 1920 to 159 in 1925. Man-hours were reduced from 818,502 to 474,646. Total wages fell from $578,052 to $294,168, while the average yearly wage per trainman increased from $1,596 in 1924 to $1,850 in 1925. All changes were made in the course of the normal turnover of platform men except that some men on the Trumbull division were furloughed without loss of seniority or wage rights. Most of them returned again in a few months.

Complete modernization has reduced operating expense per car-mile from 35.6 cents in 1924 to 32.5 cents in 1925. Energy consumption on the new interurban cars in 1925 was 2.76 kw.-hr., a saving of 28 per cent. Upkeep is 51 per cent less and platform wages 15 per cent less, despite the higher wages per man. Comparison of costs for 1922 and 1925 shows a saving of $30,000 in equipment, power and platform labor. On the first five of these cars to be placed in operation the rate of return on the investment was approximately 41 per cent.

Further economies have resulted from the building of a garage with labor-saving machinery for storing and maintaining buses and coaches, from the handling of gasoline in carload quantities, and from the adoption of pyroxyline lacquer for refinishing cars and coaches.

Standardization of bus and coach equipment has resulted in material savings. Revenue and cost figures for various years are given in the following table:



Interior Views of Latest Type of City Bus Used in Youngstown

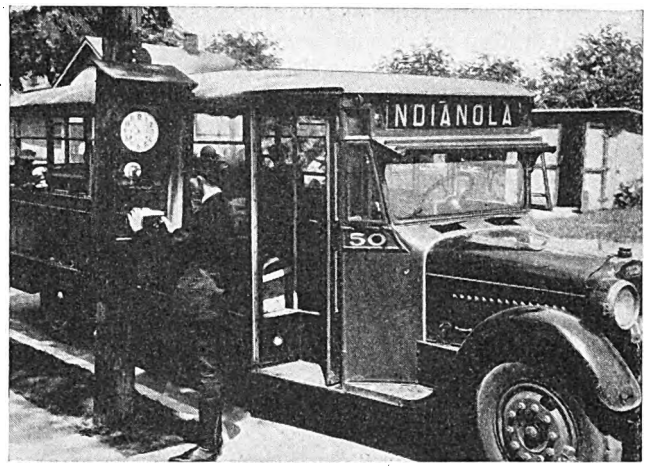
BUS OPERATING DATA—CENTS PER BUS-MILE

Type Service		1922	1923	1924	1925
City	Costs	20.60	24.60	30.20	30.10
	Revenue	25.20	24.90	29.40	29.39
Interurban	Costs	.....	.....	28.22	23.75
	Revenue	.....	.....	30.45	25.15
Tourist Lines	Costs	.....	.....	.....	15.30
	Revenue	.....	.....	.....	14.25

The foregoing table covering operations from September, 1922, to Dec. 31, 1925, shows that the true cost of service per bus-mile in city service was approximately 30 cents after the newness had worn off. In 1924, this figure was 30.2 cents and in 1925, 30.1 cents.

Since Jan. 1, 1926, motor-bus costs have been in accordance with the classification recommended in 1925 by the American Electric Railway Association. Figures

Digitized by Google



Time Clock Used to Check Regularity of Bus Operation in Youngstown

in cents per bus-mile for the first five months of 1926 follow:

January	29.83
February	31.23
March	30.26
April	27.31
May	29.04

As this period included severe winter operation and did not benefit from new and greater capacity equipment at the start, it is expected that the cost for this year will be 1 cent to 2 cents under 1925.

Improvements in Construction

"IMPROVEMENTS in construction which have resulted in reduced first cost and greater reliability of service" have been numerous on the Penn-Ohio System. Original features incorporated in the design of new cars have had an important bearing in reducing costs as well as increasing the attractiveness of the vehicles.

On the new interurban cars every seat is deep cushioned and upholstered in plush. The floor is covered with battleship linoleum easily cleaned, easy to walk on and durable. Not a pipe, bar, rod or cord obstructs the view or irks the eye. The rodless, cordless Ohmer register and table were specially devised for this operation with one man per car and nine fare classifications. On these cars the switches are inclosed in cabinets, as are also the engineer's valve and controller. The rear platform has been left as a spacious lobby. Inclosure of the equipment gives a better appearance and avoids interference by the passengers. Mahogany is used to conform to the general interior trimming.

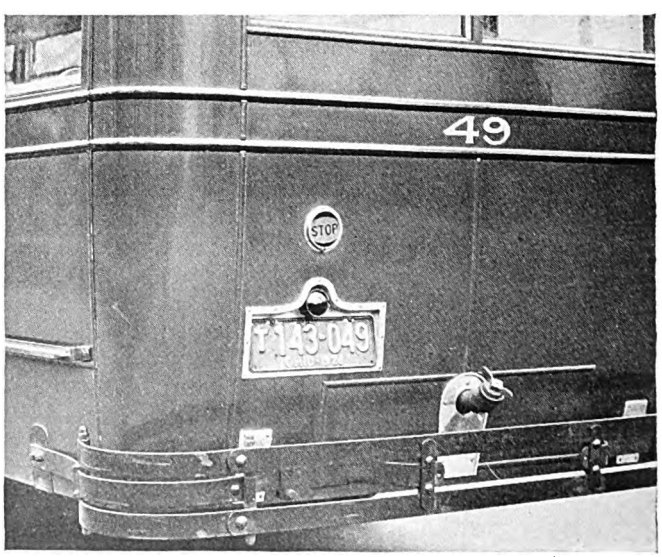
Diffused lighting fixtures give pleasant and effective illumination. Both front and rear vestibules have extra large sash to give the passengers a better view. Pneumatic control permits remote operation of the rear door. A mirror in the operator's vestibule gives a clear view to the rear.

Up-to-date features have been included also on the latest Youngstown city cars. There is a similarly complete absence of cords, rods, bars, piping or exposed apparatus. Rubber flooring is an advance on battleship linoleum in durability, appearance and ease of cleaning. The floor over the motors has a recessed manhole cover which is less conspicuous than a ring. Plate glass sash is framed in narrow fittings to improve the passengers' vision. A new system of lighting with twenty opalescent domes per car was evolved by the company's engineers.

Selective pneumatic control of wide double doors in front as well as at the rear makes it possible for one man to handle the large 64 seat industrial trippers which are used. Additional safety features have been installed on Birney cars purchased several years ago. Peacock hand brakes have been added for emergency use. Box jaws instead of clevices have been installed for the brake rigging to avoid disablement in case a bolt falls out. Steel wheels have replaced the cast iron wheels formerly used. Two home-designed mechanical sanders have been added to supplement the air sander—a special precaution taken because of the heavy grades. Plate glass has been used in the car windows because it is both safer and more attractive than ordinary window glass.

Improvements have been made also in the bus equipment operated. Special features on the new city buses include deeper chassis frame, new radiator suspension, engine with new manifold and heating attachment, chassis with new type rear axles with air brakes, and dual rear tires 34 in. x 7 in. instead of 36 in. x 6 in. for easier riding. A wireglass panel behind the operator saves him from annoyance by passengers. Longitudinal seats at front give passengers easier ingress and egress. Rubber flooring, modern lighting fixtures and ceiling ventilators are used. Wide, deep steel steps with safety tread and step light add to safety. A standing passenger has outside view. Narrow aluminum frame sash gives maximum glass area for vision of seated patron. The rear end has a single recessed panel for stop light, tail light and license plate. The fuel tank is now installed at the rear instead of the side because in this position it is more likely to stay level, to cause less slopping of gasoline and to reduce fire hazard.

On the latest interurban coaches the seating capacity has been increased from 18 to 25 and the length increased from 27 ft. 6 in. to 28 ft. 7 in. The first coach cost $7,000; latest type, $9,000. A change in seating arrangement has eliminated middle doors. Lighting improvements have been worked out by Penn-Ohio engineers in co-operation with Ivanhoe-Regent plant of General Electric Company. Lamps of 21 cp. in Miller opalescent domes are used. Seats are double, except a five-passenger seat at rear under which the baggage



License Plates of Buses Are Recessed in Rear Panel. Gasoline Tank Has Been Placed to Reduce Fire Hazard

Digitized by Google

compartment is located. The cross seats are 32 in. back to back. All seats are upholstered in grained leather and equipped with air cushions. The driver's seat is also equipped with an air cushion and is at a more comfortable height than in earlier types. The battery is now accessible from inside instead of outside of the coach. A safety light has been added at the entrance step. The cowl has a greater flare because the width has been increased from 7 ft. to 7 ft. 8 in. The windshield is now one piece, narrow vertical louvers at the side serving for ventilation. On the windshield is a spotlight operated from inside the coach. The visor is of metal instead of leather. The sign box is integral with the visor under the roof extension. The destination sign is operated from the inside.

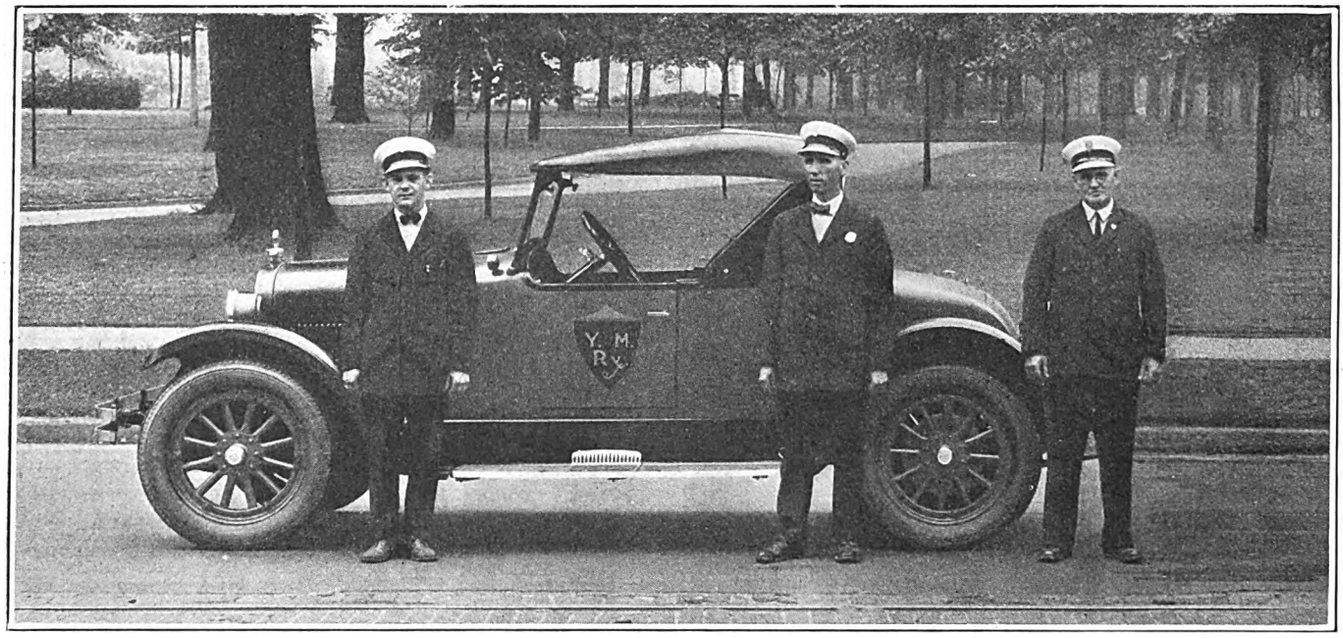
A worthy building has been constructed to house this automotive equipment. The new Youngstown garage, opened early in 1926, has a frontage of 116 ft. and a depth of 262 ft. with a rear extension running 172 ft. along a private court. Underground storage tanks are provided having a capacity of 100,000 gal. of gasoline and 20,000 gal. of oil. Their large capacity permits the company to enjoy tank car prices, sometimes 7 cents under the retail and 4 cents under the tank-wagon price in the same territory. The temperature of the brick and concrete oil chamber is maintained in winter at a minimum of 60 deg. F. for easy handling and efficient use. Electric centrifugal pumps deliver both gasoline and oil to the service station at the rear of the storage and inspection area.

Economies have been accomplished in the purchase and delivery of fuel. Tank cars deliver gasoline and oil directly to the underground tanks at the rear of the garage. A tank truck of original design is used to distribute gasoline and oil to outside garages and service stations. It has two 250-gal. gasoline compartments and one 350-gal. oil compartment. The chamber at the back is used for hose connections and miscellaneous gear.

Vehicles enter the garage via a rear court and leave via electro-pneumatically operated doors on the side. The total area is 40,700 sq.ft., of which 30,000 sq.ft. is for storage and inspection. Lamps of 200 watt capacity with enameled steel dome reflectors give 5 ft. candles intensity of illumination at the floor level. The Curtis "Air Mist" system cleanses vehicles quickly and effectively. Two "service station" pits are equipped for high pressure oiling and greasing.

During 1925, after two years of tests with a dozen kinds of lacquer, 40 per cent of the cars and 70 per cent of the buses were lacquered in accord with the chrome orange color scheme standard for Youngstown equipment. Lacquering has cut the shop time for two men from six days of the paint-varnish-enamel era to two days. The saving in cost of material is about 40 per cent. Because of the smoke and sulphur laden air of Youngstown vehicles are relacquered once a year. As this can be carried out within eight hours, a car can be put through practically between the peaks of the same day. Lacquering can be done in the open in bright sunshine. Aluminum panels have been found superior to steel for bus upkeep.

During 1925 the company completed the installation of automatic reclosing circuit breakers to tie together sections of the railway feeder distribution system. In this way loads have been balanced to better advantage and the installation of additional copper has been avoided.



One of the Service Automobiles Used by Inspectors Supervising Intercity Coach Operation

For use in the Trumbull, Sharon and New Castle districts, three line trucks were bought during 1925 to replace line cars. Aside from their greater flexibility, line trucks are cheaper to run because one driver takes the place of two trainmen. The New Castle interurban, which has much right-of-way distant from the highway, is the only division now left with a line car. The widest efficient use is made of automotive service equipment, whether in the transportation or engineering department. The automotive fleet includes trucks for slag, paving, cement, ties, rail, etc.; also welding trucks in place of welding trailers.

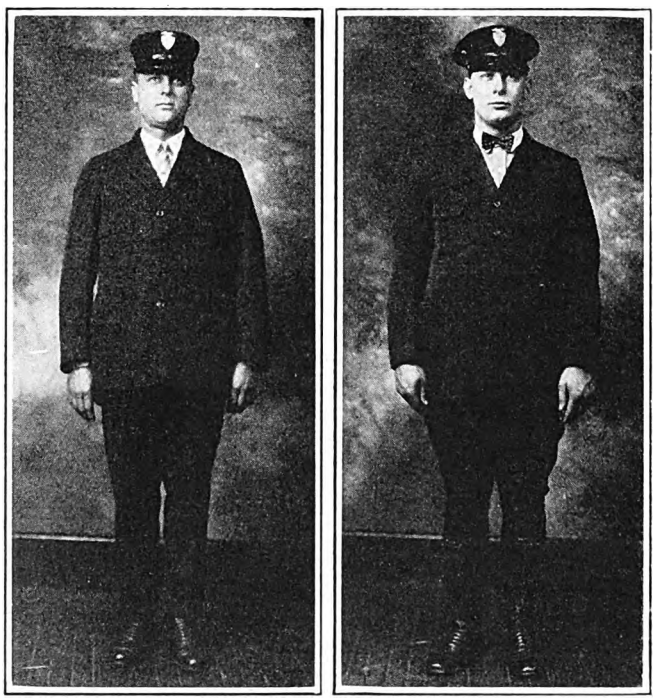
Modern light-weight cars permit savings in track construction. A 134-lb. Trilby section was used in Youngstown track rebuilt in 1916. This track was thermit-welded and laid on International steel twin ties spaced 6-ft. centers and laid in 7-in. concrete with 11 in. under the ties.

Digitized by Google

With the general adoption of light-weight cars it became possible to continue this long life construction, using only a 103-lb. section with but 4-in. concrete under the steel ties. The 1916 type of construction would cost today $68,600 per single track mile. The present type cost $55,400 per single track mile—a saving of $13,200 due to the use of lighter cars, although the new track has the additional cost of "Elastite" as a sound deadener. An index to the permanence of the track and its smooth riding qualities is afforded by the fact that during 1925 there were only seven breaks in 1,800 thermit welds.

Substantial Reduction in the Number of Accidents

"Particular success in conducting a safety program and actually reducing the number and seriousness of accidents" has been attained by the Pennsylvania-Ohio



Snappy Whipcord Uniforms Worn by Transportation Employees of the Penn-Ohio Company

Electric Company. Every passenger car in operation on the system is equipped completely with standard safety devices. Part of the credit for the reduction of accidents can be attributed to this fact and part to the closer inspection and better training of operators.

This management has engaged in safety work of an intensive character since 1920. The safety organization consists of a central safety committee, with representatives from every department, under the chairmanship of the general manager, together with intermediate safety committees within each department. All safety work is done through such committees in close co-operation with specialists of the Bureau of Safety of Chicago.

Practical suggestions for greater safety are solicited from all sources. In 1925 such suggestions numbered 215. In addition to its internal safety work, the company, as such, and its employees take an active part in all public safety organizations and movements, its general manager being president of the Youngstown branch of the National Safety Council.

Through improvement in equipment and plans for consistently maintaining the enthusiasm of the personnel, accidents per 100,000 car-miles on lines outside Youngstown declined from 36.6 in 1920 to 23.6 in 1924 and 22.6 in 1925. Accidents of all kinds, whether due to company or outside causes, declined from 1,768 in 1920 to 953 in 1924 and 887 in 1925.

There were fewer accidents with 100 per cent one-man operation in 1925 than with the two-man operation in 1920. Account 92, "Injuries and Damages," declined from 12.57 per cent of gross in 1920 to 7.62 per cent in 1924 and then to 3.54 per cent in 1925.

In Youngstown the use of modern cars having uniform equipment has been an important factor in accident prevention. Beginning in 1925, the original green body color of the cars was changed to chrome orange for greater conspicuousness in a hazy atmosphere. Cars are made still more visible by painting the bumper white. Equipment of all cars with air operated Folberth sash cleaners or squeegees gives the operator a clear view automatically.

In December, 1922, the Youngstown Municipal Railway began to segregate "chargeable" accidents. Accidents were cut from 682 in 1923 to 452 in 1925, or 34 per cent. At the same time, accidents beyond the company's control decreased only from 1,541 in 1923 to 1,516 in 1925.

ACCIDENT REDUCTION RECORD
YOUNGSTOWN MUNICIPAL RAILWAY

Accidents	1923	1924	1925
Reported	2,223	2,017	1,968
Chargeable to railway	682	497	452
Per 1,000 car miles	0.54	0.50	0.49
Per 100,000 passengers	8.68	8.12	8.11

The city of Youngstown and the company shared in the purchase of a $350 machine which is used to paint "car swing," "safety zone" and other markings on street paving. The painting is done by city workers, with a railway representative on hand, when necessary. While the work is being done, space is kept clear by means of red flags.

Red Cross first aid instructions have been added to the other safety work. In all 642 employees have received instruction. While this work has been carried on only since the early part of 1926 there have been at least two cases where the knowledge of first aid on the part of the employee has resulted in the saving of life.

Safety meetings are held in the schools and for the public. In 1925 as many as 1,200 persons attended such a rally at Warren, which was held directly under the auspices of the safety organization of the company. This meeting resulted in the organization of a community safety council.

Accident prevention contests were started in December, 1922. The car men were divided into four groups, and at a later date the bus men were similarly divided. The winning team each month is entertained at a dinner to which prominent citizens or noted workers in accident prevention are guests and speakers. The claim department acts as umpire in passing on all accident reports by team members and only those accidents which could have been prevented through the vigilance of the car or bus men involved, are charged to their respective teams. The first full year of the competition, 1923, the average monthly total of accidents charged to the car men's teams was 57. In 1924 the number was reduced to 41 and in 1925 was further reduced to 37.

Digitized by Google

A bonus system rewarding car men and bus men as individuals has been in effect since Jan. 1, 1924. One dollar is paid for the first month without an accident, two dollars for the second successive month and $3 for each successive subsequent month without an accident. During 1925, the car men earned $4,423 and the bus men $1,191 in accident prevention bonuses.

The three operating divisions outside of Youngstown also participate in safety contests. On each division, both the trainmen and bus drivers are included in the teams. However, on account of the fact that the divisions vary considerably in car mileage operated, the contest is waged, not on the basis of the number of accidents, but upon the mileage operated per accident.

The first contest of this year, ended Feb. 28, 1926, was won by the Newcastle division with a record of 14,394 miles per chargeable accident. The second contest was won by the Sharon division with a record of 39,456 miles per chargeable accident. The third contest was won by the Sharon division with a record of 44,469 miles per chargeable accident.

Excellent Relations Enjoyed with Employees

OUTSTANDING accomplishments in the development of good relations between management and employees are claimed for the Pennsylvania-Ohio Electric Company in the brief. All the trolley and city bus operators of this property are members of the Amalgamated Association. Although operating in a highly industrialized area, subject to changes in the demand for high wage workers, this management has a record of twenty years of harmony with its employees, all negotiations being conducted directly between the management and committees of employees.

Facts are given to the men on company finance, on the local wage and business situation, on the cost-of-living indices, etc., so that the men negotiate upon the same economic basis as the management. One proof of the reasonable attitude of the trainmen is that they relinquished the "two-men-per-vehicle" clause when shown that one-man operation was economically necessary. They have co-operated willingly in the use of power-checking watt-hour meters and have approved special awards for freedom from accidents.

One aid to the amicable settlement of all questions between management and men has been an unbroken agreement for the past six years that no statement regarding matters under discussion will be given to the press by either company officials or men until negotiations are ended or suspended. This has been an excellent preventive of public agitations and publicity, particularly concerning wage matters.

Trainmen no longer wear conspicuous badge numbers on their caps. The small numerals are on the back of the badge, unseen by the public. This step toward humanizing the platform job was made for the reason that complaints had diminished to the point where such iden-

Typical Examples of Commendatory Letters Received by the P-O Management

Erie Railroad Company

MEADVILLE, PA., Nov. 20, 1925.

PENNA. & OHIO ELECTRIC COMPANY,
Youngstown, Ohio.

Gentlemen:

A case has just come to my attention where your motorman, Mr. F. A. Blott, running between Warren and Leavittsburg, noted brake sticking and fire flying on our second 88 Engine 4126. Upon arrival at Leavittsburg he advised our operator, and arrangements were made to stop the train and get the brakes released. His prompt action may have prevented serious trouble, and I feel that his action is highly commendatory.

I would be pleased if you would advise him of our appreciation of this service and in case you can consistently do so, if you would make proper record thereof on his service papers.

Yours very truly,
A. L. KLINE,
Superintendent.

The Youngstown Telegram

YOUNGSTOWN, OHIO, July 28, 1925.

MR. C. S. MACCALLA,
Vice-President & General Manager,
The Pennsylvania-Ohio Electric Co.,
Youngstown, Ohio.

Dear Mr. MacCalla:

For several weeks I have been planning to write you to compliment your company on its policy of free and frank discussion with newspaper men of all subjects pertaining to the welfare of citizens in general.

Always a believer in free discussion of all subjects, I feel sure that this attitude on your part has done much to improve the relations between your company and the general public.

In this connection it would be only fair for me to add that information coming to us through your publicity department has not only been fair but thoroughly reliable.

Very truly yours,
W. L. STURDEVANT,
Editor *The Youngstown Telegram.*

---

51 Willis Avenue,
Youngstown, Ohio.

MR. R. N. GRAHAM,
Mgr. P. & O. Electric Co.

Dear Sir:

Wish to extend my deep appreciation in recovering diamond lost from my ring on Hillman bus No. 32 last Thursday night due entirely to alertness and willingness of one of your inspectors by name of James Fire, who followed and reached bus before it left termination, took friend and myself with him and found diamond.

Surely having such efficient employees is a fine recommendation for your company.

Very truly yours,
MRS. S. MCLAUGHLIN.

MR. JOHN HARVEY,
Youngstown Municipal Railway,
City.

Dear Sir:

Last evening I boarded a Mahoning Avenue car in charge of operator No. 348 and while a passenger on this car I had the pleasure of witnessing an act of courtesy which was indeed worthy of commendation. I assure you that this deed did not pass unnoticed by any of the passengers on this car.

When approaching Deed Street this operator received a signal from an old man who wished to board this car. Operator No. 348 stopped his car and alighted to assist this old man in every possible manner. He escorted him into the car and saw that he was seated before he returned to the front of the car.

The old gentleman left the car at Hazel Street and again this operator left the front of the car and went back to where he was seated and assisted him to the front of the car. The operator then left his car and lifted this old gentlemen from same to the street and escorted him through the traffic and did not return to his car until the old gentleman was safely on the sidewalk.

Trusting that I may have the pleasure of again riding behind operators of this kind, I beg to remain,

Very truly yours,
S. J. HOLT,
1651 Wellington Avenue.

Digitized by Google

tification was no longer needed. On the other hand, the name of the operator appears in his vehicle.

Early in 1926 the company took another step forward in raising the morale of all its bus and car men by presenting the newly adopted whipcord uniform to every operator, inspector and supervisor. Forty-two trainmen had paid for such uniforms, after seeing a sample, before they knew they would be reimbursed. Furthermore, a $1,000 life insurance policy was issued free and without physical examination to every employee.

The good teamwork between the company and the men is well exemplified by the fact that there exists among the company's men one full military band, three orchestras, basketball, bowling and baseball teams. Sixteen per cent of the trainmen belong to the Twenty-Year Club founded in 1925.

Noteworthy Accomplishment in Financing

THE securities of the company cover its combined light and transportation properties. Since 1917 the company has been selling its securities on the customer-ownership basis to the public through its employees and to the employees themselves, each offering resulting in a substantial over-sale. At least 75 per cent of railway employees are stockholders in the company.

The localities embraced by the Penn-Ohio System being essentially industrial, the principal product being steel and steel products, it is only natural that the public has been educated over a period of years in trading in local industrial securities, the public utilities having been considered a relatively unimportant factor. During the past year, however, the securities of the company have been established as one of the most reliable investments. Through the agencies of the securities department, 24,593 shares of $100 par value have been sold through 7,398 transactions to 2,695 customers and 1,035 employees.

A bulletin, the P-O Investors' News, issued monthly to stockholders, acquaints them with interesting and intimate affairs of the company, emphasizing its activities and relations to civic development, new business items stressing the part played as a public service organization in industrial achievements and presenting articles dealing with the affairs of the light and power industry. This bulletin is the medium for offering the industry's news on political questions and for spreading information rather than serving as an advertising medium.

The experience of employees gained in stock selling campaigns proved valuable in 1924 when it was necessary to purchase easements for a 132,000-volt transmission line between Toronto, Ohio and Youngstown. To avoid excessive prices, plans were made for a surprise attack *en masse*. First an airplane map of the entire district was made. On this every piece of property involved was plotted in relation to the course of the right-of-way. These maps were suitably subdivided for the instruction of, and use by, the squads assigned to each portion of the route. Each captain and his men knew exactly what they were to do at the zero hour when the drive for options was started simultaneously over the entire 40 miles. So effective was this mass attack that 93 per cent of the easements were obtained in two days with no further work than the cash closing by the right-of-way department. Among the participants in this drive were the manager of railways, three railway superintendents, a machine shop foreman and almost a score of railway inspectors and platform men—all of whom were chosen because stock-selling campaigns had developed the fact that they were salesmen.

Success Has Rewarded Company's Efforts

Adoption and consistent carrying forward of a progressive policy of efficient service and selling that service to the people is thus the basis of the claims made by the Pennsylvania-Ohio Electric Company in its brief. This policy has recognized the fact that the private automobile is the real competitor of public transportation companies and that public transportation must be conducted with a view to approximating the comfort and convenience of the private automobile, resulting in the necessity for rehabilitated track, new cars, high standards of maintenance and cleanliness, improved appearance and a higher standard of courtesy and efficiency on the part of all employees. Increased revenue has rewarded its efforts along these lines. Frankness in dealing with the public through its representatives in all the company's affairs and problems has enabled the company to enjoy pleasant relations in all communities through which it operates. Truthfulness and impartiality in dealing with the press have won the confidence and good will of all the newspapers in the district regardless of their political affiliations or corporation policies. A continuous and intensive safety program has materially reduced the number of accidents. Establishment of pleasant relations with its employees has avoided labor trouble and secured the hearty co-operation of all of the men.

Handling Accident Claims and Discouraging Litigation

Various Methods of Doing This Were Recommended by Speakers at Monday's Session of the Claims Association—Thursday Morning Meeting Was Devoted Largely to Discussions of Claims-Medical Questions

THE program of the Claims Association at the Cleveland convention was divided into three parts. Monday afternoon was devoted primarily to a discussion of methods of handling accident claims and discouraging accident litigation. The proceedings on Tuesday afternoon are represented in the joint meeting of the Claims Association and the Transportation & Traffic Association, reported in last week's issue. On Thursday morning the Claims Association devoted itself to a consideration of medical and surgical matters.

About 75 claim agents, attorneys and adjusters and safety managers were present at the meeting on Monday afternoon to hear the one address and four papers scheduled. The discussion was very active and presented views on all sides of the subject by delegates from all parts of the country.

J. H. HANDLON
President Claims Association, 1925-1926

The close connection of the work of the claims department and accident prevention was emphasized in an address by Charles E. Scott, president National Safety Council, Chicago. Mr. Scott pointed out the need in accident prevention for the adoption of a definite systematic plan, whether the company was large or small. Any plan lacking definiteness, orderly procedure, continuity or that close amalgamation by which it is sure to become a part of operation, he said, is sure to give disappointing results and ultimate failure. An essential feature of such a plan is the education of the employees to safety methods. Some electric railways tend to over-concentrate the efforts of safety organizations on the education of the public.

The organization of public opinion in America toward the reduction of accidents is of comparatively recent development. It was in 1913 that the National Safety Council was organized in the interest of public safety. It has two reasons for its existence. One is everlastingly to remind the general public that there is an accident problem in America, and the second is to interpret that problem to the general public. The council is trying to awaken the public to its responsibility for the country's deplorable accident situation and its efforts are not being sufficiently utilized by the transportation interests of the country. The value of the council is too often measured by the direct service it gives to its membership. The broader and better view to take is of its general influence on the public at large and that its purpose is the creation of a strong conviction in the mind of the public that we must be a more careful people. No single industry can conduct a national public movement for greater safety. It can be accomplished only through a national organization with a substantial membership having the cooperation of every industry.

In considering electric railway problems primarily, the speaker urged a separation between the claims department and the safety department, particularly in the larger operating companies. Where the two are combined, he said, there is a natural emphasis on the economic reasons for safety work. There should be a constant close, frank and friendly relationship between the two, but the employees of the company must not be led to believe that the company's interest in safety is wholly mercenary.

METHODS OF DISCOURAGING LITIGATION IN ACCIDENT CLAIMS

A paper on this subject was presented by Trevor C. Neilson, claim agent East St. Louis & Suburban Railway, who laid great emphasis on the need of fairness in dealing with claims. Otherwise, he said, the natural antagonism in every community against a traction company will find outward expressions of antagonism. Each individual claims man should check up his own personality on this matter and then consider that of the other members of the staff. Finally, the claims men should be taught to realize the importance of all employees being on the best of terms with the company's customers. Courteous treatment by car crews, when an accident occurs, may go a long way toward cutting out the aggressive attentions of the "ambulance chaser."

In connection with ambulance chasing, the speaker described a recent experience which was unique. There had been a collision of cars, and while there were no

Digitized by Google

serious injuries, a number of female passengers had been jarred somewhat. Representatives of the company's claims department were looking after the injured, when two representatives of a firm of attorneys were also noticed. One posed as a representative of the railway company and treated the persons affected by the accident with very scant courtesy, so little in fact that he was ordered off the premises. The second "runner" then called on the same persons and found the stage all set for a favorable reception. This enabled him to secure the business on a 50-50 basis.

In conclusion the speaker urged fair treatment of attorneys with claims to present and deprecated attempts to make settlements with claimants behind the backs of their attorneys. Nevertheless, he believed that at the time of the presentation of the claim a railway company is justified in pointing out to the claimant that it is to his or her advantage to save the expense of attorney's fees.

In the discussion following Mr. Neilson's paper, a difference of opinion developed as to whether it was desirable for a representative of the claims department to make an early call on a person injured in an accident. Mr. Funk, Louisville; Mr. Jack, Wilmington, Del.; Mr. Drown, Newark, N. J., and others favored the early call as a natural, humane and courteous act. Mr. Robinson, Cincinnati, and Mr. Muir, Memphis, were inclined to the opposite view, on the ground that the person injured might think the call was made from mercenary motives and primarily to obtain a release. Mr. Schmeiser, Aurora, Ill., said his policy was to have injured person sent to the best hospital and after a day or two for a representative of the claims department to call on the patient to show that the railway company has an interest in his welfare. This visit is followed by additional calls. Mr. Sweeney, Chicago, South Shore & South Bend Railroad, has found the best way to discourage ambulance cases is to advise claimants who insist upon litigation to engage the best lawyer that money can secure.

T. C. NEILSON

W. G. MARSHALL

CHARLES B. SCOTT

AUTOMOBILE CLAIMS AND METHODS OF HANDLING THEM WHEN INSURANCE COMPANIES ARE INVOLVED

A paper on this subject was presented by William G. Marshall, manager of the adjustment department, Pittsburgh Railways, who said that in that city the casualty men have an association which conducts semi-monthly evening conferences. Ten members of the Pittsburgh claims department are affiliated with this association and find that acquaintance with the casualty representatives is of mutual benefit. There is greater disposition to discuss merits of claims before legal action is brought. This applies not only to accidents caused by trolley cars but accidents to them, as where an automobile collides with the rear of a street car. In cases of this kind, insurance carriers are showing noticeable co-operation in the adjustment of the claims of the company against their assured.

In the past few years a limited amount of liability insurance has been placed by the Pittsburgh Railways covering railway, bus and auto operation. In such cases, the company does not tell the claimant simply to see a representative of the insurance company. It offers an explanation as to the coverage, telephones the insurer in the presence of the claimant and, if possible, makes an appointment for him. In claims made by letter, the acknowledgment gives the name and telephone number of the carrier's representative and information that the claimant's letter has been forwarded to the insurance company.

BONUS SYSTEMS

On presentation of the paper by G. T. Hellmuth, claim attorney Chicago, North Shore & Milwaukee Railroad, on "Bonus System—Its Value in Claim Work," a motion was carried that a committee of three be appointed—with Mr. Hellmuth as chairman and the two other members to be from companies having bonus systems—to prepare and print a report for the midwinter meeting of the executive committee, setting forth a bonus system which they recommend. Mr. Hellmuth said that he did not think bonus plans led to an increase of unreported accidents.

BUS ACCIDENTS

After the presentation of Mr. Drown's paper on "Bus Accidents," in reply to an inquiry Mr. Drown said that in his state the courts had ruled that trolley cars were not included in the automobile right-of-way rule in the traffic law, but the courts have not yet decided whether a bus is so included or not, though it has been classed as a "common carrier."

Digitized by Google

Mr. Schmeiser, Aurora, Ill., and Mr. Funk, Louisville, Ky., said that on their properties the bus drivers were men who had been street car operators and this plan of promotion was successful.

President Urges Co-operation

In his presidential address, J. H. Handlon, San Francisco, said that the outstanding feature of the work of the Claims Association this year, to him, had been the increasing interest in accident prevention. At the midwinter meeting of committees held in Indianapolis, it was also quite evident that there existed a keen desire for close co-operation between the transportation and traffic departments and the claims department. "The transportation man," said he, "is not now disposed to look upon the claims man or safety engineer as an interloper who has injected himself without leave into the problems of the transportation department. Today the claims man or safety engineer is an invited guest. His aid is sought and his advice welcomed."

Continuing, President Handlon said, in part:

"With the awakening of the transportation man to the fact that he can utilize to his advantage the resources of the claims or safety man, or both, it has dawned upon him that he has at his command the selection and training of the man-power, and that the most efficient safety device known is a careful man. Impressed with this fact, greater care is being exercised than ever before in hiring trainmen. Haphazard methods of selection have been abandoned, and intelligent, modern ideas of classifying applicants for employment have been substituted for them. Students are placed on probation instead of being accepted as full-fledged employees after having passed one examination. They are taught more, examined oftener and watched closer. There is also a growing tendency to see that company rules are rigidly enforced, especially rules designed to prevent accidents."

Physicians and Surgeons Discuss Operating Problems

Delegates Consider Desirability of Company Doctors Taking Charge of Cases of Injured Patrons, Need for Periodical Examinations of Transportation Employees and Other Live Topics

THURSDAY morning's session of the American Electric Railway Claims Association was set apart almost entirely to the discussion of medical and surgical problems. During this part of the session Dr. Frederick L. Mosser, surgeon Third Avenue Railway System, New York, occupied the chair, and while most of the papers and discussion related to the medical aspects of claims, there was also consideration of the medical care and inspection given by some companies to their employees. The meeting emphasized the constantly increasing importance attached by electric railway companies to their medical departments.

The subject was fittingly introduced by a paper presented by Dr. Mosser himself on "Practical Methods of Obtaining Greater Efficiency from the Medical Departments of the Street Railway Companies." It is published in abstract elsewhere, and the conclusions in the paper were considered seriatim in the discussion.

There was general agreement on the need for the prompt examination by the company's surgeon of persons injured in an accident and a prompt report by him of his findings to the claims department. One of the medical delegates present stressed the importance, in this connection, of the surgeon including in his report any statement made by the claimant of the extent of his injury, quoting the exact words used. Experience in a number of cities has shown, he said, that later, after the claimant has discussed his claim at length with lawyers, he is apt to adopt an exaggerated view of the injury and its effects. Discussion also developed the point that several companies were already following the recommendation of Dr. Mosser to follow up physicians who have testified as to permanent neurasthenia conditions, so that they can be checked up in future cross-examinations, and to keep a card index system for future reference of physicians who have testified at trials. Thus, it was pointed out, a doctor may testify in a case that the plaintiff has received permanent injury and the company has to pay large damages. If the claimant recovers completely later and the same physician appears in court again with a similar statement for another claimant, the earlier case can be cited. In reply to inquiries as to whether evidence of this kind is admissible in court, the point was made that it is, because the previous testimony was an official record. Several delegates took exception to the recommendation in Dr. Mosser's paper that the company doctor should not tell the claimant the results of his investigation of the claimant's injury and should not recommend any special course of treatment. They pointed out that advice from a company physician would often reduce the time of convalescence and avoid the possibility of a lasting injury, where the attending physician lacked skill. Dr. Mosser agreed that in some cases such a course might be desirable and the company doctor should use his judgment, but in general he thought his recommendation should be followed.

Another medical paper to receive extended discussion was that by Dr. Miller of Milwaukee on "Health Service Examination and Organization of a Medical Staff for the Care of Injured Patrons of a Public Utility." It is published in abstract elsewhere in this issue. In addition, Dr. Miller pointed out that while the Milwaukee system covers a wide area, his paper was confined to practice within the city of Milwaukee. The author also explained that the company has a private telephone system of its own with a telephone at practically each street intersection or car intersection so that it is a simple matter for a motorman or conductor to notify the medical department promptly when an accident happens. A feature of Milwaukee practice is for company physicians to take medical charge of persons injured by its cars, if they are willing to accept this service.

The speaker was asked whether the company found this policy less expensive than to pay for the attendance of the family physician and whether the latter did not object to giving up his case to the company. Dr. Miller replied that as the system described had been in use in Milwaukee for a long time, it was very difficult to give comparative figures, with the cost of allowing local physicians to take charge, especially as the company doctors care for employees and their families as well as for injured patrons of the utility, and it would be difficult to segregate their expenses completely. He thought,

Digitized by Google

however, that the cost is less with the present plan. As far as opposition from local doctors is concerned, if the system was to be installed today, there would be obstacles which perhaps could not be overcome. Where a recognized physician has already taken control of the case the company physician makes no attempt even to examine the injured person. An advantage of the plan, not mentioned in the paper, is that the medical department is sometimes asked to give medical aid by patrons injured in accidents which have not been reported by the car crews. In the vast majority of cases there is absolutely no opposition from the medical profession in the city to the present plan.

Physical Examinations of Employees

The discussion on Dr. Sibley's paper on "Observations on the Physical Examination of Electric Railway Employees" centered largely upon his remarks regarding high blood pressure and conditions surrounding the work of trainmen from a health standpoint.

Dr. Sibley pointed out that his experience showed the work of transportation men to be a very healthful one. Many trainmen on the Boston Elevated Railway have told him they have not lost time for any sickness for twenty years or more. He also pointed out that of the men mentioned in his paper as having died as the result of high blood pressure only one died on a car.

Mr. Funk, Louisville, said he could not recall any accident on his system having been caused by a man with high blood pressure, and he thought that an effort to retire perhaps 9 to 10 per cent of the employees because the blood pressure was above a certain amount, though many of the men had been with the company for from twenty to twenty-five years, would affect the morale of the organization.

Another delegate pointed out that while on his property a number of older transportation men had been retired because of unsatisfactory physical conditions, they had not been discharged. They were kept in use in other positions at practically the same rate of wages. Cripples were being used as flagmen. Others were in the tailor shop, pressing uniforms for car operators and bus operators, etc. Even if there was nothing for them to do, the company considered it cheaper to put them on a pension than to have the claims department pay out money for damage claims, but he thought that it is possible always to find something for them to do.

Resolutions Passed and Officers Elected

At the business session at the close of Thursday's meeting resolutions were passed on the death of Past-President Samuel B. Hare and of John J. Stanley, also expressing appreciation of the hospitality of Messrs. Weh and Kubu and other members of the Cleveland Railway claims department.

The nominating committee reported the following officers for the ensuing year:

President—C. B. Proctor, claim agent Memphis Street Railway.

First Vice-President—J. S. Kubu, assistant superintendent accident department, Cleveland Railway.

Second Vice-President—E. L. Lindemuth, manager claims department Wilkes-Barre Railway.

Third Vice-President—L. F. Wynne, general claim agent Georgia Railway & Power Company, Atlanta.

Executive committee—S. J. Herrell, claim agent Knoxville Power & Light Company; W. E. Robinson, claim agent Cincinnati Street Railway; C. E. Redfern, general claim agent United Electric Railway, Providence; B. F. Boynton, claim agent Portland Electric Company, Portland, Ore.; G. T. Hellmuth, convention secretary, claim attorney Chicago, North Shore & Milwaukee Railroad.

They were unanimously elected.

The installation of Mr. Proctor as president for the ensuing year and the presentation by H. K. Bennett of a past-president's badge to Mr. Handlon concluded the session.

Accountants Aid in Constructive Policies

Vital Problems Confronting Many Properties May Be Helped by Scientific Accounting Methods—Publicity Should Be Given to Frank and Open Pictures of the Facts, Holds Accountants' Association—Committees Report on Bus Classification, Freight and Other Problems—L. E. Lippett Elected President

MAKING the work of the accountant essential in solving industry problems was the general theme of the sessions of the Accountants' Association at the Cleveland convention. Despite small attendance the discussions developed in the meetings gave insight into many problems and showed the way to more constructive thinking. As the association standardized electric railway accounting a number of years ago it now has standardized bus accounting. Authority was given the committee on this subject to make definite rulings on cases that may be brought to its attention. Other subjects considered included bus accounting, stores accounting, fare collections, freight accounting, and taxation.

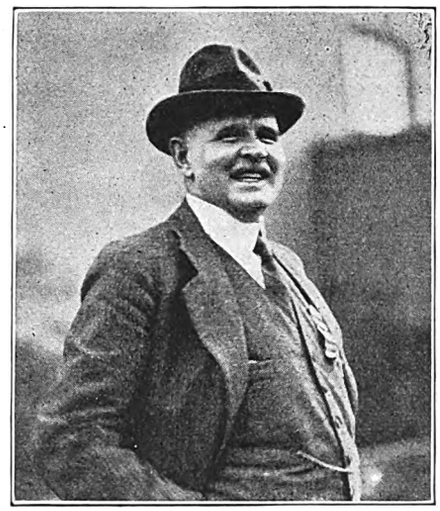
In welcoming the delegates to Cleveland at the opening session held Monday afternoon, Oct. 4, Urban F. von Rosen, accountant for the City Street Railroad Commissioner, pointed out that Cleveland, having lived through or now facing nearly every known problem relating to the accounting for and financing of transportation facilities, forms probably the best laboratory for electric railway accountants in the country.

President John J. Duck, in his formal address, congratulated the association on its accomplishment in bringing about a uniform system of accounts enabling a detailed comparison with other properties. Continuing, Mr. Duck said in part:

"We are now in the midst of what appears to be one of the most important periods of our industry. The period of reconstruction, with its great problems, looms up directly before us. Among the most important are depreciation, either by obsolescence or otherwise; increase in the use of buses, that in some cases may result in the abandonment of trackage; public relations with all that that subject entails, requiring more detailed information from the accounting officer to supply the management or publicity department with the facts to enable it to present to the public the truth of how our industry is burdened with expenses that in these days are unjust, such as paving, maintenance of paving, sprinkling and cleaning of streets, and other public benefits imposing increased taxation upon our industry. These are vital problems confronting many properties whose life and existence may be helped by scientific accounting methods.

"This is a day of publicity. Public confidence can be created and encouraged by giving a frank and open picture of facts, and acquainting the public with some of our unjust burdens. Put these figures and facts in language understood by the public, for the public is not always familiar with the accountant's language.

"We should cultivate suggestions from our assistants and clerks who handle the detail, for improvements and short cuts in compiling our figures. Also a survey should be made of our work to find out if we could make more use of the many mechanical devices used in office work. We may find that we can use more of them to improve our work and at a saving that will well justify their purchase."



JOHN J. DUCK

BUS ACCOUNTING STANDARDIZED

Questions on the classification presented by the committee on bus accounting should be given publicity and official rulings made, according to M. W. Glover, chairman. Everybody knows there are things that are wrong and will have to be changed in time, but in order to get the classification adopted throughout the country it is considered undesirable to make any minor changes at the present time. Companies operating more than 3,000 buses are now using the classification.

The condensed classification submitted by the committee is in no sense a revision of that in the report submitted last year. It is merely a less detailed classification for those motor bus operating companies where the volume of business is not large enough to warrant the use of the full classification.

Adrian Hughes, Jr., pointed out the necessity for cooperation between heads of operating departments and the auditing department. It is essential, he said, not only to get over-all costs correct but to analyze the individual parts of the operation so as to know where we are making money and where we are losing. For this reason he feels that the classification proposed should be used for all bus operations.

After adoption of the report on classification of bus accounts, a motion was adopted giving the committee on bus accounting authority to make official interpretations and rulings on bus accounts, until such time as the Interstate Commerce Commission takes over the matter and is in a position to give rulings.

It was also agreed that any questions and answers arising from interpretations of the accounts should be

Digitized by Google

LESLIE VICKERS, ECONOMIST OF THE A.E.R.A.

published from time to time in ELECTRIC RAILWAY JOURNAL, *Bus Transportation* and *Aera.*

The principal criticisms, according to Mr. Glover, were with respect to division in groups. Certain items which are now in the group of garage expenses were classed as maintenance items, others as transportation items. The groupings were made to agree as nearly as possible with the electric railway classification.

E. A. Tuson, Newark, N. J., explained that three classes of accounts were made to cover maintenance, movement costs and transportation.

A resolution of appreciation of the work of W. F. Ham, a member of the committee on the classification of accounts since its organization in 1897, was passed. Mr. Ham has resigned from the committee because of the press of other duties.

The address of the afternoon was delivered by Carl H. Nau, C.P.A., of Nau, Rusk & Swearingen. He defined the accountant as a very important factor in a company. His work is far more than that of bookkeeping or auditing, as he must be able to plan expenditures and be skilled in the affairs of commerce and finance. In closing, he expressed the debt of his profession to this and similar organizations for the constructive work they have done.

Fare Collection Methods Discussed

Registration in Addition to the Fare Box Is Favored by Accountants—Successful Use of the Weekly and Sunday Pass in Several Cities Described

ON TUESDAY the first part of the afternoon was devoted to a joint session of the Accountants' and Engineering Associations, the subject being depreciation. The principal paper on this subject was presented by Prof. Henry E. Riggs of the University of Michigan. A report of this session appeared in ELECTRIC RAILWAY JOURNAL for Oct. 9, page 618. Following the close of the discussion on Professor Riggs' paper the members of the Accountants' Association resumed their regular session.

A resolution offered by T. B. MacRae upon the death of John J. Stanley was adopted by a rising vote.

The report of the committee on fare collections was presented by its chairman, E. A. Tuson of Newark, N. J. In the ensuing discussion it was pointed out that in all cases registration is recommended in addition to the fare box record. There was some question as to whether all fares should be registered or only those which are not placed in the fare box. Following the discussion the report was adopted as submitted.

O. H. Bernd, Des Moines, told the association about the experience in his city with the weekly and Sunday pass. The Sunday pass was inaugurated on June 4 and was found to give an additional revenue of $300 a Sunday or about 6½ per cent. Special counts made by the conductors showed that the pass holders were taking many more rides than they previously had when paying cash fares.

J. P. Longon, Cincinnati, was also enthusiastic about the use of the pass on his interurban line. The car operators are furnished with green checks, one of which is deposited in the fare box when the passenger displays his pass for fare. This gives a check on the number of rides taken by pass holders.

On the Chicago Rapid Transit Company's lines Mr. MacRae stated that a check is kept by means of Veeder counters which are operated by the station agents.

H. E. Vordermark, Fort Wayne, stated that in his city passes were put on for political reasons some three years ago. The pass created good will with the public and has enabled the company to keep up the rate of cash fare. He is in favor of the pass and would not want to give it up.

The only difficulties that have been found with weekly passes have been due to certain persons obtaining admission to the car and then throwing the pass out of the window for others to ride. The opinion was that this is easily taken care of so as to present no particular difficulty.

Freight Accounting Considered

Use of Three-Part and Five-Part Waybills Discussed at Final Meeting—Resolutions Adopted and Officers Elected for the Ensuing Year

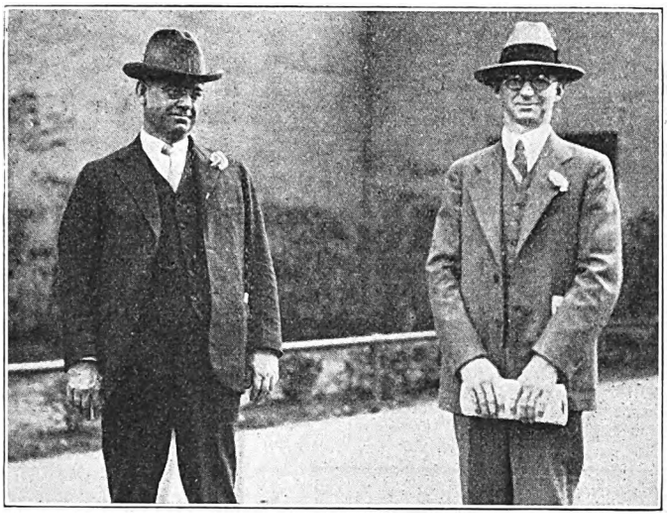
FREIGHT accounting occupied the greater part of the time at the Thursday session. Previous to its presentation the report of the committee representing the Accountants' Association at the annual convention of the National Association of Railroad and Utilities Commissioners, of which W. L. Davis, Allentown, Pa., was chairman, was read and adopted into the record.

The report of the committee on freight accounting was read by the chairman, O. H. Bernd. A lively discussion ensued. W. A. Blasing, Albany, N. Y., stated that the Hudson Valley Railway has changed from the practice of making the waybills at the point of origin while the freight bills were made at destination. The agent at the forwarding point makes out the freight bill and the waybill all in one writing, so the destination agent has no freight bill to make out.

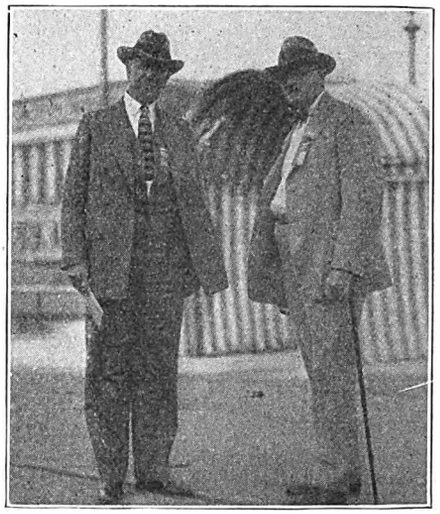
C. A. Dugle, Rushville, Ind., said that some years ago the Central Electric Railway Association adopted the five-part waybill, but it was objected to by some roads doing an interchange business, so that both the five-part and the three-part waybills are now used. O. A. Small, South Bend, is of the opinion that the five-part waybill, including the expense bill for the use of the destination agent, has been almost entirely eliminated. This is because of confusion from having the originating company's imprint on the freight bill.

Walter Shroyer, Anderson, Ind., feels that the American Association can afford to follow the work of the

Digitized by Google



M. R. BOYLAN AND A. J. WARNER



J. P. BARNES AND H. A. NICHOLL

C.E.R.A. and the steam roads. He believes the unit waybill, carrying with it the freight and expense bill, is the one for electric railways. It was the opinion of Mr. MacRae and Mr. Duck that where there is interchange with a steam railroad the electric line will almost be forced to adopt the latter's methods.

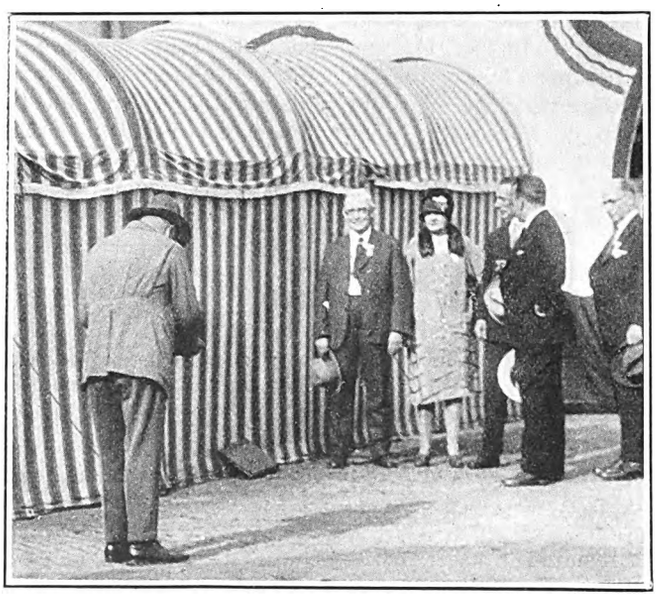
Following the discussion the report was adopted as an interim report.

The report of the committee to review the proceedings of the Accountants' Association was read by its chairman, J. E. Heberle, and adopted without discussion.

A paper on "Transportation and Taxation" was read by A. F. Elkins, manager Peat, Marwick, Mitchell & Company.

Depreciation of amusement park property was brought up for discussion by Mr. Lyons. If the receipts could be classified as auxiliary operating revenues and the expenditures as auxiliary operating expenses he feels it would assist to accomplish the desired result. It was the opinion of those present that the classification must follow the standard set by the state commission, but that in some cases the accounts may be carried in two different forms to cover the item on the company's books and in the commission report.

C. R. Mahan read the report of the resolutions committee in the absence of Chairman May. Appropriate resolutions were adopted acknowledging the efforts of the retiring president, and expressing thanks for his successful administration, for the efforts of the committees, for the speakers, for the technical press, and for the courtesy of Mr. Bernd in acting as convention secretary.



GETTING ILLUSTRATIONS FOR THE DAILY—
C. L. HENRY AND PARTY POSE

OFFICERS ELECTED FOR THE ENSUING YEAR

The committee on nominations, T. P. Kilfoyle, chairman, presented a list of names for the various offices. These were duly elected as follows:

President—L. E. Lippitt, general manager Auburn & Syracuse Electric Railway, Auburn, N. Y.

First Vice-President—T. B. MacRae, general auditor Chicago Rapid Transit Company, Chicago, Ill.

Second Vice-President—O. H. Bernd, secretary Des Moines City Railway, Des Moines, Iowa.

Third Vice-President — Edwin H. Reed, auditor Brooklyn City Railroad, Brooklyn, N. Y.

Secretary-Treasurer—J. W. Welsh, executive secretary American Electric Railway Association, New York City.

Executive Committee—C. E. Yost, auditor and assistant treasurer Wilmington & Philadelphia Traction Company, Wilmington, Del.; J. E. Heberle, assistant to president Capital Traction Company, Washington, D. C.; Edward A. Tuson, general auditor Public Service Railway, Newark, N. J.; C. R. Mahan, auditor Chicago, North Shore & Milwaukee Railroad, Highwood, Ill.

President Lippitt then took the chair, and after pledging his support to the association, called on the other new officers for remarks. After presentation of the past-president's badge to Mr. Duck, the meeting adjourned.

Bonus or Award Systems*

More than Fifty Companies Have Found the Plan Successful in Reducing Accidents, Accident Claims and Unreported Cases —Bonus Plans Offer Inspiration to Continue Safety Work

By **G. T. Hellmuth**
Claims Attorney
Chicago, North Shore & Milwaukee Railroad

AT PRESENT there are at least 50 electric railways in the United States using one variation or another of the bonus plan for the reduction of accidents. The list of users includes companies in very large cities as well as in small communities, for example: Birmingham, Brooklyn, Denver, Los Angeles, Milwaukee, Louisville, St. Louis, Washington, D. C.

G. T. HELLMUTH

So far as I know, there are only two reasons given for their attitude by those who do not believe in the bonus plan. First it is said by some objectors that it is not right in principle to reward men for doing unusually well what they have already been paid to do. Such a position, it seems to me, is equivalent to the argument that one ought always to work in whatever endeavor one is engaged, without any expectation of promotion or increase in pay. Such a situation would deaden for me both initiative and mental activity. In fact, I do not think it would be too broad a statement to say that to work with the definite knowledge that no sort of reward could be expected, either in the shape of a promotion or a pay increase, would inevitably take from any individual the incentive for extra effort. And it is the extra effort, and extra effort only, that will produce results above the average.

The second objection advanced to the use of the plan is that trainmen will attempt to keep their accident records clear by omitting to report some of their accidents. However, this situation, as may be ascertained by examination of some of the plans contained in my files, has been anticipated and successfully handled by a provision that an unreported accident will be scored as two accidents, or demerits, against the individual failing to report. Consequently, so far from producing unreported accidents, the adoption of the plan has had just the opposite effect and has resulted in users of the plan being able to reduce their unreported accidents.

*Abstract of a paper presented at the annual convention of the American Electric Railway Claims Association, Cleveland, Ohio, Oct. 4-8, 1926.

I would like to call attention to one representative plan—the one in use by the Nashville (Tenn.) Railway & Light Company. There the year is divided into three contest periods of four months each and at the beginning of each contest the company sets up a bonus fund of $1,500. The contest consists of a comparison in each four months contest period with the corresponding four months of the previous year. If there are more accidents during any contest period of the current year than there were during the corresponding period of the previous year $20 is deducted from the fund for each accident above last year. For every accident less than the number charged during the same period during the previous year $20 is added by the company to the bonus fund of $1,500, but an unreported accident is counted in getting at the total of the contest period as two accidents. This means that unreported accidents will cut sharply into the fund distributed among all the employees. Consequently, unreported accidents are at a minimum with the Nashville Railway & Light Company.

Brief extracts from comments by officials of some of the railway companies using the bonus plan follow:

We started our bonus system in 1923. . . . Since the system was inaugurated we have had but one blind case. . . . The amount received by each man with a clean record is from $15 to $20, each six months. We feel that the bonus system has resulted beneficially in every way.—BUTTE ELECTRIC RAILWAY, Butte, Mont.

This plan has undoubtedly reduced the number of our accidents and in doing so has reduced our claim costs. . . . You will be surprised how our men covet the Star Class and how hard they strive to reach that goal.—CHARLESTON INTERURBAN RAILROAD, Charleston, W. Va.

In 1919 we began giving a bonus to the platform men and others eligible under the rules governing the bonuses. For the ten years preceding 1918 the average cost of the claim department was 12 per cent of the gross passenger revenue earned. For the years 1919 to 1924 inclusive the cost was 5.72 per cent; for the year 1925, the cost for the first six months was 3.25 per cent. . . . We have been able to reduce our pull-ins from 350 per month to 49 per

Digitized by Google

month.—TENNESSEE ELECTRIC POWER COMPANY, Chattanooga, Tenn.

Our figures show a decrease in accidents from 1923, when the bonus system was started. . . . In the final analysis, to have the men interested in their work is the best accident preventive, and we think this interest is produced by the spirit of competition and personal gain.—CITY RAILWAY, Dayton, Ohio.

We feel that its popularity and benefits (of the bonus system) are constantly increasing, and we have watched the program very carefully and with much interest.—EL PASO ELECTRIC COMPANY, El Paso, Tex.

The Gary Street Railway is sold on the five-day-a-year vacation bonus plan.—GARY STREET RAILWAY, Gary, Ind.

The merit system has succeeded beyond our expectations, and after five years the higher officials of the company, as well as all others in authority, could not be prevailed upon to abandon it, nor would the trainmen themselves give their consent to such a course.—LOS ANGELES RAILWAY, Los Angeles, Cal.

The first year the plan was in operation the men received 1.65 cents per man-hour; the second year 2.60 cents. During that period our total accident costs were reduced from 5.59 per cent to 3.43 per cent of gross. Outstanding liability was reduced 36.8 per cent; number of accidents 34.3 per cent, and cost of repairs to equipment damaged in accidents, 64.6 per cent. The turnover of men during this same period was reduced 63 per cent.—MEMPHIS STREET RAILWAY, Memphis, Tenn.

In 1921 the company expended 9.5 per cent of its gross revenue in settlement of accident claims; in 1922, 6.2 per cent; in 1923, 5.8 per cent, and in 1924, 3.4 per cent. During 1923, the first year of the bonus system, claim costs amounted to $128,638. This amount was reduced to $77,284 in 1924, the latter amount including the bonus awards, which totaled $9,640. . . . We attribute the net savings of $51,354 largely to the bonus system. . . . This company expended 3.2 per cent of its gross revenue in settlement of claims during the six months ended June 30, 1925, as compared with 4.5 per cent of its gross revenue expended for the same purposes during the first six months of 1924.—NASHVILLE RAILWAY & LIGHT COMPANY, Nashville, Tenn.

We feel that the bonus method has increased the number of reported accidents, whereas before the institution of this system there were numerous slight accidents which were considered by the crews too trivial to report.—WEST PENN RAILWAY, Pittsburgh, Pa.

In February, 1921, our company inaugurated its trainmen safety contest. . . . The first statement, or that for the year ended Jan. 31, 1922, and the statement for the second year, or that ended Jan. 31, 1923, follow:

REDUCTION IN PER CENT OVER PREVIOUS YEAR

	First Safety Year	Second Safety Year
Accidents	15.9	24.6
Claims	16.9	24.5
Collisions of cars	48.1	66.7
Personal injuries serious	43.3	42.0
Personal injuries not serious	18.3	24.6
No reports	27.2	47.8
Deaths	40.0	43.7

—WASHINGTON RAILWAY & ELECTRIC COMPANY, Washington, D. C.

The Milwaukee Electric Railway & Light Company has enlarged and added to the scope of its award plan.

Going outside our field we find that prizes are given in Cleveland to careful taxi drivers and that Armour & Company distribute bonuses to "better than average" employees.

While the plan is largely in use, to those of us who do not use it it is a new way of aiding in our work of accident prevention. Accident prevention is the finest and highest development of claim work. We have all preached it; we have all contributed as best we could to it. To be most effective, it must be carried on continuously. When one method becomes stale, fresh inspiration is needed to "carry on." I think that we can obtain it through use of the bonus and award plan.

Bus Accidents

Their Causes and Successful Methods of Prevention*

Last Year Bus Accidents per Million Passengers Were Higher on Public Service than Trolley Car Accidents—Causes of Bus Accidents Analyzed and Remedies Suggested

By **H. V. Drown**

General Claim Agent Public Service Railway and Public Service Transportation Company, Newark, N. J.

H. V. DROWN

IN THE fall of 1923 Public Service decided to go into the bus business and in July, 1926, was operating 833 buses on 101 lines, most of the lines having been formerly operated by so-called independents. The company, however, has discarded most of the buses taken over, as almost every known type and manufacture of bus was included. In their place it has in operation 729 new buses and further replacements will be made when practicable. These buses are operated by the Public Service Transportation Company, but this company is jointly managed and operated with the Public Service Railway.

When confronted with the problem of handling bus accidents, naturally the first questions to arise in one's mind are: What will they amount to? How much work will be involved? My own first thought was they would

*Abstract of a paper presented at the annual convention of the American Electric Railway Claims Association, Cleveland, Ohio, Oct. 4-8, 1926.

Digitized by Google

be less troublesome and expensive than those with cars and that a vehicle not confined to rails would have a distinct advantage. My experience has been that while the bus has the advantages mentioned, it also has disadvantages to be reckoned with. It is a smaller vehicle carrying considerably fewer passengers, and while our last year's operation showed 442.46 accidents per million bus-miles against 444.99 accidents per million car-miles on the railway, there were 82.86 accidents per million passengers for the buses as against 51.91 for the railways.

The Bus More Fragile than the Car

The bus is a much more fragile vehicle than the trolley, and in severe smashes it is more susceptible to being crumpled up, with consequent injurious effects to passengers. While the bus is not held to a fixed course, as is the car on its rails, this advantage is at least partially offset by the fact that in turning from its course the bus may sidewipe other vehicles or otherwise get into collisions with vehicles in congestion. Then the bus with its rubber tires may skid on slippery pavements.

In arriving at conclusions based on our experience for the first full year, claims men will, of course, take into consideration that on a new proposition such as this, all things being equal, claim costs will increase from year to year until a peak is reached, due to the necessary delay in liquidating certain claims, particularly those that have gone to suit. Our expenditures on account of bus accidents for the first year, including everything chargeable to the accident and damage accounts, amounted to 3.17 per cent of the revenue. For the same period the claim cost for Public Service Railway amounted to 5.37 per cent of its revenue. On this showing alone, I would assume that in about four years, when I should expect the bus percentage to hit its peak, it will at least equal and more than likely exceed that of the railway, but I confidently expect that it may be kept lower through the beneficial effect on the accident situation of standardization and improvement of equipment and operation, toward which great strides have already been made. I also look forward to marked improvements in traffic regulations which will materially help.

Our expenditures for the last year amounted to $253,263, divided as follows: For personal injury claims, $93,404; property claims, $78,458; workmen's compensation, $21,885; expenses $59,516. The accompanying table shows the percentage of accidents by classifications to the total number of accidents for both buses and trolleys respectively, coupling like or similar classifications.

Character of Hazard Not Greatly Different

It is apparent from the comparisons in the accompanying table that there is not a great deal of difference between the character of accident hazards arising out of the operation of the two vehicles. Our railway claim men took up the work with practically no difficulty. However, I think there is sufficient difference in the operation to justify separate printed forms and records throughout. We did this of necessity because the bus company was a separate corporation, but even where the business is merged with the railway I should deem it an advantage to keep separate records. There is sufficient difference in the physical layout to warrant it, and the records afford opportunity for profitable study.

As to the cause of bus accidents, there are three general causes, and this statement applies to trolley car accidents too. In the order of their frequency they are, first, negligence on the part of the public; second, negligence on the part of employees, and third, defects in construction and equipment.

To minimize the first, we are dependent on various educational features well worked out through this association and allied bodies, on the enforcement of existing traffic laws and ordinances and on enactment and enforcement of additional regulations when necessary. Where the proposition is large enough to justify it, the services of the National Safety Council will be found well worth while. Probably the greatest opportunity right now for bringing about a reduction of bus accidents lies in the direction of better traffic regulations, particularly in the direction of parking, of exceeding the speed requirements at highway and street intersections and of "keeping the line" in heavy traffic.

CLASSIFICATION OF BUS AND TROLLEY CAR ACCIDENTS IN PERCENTAGES OF TOTAL NUMBER, PUBLIC SERVICE OF NEW JERSEY, YEAR ENDED APRIL 1, 1926

Type of Accident	Bus	Trolley
Collisions with automobiles	49.05	52.81
Boarding and leaving	7.10	7.29
Employee accidents	6.53	3.47
Collisions, bus with bus or car with car	5.20	2.35
Collisions, bus with car or car with bus	3.97	(a) 4.93
Accidents involving injuries to passengers while on bus or car	3.47	3.58
Collisions with fixed objects	2.26	(b)
Pedestrians struck	1.81	2.17
Derailments	(c)	1.18
Collisions with wagons	1.13	1.40
All other accidents	19.48	19.82

(a) Includes collisions of cars with independent buses; (b) no such classification with cars; (c) no such classification with buses.

In minimizing the negligence of the employee, much can be done in the original selection of the man, and then in giving him proper and sufficient training.

Defects in the construction and equipment of buses are, if anything, more harmful in relation to accidents than in the case of trolley cars. It is therefore highly important that the bus be constructed with due regard to safety and maintained in as near a state of perfection as is practicable.

Standard Company Buses Desirable

Standardization is most desirable, so that the operator in shifting from one bus to another will find conditions with which he is familiar, so that when the emergency arises he will not have to stop to think, for that moment, so often fatal. Uniform widths and lengths of buses count much in obviating costly mistakes in judging clearances. The matter of clearance comes into play very frequently, not only in straightaway running, when other objects are being passed, but also when the bus must deviate from its course, particularly in turning to or from the curb, where a miscalculation may result in sidewiping other vehicles.

The steering apparatus merits a lot of attention. Here the trolley car has a great advantage as, confined to its track, it is practically a self-steerer. The brakes should be of the best type and be serviced up to the minute. With traffic already highly congested and still increasing steadily in density and with four-wheel brakes appearing in increasing numbers, even on the cheaper and lighter autos, by means of which they may be stopped in their tracks, so to speak, good braking equipment is increasingly essential.

Greater Efficiency from the Medical Departments*

Suggestions on Ways in Which the Company Doctor or Surgeon Can Be of Greater Help to the Claims Department, Particularly in the Information Given in His Reports

By **Frederick L. Mosser, M.D.**
Surgeon Third Avenue Railway, New York

PRACTICAL methods which will produce greater efficiency from the medical departments can be obtained in two ways: (1) The medical examiner can select for employment the standard, healthy individual, and (2) the railway surgeons can render to their claim agent or legal department, instructive, intelligent and helpful reports, covering their examinations of those individuals who have been injured in accidents. It is my intention to address you mostly on the latter subject. I shall not dwell long upon the former, except to say that the examination of a prospective employee should be undertaken in a regular, systematic way. In this connection, several points stand out as prevailing topics of the times, and may work great harm or great benefits to railway corporations.

F. L. MOSSER, M.D.

As to the harm: I think principally of the danger of impending legislation in many of our states which will permit employees to choose their own physicians in workmen's compensation cases, and it is recommended that proper committees be organized by those interested to work against the passing of such legislation in any of our states.

As to the benefits: (a) The periodical examinations of all employees is recommended by most of our corporation surgeons. (b) The maintenance of competent first-aid captains. Dispensary and hospitalization facilities under the direction of the industrial surgeon are beneficial to those employees who are injured in the discharge of their duties and are facilities of which they are in duty bound to avail themselves. Lastly, under my first group division, let me call your attention to the great necessity of maintaining a well-equipped and efficient welfare department. Such a department can help employees greatly by posting notices warning of impending epidemics and of social and economic disturbances. These warnings not only benefit the employees of street railway companies, but all industrial organizations and corporations.

In the second group division, namely, the relations between the examining surgeon on accident cases and the claim agent and legal departments, let me suggest that one of the most important essentials is the selection of competent medical men, those with considerable experience, especially those who are alert and willing to make the examinations when assigned to them without delay. You will concur with me when I say that to make the examination immediately after the accident is reported, or as soon after the accident as can possibly be arranged, does more to discourage malingering on the part of a claimant and more to keep ambulance chasers away from your cases than anything else with which I am acquainted. The net results to my mind of a quick and concise surgeon's medical report to the claim agent represents 100 per cent efficiency.

How the Surgeon Can Help

Practical help can be further rendered to the claim agent by the examining surgeon in the manner indicated as follows, which I will set forth under suggestions or topics for your consideration and discussion in order to save time. These suggestions or topics I believe will prove instructive and of a material aid to those who are called upon to interpret intelligently the surgeon's report rendered to claim agents.

1. A surgeon's report will help greatly by giving the physical characteristics and make-up of a claimant

*Abstract of a paper presented at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Oct, 4-8, 1926.

Digitized by Google

such as: age, weight, married or single, etc., together with the type of claimant, as if, in your opinion, he is truthful or is inclined to exaggerate or malinger.

2. Before an examination of a claimant, it is well for the surgeon to have the claimant specify to him in the claimant's own words a detailed account of the alleged injury. This helps the surgeon not only in the making of his report but, in the course of his examination, to discover some condition not claimed by the injured, such as hernia. Do not apprise the claimant of your findings by spending too much time over such a fact; but continue with your examination.

3. In cases of fractures or sub-luxations, the surgeon should make clear in his report whether it is a case of bad union; whether there will be a shortening of the limb; whether a limp will persist, or whether the limb, when union is completed, will properly function; state if there is any possibility that the result of any fracture or sub-luxation will interfere with the plaintiff following his regular occupation. This latter is very important. In examining injuries to the spine or sacro-illiac joints the surgeon as a rule finds no objective symptoms. In these cases the surgeon should try to reserve the right to get X-ray pictures, if such a procedure is later approved by the claim agent. In the examination of eyes, ears, nose, throat, etc., or in fact any special condition, it is also advisable for the surgeon to reserve the right to employ the services of a specialist, if necessary, or if thought advisable later on in the case.

4. *Neurasthenia*—After the trial, claimants whom physicians have declared to be permanently neurasthenic should be followed up to learn whether these doctors are in error. This procedure can be used in subsequent cross-examinations of the same doctor. In similar cases a card index record of physicians who have testified at trials has been found to be of great value for references by the legal department in future cases. This, not only refers to neurasthenia cases, but in all permanent injury cases. The surgeon's report of neurasthenia cases could also well include the following:

(a) Does claimant appear of the type that will be susceptible to suggestions?
(b) Is there anything about the physical condition of the claimant that could be a producing cause of neurasthenia?
(c) A concise and complete history of any previous medical or surgical records that can be obtained, is naturally a great assistance at the trial.

5. *Women*—In reporting the examination of women claiming miscarriage the following suggestions will help the claim agent to interpret the surgeon's report:

(a) How long has she been married?
(b) How many children has she had?
(c) Has she ever had any previous miscarriages; if so, at what months?
(d) In your opinion, is an apparent constitutional condition the cause of miscarriage? Where have previous children been born, at home or a hospital? If in a hospital, try and obtain the name of the institution.

6. Where the examiner finds some condition is alleged, that he believes or knows could not be caused by such an accident as a claimant describes, it is very helpful for the surgeon's report to give a statement to that effect, suggesting some authority if possible. For example, where the claimant alleges an assault and claims hernia from a probable kick in the abdomen, it is generally conceded by the authorities, I believe, that violence of that kind cannot cause a hernia unless there is a penetration of the abdominal wall.

7. It is helpful if the surgeon's report states whether he knows the attending physician, and if he does, whether the physician is a man of ability and honesty, and if he would be apt to be persuaded by his feeling toward his patient.

8. The surgeon's report to the claim agent should say whether the claimant's injury has dangerous possibilities. This should be specifically mentioned. It should also give a statement of the alleged injuries which cannot be verified by the surgeon, and whether in the surgeon's opinion the case will be a hard one to dispose of. In the latter, aggravation from old conditions must be thought of and in the examining of pregnant women, whether the surgeon finds any reason that might lead to a miscarriage, such as nervousness, etc. Acquaint your claim agent with these facts.

9. The surgeon's report should give his opinion as to whether the claimant is being properly treated by a competent physician, and if there is any possibility or danger of a bad result therefrom.

10. The examining surgeon should never indicate to the claimant by his actions or verbally what his findings are, nor should he direct or suggest any treatment.

Topics to Be Emphasized

In conclusion, permit me to reiterate the topics which to me seem important.

1. The danger of permitting employees to choose their own physicians in workmen's compensation cases.
2. The advisability of immediate examination after an accident and the examining surgeon's prompt report of such to the claim agent.
3. The following up of physicians who have testified as to permanent neurasthenia conditions, so that they can be checked up in future cross-examinations, and the keeping of card index systems of physicians who have testified at trials for future reference.
4. Concise and intelligent reports should acquaint the claim agent with the proper explanations as to conditions found and the probable results. I speak especially of neurasthenia, fractures and dislocations and information regarding accidents to pregnant women, miscarriages, etc.
5. The surgeon to report about the reliability of a claimant's physician and whether the claimant is receiving proper treatment.

Committee on Medical and Surgical Work

The committee on medical and surgical work of the Claims Association this year consisted of:

Dr. Frederick L. Mosser, chairman, surgeon Third Avenue Railway System, New York, N. Y.

Dr. A. S. Driscoll, railway surgeon Richmond Light & Railroad Company, Staten Island, N. Y.

Dr. C. H. Ernst, surgeon the Wilkes-Barre Railway Corporation, Wilkes-Barre, Pa.

Dr. H. A. MacLean, chief surgeon Virginia Electric & Power Company, Richmond, Va.

Dr. Ernest W. Miller, surgeon the Milwaukee Electric Railway & Light Company, Milwaukee, Wis.

Dr. B. E. Sibley, surgeon Boston Elevated Railway, Boston, Mass.

During the past year the committee has been active in carrying on the work outlined for it by the Claims Association. It has been in communication with many surgeon members, and judging from the many replies received, the committee reported a very general increased interest on the part of every one in the work and a desire to co-operate. The program of the medical and surgical session of the Claims Association at the Cleveland convention on Thursday morning was under the direction of this committee.

The Medical Department and the Injured Patron*

The Proper Kind of Organization and a Well Selected Personnel Are Essential to Success —In Milwaukee Good Results Have Followed Permission to District Physicians to Take Outside Practice

By **Ernest W. Miller, M.D.**
Surgeon Milwaukee Electric Railway & Light Company

SUCCESS of any enterprise in these times depends largely upon the formation of its forces into a well-balanced, smoothly operating organization, with careful selection of its units. This discussion is confined to public utilities in cities of not less than 100,000 people, as it is my belief that a utility medical staff for the care of injured patrons can scarcely be organized with economy in smaller cities. It is also essential that the foundation for such organization be based largely upon the relations between the medical department, the claim department and the public. These relations should be extremely close, yet this relation must never be stressed to the point of spreading even the suggestion that the medical department is an adjunct to, or an accompaniment of, the claim department.

For 30 years it has been the pleasure of the Milwaukee Electric Railway & Light Company to render medical and surgical care to a large majority of patrons injured on its lines. Institution of such medical service at this particular time would undoubtedly meet with many obstacles unheard of 30 years ago.

The plan which many public utilities have of engaging medical men to make examinations of injured patrons immediately and pass them on to some other physician for treatment, can in most cases meet with but indifferent results at the best.

The initial step in an organization of this character is proper selection of a head or chief. It then remains for the head to select such associates as may be qualified for this particular kind of work.

As years go by, I am more convinced that to serve the patrons of a public utility properly, the medical man must be born, not made. It requires men with a broad view of life; men with more than ordinary tact and diplomacy. During the past fifteen years, the Milwaukee Electric Railway & Light Company has found that only about 50 per cent of the medical men who apply for positions on our staff qualify to carry the work to a successful conclusion.

The chief surgeon or head, having selected carefully the personnel of his department, must outline the most economical distribution of duties. The division of our city into eight districts has made much improvement in the handling of injured patrons. Primarily there is a smaller territory for the physician to cover; he can arrive at the scene of an accident with no loss of time,

*Abstract of a paper presented at the annual convention of the American Electric Railway Claims Association, Cleveland, Ohio, Oct. 4-8, 1926.

E. W. MILLER, M.D.

and in the course of a few years he can extend his acquaintance within the district in which his work is confined. The medical department of our utility cares for about 4,000 injured patients a year, which is something like 90 or 95 per cent of all those injured.

The physicians selected in these various districts, while on the payroll of our company, are not full-time employees. They are obligated to carry on our work at all times, but in addition are permitted to extend their private practices. This removes much of the stigma which in the past has befallen the title of "company doctor" or "company physician." Indeed, now it quite frequently happens that the injured patron has been for some time a personal patient of the doctor in question.

ALSO ATTEND EMPLOYEES AND THEIR FAMILIES

The work of our district physicians has been further augmented by the rendering of medical and obstetrical care to employees of our company and their families within the districts in which each physician resides. The medical service is primarily for the benefit of the employees and their families, but secondarily it has the advantage that the satisfactory medical care given to the employees and their families by these district physicians spreads further the favorable contact of the physician. The medical care of employees and their families is organized under and paid for by the Employes Mutual Benefit Association. The combined remuneration for the care of injured patrons and medical service to employees and their families is sufficient to make possible employment of well-trained and carefully selected medical men.

Each district is equipped with a surgeon's office at its carhouses and other properties, so that the district physician may remove his patient from the scene of accident to one of these offices for first-aid treatment. In case an accident happens near one of these offices, the motorman or conductor almost without fail will transport the injured person to these localities, where, in

Digitized by Google

many instances, the physician is awaiting their arrival, having received notice by telephone of the accident and of the disposition of the injured. The physician in each district is instructed to report immediately to the chief surgeon, or his first assistant, the condition which he finds after the examination of any injured patron. If the condition found is other than a minor one, or one which does not come under the scope of the general practitioner, the case is referred to the chief surgeon, or his first assistant, for subsequent treatment and if hospitalization is necessary, the patient is immediately sent to an institution and cared for at the expense of the company.

Further facilities for caring for patrons and injured employees, and also for medical diagnosis and treatment of employees and their families, are afforded by central offices in the Public Service Building. These offices are equipped with the most modern means for diagnosis and treatment and are centrally located, making them readily available to the entire territory served by our utilities. The executive work of the medical department is carried on in these offices. The office hours are spread over practically the entire day. Regular office hours are held regularly by the district physicians at each of the local district offices further to accommodate the convenience of the employees and their families as well as injured patrons.

Subsequent to the telephone report of the condition found by the district physician, a written report of each injured patron must be in our claim department within 24 hours after the doctor has made his examination. These reports are supplemented from time to time as new conditions may arise, or as progress is noted in the recovery. This enables the claim department to have frequent information as to the possibility of the opportune time for effecting a settlement in the event that immediate settlement is not possible.

Weekly reports are sent to the chief surgeon by each district physician, incorporating the name of the injured patron, the dates of treatment and the progress of the case. These reports may be transmitted to the claim department, giving them a complete survey of the cases for which the medical department is caring. Frequent staff meetings are held for discussion of all cases of injuries to patrons, as well as topics of general interest to the members of the staff. These staff meetings are probably as valuable to the claim department as anything we can do.

Four Advantages Cited

The advantages of an organized medical service, such as I have briefly described, are manifold. First, it gives immediate knowledge of the condition from which the injured patron is suffering. Second, it insures to the injured patron adequate and thorough medical and surgical service, thereby in many instances minimizing the permanent disability which might arise; I could cite a number of cases where claims for personal injury have been reduced thousands of dollars by rehabilitation and reconstruction work necessitated by primary unqualified medical attention. Third, such service establishes a better relation between the public and the utility. Fourth, the complete care of any given case is a marked advantage in the event of litigation. Fifth, organized medical and surgical service effects economies to the public utility.

Physical Examinations of Employees*

Every Uniformed Employee More than 50 Years Old in Boston Is Examined Yearly and the Results with the 900 Men So Tested Last Summer Are Given—High Blood Pressure Considered Most Important Pathological Condition

By **Benjamin E. Sibley, M.D.**
Surgeon Boston Elevated Railway

LAST year at Atlantic City I presented a paper on the "Routine Methods of Physical Examination of Employees." That discussion was based on the examination of 1,200 men during the summer of 1924 and on the physical examinations given to all uniformed men employed by the Boston Elevated Railway, about 28,000 in all. This number includes all car and train operators who have entered the service since 1901. Two years ago, all uniformed employees 50 years of age, or over, were re-examined. Beginning with this year, the company has adopted the policy of examining the men who are 50, or over, every year. We have just completed the physical examination of 900 men ranging in age from 50 to 76 years, and the present discussion is based largely on the conditions found in this group.

After considerable experience in studying the physical condition of street railway employees, I have become a firm believer in the importance of making yearly examinations of the older men. After 50 years of age, the development of changes in arteries, heart and kidneys becomes most important, and there arises the necessity of a change in the personal habits and hygiene of these individuals. This health axiom is well known to many but we are dealing with a class of men who give little thought to personal hygiene and health, until conditions arise which interfere with their work.

Yearly physical examination and advice to these men will do much to prevent and retard the development of those organic changes which appear in this era. Loss of time may be minimized and years of service lengthened.

I have found that periodical examination stimulates the interest of the men, and impresses them with the importance of following the advice given. Without a regular "follow up," the things the doctor said are often forgotten, and nothing is done until some serious condition develops and causes disability.

Each year I find men who have done nothing to remedy the defects found, and they are again impressed

*Abstract of a paper presented at the annual convention of the American Electric Railway Claims Association, Cleveland, Ohio, Oct. 4-8, 1926.

Digitized by Google

with the importance of attending to physical ailments at once. Each year I am also gratified to find an increasing number of men who return with pathological conditions corrected.

In a group of 74 men with blood pressures of 200 or more, 42 per cent were able to get reductions to points below 200. Cases of albumen and sugar in the urine have been cleared up, trusses secured for herniæ, and bad conditions of the teeth remedied. A man this summer proudly displayed a set of artificial teeth which had displaced some very bad ones he had when examined previously. He said that his chronic indigestion had disappeared and he had gained 10 lb. in weight.

The interest and co-operation of these men has been gratifying. Over and over again they tell me that they regard the examination as a good thing. They ask many questions about their condition, and when given a "clean bill of health" are very much pleased. When told of conditions which need attention, they are very willing to do whatever is advised.

Moreover, this spirit of appreciation and co-operation is growing each year. This is true because the men realize that the examination is not a means of finding some reason for laying them off, but rather to keep them in health and on the job longer. Every man is told the results of his examination, and if he needs treatment he is sent to his own physician. He is given a blank form covering heart, urine and blood pressure for his doctor to fill out and return, so that we thus obtain a further observation and check-up on whether medical aid has been sought.

The examination is not a long one. Eyes and ears are tested, and conditions of the teeth, heart, lungs, blood pressure, urine, hernia and varicose veins noted. Men found unsafe to run cars or trains are laid off, and given other work until in better condition. Cases found to be not immediately unfit, but not really good risks, are kept under observation and re-examined at intervals of a few months, and sometimes more often.

The following is a brief review of the results obtained in the 900 men examined during the past summer. The teeth head the list of defects.

Twenty-five per cent showed bad teeth, very many more poor teeth, and most of them showed almost complete neglect of the teeth.

Twenty-one per cent had varicose veins, but in no case were they causing disability.

Sixteen per cent had hernia, most of them wearing trusses.

Three per cent showed some disturbance of the lungs, i.e., bronchial, not tubercular.

Sugar was found in the urine in 2 per cent and albumin in 3 per cent.

Heart trouble was noted in 7½ per cent.

High blood pressure existed in 9 per cent., i.e., blood pressures with systolic readings of 180 or over. This percentage would be higher if the reading abnormal for each individual at his age was tabulated.

Of these hypertension cases, 23 per cent showed pathological heart conditions as well. Four per cent of them showed heart conditions and albumin, and 9 per cent showed albumin with no heart pathology.

In this group, then, we have a considerable number of cases where the high blood pressure is due to sclerotic changes in the arteries, the heart and the kidneys, and these cases will be kept under the most careful observation.

Many in this group, however, owe their hypertension to bad habits of eating and resultant overweight, to excessive use of tobacco, tea and coffee, and can readily be helped. Perhaps it is to this particular group that the yearly examination renders its greatest service, by the prevention of later chronic, incurable organic changes.

The hypertension group, while relatively small, is by its nature the most important. I will return to it later.

The next most important pathological condition is that of the teeth; it is by far the most prevalent condition, and is a factor in causing bad digestion, heart and arterial trouble and rheumatism.

But let us return now to the hypertension group, which furnish the greatest and most imminent threat to the safe operation of cars and trains. This class has become doubly important since so many of the older men, formerly conductors, have now become one-man car operators.

Two years ago we selected 76 men with systolic blood pressures ranging from 200 to 210, 230 and even 250, and with diastolics from 120 to 140. These men have been under treatment by their own doctors and have been tested by me personally at frequent intervals. In two years time, one-fourth or 25 per cent of these men have passed off the scene. Of these men no longer actively employed, 68 per cent have died and the others have been pensioned. In some cases, death was due to "shock" or "heart failure," but other causes, such as carbuncles, pneumonia, appendicitis, etc., were given as the cause.

Whatever the immediate cause, a group which loses 25 per cent of its personnel in two years time, offers a grave risk if employed in operating street railway cars or trains. It is simply a matter of chance whether some of these men die at the front end of a car in motion, or at home.

It is a difficult matter to lay down hard and fast rules about blood pressure limits. The whole picture, including the condition of the heart, kidneys and general health, must be considered. However, as a rough working standard, we have adopted certain arbitrary limits as a guide in these cases. No man with a diastolic pressure of 120 or more is permitted to operate a car or train, even if he seems sound in other respects, and no man with a systolic pressure of 200 or over, unless he has a diastolic pressure below 120, is permitted to operate a car or train. Men with lower readings but with bad heart action or other conditions, may be laid off also.

In determining the fitness of men with hypertension for work, we are laying greater stress on the diastolic than on the systolic pressure. The men who have died have been those with high diastolic readings, while we have a considerable number of men with high systolics and relatively low diastolics who are doing well. None of the high systolic with relatively low diastolic have died.

The cases removed from car or train operating are given other work and not returned to regular duty until their physical condition indicates that they are reasonably safe risks.

I believe that the yearly examination covering an age era when hypertension is to be expected, and a close following up of the cases found, offers us the best safeguard we have in dealing with men who operate street railway cars and trains.

Value and Uses of Medical Testimony*

In Preliminary Investigation, Company Physician's Report Is Sent for Approval or Comment to Attending Physician—In Court Proceedings Medical Testimony Should Be Given in Language Easily Understood by Laymen—Careful Preparation by Trial Attorneys Is Most Essential

By **H. Stuart MacLean, M.D.**
Chief Surgeon Virginia Electric & Power Company
Richmond, Va.

MEDICAL information is essential in the consideration of personal accident claims. This information is to be used under two conditions: In settlement of a claim by compromise or adjustment, and as testimony in trials.

In the first instance this information is of the greatest importance to the claim department, and it should be full, simply stated and given with due regard for probable or possible disagreement, of an honest character from the physician treating the claimant. The methods of obtaining this information vary with different companies, and as these variations are the outcome of long standing local customs it is not possible to adopt a universal plan for obtaining it. Some companies treat or see all injured parties promptly; others have medical investigation of injuries only as claims or other occasion arises, while still others pay no attention to the nature and extent of the injuries as a routine measure.

H. S. MACLEAN, M.D.

In outlining the procedure of the company which I represent, it is not intended to give the impression that we believe our system so much better than others. We have found it to work satisfactorily, showing at least an apparent interest in the injured party and in no small degree facilitating early and prompt settlements. We offer treatment to all injured parties, including hospital attention when necessary, provided they have not called or state that they do not want their own physician. Our doctor makes a prompt report of the nature and extent of the injuries together with a liberal estimate of the probable duration.

Cases treated by company physicians are carefully reported upon when discharged. Those treated by physicians of their own choice are checked by the preliminary report from the company's physician who called immediately after the accident. As the claim comes up for adjustment the name of the attending physician is obtained, also permission for the chief surgeon to call this physician and obtain a report as to the extent of the injuries. This is done promptly, a report of the conversation is written to the claim department and a copy of the report sent to the patient's physician. Accompanying this copy is a letter to the physician asking him to correct any errors or misquoting which may appear in the report.

This plan affords an opportunity for the chief surgeon to "iron out" any differences in diagnosis, prognosis or opinion which may appear between the information we have at hand and the opinion of the physician. By consistent fair dealing with attending physicians we have reached a point where we can almost always get a fair and conservative opinion from the physician and come to a surgical understanding upon which we both practically agree. The influence of this is considerable. In the event of liability it means that the attending physician agrees to physical injuries which the chief surgeon can approve. A report from the chief surgeon uncorrected by the physician means a tacit agreement in the salient points in the report, and if the claimant chooses to refer back to the attending physician the latter has the moral support of an opinion already given with the claimant's consent and will come pretty near "standing pat." The chief surgeon confers frequently with the claim department and interprets the medical reports as nearly as possible in terms of dollars and cents.

In the matter of medical testimony in suits for damages, a different view is held by the writer. The papers in the suit should, of course, include full and accurate information as to the nature and extent of the injury. This is an important factor in considering questions of

*Abstract of a paper presented at the annual convention of the American Electric Railway Claims Association, Cleveland, Ohio, Oct. 4-8, 1926.

Digitized by Google

compromise, and the information must therefore be as accurate as obtainable and in the last analysis should "lean" toward the plaintiff.

Medical Testimony in Court Proceedings

The use of medical information in the court room comes under two heads: favorable and unfavorable statements from plaintiff's physicians.

The average jury is skeptical about medical testimony. The jurymen become listless or indifferent during immaterial medical testimony, particularly when given in the manner common with physicians, that is to say, testimony embellished with long, unintelligible words or statements given without reasonable effort to make them plain to a layman.

If a physician must be put on the stand, impress upon him the desirability of using "words of one syllable," and explaining or defining so that a layman can understand any technical terms for which he can find no fitting substitute. When we enter the trial of a contested case we have the statement of our own physicians and that of the attending physician as already outlined. If these two statements reasonably agree, we consider the medical phase settled. If the plaintiff's physician testifies along the lines of our advices on direct examination, he is thanked, complimented and released. One of the worst things that can be done is to cross-examine a reasonably satisfactory medical witness on some minor aspect of the case. Physicians on the witness stand, when cross-examined, are prone to imagine ulterior motives or veiled reflections upon their ability or judgment, and their reaction may result in some impulsive statement which will be damaging to the case or at least give rise to acrimonious, immaterial discussion. Under such conditions it takes a physician trained in court testimony and a suave lawyer to avoid making a bad impression upon a jury, and then the defendant usually gets the credit for causing it.

When the testimony of a plaintiff's physician is expected to be adverse and not in accordance with the facts as known to the defendant, it becomes necessary to combat him. When occasion arises, this should be done frankly, without any malice or feeling, and thoroughly.

The chief surgeon of the company, if a competent witness, should testify last in order to clear up any obscure points, make plain any technical information, and minimize any suggestion of personalities which may have arisen during the testimony of the other medical witnesses. The chief surgeon who cannot make plain any medical terms or conditions and who cannot abstain from all suggestions of personal feeling in his testimony is a poor man to put on the witness stand.

Expert Testimony as a Last Resort

As for experts, they are good things not to have to use. They should be a last resort, used only when you are convinced the claimant is flagrantly imposing or the claimant's physician is obviously wrong. When an expert is used, it often happens that the greatest value of his testimony is lost by reason of carelessness or insufficient preliminary discussion. He should be chosen not only for his general standing and peculiar knowledge of the matter in controversy, but because he is skilled in making the facts simple and plain. When a case is serious enough to need expert testimony, it is worthy of painstaking preliminary work. All the facts of the case, including any animosity or other unfavorable attitude of the plaintiff's physicians, should be placed before him. Then the questions which he will be asked in court should be considered and answers outlined. After this is done, a careful effort should be made to view the case from the plaintiff's angle and questions on that line asked in order to develop any weak point in the expert's opinion.

Proper Preparation and Presentation Most Desirable

After 25 years experience in giving medical testimony I am forcibly impressed with the frequent lack of proper preparation and presentation of good, sound medical information in such trials. It seems that the following important facts are lost sight of: (1) The jurymen are anxious for plain, straightforward facts which they can readily grasp and apply to the issue. (2) Trial attorneys are too often possessed of only a superficial knowledge of medical facts in general (total ignorance would really serve them better), and they are unable to draw the facts from their own medical witnesses or successfully cross-question an opposing medical witness. (3) Physicians are sent to the stand when the attorneys have no foreknowledge of their testimony other than a brief report on the case or a sentence opinion expressed in a five-minute interview.

If medical testimony is to be used certain considerations should be observed.

1. The facts must be studied and arranged with a view to "getting them across to the jury." Don't give them any facts unless you are going to do it in a way they cannot fail to grasp and apply to the case. Be careful that you do not belittle any ailment testified about unless you can fully establish your contention. Some of the jury may have that very trouble.

2. A trial attorney should have a good working knowledge of the medical facts in a case and be prepared beforehand. A medical advisor seated by the side of an attorney may be helpful in suggesting certain questions at a trial, but it makes a deeper impression on both the jury and medical witnesses if such an adviser neither suggests questions nor is called upon for advice during cross-examination. All these points should be anticipated in preparation for the trial.

3. Spend too much, rather than too little, time learning what your medical witness intends to say may inadvertently say, or might be lead into saying by opposing counsel. In conference, do not take a medical witness' initial statement as final. Approach the point from different angles and with different qualifications. Physicians on the witness stand are prone to accept suggested qualifications or modifications in cleverly worded questions which are made to appear as contradictions and then the witness will become confused or offer a technical explanation. When this happens, "good night" jury.

Above all, make the testimony plain, make it simple, make it brief and make it in a kindly, considerate manner.

To summarize: Medical information is essential and very valuable in the adjustment of claims, and if properly obtained and used is an influential lever in effecting compromises up to the doors of the court room.

In the court room the less it is used, the better. When used it should be simple, direct and well planned in advance.

Accounting and Taxation of the Transportation Line*

Development of Electric Railway Practice from the Inception of the Accountants' Association in 1898 Is Sketched—Appointment of Committee to Act with the Congressional Committee on Internal Revenue Taxation Is Urged

By **Albert F. Elkins**
Manager Peat, Marwick, Mitchell & Company

WITHIN the brief span of 25 years the progress of the electric railroad, and especially the interurban, has been the marvel of the age. Towns, villages and hamlets have been linked together and production and distribution brought to the doors of our great cities of commerce and industry. Truly, the electric railway is an essential factor in our commercial life today, for without transportation facilities there would be no commerce. I have faith in the future of this industry, notwithstanding the recent development of the motor bus, and I predict that the electric railroad will increase and improve with the needs of commerce. We acclaimed the electric railway in the building, and although its natural growth has been hampered, and precautions which would have avoided many difficulties omitted, no modern community would welcome a return to the old order, or be content with limited transportation facilities.

A. F. ELKINS

It has been my privilege to witness the advancement of the accounting department of the electric railroad, which, in the old days, was looked upon as an unproductive and unnecessary adjunct of the business. However, the business executive soon displaced the old-time operator, and the transportation system entered the modern stage of business through the adoption in 1908 of a uniform classification of operating expenses, operating revenues and expenditures for road and equipment.

The first Street Railway Accountants' Association was organized at Cleveland, in March, 1897, and at that time the question of the adoption of a standard system of accounts was considered. At the second convention of the association, in 1898, a standard classification of operating expense accounts was adopted, which called for 39 such accounts in all. That classification, with some minor changes, remained the standard up to 1908.

The first classification was designed for use by street railways primarily, but with the advent of the interurban road it was considered desirable to have a classification which would meet the requirements of all classes of electric roads. Under the able leadership of W. F. Ham, chairman, the second classification was adopted at the Atlantic City convention in 1908. The Uniform System of Accounts for Electric Railways, prescribed by the Interstate Commerce Commission in 1914, superseded the tentative classification of Jan. 1, 1909, and is in effect at the present time. Like the classification for steam roads, prescribed by the commission at the same time, it has stood the test for twelve years, under rapidly changing conditions, and reflects the best thought not only of the accounting officers, but also the executive and operating officials, as well as the state commissions.

In the old days before public regulation, there was, as you know, practically no standard accounting system, and the auditor's position frequently depended on his ability to maintain pleasant relations with the operating department. The published balance sheet and profit and loss statement of the railroad were unknown quantities in those days, but that condition has changed and the confidence of the general public in our public service corporations has been strengthened. Much of the credit for this condition is due the auditor, who is required to keep his accounts in strict accordance with existing laws and regulations, and who

*Abstract of a paper presented at the annual convention of the American Electric Railway Accountants' Association, Cleveland, Ohio, Oct. 4-8, 1926.

Digitized by Google

is held responsible for results in this connection. Ability of the highest type is now required, and the successful auditor necessarily must remain true to conscientious standards under the most trying conditions.

The railroad differs from the ordinary industrial enterprise, in that it has but one product to sell, that of transportation, though it may be, and frequently is, engaged in other lines of activity. Its accounting system is prescribed by the Interstate Commerce Commission and the various state commissions, and uniformity is its keynote. While no system of accounting can be classified as perfect and as representing the last word in accounting detail, it is my opinion that public service accounting combines as nearly as possible all of the elements necessary to a complete system under existing laws and regulations.

The primary object in the mind of the railway accounting officer, of course, has always been to keep his accounts in such a way that the management might profit by this information, but the public nature of the enterprise has demanded publicity.

New Taxes Revolutionized Accounting System

We had only the corporation excise tax law in 1909, which was in effect an income tax, but we were beginning to forecast breakers ahead and lay our lines accordingly. Some of you may recall the so-called "Langdon tax law" of Ohio, a device for obtaining additional revenue, which necessitated a segregation of the accounts of railways as between state and interstate, in order correctly to apply the earnings. The Langdon law really presented the first accounting question of any importance so far as I know, until the enactment of the income tax law of 1913, following the constitutional amendment. This law imposed a tax of 1 per cent on corporations, and removed the $5,000 exemption provided for in the 1909 act.

There followed in quick succession the normal tax law of 1916, which was amended by the act of Oct. 3, 1917, and on the same date the war excess profits tax act was passed. This law, together with the war profits and excess profits tax law of 1918, actually revolutionized the accounting systems of corporations, and in order to meet the requirements of a statute that even experts had difficulty in interpreting, it became necessary to change accounting systems, radically in some instances, to reflect properly the true taxable income. Complexities multiplied, however, in the literal application of the statute to existing conditions, especially with respect to consolidated returns.

In those cases, especially among the railroads and public utility corporations, characterized by frequent changes in corporate ownership, accompanied with more or less complicated financial transactions, involved in organization or reorganization, the problem respecting the determination of invested capital became a real issue, magnified over and over again as other issues came to the front, such as affiliation, natural resources, good will, depreciation and amortization.

The revenue act of 1926, and regulations relating thereto, provide that when the taxpayer has had his "day in court" within the income tax unit, and the commissioner of internal revenue determines there is a deficiency in taxes, a notice of such deficiency is sent to the taxpayer by registered mail. Within 60 days after such notice is mailed the taxpayer may file a petition with the board of tax appeals for a redetermination of such deficiency. Except in those cases where the commissioner is authorized to make jeopardy assessments, the deficiency cannot be assessed within the 60-day period, nor, if the taxpayer has filed a petition with the board, before the decision of the board has become final.

Since the enactment of the sixteenth amendment to the Constitution, authorizing Congress to impose an income tax upon all incomes irrespective of the source from which derived, we have witnessed the enactment of several income tax laws, and with the expenses and obligations of the war, it is not unreasonable to believe that we will have this system of taxation with us for many years, graduated of course with the necessities and economies of the government. Secretary Mellon's argument that reduced rates of taxation would produce more revenue carries much weight in the light of results since the enactment of the revenue act of 1926, and a continuation of prosperous business as a whole will doubtless bring further tax reductions.

A very interesting feature of the revenue act of 1926 is the provision for a joint congressional committee on internal revenue taxation. This committee will, among other things, investigate measures and methods for the simplification of taxes, particularly the income tax. All of our tax laws have been more or less complicated, and every new act will contain many problemes of interpretation and application, but it is recognized that a simple system cannot be devised under present conditions. It is obvious that many difficulties will be encountered in the literal interpretation of the statutes, and I am quite sure this committee will welcome all constructive suggestions, especially from those who must bear the burden of taxation. To this end I recommend for your consideration the appointment of a special committee of this association to co-operate with the joint congressional committee, and suggest ways and means of not only tax simplification but a special form of return suitable for railways.

In closing I want to leave with you this thought: that the chief accounting officer of the railway occupies a more important position of trust than ever before, and that the public service corporation today more nearly approaches the ideal than at any time in American history. Today the progressive manager recognizes that the people have rights that should be respected, and he values the confidence of the people more than he does a franchise. It is up to you, therefore to maintain the highest standards of your profession, to the end that your company may merit the respect and confidence of the public you serve.

S. E. Emmons Misquoted

REMARKS of S. E. Emmons, assistant general manager of the United Railways & Electric Company of Baltimore, before the recent T. & T. meeting at Cleveland were misleading as reported in the Oct. 9 issue of the JOURNAL. On page 622, Mr. Emmons states that 30 new cars were added in Baltimore, which was erroneously reported 130.

The purpose of presenting these figures was to show that there had been a large retirement of the older type of cars, thereby effecting a large operating saving, while at the same time there had been an increase in service (seat-miles) more than meeting the increase in riding.

Retirement of single-truck equipment has been confined to those cars used with two men. Some single-truck cars are still used in one-man operation.

Building Company Esprit de Corps*

No Effective Public Relations Work Can Be Done Unless All Departments Function as a Team—The Purchasing and Storeroom Forces Are of Great Importance Due to Their Contacts

By W. E. Wood
Vice-President Virginia Electric & Power Company, Richmond, Va.

PRIMARILY, employees are working for the success of their company and quite incidentally they are working for the success of their particular department. But whenever, in their desire to obtain departmental efficiency, their enthusiasm leads them to somewhat forget the rest of the company, the company's interest, the thing of prime importance, is not well served.

Happily, in a well synchronized organization, serving the company's interests and perfecting departmental efficiency do not conflict.

W. E. WOOD

The perfect electric railway employee must measure up to the following requirements: (1) He must understand generally the policies and theory of operation of his company; (2) he must possess a detailed knowledge of that particular department with which he is connected; (3) he must earnestly desire to carry out the policies of his superiors; (4) he must stimulate a sincere co-operation between all departments.

Let us discuss briefly in order these four requisites of the perfect employee.

1. Every employee should understand generally the policies and theory on which the operation of his company is based. Unfortunately, far too often the general policies and theories of the company, as a whole, are not made known to the individuals of the purchasing department. And the point I want to emphasize is that in this event, regardless of the fact that the individuals of your department might be the most ingenious, efficient and scientific buyers, storers and distributors of supplies, yet your department, broadly speaking, cannot be rendering the most useful service to your company.

Does every employee thoroughly appreciate and understand that no street railway can continue to succeed unless it can obtain the confidence and good will of the public? If they do, they must recognize that their every contact with the public will have a bearing on the public's attitude toward their company. And, furthermore, if they do not have confidence in, respect for, and sincere good will toward their company and all its other departments, surely they cannot expect these things from the general public.

The only successful public relations department of any transportation company must be composed of the entire personnel of that company. Every member of each department has friends and acquaintances not connected with the company. Company and departmental affairs will almost unconsciously be discussed at times with these individuals. The tone of these discussions has an important bearing on the attitude of these individuals toward the company. If the employee does not understand and believe in the policies and theory of his company, it is obvious what harm is done. A department technically efficient cannot outweigh this harm.

2. Possess a detailed knowledge of that particular department with which he is connected. I need not discuss the necessity for this, as it is the object of the endeavors of your committee. We all know that a purchasing agent does not necessarily have to know how to wind an armature, nor an armature winder how to obtain quotations on armature coils, although both should understand that the company is obliged to render the best possible service at the very lowest consistent cost. Obviously to perform your part of the work, your department must know its part of the business. It is intricate and involved and requires constant thought and study. The saving you can effect by this knowledge can be so great as to reflect itself in our rate of fare, or enhance the possibility of being able to earn a fair return. Intelligence as regards our needs and promptness of delivery reflects itself in the perfection of the service we render.

3. Earnestly desire to carry out the policies and wishes of his superiors. This implies, of course, that the superior officers have plans in operation for keeping the employees informed as to these policies. Too

*Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Oct. 4-8, 1926.

Digitized by Google

often in the past this has not been the case. Where an employee does not know the policies of his company, especially as to the generalities of its daily operation, such as those pertaining to the development of public good will, the use of publicity, the handling of complaints, activity in civic affairs, service extension and expansion, he does not acquire that intimacy with his company which really makes him feel a part of it. The purchasing department employee, with his many contacts, has a wide field for service to his company by putting into practice, and giving expression to, its policies, which, in short, are the morals of the organization and need no further explanation.

4. Stimulate a sincere co-operation between all departments. Some call this *esprit de corps*, but Kipling came down to the level of the average man and gave it a human and understandable term, namely, "the everlasting teamwork of every bloomin' soul." There always is a strong tendency for each department to keep the teamwork within that department and to overlook the importance of synchronizing its work with that of the other departments. To illustrate: where a patron of the railway service meets with discourtesy or is passed up at the corner, the picture that comes to his mind is that of a company with a "don't-give-a-damn" policy. He imagines that the attitude of that one employee in that one department of the company is the spirit of the whole organization. It works the other way also. The impression made by a kind, courteous and "on-the-job" employee reflects favorably on the whole company and not on any particular department.

The purchasing department can be most helpful in the satisfactory operation of a transportation system both by assisting in its economic operation and by assisting the operating departments in doing good work and avoiding delays by keeping available well-balanced supplies of whatever they may want. You say the operating departments fail to foresee their requirements and insinuate responsibility for delays in your department. You will be best serving your company when your department is able to absorb such insinuations without resentment and counter-attack by winning their confidence and co-operation.

There can be no doubt that a well-devised rigid system is necessary for the best operation of your department, yet one with too little flexibility is frequently the cause of ill feeling on the part of the other departments and of those of the public with whom you have to deal. Any system to be devised must contain, as an essential element, what we will call an "understandingly sympathetic flexibility" which those of discernment can readily distinguish from "unwarranted or haphazard flexibility."

The merchants and supply men of any city are by nature interested in the purchasing departments. Do they and all of their employees have a respect for the efficiency, loyalty and fairness of the personnel of your department? Can we count on their unselfish co-operation, which has been induced by this respect of personnel? And are you and your employees so conversant with the company's affairs, needs and aims that you can convince them, who are invariably useful citizens, of the justness of the company's needs? What a wonderful help you can be towards the main objective of the company if by virtue of being in the purchasing and stores department you can contribute so greatly to the company's public good will and success.

Care in Ordering Is Essential*

By **Henry S. Day**
Manager Transportation Division, Westinghouse Electric & Manufacturing Company, Boston, Mass.

HENRY S. DAY

Failure to List Complete Catalog Data in Placing Orders for Parts or Materials Wastes Both Time and Money—Obsolete Catalogs Should Be Destroyed

IT IS a fairly safe statement to make that almost the first inquiry that comes up between the salesman and the purchaser in the average negotiation is, "What is your best delivery?" and very frequently the success of the sale depends on how quick the purchase can be delivered.

If the product being purchased is a stock item, there is no good reason why the interval of time between the closing of the sale and the delivery should be great if the necessary paper work is properly executed, first by the purchaser, and second by the manufacturer.

The same applies to non-stock or special items, with the difference that parts or material that must be manufactured after receipt of the order require more time, and the actual order passes through many more hands.

*Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Oct. 4-8, 1926.

Digitized by Google

It is, of course, assumed that the manufacturer carries a good stock of standard parts and material, and is equipped to manufacture and ship non-stock and special items just as soon as he knows accurately exactly what the purchaser wants, but until the order, correctly written, reaches the warehouse or shop, production or shipment cannot proceed.

Naturally, there are many orders that meet with delay, for which incorrect preparation is not responsible, but there are too many where the delivery would satisfactorily meet requirements if someone along the line had not made an error. With the necessarily complex organization of the average purchaser and manufacturer the path the order follows is long and involves many individuals, and a small mistake in paper work is very often responsible for long and costly delays.

Manufacturers expend large sums each year in trying to supply accurate and up-to-date ordering information, and are constantly issuing new and revised catalogs and descriptive matter. When these are carefully followed, an order is quickly and easily interpreted and generally gets through without unnecessary loss of time. Manufacturers also spend much time and money in the organization of an order department, whose business it is not only to receive and enter orders, but to check all information for possible errors.

When it is considered that a large manufacturer handles a great diversity of parts and material that run into many thousands numerically, it can be readily understood that too much care cannot be exercised at the first point in the line in seeing that the proper catalog is used and that the correct description, type and catalog designation—whether it be style or catalog number—is given. Mistakes that result in delays are usually easily avoided and, therefore, unnecessary. The wrong type used or the type omitted, transposition or omission of digits in style or catalog numbers, and lack of full and complete description—all of these are essential. Probably more orders go wrong when ordering parts for apparatus than when ordering material.

In ordering parts, the type of the apparatus the part is to be used with, the style or catalog number, and the complete catalog description are all equally essential because types change and styles or catalogs are superseded. If, in writing up the order, one of these three has been given incorrectly, the other two will furnish enough information for reference and check in a catalog, and generally result in the customer's order being corrected at the time of receipt. On the other hand, if one of the three is omitted and there is a mistake in either of the other two, the case is generally hopeless, and the order stands still until the customer can be reached and the item checked.

Very often orders are received that from their wording indicate that the purchaser may be rather uncertain as to exactly what he wants, but feels that the manufacturer's order clerks are familiar enough with the apparatus for which the part is required, to correctly interpret the order, and therefore allows it to come through in a more or less incomplete state. As a matter of fact, the order department of a large manufacturer is handling many thousands of orders each month, and the clerical force of which the order department is composed is very likely not to be any more familiar with the technical terms and designations than is the purchaser's order department.

There is no hard and fast rule for eliminating errors in ordering that will meet all circumstances, but some of the very essential points to bear in mind are to:

Always use catalog specifications, drawing numbers and complete description when available.

Destroy all old catalogs as soon as new and later or revised copies are received. When catalogs, drawings or specifications are not available, give nameplate data in full, with a complete description of parts required, dimensions, what it is for and how it functions, and when practical send a sample.

Keep catalogs up to date, but keep all old catalogs which have not been superseded, for obsolete equipment which may be in service, as old catalogs may be out of print and difficult to obtain.

Regarding the last, it is unquestionably the manufacturer's job to keep the purchaser fully supplied with the latest ordering information and it is certainly to his interest to do so. On the other hand, if he fails, as he sometimes does, it is just as much to the interest of the purchaser to obtain and use the proper catalogs, as his interests are directly served by any reduction in time of delivery of orders.

The average catalog is so arranged as to make ordering information easily accessible and plainly interpreted, but it not infrequently occurs among mechanics and operators that there is a reluctance on their part to use catalogs correctly. Here again it is to the manufacturer's interest to see that those in the purchaser's organization who are responsible for the ordering of material, even though indirectly, are not only thoroughly supplied with catalogs, but are thoroughly posted in their use. If again the manufacturer's representatives fail, a little attention by the purchaser to the men in his own organization along these lines will produce far-reaching results.

Manufacturers are coming more and more to unit quantity packages and, particularly in small items, shipments will usually be made more quickly and with less liability of error if ordered in this manner.

Prompt shipment of orders received, without error is a subject that is foremost before the manufacturer, and always will be and, to a considerable extent, the degree of success attained will be the measuring stick used to gage his service to his customer. The cause for the many mistakes and delays lies on both sides, but by close attention to details and hearty co-operation, a great deal of time—and therefore money—can be saved.

MANUFACTURERS expend large sums each year in trying to supply accurate and up-to-date ordering information, and are constantly issuing new and revised catalogs and descriptive matter. When these are carefully followed, an order is quickly and easily interpreted and generally gets through without unnecessary loss of time. Manufacturers also spend much time and money in the organization of an order department, whose business it is not only to receive and enter orders but to check all information for possible errors.

Traffic Congestion

The Fundamental Approach*

Traffic Problems Becoming Rapidly More Acute with Growth of Cities—Selective Transportation the Nearest Approach to an Answer—Speed Restrictions, Street Signal Control, Parking and Day Storage Problems Considered

By **J. Rowland Bibbins**
Transportation Engineer, Washington, D. C.

THE so-called "traffic problem," formerly everybody's business, is now graduated to a higher plane of engineering analysis and transportation practice, where it always belonged. This is the place assigned to it by the committee on metropolitan development in the Washington Conference report. The time for unskilled experiment has passed and that for technical leadership, much of it embraced in this association, has arrived.

Population density lies at the bottom of our trouble. The drift to our cities is a matter of concern. In 1890, 35 per cent was urban, in 1900, 40 per cent; 1910, 46 per cent, and 1920, 51 per cent. During the last census decade our cities grew half as much as in their entire history up to 1890. While million class cities are slowing down, unfortunately the half-million near-big cities are accelerating. They are catching the fever of greatness but not adequately planning ahead for it. By 1950 the physical problem of transportation and traffic will at least double in magnitude. One large city doubled in population in five years, four in seven years, 228 in 30 years.

Metropolitan economic growth also follows mathematical laws. When city population doubles, land value, the basis of all taxation, revenue and public works, trebles or quadruples; city passenger transport, rail and rubber, probably quadruples; railroad tonnage increases nearly seven times, passenger traffic about eight times, or as the cube of the population; Detroit building permits and high building floorage nearly as the cube. These rates, however, pale into insignificance in comparison with automobile registration, which increased as the twentieth power of the population, 1905 to 1920, perceptibly declining thereafter in rate, though not in total.

Our urban dwellers own nearly over 70 per cent of the nation's motor cars. The approach of so-called "saturation," so widely heralded, has become a delusion. My estimate of 30,000,000 motors, made two years ago on the basis of the California unit density of one motor per family for the whole United States in 1940, it appears from present indications, will be exceeded. This city registration doubled within four years and with about the same rate in both large and small cities.

There is only one escape from this traffic concentration, with its appalling problems of capital expenditures for transportation, traffic facilities and thoroughfares; that is decentralization, both for the city and the nation. Until downtown business men stop building skyward, city budgets will grow with appalling speed. In spite of billions invested in rapid transit, street and sidewalk capacity has become the acute problem, which finds no solution where half a city's working population is dumped into the mile circle each day. Peak-load factors, both in transportation and traffic, are the crucial economic points in service and investment.

Selective transportation seems to be our nearest approach to an answer: (1) De luxe bus, long haul; (2) local and transfer bus, short haul; (3) street railways, long and short haul; (4) subways, elevated and suburban railroad, long haul; (5) taxicabs and private autos. This system, with its differential fares and differential speeds, will alone meet the need of our expanding metropolises, with a real and practical zone system not otherwise obtainable. The 30-minute time zone seems to define generally our transportation necessities and calls for express streets, buses and rails, as the basic requirement to secure the increased scheduled speed we so greatly need. We have now imported from European practice the limited "Car Full" regulation in bus operation, hitherto an impossibility in America. This means that the railways alone must still be relied upon to meet the balance of the peak-load demands of mass transportation in large centers. Until we change our habits of travel and of business by staggered hours mass transportation must stay on rails.

Capital investment in city highways and paving, so large a proportion of the traffic problem, seems to receive little consideration. The average in 290 cities is nearly 1,000 miles per million inhabitants, four cities ranging from 1,100 to 2,000 miles. The present shifting from rail to rubber of both passenger and freight movement emphasizes this great problem of 60,000,000 inhabitants, 60,000 miles of pavement and $3,000,000,000-odd investment. No one knows yet how to distribute the huge maintenance cost between public and private carrier, but it must be apparent that as the paving budgets grow local transportation will automatically be called upon for a larger share, which must be reflected in the fare, and in the end bring about the thing we want, decentralization.

City debt limit and taxation are the final factors limiting traffic and transportation development. With

*Abstract of a discussion before the annual convention of the American Electric Railway Transportation & Traffic Association, Cleveland, Ohio, Oct. 4-8, 1926.

Digitized by Google

basic land values increasing only as the square of the population or less and city construction budgets as the cube, as in New York, some one must make up the difference. The Detroit debt limit is now increasing over the fourth power of the population, likewise Chicago. Private contributions to city building may hardly be expected. The next step is local district benefit assessment. Already advocated for rapid transit, it is now talked of for traffic and city improvements also. The principle is right, applying a little of the unearned increment to offset the greater benefit derived from these improvements, although it means more capital load upon the land, higher cost of doing business at the center, but in the end, decentralization. The same principle has got to be applied in allocating traffic improvement costs as between city, county and state.

Car routing improvements are needed in many cities and would seem to be one of the best ways to meet private automobile competition, along with improved service and running time. In a city of 350,000 inhabitants I found automobiles to be carrying practically as many people in and out of the central district as street cars, even during the maximum rush period, largely due to a fixed loop terminal system of routing, pay transfers at the center, and lack of logical through routes and adequate by-pass traffic routes. In another city of 500,000 autos carried 60 per cent more people than street cars into the 2-mile circle. Loop car mileage runs into astonishing high figures, and in one important case I found loop time to be more than the running time of the average passenger to his rush-hour home destination.

Transportation lies at the bottom. It has always seemed to me that in so-called "planning," both city and traffic, the planning has been entirely too sketchy and indefinite. We must think in terms of city building, not planning; traffic program, not ordinances; transportation, not individual or corporate facilities. This clearly requires unification to develop street and track capacity for both passenger and freight traffic, however carried. To grant multitudinous franchises today is repeating the economic fallacy of multiple franchises it has taken 30 years to eradicate in transit. It is a hopeful tendency that the "unification for profit" in the past is being replaced by "unification for service."

Finally, a few definite comments on the traffic conference report:

1. Traffic speed restrictions are too low. With street cars geared to 20 to 25 m.p.h. maximum speed and usually reaching 18 or more, I see no reason why traffic should not be encouraged to keep ahead of and out of the way of street cars rather than trail them, so as to use up the clear headway spacing ahead. Street cars and buses should have the right of way at crossings over traffic, and traffic over pedestrians. Running through or over safety zones is a moot point. Detroit permits it, Washington does not. I see no logic in pre-empting four out of six lanes of a roadway on a five-minute headway car line street. Perhaps a good compromise would be to divert traffic by arrows around the station under one-minute headways and everywhere during rush hours.

2. More efficient signal control must be worked out—by engineers rather than by policemen. The fixed synchronous block signal is poorly adapted indeed to transit or speed traffic. In Philadelphia this added from 1½ to two minutes running time per trip to all cars in the downtown delivery district on Walnut and Chestnut Streets, already running 22 seconds headway. My analysis in Lancaster indicates manual control handled traffic with 50 per cent greater efficiency. The use of this "stop and run" signal on heavy traffic clearing streets, especially retail streets, is exceedingly dubious. The progressive synchronous or speed control is plainly the best system for heavy traffic arteries with the shortest possible time interval. This interval is extremely important and on street car trunks should be adjusted primarily from the typical speed-time curve and varied throughout the day according to traffic pressure as nearly for individual crossings as possible. Even with this system, manual sub-control will probably be necessary to clear traffic jams.

3. The parking problem has not been approached fairly. There is no economic logic in the prevailing lack of enforcement of existing regulations. Moderate regulations enforced should produce far better results. This requires a selected and technically trained patrol with the aid of the general police also instructed for emergencies. My surveys indicate an average parking time in the central district around 30 minutes and well within the hour. This emphasizes the wisdom and practicability of graded parking time, properly enforced, and this time should gradually be reduced until sufficient parking gaps along the curb are provided for convenient loading and unloading.

4. Day storage is imperative. I believe it fair, in the case of such a national family utility as the automobile, to see that day storage is provided, either by private or public means, before rigid exclusion laws and regulations are passed. Low monthly rates are the key to success if off-street garaging is to become of any importance. It may have to become a city cost-of-service enterprise. Nothing is heard in traffic discussions of commercial vehicles as a congestion factor except double parking. Yet I have found them responsible for half as much traffic as private automobiles downtown, and at many important intersection districts as much as 100 per cent.

In conclusion, the recommendations of the traffic conference report will clearly have to be modified to suit local needs in many particulars, but it is a start, and, in my judgment, the contribution of the Metropolitan Traffic Development Committee, though small in volume, is outstanding in principle. "Traffic," so called, is not the major factor. The real problem is transportation, economics, engineering and horse sense.

WE must think in terms of city building, not planning; traffic program, not ordinances; transportation, not individual or corporate facilities. This clearly requires unification to develop street and track capacity for both passenger and freight traffic, however carried. To grant multitudinous franchises today is repeating the economic fallacy of multiple franchises it has taken 30 years to eradicate in transit.

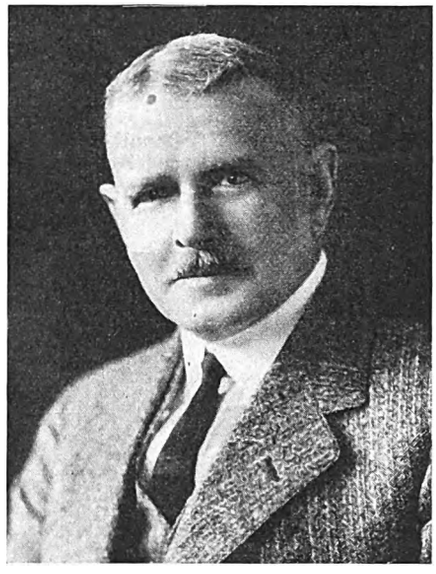
Accountants' Committees Standardize Practice

Fare Collections, Standard Classification of Accounts, Bus Accounting and a Review of the Work of the Association Since Its Formation Are Subjects Treated During the Year Just Closed

FROM its inception the activity of the Accountants' Association has centered in the standard classification of accounts. The work of this committee has been augmented for the past two years by that of the committee on bus accounting. The latter committee presented a complete classification of accounts for bus operators last year, and this year made a condensed classification for those companies having such small revenues that the greater subdivision is not justified. These and other committee reports are abstracted below.



JOHN J. DUCK
President Accountants' Association, 1925-1926

Fare Collections

OF MANY new problems of fare collection the two most important developments are one-man operation, and the motor coach or bus.

One-man operation undoubtedly presents the greater problems. This presents serious difficulty to the system that has a multiple coin fare, but where a single coin or token is, or can be made the medium of payment, the saving in expense which the one-man car offers is worthy of most earnest consideration. In a general way fare collection methods on buses need not differ greatly from those used on one-man street cars.

E. A. TUSON
Chairman

The following propositions are submitted for fare collection on street cars and buses operated by one man.

1. *Single Zone Lines, Street Cars and Buses.*—Pay-enter. In the case of automatic registering fare boxes a separate overhead register should be provided for the registration of tickets and other paper. When non-automatic boxes are used an overhead register should be provided for the registering of all fares.

2. *Two-Zone Lines, Street Cars and Buses.*—Zone 1—Pay-enter. Zone 2—Pay-leave. Registration as for one-zone lines.

3. *Three-Zone Lines — Street Cars and Buses.*—Zone 1—Pay-enter. Zone 2—Pay-leave. Zone 3—Pay-enter with identification check—pay-leave. Registration as for one-zone lines.

4a. *Line of Four or More Zones—Street Cars Only.*—Zone 1—Pay-enter. Zone 2—Pay-leave. Inside collection. Zone 3—Pay-enter. Zone 4—Pay-leave. Registration as for one-zone lines, but in addition thereto a register should be provided for inside collections. At the end of Zone 2, an inspector boards, counts the load, and then operates the car while the regular operator goes through to collect two fares from each passenger, registering these on the inside collection register. This done, the inspector verifies the registration from his count and leaves the car. The operator continues through Zones 3 and 4 on pay-enter and pay-leave respectively and, where the line is more than four zones long, the inside collection is repeated at the end of Zone 4, and so on to the end of the line. Where desirable, the operator may perform the inside collection, holding the car at the zone point.

4b. *Line of Four or More Zones—Buses.*—Zone 1—Pay-enter. Zone 2—Pay-leave. Zone 3 and all succeeding zones — pay-enter with identification check—pay-leave. Registration as for one-zone lines. On very long lines, the non-automatic box is perhaps preferable, because of its capacity to take coins of larger denomination. In zone 3, and succeeding zones, each passenger boarding pays one fare as he enters and receives an identification check which establishes his point of origin and which he holds until he leaves. There are several elements of safety and convenience which make this scheme preferable for buses to that outlined for street cars under 4a.

The recommendations offered under items 1, 2 and 3 above are felt to be entirely satisfactory and workable under practically all conditions of operation, Plan 4a is also reasonably satisfactory except in its application to lines of two or more zones operating on a half-hour headway or longer, where its interference with running time might be a factor. Plan 4b is the least satisfactory of all in that it does comparatively little toward abolishing the ever-troublesome paper.

As alternative to these latter two plans may be suggested the use of the overhead classified register which handles the problem in a fairly satisfactory manner, especially where there is a complicated ticket situation, but there is now under development by at least two of our prominent manufacturers what is, in effect, a fare cash register, which issues a ticket showing thereon the points of origin and destination, the date of issue, the kind of fare paid, whether cash or ticket, and the amount paid, these amounts being accumulated in a totalizing register. The success

Digitized by Google

of this machine may solve our difficulties under plans 4a and 4b.

In conclusion the committee emphasized the great value of one-man operation in net earnings. Its success is a vital thing to many companies. To insure this success, the operator must be given all the help possible in the way of simplified fare collection, reduction of manual and clerical duties, in which the automatic registering fare box greatly assists, and the elimination of paper tickets wherever possible.

These fare collection methods were recommended to those whose enthusiasm for conversion to one-man operation has been tempered by fears on the score of proper handling and protection of revenue.

The report was signed by J. D. Evans, A. G. Neal, W. G. Nicholson and E. A. Tuson, chairman.

Committee to Review the Proceedings of the Accountants' Association

COMPARATIVELY small individual membership in the Accountants' Association at the present time is believed to be caused by a lack of in-

J. E. HEBERLE
Chairman

formation as to benefits to be gained by such membership rather than a lack of interest. The records are eloquent in this respect. The high point in membership seems to have been reached in 1907 with 246 members. The individual members at present number 65.

The committee recommends that a membership committee be appointed to bring into the Accountants' Association as individual members representatives from all companies affiliated with the parent association and believes that successful achievement of this committee's function will greatly stimulate interest in the Accountants' Association work and will result in corresponding benefits to member companies.

It was the sense of the committee that the subject of fixed capital records has not been given the attention this important matter deserves, and should be made the object of committee study.

The committee believed that one of the most important questions affecting the industry at large at the present time is that of bus accounting, in its broader aspects, and urged that careful study be given to the accounting features involved in the co-relation of bus operations with street railway operations in the general field of our industry —that of furnishing transportation. It was also recommended that a committee be formed to study and report on the subject of bus depreciation, including the basis and methods and the experiences of member companies.

The subject of forms for condensed operating reports, with operating statistics, and the use of graphs in connection therewith, is one that might be usefully developed.

It was suggested that the best methods to be followed in ascertaining and recording the cost of projects or units or property should be the subject of study, and that such a study might well be combined with that of the application of cost accounting to our industry.

It was urged that measures be taken to stimulate interest in the association magazine, *Area* and in the accountants' section of the "Question Box."

The committee incorporated in its report the following quotation from the address of President Budd at the 1924 convention:

"The accountant in addition to all his multitude of work in the handling of figures, reports, etc., also is the officer, more than any other, who safeguards the business principles and the business methods; that should be his function and it shouldn't stop merely at the compilation of figures. He should be the officer who is the warning signal for slipshod, wasteful, inefficient or unbusinesslike practices. Therefore, the accountant and accounting officers exert a very great influence on an organization.

"Also, the accountant in later years has become more and more of an important factor in connection with our valuation and rates and the compilation of figures and the analysis of them. The statistical information that is now absolutely essential to any executive in order to get correct information is almost a profession in itself, not only to compile these statistics, but to analyze them and show what they mean and what tendencies they disclose."

The report was signed by O. H. Bernd, F. J. Gannon, L. A. Lovell, and J. E. Heberle, chairman.

Standard Classification of Accounts

DURING the past year the committee has received several inquiries relative to interpretations of the classification of accounts and has handled these requests by correspondence.

At the request of Alexander Wylie, director bureau of accounts, Interstate Commerce Commission, the committee held a meeting in Washington, D. C., in connection with the proposed revision of the classification of accounts for electric railways and will keep in close touch with the bureau in connection with this subject.

During the past year W. F. Ham, a member of the classification committee since the organization of the Accountants' Association in 1897, resigned from the committee on account of the press of other duties and I. A. May, comptroller of the Connecticut Company, New Haven, Conn., was appointed to fill the vacancy.

The report was signed by I. A. May, C. S. Mitchell, H. L. Wilson, P. S. Young and M. W. Glover, chairman.

Bus Accounting

THE classification of bus accounts presented by the committee at the 1925 convention was adopted by the association with certain amendments. These amendments were incorporated in the classification, and the association published the classification as amended.

During the year several questions relating to interpretations of the classification were presented to the committee by companies, and replies to these questions were given by the committee.

The committee received many calls for a condensed classification from companies whose revenues amounted to less than $100,000 per year, and issued in May, 1926, a condensed classification of accounts suitable for such companies.

The condensed classification, as published in May, 1926, was presented to the association for adoption. The committee suggests that if any changes in the classification of bus accounts are considered desirable, that such changes

M. W. GLOVER
Chairman

be referred to the committee for investigation and consideration, the committee to report back to the association with recommendations as to the desirability of the proposed changes.

The committee has been unable to get a complete list of all companies which have adopted the classification, but it appears to have been found satisfactory both for the use of independent companies as well as for electric railways operating motor buses in connection with other rail operations. The classification was devised with this end in view and no difficulty has been experienced in subdividing the classification of accounts prescribed for electric railways to include motor bus operations as a subdivision of the accounts affected.

The classification is now being used in the District of Columbia, and in the states of West Virginia, Connecticut, New Jersey, Pennsylvania, New York and Ohio, and possibly in other states, which have so far not issued an official classification for motor bus operations.

The report was signed by P. R. Jacques, H. C. Kimball, C. R. Mahan, C. W. Stocks, N. E. Stubbs, E. A. Tuson and M. W. Glover, chairman.

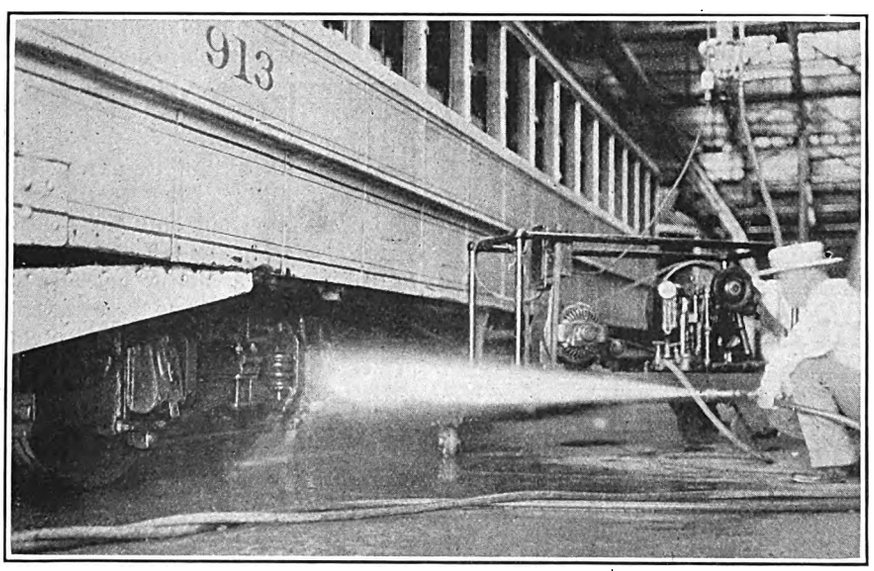
Maintenance Notes

High-Pressure Water for Truck Cleaning

WATER at high pressure is used in the Cleveland Railway shop to clean trucks before going to the paint shop, as it easily removes accumulated mud and grease with surprising ease. The pressure is obtained by use of a portable motor-driven pump. The equipment, manufactured by the Ralph L. Fuller Associates, Cleveland, Ohio, is mounted on a portable truck that may be moved to any position. As shown, permanent connections are run to several overhead points that supply water and electricity for the equipment, thus avoiding the need for long lengths of either hose or conductor cable.



High Pressure Water Is Used to Clean Trucks in Cleveland. Ralph W. Emerson, General Manager of the Cleveland Railway, Is Illustrating the Use of This Equipment

Emergency Calls Greatest Between 9 A.M. and 5 P.M.

BY G. H. MCKELWAY
Engineer of Distribution, Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y.

ONCE it was the custom on a certain electric railway to work the same number of emergency line crews at night as during the day. As the crews were used for little aside from emergency service, and as the number of calls received during the night was much less than during the day, the night crews had a much easier time of it than those that were working during the day.

Any dissatisfaction of the men was avoided by having the crews change shifts every two weeks, but the company executives were not satisfied because it was evident that the night men were, as a rule, doing much less than they could do and that some of them might be taken off of emergency duty and put on other work.

In order to find out just how the calls were coming in and to learn what crews could be spared best, the records of the preceding year were gone over in detail, and the average number of calls each hour of the day received by each crew, and in each month of the year was found.

After studying the results carefully, it was decided that one-third of the night crews could be done away with without danger to the service, so this cut was made.

RELATIVE NUMBERS OF EMERGENCY LINE CALLS BY HOURS AVERAGED FOR A YEAR

A.M. Hour	Per Cent of Total Calls	P.M. Hour	Per Cent of Calls
12-1	0.91	12-1	5.88
1-2	1.09	1-2	5.04
2-3	0.57	2-3	7.40
3-4	0.61	3-4	8.96
4-5	0.81	4-5	7.93
5-6	2.01	5-6	4.02
6-7	2.97	6-7	4.26
7-8	3.20	7-8	4.58
8-9	5.36	8-9	2.57
9-10	9.30	9-10	2.19
10-11	8.96	10-11	1.21
11-12	8.64	11-12	1.53

The detailed figures would not apply to other systems but the average per cent of the total calls on the system, as received each hour, should be interesting, and they were found to be as shown in the table.

During the year that was analyzed as given above, the calls to the emergency crews on this system, for all purposes, averaged approximately 1,000 per month.

Time Basis Used for Inspection of Los Angeles Cars

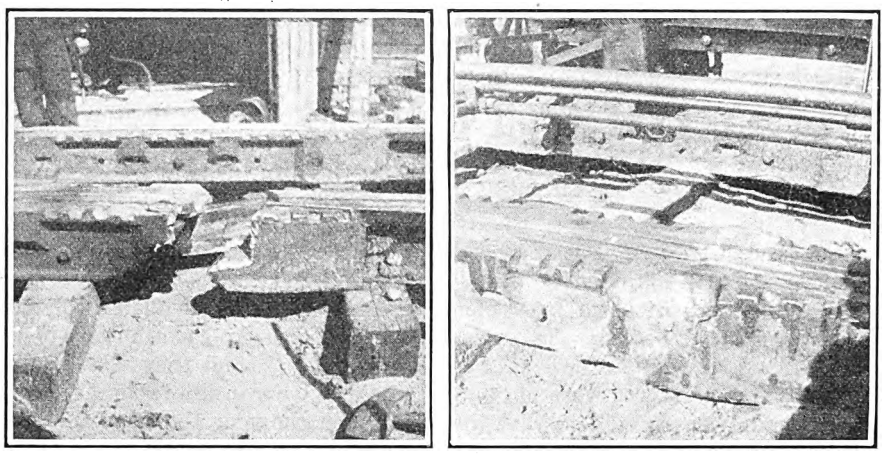
IMPROVED appearance of cars and equipment and the reduction of noise to a minimum have been stressed particularly in the maintenance of cars operated by the Los Angeles Railway, Los Angeles, Cal. This company is very exacting in its requirements as to the mechanical perfection of the equipment. Each car in regular service is given a safety inspection every night. This includes the inspection of brake shoes, brake rigging, wheel flanges, gear cases and truck bolts. Each car is also swept and dusted every night. Cars that are used for morning tripper service and are due for regular inspection during the day are cleaned during the daytime and are washed when necessary.

The regular inspection of cars is divided into three classes, A, B and C, which differ in the amount of detail work done. Cars with "K" type control are given the A inspection every 80 hours, the B inspection every 960 hours and the C inspection every 1,920 hours. Cars with multiple-unit type control are given the A inspection every 120 hours, the B inspection every 960 hours and the C inspection every 1,920 hours. All cars are sent to the shop for a general overhauling every eighteen months.

Switch and Mate Rebuilt by Welding

THERMIT welding was recently used with entire success by the Union Street Railway, New Bedford, Mass., to rebuild a track switch and mate that had broken apart from their original castings. Upon ex-

Digitized by Google



At Left, Broken Mate Casting Before Welding. At Right, Same Casting After Welding

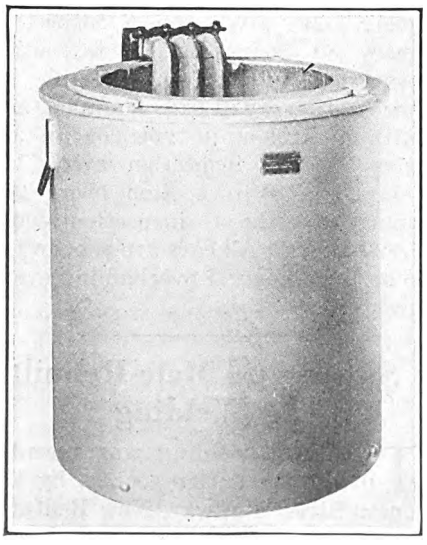
amination it was found that the switch and mate were in excellent condition, but the castings were broken. It was thought that if these were recast they would probably render good service for some time to come.

The pieces were taken out of their positions and brought to the side of the road, where they were relined and thermit welded. After being replaced they were surfaced with an electric grinder. It is the belief of the company that they will give several more years of satisfactory service. The cost of the work was about 25 per cent less than the cost of new pieces of trackwork.

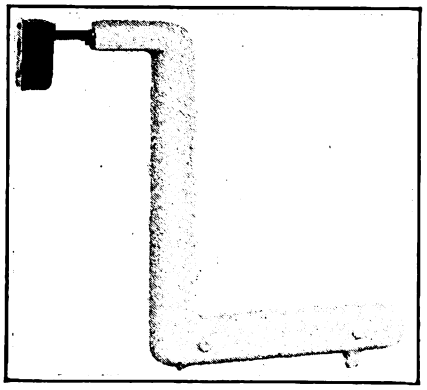
New Equipment Available

Larger Metal Melting Pot Is Developed

A NEW metal melting pot, with a capacity of approximately 1,000 lb., has been added to the General Electric line and is now on the market. This pot, utilizing the electric heating principle, is practically the same as other standard General Electric melting pots except that three cast-in, sheath-wire immersion heating units are used instead of two.



This Metal Melting Pot Has a Capacity of 1,000 Lb.



Heating Unit Used with the New Melting Pot

Each heating unit is rated at 5 kw. The pot may be operated either on 110 or 220-volt a.c. or d.c. circuits and the use of three heating units will also permit balanced three-phase operation.

The pot itself consists of a sheet steel cylindrical casing in which is supported a cast-iron crucible of the following dimensions: inside, 18 in. diameter and 15 in. depth; outside, 29 in. diameter and 31 in. depth. The space between the casing and the crucible, measuring about 3 in., is efficiently insulated with a compact heat insulator. The leads of the heating units are brought over the top of the pot into a connection box fixed to the unit itself.

Melting pots of this type are designed for melting lead, babbitt, tin, solder and similar alloys or metals, except spelter or zinc, at temperatures not exceeding 850 deg.

Full-automatic control is recommended, consisting of a standard automatic control panel and a temperature control instrument equipped with a special bulb for metal immersion. Separate heating units may be installed in existing installations of melting pots where dimensions permit and where temperatures do not exceed 850 deg. F.

Combined Heating and Ventilating System

HEATING and ventilating of buses are combined in a system announced by the Consolidated Car Heating Company Albany, N. Y. This has been developed in conjunction with Thompson Research, Inc., Cleveland, Ohio. New features include provision not only for heating and ventilating buses mechanically by the use of a blower but also for removing all odor and poisons from the exhaust gases. The system comprises an air intake communicating with the exhaust pipe from the engine, an air mixing chamber in which the exhaust gases are automatically mixed with the proper proportion of outside air to form an ignitable mixture, and a combustion chamber in which this mixture is ignited and burned, the latter serving as a most effective muffler.

Surrounding the exhaust pipe leading from the combustion chamber is a heat-insulated housing or air heater which communicates by means of a sheet metal duct with the front and also with the rear of the bus body. A blower mechanically driven by the engine forces air through this heater into the front of the bus. The air supplied to the heater may be taken either from the inside of the bus at the rear or from the outside, as desired. By means of dampers operated from the dashboard outside air can be mixed in various proportions with the air from the bus, or the entire supply can be taken from the outside. When no heat is needed air is drawn from the bus through the heater and discharged to the atmosphere.

The system is extremely flexible and is said to provide ample heating and ventilating capacity for the most severe weather, or it may be used entirely for ventilating purposes. The burning of the exhaust

Digitized by Google

gas mixed with air in the combustion chamber results not only in the complete elimination of all odors and poisonous gases from the exhaust, but also generates an immense amount of heat, which is utilized in the air heater. In designing the equipment it has been the aim to keep the exhaust outside the bus body at all times and to destroy the odor and poisons in it before utilizing it as a source of heat. The air within the bus is therefore clean, pure and odorless, as are the gases discharged from the exhaust pipe.

Truck Dumps at Either Side or Rear

DESIGNED particularly to meet electric railway needs, the Differential Steel Car Company, Findlay, Ohio, has just brought out a new dumping body for motor trucks. An outstanding feature of this new dumping body is its arrangement so that it can dump to either side or to the rear. In electric railway track construction it is frequently of particular importance to deposit material in the track area. The side-dumping feature meets this condition. When depositing material in a trench or at the dump, time and labor are saved by driving alongside of the excavated area and then depositing the load where required. The end dumping feature is of advantage in working on crowded streets where material must be deposited alongside the work.

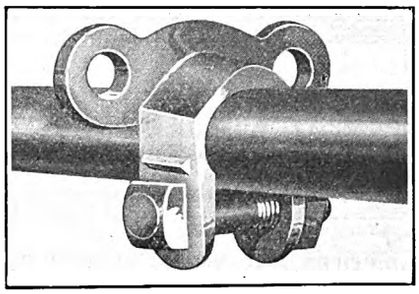
The body is constructed entirely of steel and is designed to give great strength without excessive weight. The side doors are hinged at the bottom and in dumping the door of the low side automatically pulls down into the same plane as the floor. The door on the other side remains closed. This arrangement gives a clear opening so that material of any size may be dumped and the door forms an extension to the floor, which deposits the load clear of the roadway so as not to interfere with the movement of the truck itself. A simple system of levers governs the opening and closing of the doors automatically.

The hoist consists of a telescoping screw which is driven by a set of bevel gears. When this screw is driven in a clockwise direction it extends itself, thereby imparting the motion to the body for dumping. At both top and bottom of this screw are ball and socket joints which allow for extreme flexibility.

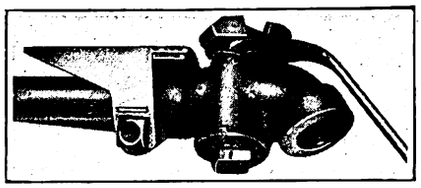
Angle Cock Holder and Pipe Clamp

FOR the purpose of holding angle cocks securely in their proper position, Mudge & Company, Chicago, Ill., have just placed a new pipe clamp and angle cock holder on the market. It is made of forged steel. The angle cock holder can be used with any shape of steel bracket which the construction of the car requires. No special keys or forgings are needed as the ordinary bolts produce a clamping effect.

The manufacturer states that ample bearing surface on the bolts and clamps secures positive anchorage of the brake pipe and prevents vibration and longitudinal movement. The projecting lip on the



Forged Steel Pipe Clamp

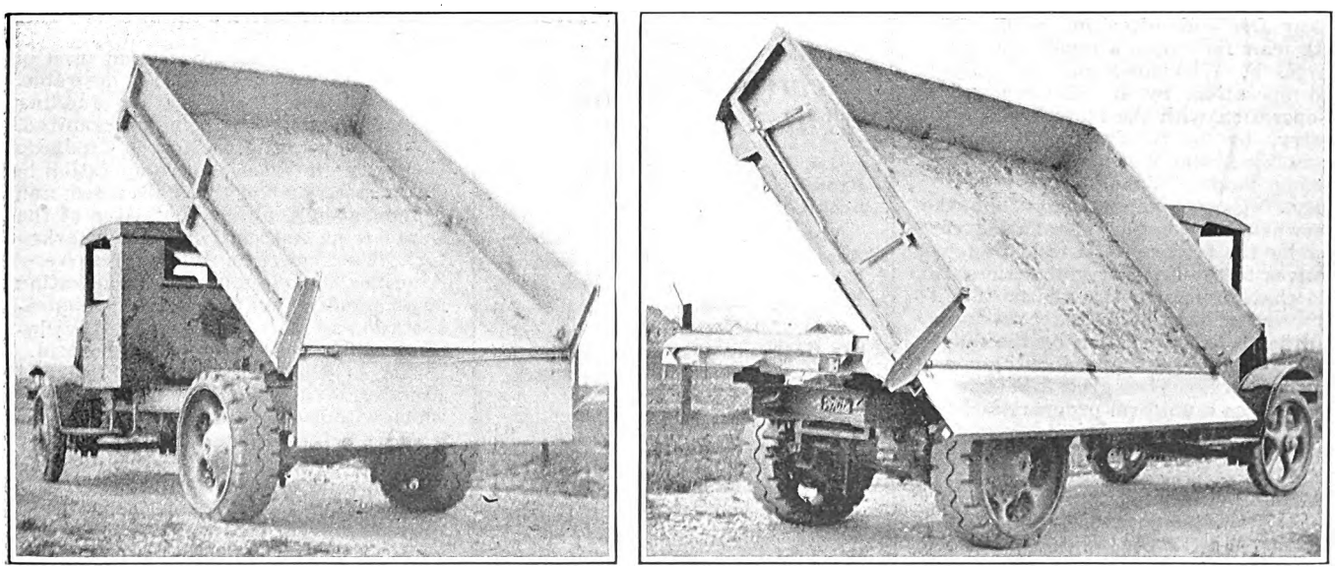


Angle Cock Holder for Use with Varying Steel Brackets

angle cock holder fits over the hex on the angle cock and prevents the latter from turning or becoming disordered.

The holes in the clamp through which the bolt passes are elongated so as to allow necessary movement of the bolt in the clamp. When the bolt is tightened up the two legs of the clamp are drawn in, and as this action takes place the bolt is forced up against the pipe. A few turns of the nut cause the bolt to bite into the pipe, thereby clamping the latter effectively.

The bolt is practically self-locking because of the lug provided on one of the clamp legs and the angularity of the clamp legs when in the clamping position. Double nuts or lock nuts are not essential unless the standard practice of the railway requires their use under such conditions.



At Left, the End-Dumping Construction Is of Particular Advantage in Crowded Sections. At Right, Position of Body When Dumping at the Side

American Association News

American Executive Committee Meets

PRESIDENTS of all sectional associations in the United States and of the Canadian Electric Railway Association, Canada, were invited to attend the meeting of the American Electric Railway Association executive committee held at the Hollenden Hotel, Sunday night.

Reports of standing committees and presidents of affiliated associations were made. There were also short addresses by some of the presidents of sectional associations.

For the Cleveland convention committee, J. H. Alexander reported that 119,007 sq.ft. of inclosed exhibit space has been purchased. When the space for working track exhibits under the canopy, and the outdoor car exhibits are included, the total space taken is much greater than at any previous convention of the American Association. He reported a total of 271 exhibitors. The car exhibit, which includes 41 different units, is the largest ever held in the history of the industry.

S. J. Cotsworth outlined the work of the entertainment committee. Transportation arrangements made for the convention were discussed by E. C. Faber.

Reports of other committees included that on policy by W. H. Sawyer; subjects and meetings by J. P. Barnes; publicity by Barron Collier; membership by J. H. Hanna; finance by R. P. Stevens and publications by E. C. Faber.

C. H. Harte reported for the Engineering Association, G. H. Clifford for the Transportation & Traffic Association, J. J. Duck for the Accountants' Association, and J. H. Handlon for the Claims Association.

For the committee on co-operation with manufacturers, a report was made by E. F. Wickwire; on management and operation, by R. F. Carbutt; on co-operation with the motor vehicle industry, by L. S. Storrs; on special taxes, by Leslie Vickers and on insurance by Paul E. Wilson.

Mr. Vickers pointed out that the overwhelming burden of taxation carried by the industry is awakening executives to the necessity for action. He said that at present there is no intelligent and scientific basis for taxation, and that collective action by the industry is needed to bring about general improvement. The gross-net tax is proposed as a uniform program and the committee has expanded its organization to give representation in each state.

At the invitation of President Coates, W. R. Robertson, president Canadian Electric Railway Association, outlined briefly the electric railway situation in Canada. Despite the automobile, bus and truck competition, electric railway business has grown from $17,000,000 in 1910 to $50,000,000 in 1925, Mr. Robertson said. The Canadian Association is making a study of bus and truck operating costs in comparison with those of electric railways and has a fact-finding committee going into the details of this situation.

A meeting of the new executive committee was held on Thursday afternoon with President W. H. Sawyer in the chair. The new presidents of the affiliated associations were presented to the executive committee. Mr. Sawyer announced that appointments would be made early in the year for committees on revision of the constitution and on location of next year's convention. Nov. 19 was selected as the date for the next meeting of the executive committee.

Old Engineering Executive Committee

SUNDAY evening the executive committee of the Engineering Association held a dinner meeting at the Hollenden Hotel. Those present were President Charles Rufus Harte, Vice-Presidents Daniel Durie and R. H. Dalgleish, Past-Presidents C. H. Clark and H. A. Johnson and G. H. Hecker, A. W. Baker and Morris Buck. The meeting was taken up largely with reports of action on various matters which have been pending for some time. It was decided to reorganize the equipment committee along the same lines as those adopted for way and structures a year ago. The standards committee will be reorganized accordingly.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Oct. 25-29*—Annual Congress and Exhibit, National Safety Council, Book-Cadillac Hotel, Detroit, Mich.**

***Nov. 5*—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p. m.**

***Nov. 16-18*—Society of Automotive Engineers, National Transportation and Service Meeting, Boston, Mass.**

***Nov. 17-18*—Iowa Electric Railway Association, operating and maintenance section, annual convention, Fontanelle Hotel, Omaha, Neb.**

***Nov. 16-19*—American Welding Society, fall meeting and International Welding and Cutting Exposition, Buffalo, New York.**

New Engineering Executive Committee Meets

SUBJECTS were assigned and committee personnel considered at the first meeting of the new executive committee of the Engineering Association held at the Hollenden Hotel, Cleveland, on Thursday evening, Oct. 7. Those present were President Daniel Durie, Past-Presidents H. H. Adams, Harley A. Johnson and Charles Rufus Harte; members L. D. Bale, R. H. Dalgleish, C. H. Jones, F. H. Miller and Pierre V. C. See, and guests A. W. Baker, A. T. Clark, H. H. George, G. C. Hecker and Clarence W. Squier.

It was agreed that the minutes of the last meeting together with those of the present meeting should be written up and sent to the various members of the executive committee for approval by letter ballot. The subjects committee assignments were reviewed and discussed. Some changes and additions were made. The report was then approved.

The personnel of the new engineering committee is nearly complete and an early start of the work is expected. Appointment of a representative on the National Fire Protection Association's committee on garages was discussed and it was considered that this might be a matter for work under American Engineering Standards Committee procedure.

The organization of a committee to revise the rules for procedure in approving standards was approved. This is needed properly to care for the changes necessitated by the reorganization of the way and structures committee, which was effected last year, and the equipment committee which is now being undertaken.

The organization and work done during the past year by the way and structures committee was discussed and some changes in procedure from that used in the past was considered desirable. These will also apply to other standing committees which are being reorganized.

American Engineering Standards Committee international co-operation in standardization work was discussed, and comments by the representatives of the Engineering Association are to be asked for. The American Wood Preservers' Association contemplates organization of a committee on pole service. Representation of the Engineering Association on this committee was authorized.

The American Institute of Electrical Engineers is organizing a committee which will develop standards for switchboards for power and light. Further information regarding the work of this committee is to be asked for.

The sponsors for some committees were approved and C. R. Harte was authorized to follow up recommendations of the heavy electric traction committee regarding the publishing of a bibliography.

Accountants Executive

MEETING in the English Room of the Hotel Hollenden on Sunday afternoon, the executive committee of the Accountants' Association approved the presentation at the convention of the reports of the various committees. It was decided to recommend the continuation of the same committee for next year. Members present were L. E. Lippitt, T. B. Kilfoyle, T. B. MacRae, E. A. Tuson, J. E. Heberle, E. H. Reed, C. E. Yost and J. J. Duck, president.

Claims Executive

DISCUSSION of the convention program and future policies was held by the executive committee of the Claims Association on Oct. 3 at the Hollenden Hotel, Cleveland. The subjects discussed included the work of the various committees of the association this year, topics to be referred to the consideration of the incoming executive committee and the appointment of a committee to consider conditions for a safety contest for the Anthony N. Brady medal. This medal was offered annually for a number of years before the war to the electric railway company making the best safety record. This award was discontinued during the war, but announcement has recently been made by executors of the Brady Estate that it will again be available. Those present were J. H. Handlon, president; C. B. Proctor and J. S. Kubu, vice-presidents; S. J. Herrell, Knoxville, H. O. Allison, New Brighton, and G. T. Hellmuth, Chicago, members of the executive committee; W. F. Weh, Cleveland, past-president, and G. C. Hecker of the association staff. Mr. Hellmuth acted as secretary.

Old T. & T. Executive

TRANSPORTATION and Traffic executive committee members met in the Hollenden Hotel, Cleveland, on Sunday evening, Oct. 3, to discuss plans for the coming year. The suggested program for next year's topic developed by the subject committee in the meeting in the afternoon of that day were tentatively adopted.

Those present at the meeting were: George H. Clifford, president; T. C. Cherry, John Colton, Samuel Riddle, E. M. Walker, J. V. Sullivan, G. B. Anderson, and Melvin W. Bridges.

New T. & T. Executive

TOPICS for next year's committee considerations were mapped out at the Transportation & Traffic executive committee meeting held on Oct. 6, in the Hollenden Hotel. Three committees of this association will perform the work done by four committees the past year.

Bus operation will be under the sponsorship of Paul E. Wilson and A. R. Myers. General subjects suggested for this committee were: fare collections methods; bus rules; operation of buses in competition with railways, and size of buses for different classes of service.

Traffic and safety will be under the sponsorship of Samuel Riddle, W. H. Boyce and E. M. Walker. Part of the work of this committee will be done jointly with the Claims Association and the plan was suggested of having a joint session at the next annual convention.

"Service betterments" will be the title of the committee previously functioning as "merchandising transportation." This committee will be sponsored by Edward Dana and G. B. Anderson. Topics suggested for this committee's consideration were all matters pertaining to the furnishing of a superior service to the public such as more comfortable seating, use of signs, simpler fare and transfer collections, courtesy of employees and other allied matters.

W. H. Sawyer, president-elect of the American Electric Railway Association, looked in on the meeting. He offered many valuable suggestions and assured the executives of the Transportation and Traffic group of the continued support of the parent association. Mr. Sawyer spoke of the co-operation desired on the part of the new traffic and safety committee in connection with working out certain details of the American committee on the Hoover Conference. The meeting was attended by J. V. Sullivan, president-elect, G. B. Anderson, E. M. Walker, A. R. Myers, Samuel Riddle, E. J. Murphy of the association headquarters, W. H. Boyce and John Dewhurst.

T. & T. Subjects

CONSIDERABLE thought and discussion were given by the subjects committee of the T. & T. Association at its meeting at Cleveland on Oct. 3 to the value of continuing four subjects —used during the last two years for transportation and traffic committee investigations. The subjects committee of this association considers that it would be valuable to adopt different subjects for the coming year. After careful consideration, it was decided that three general topics would be adopted for committee work. They are: Bus operation; service improvement; traffic and safety. Each of these three general subjects will be expanded into a number of topics, which will ultimately be assigned to sub-committees of each of the three main committees.

Those in attendance at the meeting were George H. Clifford, chairman; J. N. Sullivan, John Colton, W. H. Boyce, J. W. Welsh and John A. Dewhurst.

Exhibit

PRIOR to its scheduled meeting held in Cleveland on Oct. 3 the exhibit committee examined all of the displays between 10 and 11:30 Sunday morning and held one of the shortest meetings on record. There was nothing left to be done except to register a vote of thanks to Director Fred C. J. Dell and the Cleveland convention committee for their excellent accomplishment in assembling the splendid array of transportation equipment, supplies and accessories.

Mr. Dell reported 119,007 sq.ft. of inside space sold to 271 exhibitors. In addition about 1,900 lineal feet of track space or 50,000 sq.ft. is used by the most pretentious car show ever held by the association. Forty-one cars of modern type were on display, as well as many pieces of service equipment. The total actual exhibit space including the cars and open track is over 180,000 sq.ft. The bus, truck and allied accessories space is 23.8 per cent of this total.

Joseph H. Alexander, chairman, conducted the inspection trip. The meeting was attended by L. D. Bale, Fred B. Bullock, Frank W. Campbell, C. H. Clark, S. J. Cotsworth, H. Fort Flowers, B. A. Hegeman, Jr., R. R. Holden, C. E. Morgan, A. Frank Paul, A. M. Robinson, L. W. Shugg, and Fred C. J. Dell.

Taxation Plans Discussed at Special Meeting

INFORMAL discussion took place on the general subject of taxation with particular reference to the recommendation by Leslie Vickers, economist of the American Electric Railway Association, at the taxation meeting Thursday morning. Copies of a recent article defining the gross-net tax principle were available and an abstract of an analysis of public utility taxation systems in the various states was presented by Mr. Vickers.

The meeting, which was called as a special sessions of the taxation committee, was augmented by the recently appointed advisory members. Since no members of the taxation committee were present F. W. Doolittle, vice-president North American Company presided. After a brief talk on the gross-net tax by Mr. Vickers, all of the fourteen delegates in attendance, most of whom were advisory members of the committee, were called upon for remarks.

The consensus of opinion was that any plans involving general tax revision would have to be considered co-jointly with other utility representatives; if not, representatives of industries. The general principle of a sane and uniform taxation basis was approved and no objections were presented to the gross-net tax plan suggested.

International Road Congress

FIFTEEN HUNDRED delegates from 50 nations met at the Fifth International Road Congress held in Milan and Rome, Italy, from Sept. 6 to Sept. 15, to discuss city traffic and adaptation of successful methods to suit local conditions. The United States which has been an onlooker for several years became an active member, and the next world congress to be held in 1928 will meet in Washington, D. C.

T. H. MacDonald, chief of the Bureau of Public Roads, was the chief spokesman of this country. He explained the relationship between highways and civilization.

Iowa Operating and Maintenance Men to Meet Nov. 17-18

OPERATING and maintenance men of the Iowa Electric Railway Association will hold the annual convention of their sections on Nov. 17-18 at the Fontenelle Hotel, Omaha, Neb.

The News of the Industry

Philadelphia Lease Signed by Mayor

Despite popular disapproval Mayor Kendrick of Philadelphia, Pa., on Oct. 13 signed the ordinance providing a 30-year extension of the Frankford elevated agreement with the Philadelphia Rapid Transit Company. His signature was affixed to the document following a meeting with members of the transit commission, four of whom were opposed to the negotiation of the lease. The Mayor said that he "about understood the various sentiments of the commission members" and would not call for a vote on the question.

Alva B. Johnson, who represented the chamber of commerce on the commission, filed a report declaring his objections to the lease negotiations at this time. He recommended that the ordinance should not be signed and should be returned to the Mayor by the Council with the request that it be included in a new agreement to cover the entire transit properties. Charles B. Hall, president of the City Council and sponsor of the elevated agreement, declared that the funds released by the new agreement probably would not be used to meet the Sesqui expenses. It was charged that the lease had been amended to make available $5,000,000 for payment of the Sesqui deficit.

Under this new agreement the Philadelphia Rapid Transit Company will make an average annual return of $780,000.

Many Moves in New York Fare Referendum Action

The legality of the submission to the voters of the 5-cent fare referendum in New York city was upheld on Oct. 13 by the Appellate Division without written opinions. The views of the Supreme Court Justices, from whose decisions appeal was taken, were supported by the higher court. The referendums will appear on the ballot at election day unless the Court of Appeals reverses all the previous decisions.

Charles L. Craig, former comptroller and author of the bill which would allow a popular vote on whether transit fares could be raised without submitting the matter to the people, successfully argued that the referendum was legal under the City Home Rule Law and the Home Rule Amendment. Modification of subway contracts or franchises in other particulars than fares could still be effected, he said.

The 5-cent-fare referendum was attacked again on Oct. 14 from a new angle, when two transit companies filed suits in the Supreme Court to enjoin the Board of Elections from submitting the question to the voters in the coming elections. It was expected that Justice John M. Tierney would hear argument on Oct. 15 on the application for an injunction pending trial.

Unlike the previous action, the suits filed on Oct. 14 will be pressed by the transit lines themselves, on the principal ground that they will be deprived of property if the referendum results in approval of the proposition that fares may not be raised without a favorable vote of the majority of the city electors. The attorneys for the companies hope to get a definite ruling from the Appellate Division on all the points involved. The previous suit was a taxpayers action.

Counsel for the transit companies declared that his clients wanted a ruling by the Appellate Division on the constitutionality of the referendum. He said:

> The affirmation of Justice Valente's decision by the Appellate Division left this point undecided. We believe the law to be unconstitutional and harmful. In starting the new actions we may be able to save taxpayers the expense of holding a referendum on a law that later may be found unconstitutional.
>
> Justice Valente dismissed the first petition on three grounds: that the taxpayer was not a party to the action, that the legislation should be completed by the holding of the referendum before the court passed upon it, and that the law was constitutional. The Appellate Division in affirming Justice Valente's dismissal of the petition did not state how many of these points had been sustained. By establishing the petitioners in the present case as parties to the action, we hope to obtain a ruling on the two other points, including the constitutionality of the law.

Opposition Develops to Toledo Grant

Board of Control Outlines Objections to Modification of Present Milner Grant—Ordinance About to Go to Public for Ratification—Terms of Grant Reviewed

OPPOSITION to the submission to the electors of the proposed railway franchise to replace the Milner ordinance now in effect in Toledo was voiced by the Street Railway Board of Control in an opinion rendered to the committee of the Council which now has the ordinance under consideration.

The ordinance was drafted by Frank M. Dotson, city law director, and Attorney Dewey C. Bailey, representing Henry L. Doherty & Company, and approved in its legal and engineering details by Newton D. Baker, Cleveland attorney, and Prof. Henry E. Riggs of University of Michigan, experts hired on behalf of the city of Toledo.

The board in its analysis of the ordinance sees no prospect for lower fares within five years, that better service is only implied and not guaranteed, and that big burdens are transferred from the company to the city—paving obligations mostly—without corresponding benefits to the car riders.

It is also pointed out that the grant is monopolistic and by its terms practically perpetual with inadequate provisions for forfeiture in case of violation of the ordinance.

Defects in the Milner plan are conceded, but it is pointed out that many things the city would do under the new plan could voluntarily be assumed under the present ordinance.

In the communication of the board, signed by its three members—David H. Goodwillie, chairman; Henry Truesdall, banker, and William W. Knight, wholesale hardware merchant — failure of both the city and company to carry out important provisions and the spirit of the Milner ordinance is cited as partial cause for the present condition of railway service in Toledo. More extensive use of private motor cars is also presented as one of the big obstacles to the successful working out of the Milner plan not contemplated when it was put into effect six years ago.

Failure of the city to eliminate wildcat bus competition has also hampered the company. The city, too, failed to take advantage of the requirement for securing added new capital under the Milner plan.

The board desires all defects in the Milner ordinance to be cured and some adjustment made in capital value. Professor Riggs in his original report indicated some such step was necessary, but no provision for it was made in the ordinance. The board says:

> This new ordinance proposes to make a new 25-year grant. Why not then correct all the unwieldy and objectionable features of the Milner ordinance, and if we are to grant monopoly of service, let us have capital values reduced to an amount commensurate with earnings and take into account the railway situation of today and not that of 1920!

By continuing under the Milner ordinance until a more equitable plan is found the board members feel that the city would be free to negotiate other franchises.

Toledo's new ordinance embodies within its text changes in the city charter which will permit the company to have a complete monopoly of railway and bus transportation within the city for 25 years. The present city charter prohibits any exclusive monopoly of any public service.

The ordinance contemplates a five-year reconstruction program in which the Doherty interests would furnish $1,051,600 of new capital to go for the purchase of buses, replacement of tracks and other improvements. Failure to provide the necessary capital would forfeit the exclusive grant.

Control of the city transportation is

Digitized by Google

vested in the board of street railway control rather than in the City Council as at present. The board is composed of three members named by the Mayor for terms of six years each. The present board would continue under the new ordinance.

No maximum nor minimum fare is named in the ordinance but full power is vested in the board of control to fix a sliding scale that will meet requirements of the stabilizing fund, and various other operating and sinking fund requirements. Bus fares are set at 10 cents to begin with, but railway fares remain as at present—10 cents cash, three tickets for 25 cents, and 1-cent transfer.

The ordinance relieves the Community Traction Company of an old paving obligation of $182,421 owing to the city and provides also that the company will not have to pay for paving or repairing of pavement between tracks nor for the foundations for new tracks when new pavements are laid.

In the interests of economy of operation there is a provision that wages shall not be in excess of those paid for similar service in similar lines of business in cities of the same relative size and importance.

The ordinance makes it mandatory for the Community Traction Company to purchase power from the Toledo Edison Company, but if the rate is not satisfactory to the board of control it is to be fixed by the Ohio Public Utilities Commission.

The city purchase plan of the Milner ordinance by which the city now has become the owner of $1,261,000 of common stock is eliminated, but a similar amount is to be set aside for the depreciation fund to pay for replacements of equipment and some betterments.

Provision is made for sale of weekly pass, lease of the lines by the city, and lease by the city of land in the downtown district for a car storage yard. Arbitration of differences between company and board of control is also provided.

In the Riggs report the need is suggested of scaling down the capital.

Plans for fifteen bus routes—some feeders and some through lines—as outlined in the Riggs' recommendations are carried in the ordinance.

Fares in Pasadena Fixed by Commission

The Pacific Electric Railway has been authorized by the Railroad Commission to establish the following schedule of fares for motor coach and railway service in Pasadena, Cal.: One-way cash fare (one zone) 7 cents; one-way cash fare (between zones) Pasadena-Altadena, Pasadena-Country Club, Pasadena-East Washington Street, 12 cents; book tickets (good within either zone 1 or zone 2) eight for 50 cents.

Modified Lisman Plan Presented

Conditions Recapitulated Under Which Eastern Bankers Would Undertake Chicago Unification Program—Aldermen Still Frown Upon Proposal

A NEW draft of an ordinance embracing the plan proposed by Frederick J. Lisman of Lisman & Company, New York bankers, for the solution of Chicago's traction problems differing considerably from the original proposal made on Sept. 17 was submitted Oct. 2 to the City Council committee on local transportation.

In compliance with Alderman A. F. Albert's objection that the railways should not be paid for doing their own extension construction, the initial proposals of the Eastern bankers for the payment of 10 per cent interest to construction companies building extensions to street car lines were abandoned in the revised ordinance.

Briefly, the new draft contemplates the following steps:

Holders of $95,000,000 of first mortgage bonds of the Chicago Surface Lines, due Feb. 1, 1927, would receive new first mortgage bonds payable in twenty years.

New capital to the extent of $250,000,000 would be invested in extensions, subway construction and other improvements. Of this sum, the new company will make available immediately $45,000,000 in cash for extensions. An additional $50,000,000 would be invested "during the twenty-year term of the franchise." If the Legislature and the city grant an indeterminate permit, $150,000,000 more would be spent. If such a franchise is not eventually granted, the $150,000,000 would be spent at the rate of $50,000,000 during each ten-year extension of the twenty-year franchise.

The company will advance immediately some $6,500,000 as half the cost of building a subway for surface cars, extending from the West Washington and Van Buren Streets tunnels under the Chicago River and running "U" shape under Washington, Michigan and Van Bureau Streets. The other half of the cost would be raised by levying charges on property owners whose holdings abut on subway platforms and at entrances.

In connection with the proposed $24,000,000 subway under State Street between Eighteenth Street and Chicago Avenue, the Lisman syndicate would contribute $8,000,000 if the city contributed a like sum from the present traction fund and property owners raised the balance through special assessments. The company's share would be applied on the rental for the use of the subway, which is to be leased to the company for twenty years.

The elevated lines would either be purchased by the syndicate or it would enter into an operating agreement for the interchange of transfers between surface, elevated, subway and bus lines.

The present 7-cent fare on the surface cars would be maintained for the time being and a 1-cent charge made for transfers between surface and elevated lines on the buses. The ordinance provides, however, for service at cost and the creation of a stabilization fund. Instead of being made up from the proceeds of bond sales, this fund would simply be taken out of the city traction fund.

Under the financial terms proposed default in principal on more than $165,000,000 of bonds maturing early next year will be avoided and the security holders protected. Old and new first mortgage bonds are both to be paid off within twenty years.

At the end of 30 years the city will obtain without cost and free of all debt the transportation system to be created under the new ordinance.

Opposition to the Lisman proposal still persists in meetings of the City Council sub-committee.

The questionable part of the plan, according to Major R. F. Kelker, committee engineer, hinges on the amortization of $50,000,000 of new money in first mortgage bonds out of 2 per cent of the gross receipts, or just one-fourth of the amount heretofore set apart in the renewal and depreciation funds.

"If any part of these funds is taken out without provision to return them soon," said Major Kelker, "the fare may have to go up to pay for rehabilitation."

Leonard A. Busby, president of the Chicago City Railway, estimated that the total payments to the amortization fund would run to more than $8,000,000 a year.

"This would mean," he said. "a 1-cent, 1½-cent, or possibly even 2-cent increase in each fare. If anybody thinks you can amortize $145,000,000 (the $50.000,000 in new money plus $95,000,000 bonds to be exchanged for present first mortgage bonds) in twenty years without going into the car riders' pockets, he has another guess coming. It can't be done."

Sub-Committee Asks Approval in Naming Committee of Citizens

After a series of prolonged and heated debates, the local transportation committee, which is charged with evolving a suitable traction ordinance before the present Surface Lines franchises expire four months hence, decided on Oct. 8 to ask the Chicago City Council to approve the naming of an advisory committee of private citizens at its next meeting, early in November.

The citizens finally agreed upon for membership on the commission are James Simpson, president of Marshall Field & Company; Stuyvesant Peabody, president of the Peabody Coal Company; William R. Dawes, banker and president of the Chicago Association of Commerce; W. A. Wieboldt of W. A. Wieboldt & Company; M. E. Greenbaum of Greenbaum & Sons, bankers; Patrick A. Nash, contractor; George Woodruff, banker; John Hayes, hotel proprietor; Richard Bland and a Chicago Real Estate Board representative. The City Council will be asked to select seven from this group.

This board of citizens was pictured by its advocates as a means of permanently solving the entire local transportation problem. Alderman Joseph McDonough, the committee's chairman, pointed out that as the Surface Lines grant expires next February "We must act fast, and I think it is

Digitized by Google

time the public knew we are not playing politics. Selection of a citizens' committee is the way to prove it."

Others, however, declared that the group will be only an advisory body and that practical business men will not relish the idea of indulging in the oratorical sessions of half a score subcommittees.

The plan for a citizens' advisory committee was approved by the local transportation committee last June, but its execution has been delayed in the hope that progress could be made between the Aldermen and traction officials without resorting to outside aid.

If appointed, the advisory committee will sit with the traction sub-committee in its dealings with the local traction executives and baskers.

Help Needed by Denver Tramway

Committee of Chamber of Commerce Sees Situation as Serious Unless Income Can Be Increased or Expense Be Cut—An Economic and Civic Problem Is Before City

IT APPEARS to a committee of the Chamber of Commerce of Denver, Cal., of which Judge W. Freeman is chairman, that the present operation of the Denver Tramway presents a very discouraging and alarming economic prospect for the future of the institution as a going concern in the city of Denver. As the committee sees it, there is no hope for the permanency of the operation of the company unless its income can be substantially increased, or its cost of operation can be substantially reduced.

The committee appointed to look into the economic situation surrounding the operation of the railway gave a good deal of time to the matter and had Ernest Stenger, president of the tramway, present at two of its sessions. At the request of the committee Mr. Stenger filed with it a copy of the communication which the Tramway company filed with the City Council of the City and County of Denver, together with the data attached thereto.

Mr. Stenger assured the committee that every economy was being adopted and that the prospect of further substantial reductions in operating costs could be considered negligible.

After going into the matter quite fully the committee believes that an improvement can come only from one of two sources, or a combination of two sources:

(a) That the fare be increased; (b) that the patronage on the present rate be substantially increased.

Doubt is expressed as to whether a very substantial increase in fare would not automatically reduce the patronage to a degree that would probably more or less defeat the objective.

Suggestion was made that if certain improvements in service could be had it would unquestionably result in a larger patronage in certain sections of the city, but the committee says that this would involve a cross-city service —broadly, between Washington Park and the Stockyards area. Whether this is practical or not the committee expresses no opinion in view of the fact that it would involve certain new construction and also raise the question of franchise over new streets, which could only be given by special election, and would be expensive and the result doubtful.

The committee says that the most practical suggestion it has discussed is a program of education pointing out the desirability of an increased patronage of the tramway by people who are so largely using automobiles for transportation between home and the downtown district in the ordinary course of the day. The committee was assured that if 10 per cent additional fares could be had on the present rate the economic situation of the tramway would be bearable. It was practically convinced that this was the most desirable solution of the whole question and one that would be of benefit to the individual, to the tramway, and to the community at large. The committee was not sure as to the method that would be most effective in this respect. The means to the end must be purely educational and must be based upon some appeal other than that of direct benefit to the tramway as a privately-owned enterprise.

The committee was persuaded that a community of the size of Denver cannot do without the service of a tramway and that, equally, the tramway cannot operate except on the basis which will take care not only of the current expense and upkeep but also a reasonable, if modest, income to the owners. The committee sees the matter as a community problem wholly apart from the fortune or misfortune involved in the ownership of the tramway.

The committee expresses no opinion and makes no recommendation as to whether or not the Chamber of Commerce should initiate a program to bring about a larger patronage of the street car. Its opinion merely is that from a community point of view something must be done to prevent great inconvenience to the community at large.

In conclusion the committee said:

> Your committee believes that with this report its functions should terminate and that if the Chamber, in light of the information herein transmitted, feels that it has a legitimate and promising field in which to function in the matter, the Chamber should itself determine the further ways and means for carrying out any procedure which, after full discussion in light of this report, the Chamber feels it should take.

Mayor Loath to Lose White Plains Trolley Lines

The proposal of the Third Avenue Railroad, New York, to substitute buses for trolleys on the Mamaroneck, Scarsdale and Silver Lake lines and to keep trolley cars running on the Tarrytown line at a 10-cent fare was rejected recently by Mayor Frederick C. McLaughlin and the Common Council. Instead, the city will seek to require the company to operate cars in White Plains for a 5-cent fare, as provided in the franchise of the Westchester Street Railway, which the Third Avenue interests purchased a few weeks ago at auction for $70,000.

Trolley cars have been running with a 5-cent fare since June 1, when Leverett S. Miller, then receiver, planned to discontinue them for buses. Prior to that time the fare had been 10 cents in zones. The Mayor is reported to have said:

> We are not by any means sold on the desirability of buses. It has not been fully demonstrated that they are preferable to trolleys. It might be a great mistake for White Plains to lose its trolley system at the present time.

Work Begun on Kansas City Rehabilitation

The Kansas City Public Service Company, Kansas City, Mo., following the approval of a twelve-year extension to the local city franchise, began on Oct. 11 to carry out several promised improvements and repairs. The actual beginning of the promised work was called to public attention through a double-page announcement carried in both morning and evening papers. The work under way is a portion of an outlay of about $6,600,000 to be made in rehabilitating the system.

Frank L. Conrad, vice-president of the company, said that crews will be put to work as quickly as they may be organized and that, granted open weather until late in the coming winter, the company expected to have much of the proposed work finished by the beginning of the snowy season.

Plans are also being formulated for the construction of two new substations, each to cost approximately $250,000, and a new carhouse to cost about $300,000. A new garage is also contemplated, and plans are now being drawn for an ornamental viaduct to be constructed at 43d Street and Millcreek Parkway, replacing the present unsightly trestle at that location.

Notice of intention to circulate petitions for a popular referendum on the twelve-year extension of the local franchise was being prepared early during the week ended Oct. 16 by Herman M. Longworthy. Such a notice, to be legally effective, must be filed not later than Oct. 15. If filed by that date, the notice will automatically delay the effectiveness of the franchise extension ordinance 30 days. About 15,000 persons must sign the petitions before a referendum may be taken.

A meeting of the special franchise committee of the City Council was announced for Oct. 14 to confer with officials of the railway about a complete new franchise. It is said that the old franchise will be considered, section by section. President Woolfolk has expressed his willingness to work with the city, or its Council committee, at any time, to formulate a new franchise which would be satisfactory to the public, the city officials and the company. The idea is to have the new grant supersede the present franchise and its twelve-year extension, voted by the City Council two weeks ago.

The special committee was appointed on Oct. 11 at the suggestion of Mr. Woolfolk.

Chicago Extensions in Effect

Officials of Rapid Transit Lines and Aurora & Elgin Announce Details of Operation

The Chicago Rapid Transit Company, Chicago, Ill., has extended service westward to Maywood, Bellwood and Westchester. This new "L" service now places the new model suburban residential community of Westchester within 42 minutes of the Loop.

Rapid Transit trains are operated direct from the Loop to Maywood, Bellwood and Westchester over the Garfield Park branch of the Metropolitan division. A 24-hour-a-day service is being maintained, with express service at twelve-minute intervals throughout the day. Eight-car trains are now operated between the new Westchester terminal and the Loop in the rush-hour periods. This means an extension of "L" service westward from the present terminus at Des Plaines Avenue, Forest Park, over the tracks of the Chicago, Aurora & Elgin Railroad. Rapid Transit trains now operate southward from Bellwood to Roosevelt Road, Westchester, over the new tracks just recently completed.

This new Rapid Transit service has replaced the Chicago, Aurora & Elgin local service to and from Chicago. However, the Aurora and Elgin is continuing to maintain stations at Fifth Avenue, Maywood, and at Bellwood, where passengers are received and discharged to and from all points west of Bellwood. For this same purpose the present stations also are maintained at Marshfield Avenue and Laramie Avenue, Chicago; Oak Park Avenue, Oak Park, and Forest Park.

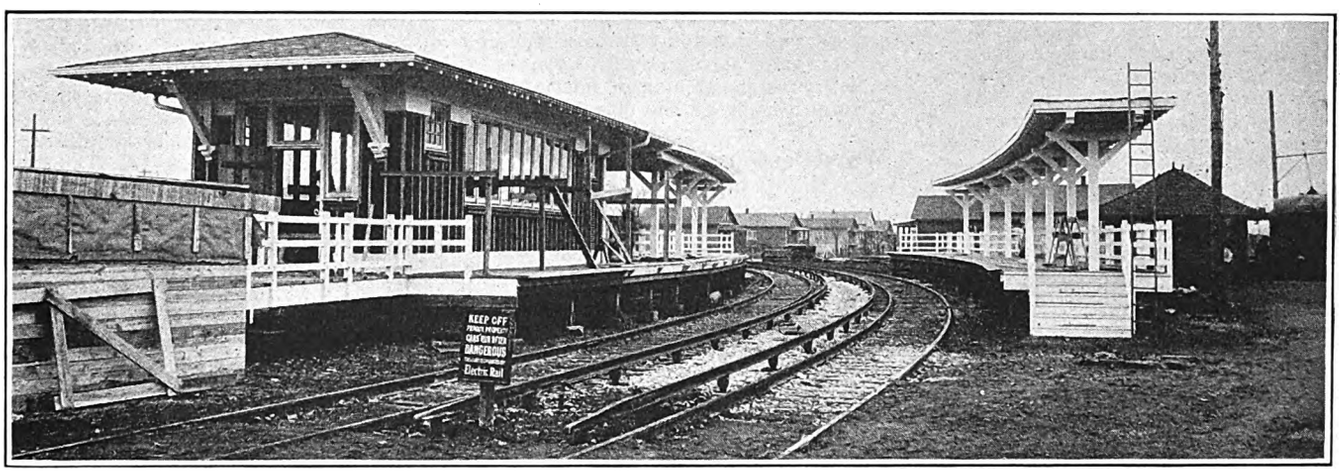
Through this operating arrangement greater transportation facilities are offered both within and beyond the Chicago Metropolitan District. Extension of Rapid Transit service means improved service for Maywood and Bellwood. The release of Aurora and Elgin equipment from this local service likewise will mean improved service for Elmhurst, Lombard, Glen Ellyn, Wheaton and communities further west.

Rapid Transit trains to and from Westchester are operating around the Loop and free transfer privileges enable one to transfer without additional charge to and from "L" trains reaching all other sections of Chicago.

Further improvement of facilities for the proposed extension of the service of the two railway companies westward will be made in the near future with construction of the new Wells Street terminal, to be used jointly by the "L" and Chicago, Aurora & Elgin lines.

Improvements on Elgin Line

Increased service, adjustment of train schedules for the greater convenience of passengers, a new midnight flyer to Fox River Valley points and an additional limited train at 11 p.m. were recently announced by Col. E. J. Blair, general manager of the Chicago, Aurora & Elgin Railroad, Chicago, Ill. The changes were effective Oct. 1. At the same time Colonel Blair announced that contracts had been let for the new Chicago loop terminal at Wells Street, and that right-of-way had been improved with runs around the track at Forest Park and Oak Park. This will permit of faster operation. Construction work on the new station will be commenced as soon as possible. In addition the right-of-way east of Wheaton has been improved by laying 2,100 tons of 100-lb. rail. Colonel Blair believes that the taking over of the local service to Maywood and Bellwood by the Chicago Rapid Transit Company will materially aid the value of the service of the Aurora-Elgin Line.



Commodious Station at Bellwood on New Chicago Rapid Transit Line

New Line Projected in Milwaukee

The Milwaukee Electric Railway & Light Company has applied to the Wisconsin Railroad Commission for permission to construct a new electric railway south of the city of Milwaukee. The new line will be located in the towns of Lake and Oak Creek, connecting with the present southern terminus of the Vliet-Howell Avenue line, where it will be joined to the freight line to be built west from the Lakeside power plant to the Chicago, Milwaukee & St. Paul Railroad tracks. The proposed line would form a connection between the Howell Avenue line and the proposed cut-off west of Cudahy and South Milwaukee. It will provide a rapid transit service similar to the Waukesha rapid transit line, connecting Milwaukee, Racine and Kenosha.

Eight Cents in Duluth

The Duluth Street Railway, Duluth, Minn., will collect a cash fare of 8 cents or will sell tokens at the rate of five for 35 cents, beginning Oct. 15, in accordance with an order made on Oct. 4 by the Minnesota Railroad and Warehouse Commission, with one of three commissioners dissenting. The order followed hearings on the application by the company several months ago and is based on the theory of allowing the company a return of 7½ per cent on its property valuation, the same as in the Twin City Rapid Transit cases of last year. The found valuation is $5,291,710, as of Dec. 31, 1925. Passengers carried that year totaled 25,149,212, to date in 1926 24,193,209, and the company's estimate for 1927 is 23,273,867. The application which has just been acted upon by the commission was filed July 31, 1925. The commission also indicated that the rate of 8 cents cash and six rides for 40 cents established in the Twin Cities would be comparable to a 10-cent cash fare in Duluth, with six tokens for 40 cents.

An appeal was taken from the commission's ruling of July 13, 1922, ordering a rate of 6 cents cash and five rides for 25 cents to the U. S. District Court. Following the order of the court establishing this rate another application was made. The valuation as of December, 1921, was found to be $4,599,978. The return was set at 7½ per cent and the 6-cent rate made effective Aug. 1, 1922. The city appealed to the district court and the railway applied to the federal court for an injunction on the ground that the rate was confiscatory. The injunction restrained the commission from interfering with the collection of not more than 6 cents cash. On Jan. 24, 1925, the federal court permanently enjoined the commission from enforcing its order of July 13, 1922, until such time as the commission would establish a just and reasonable rate of fare. This decision was appealed to the United States Supreme Court.

The dissenting commissioner, O. P. B. Jacobson, said action should be withheld until a ruling has been rendered on the appeal taken to the U. S. Supreme Court from the district court.

Half Pay Pensions for New Jersey Employees

Changes in the welfare plan of the Public Service Railway, Newark, N. J., which provide what is practically half pay pensions for employees upon retirement, were announced recently by President McCarter. He said the new provisions were voted by the boards of directors "as a further recognition of the faithful and loyal service rendered by Public Service staff."

The new provisions are retroactive and apply to the 192 former employees now receiving pensions as well as to all other eligible employees. Employees upon retirement will receive a pension computed upon the average yearly wage or salary received during the five years next preceding the date of retirement. For each year in the company's employ they will receive 2 per cent of such average pay, this allowance being double that which was formerly made. The maximum pension payable after 25 years service will be half pay, but no pension will be less than $500 a year. For exceptionally long employment additional provision is made. For men retirement is optional between 65 and 70 years of age and compulsory at 70 years; for women, optional between 60 and 65 and compulsory at 65 years.

The Public Service welfare plan was established Jan. 1, 1911.

Baseball Crowds in St. Louis Handled Expeditiously

The United Railways, St. Louis, Mo., handled effectively on Oct. 5 one of the city's greatest transportation problems. In the afternoon the opening St. Louis game of the World Championship Baseball Series was played at Sportsman's Park, Grand Boulevard, while that same evening the annual parade of the Veiled Prophet was held.

To handle the 40,000 fans who managed to get into the baseball park and many additional thousands the railway maintained special service on nine lines running to or near the ball park. When the baseball game was over the company had cars available on all of the lines sufficient to handle the fans with a minimum of delay.

Petition of Gloversville Road Heard

The Public Service Commission recently heard the petition of the Fonda, Johnstown & Gloversville Railroad for permission to increase passenger fares on its New York electric division in the cities of Gloversville, Johnstown, Schenectady and Amsterdam and the villages of Fonda, Fort Johnson, Hagaman and intervening stations. The company proposes to increase fares from 3 to 3½ cents per mile on interurban lines and to 8⅓ cents in municipalities, with a maximum charge of 10 cents for individual rides. It proposes to issue six tickets for 50 cents and school tickets in coupon books of 100 for $5.30. "Workmen's tickets," so called, would also be issued at the rate of three for 25 cents. In its petition the company states that the gross revenues derived from the operation of its electric division for some years past have been so seriously impaired by the use of automobiles that the proposed increase in fare is immediately needed.

Program of Improvements Fast Being Completed in Hamilton

Answering questions as to what progress is being made with the various improvements to the railway system provided in the agreement reached between the city and the company last spring, George E. Waller, general manager of the Dominion Power & Transmission Company, stated that there were now ten buses in operation on the Cannon Street and Main Street routes and that orders for 24 new street cars would be placed within 30 days. Work of relaying the tracks on King Street, East, has just been completed and the work on Barton Street between Ottawa Street and Kenilworth Avenue will be finished soon. The company has purchased all the land necessary for the erection of the new carhouse and all that is holding up the spending of approximately $300,000 upon these buildings is the closing of part of King William Street by the city.

Wages Adjusted to Living Costs in Salt Lake City

A reduction of 1 cent an hour in the wages of the platform employees of the Utah Light & Traction Company, Salt Lake City, Utah, has been made in accordance with a contract between the company and the employees by which the wage scale is to fluctuate with the cost of living in Salt Lake City. The living costs are taken from the United States bureau of labor statistics. This month the bureau reported a reduction in the cost of living of 3.1 points for the first six months of this year.

The reduction went into effect on Oct. 1.

Strike Off in Asheville

Striking employees of the Carolina Power & Light Company, operating in Asheville, N. C., returned to work on Sept. 29 under exactly the same conditions and same wages as prevailed prior to the strike. These conditions and rates of pay were covered by a contract to run two years.

The strike in Asheville was occasioned on Sept. 25 when the men quit work after the company refused to accede to demands for an increase in pay of 10 cents an hour, a six-day week, pay for time off for lunch and the execution of an agreement whereby the same working conditions would extend to the bus operators. In the past the company has been unable and unwilling, for operating reasons, to make it an inflexible rule that men should have one day off a week. However, the company has been allowing the men, when they so requested, one day off each week and many of the men have been availing themselves of this privilege. Other men have desired to work seven days a week, and this has also been permitted. Under normal conditions all platform men who so desire will have a day off each week as heretofore.

News Notes

Educational Courses in Milwaukee.—What it purposes to accomplish for the educational advancement of its employees is outlined by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., in a 36-page pamphlet entitled E. M. B. A. Educational Program. Under the slogan "The Trained Man Wins" many and varied courses are herein described, advice given to members of the Employees' Mutual Benefit Association on elective subjects and general information on class hours, home work and books. Many courses are offered on utility operation, each one dealing "with some particular phase of our service or the operation of our system." All educational work is supervised by the staff of the educational department.

Utility Courses Will Not Conflict with Students' Employment. — The Northwestern University School of Commerce, Evanston, Ill., will begin its afternoon and evening courses in public utilities in Wieboldt Hall, Chicago Avenue, Chicago, on Oct. 14. The first semester will terminate Feb. 12. The second semester starts Feb. 21 and concludes June 13. These courses emphasize the economic, financial, legal and managerial principles underlying effective operation and management and the problems arising out of public regulation and control. Many of the courses are offered in hours which will not conflict with a student's regular employment. These courses are offered by members of the regular faculty, or members of the staff of the Institute for Research in Land Economics and Public Utilities, which has recently become affiliated with Northwestern University.

Utility Courses at Indiana U.—Indiana University, Bloomington, Ind., through its School of Commerce and Finance, is again offering a course in the principles of public utility operation. The co-operation of the Indiana Public Utilities Association has been obtained to give the practical information to students. Executives of the association's member companies will deliver addresses on some phases of the utility industry, to supplement the classroom and textbook work. Dean William A. Rawles, in announcing the course, explained that it was not intended to be a professional course for the training of future utility executives, but a course in general information on utilities for young men planning to enter the business world.

More One-Man Cars at Montreal.—The Montreal Tramways, Montreal, Que., has selected four routes on which to start the new one-man cars. They are: Guy-beaver Hall, St. Antonie, Amherst and Notre Dame East. Oct. 12 was set as the tentative date for the starting of the new service. On that day the regular two-man cars were to be withdrawn on the four routes and only one-man cars run. J. E. Hutcheson, vice-president and general manager of the company, said that the

Digitized by Google

change to one-man cars would mean a more frequent service. All of the 50 cars ordered some time ago from the Canadian Car & Foundry Company have been delivered. The employees are now undergoing a course of training qualifying them to serve as motormen and conductors combined.

Foreign News

Berlin Officials Visit American Cities

F. Lademann, in charge of traffic of the Berlin Street Railway, Berlin, Germany; F. Lange and H. Amberg, members of the advisory board of the city of Berlin, are on a tour of the United States to study traffic and transportation conditions. They were in New York on Oct. 2. They plan to visit Boston, Cleveland, Chicago, Detroit, St. Louis, Pittsburgh, Washington and Philadelphia. The party expects to be back in New York on Nov. 1.

New Electric Railroads in Germany

Two sections of the Berlin Town, Circle & Suburban Railroad have so far been electrified, that between the Stettiner station and Bernau, 15 miles, and that between the same station and Oranienburg, 17½ miles. Work is now in hand on the electrification of the section between the Tegel section and Velten. On the two completed lines 29 "half-trains" are in use, these consisting of two motor coaches and two non-motor coaches, each train having accommodation for 800 passengers. Owing to the greater acceleration and speed of the electric trains over the old steam system the time for the journey between Berlin and Bernau, including stops at intermediary stations, has been reduced from 48 to 36 minutes.

One-Man Operation in Switzerland

An electric motor car designed for one-man operation has recently been put in service on the Berne-Worb Railway in Switzerland. The car was built by the Swiss Industry Company of Neuhausen and the electrical equipment supplied by the Ateliers de Secheron of Geneva. This is designed to operate on 750 volts d.c. and to haul three trail coaches of a total weight of 30 tons at an average speed of 15½ m.p.h. The line is 6 miles in length and has an average gradient of 1.6 per cent, the maximum being 3.6 per cent.

Two electric motors of the four-pole type are provided, each with an hourly capacity at the wheel rims of 75 hp. The ratio of the gearing is 5.42 to 1. The coach measures 43 ft. 4 in. over all, with a wheelbase of 26 ft. 2 in. It has a capacity for 36 seated and sixteen standing passengers. The electrical equipment weighs 7,600 lb. and the body and mechanical equipment 30,400, or a total weight of 19 tons.

Recent Bus Developments

Police Guard Riderless Buses in Buffalo

Railway and City Cold Toward Roseate Dream to Spend $8,000,000 on Mayor's Experiment

Buffalo newspapers are having quite a bit of fun at the expense of Mayor Frank X. Schwab, whose latest roseate dream for the solution of Buffalo's transportation problem is a municipal fund of $8,000,000 with which to finance the purchase and operation of 800 buses, together with garages, service stations and all the paraphernalia that is needed for a successful transportation system in competition with the International Railway and its subsidiary, the International Bus Corporation.

The latest idea of Mayor Schwab does not fall with soothing effect on the ears of the other four statesmen in the City Council. They have been trying unsuccessfully for the last three or four weeks to find out what has become of the $10,000 they appropriated for municipal buses. There has been talk that a taxpayers' action might be started against members of the Council, individually and personally, to collect the funds out of their own respective pockets and place them back in the city treasury. This has made their nights uneasy and their days dreaded for fear of process servers.

So it came to pass that Commissioner John J. Love hastened to the City Hall and announced that he will vote against any further appropriations to continue Mayor Schwab's experimental bus lines and that he will vote against any contracts for the purchase of additional buses.

Commissioner James P. Moore says he will stand by his friend Love in the Council and Commissioner Schwartz is practically certain to join the group. Mr. Love wants it made clear that he is basing his action on an opinion given by the City Law Department to the effect that the courts have held that a municipality cannot legally operate bus lines. The Mayor, however, is emphatic that he is going ahead with his plans even if it might cost the taxpayers the $8,000,000. Says the Mayor:

> Besides placing the control of the transportation system in the hands of the city, where it should be, the bus routes will reduce the number of traffic accidents, because riders will get on and off at the curb instead of being forced to walk to car tracks.
>
> The present two bus lines will be augmented as fast as possible. The International Railway threatened to get an injunction out against me within two days after I started the bus lines, but the lines have been running two months and the railway officials haven't one yet. There are plenty of parallel streets between Buffalo parks, and if they enjoin us from running on one street, we'll move over to the next street.
>
> I am in this fight to a finish. Winter is coming on and I am not going to see the people standing around in slush and zero weather waiting for street cars that don't come. I'm going to provide adequate transportation.

While all this talk is going on the International Railway is watching the municipal buses run up and down the city streets with practically no passengers, but well guarded and protected by city police. This has continued for several months and taxpayers are beginning to wonder what the Mayor's experiment is costing them.

B. J. Yungbluth, president of the railway, says that the minute the City Council approves applications pigeonholed for more than a year additional bus routes will be established to meet the needs of rapidly growing sections of the city. Several new cross-town bus lines are said to be essential.

Co-ordinated Service Extended in Hammond

A new motor coach line, demonstrating the benefit the public receives when motor coach and electric railway service is co-ordinated, was established on Sept. 27 by the Calumet Motor Coach Company in Hammond, Ind.

The service was started to bring the station of the Chicago, South Shore & South Bend Railroad, an allied company in the control of the Midland Utilities Company, closer to the business district of that city.

The schedule has been so arranged that all east and west bound South Shore trains are met by the coaches. The line is about 1 mile long. The fare is 10 cents, but transfers are issued to all other city lines of the Calumet Motor Coach Company.

The South Shore Line is growing increasingly popular with the residents of Hammond and the demand has been insistent for dependable service to and from the local station.

More Bus Lines for Milwaukee

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has applied to the city for permission to install auxiliary bus service on the south side. This line would extend from National Avenue and Twenty-second Avenue south to Forest Home Avenue.

Other Angles to Detroit Jitney Case

The fight against jitney operators in Detroit, Mich., has been renewed by the city's legal department. In answer to a motion filed with the State Supreme Court, asking the dismissal of the stay of proceedings under which the jitneys are now operating, the jitney operators received a ten-day respite.

An opinion of the State Supreme Court, handed down last spring, held that the ordinance barring jitneys was constitutional. Later Judge Bird restored the original injunction issued by Judge Hunt in 1923, which permitted the jitneys to continue. It was argued by the corporation counsel that Justice Bird's order was improperly issued, and

Digitized by Google

it is considered by other justices that the chief question is the right of Justice Bird to issue such an order during the vacation period and without consulting the other members of the court. Justice Bird's order remains in effect while the briefs are being prepared by the attorneys for the two sides.

The corporation counsel argued that the writ issued by the United States Supreme Court was simply an expression of willingness to review the case. Barnard claimed that Justice Bird was within his rights, and contended that the restraining order against the city acts only to keep the issue alive until it is settled in Washington by the United States Supreme Court. It was his further claim that if the order is withdrawn, the jitney organization will be out of existance by the time the United States Court has issued a decree.

In his motion asking dismissal of the stay of proceedings, the assistant corporation counsel pointed out that the primary election on Sept. 14, when the people voted against an amendment to allow jitneys to operate, shows that most voters wish to pursue the course outlined in the city charter and bring all the city transportation agencies under municipal ownership as soon as possible.

It is further cited in the bill that since the original injunction was issued, the city has not been able to exercise even precautionary measures of regulation over the jitneys. The jitneys, it is cited, have obtained a revenue of approximately $1,500,000 from the free use of the streets since 1922 and that the operation of the jitneys has caused a net loss of revenue of about $1,000.000 to the municipal railway. The bill reads:

> If an exclusive franchise were given to a private corporation under the laws and ruling of the court, its rights and property would and must be protected by the court. The city of Detroit, which has invested its taxpayers' money in a transportation system, giving it an exclusive franchise, is entitled to the same protection and even more so, because the money of the public and taxpayers is invested not for pecuniary profit but to serve themselves and the public at large at a cost of operation fare.

The corporation counsel asks that the stay of proceedings be dissolved or that a bond of $1,000,000 be issued to protect the city against any loss by reason of the issuance of the stay, pending the settlement of the case by the United States Supreme Court.

More Puget Sound Bus Lines Purchased

The Park Auto Transportation Company, Tacoma, Wash., a Stone & Webster concern operating bus lines in connection with the interurban electric line between Seattle and Tacoma, has purchased holdings and property of the Northwest Transportation Company, Olympia, which give it bus lines for the continuous trip between Seattle and Portland and from Tacoma to Tenino.

In addition the Puget Sound Electric Railway, also a Stone & Webster concern, has purchased the stage lines of the Northwest Transportation Company between Olympia and Kelso.

Holyoke Bus Argument Reassigned

The Interstate Buses Corporation, filed a brief in the Supreme Court on Oct 4 in its appealed case against the Holyoke Street Railway, Holyoke, Mass., and the case has been reassigned for argument on Oct. 25 before the United States Supreme Court. The bus company, a Connecticut corporation, seeks to have an injunction removed which prevents the operation of its bus line between Hartford, Conn., and Greenfield, Mass., via Springfield, Holyoke, Amherst and smaller towns.

The Holyoke Street Railway alleged illegal operation and declared that the bus company was competing unfairly with the railway in Holyoke. At the same time it stated that passengers were being transported over a route in Massachusetts without the required certificate and licenses.

The bus company applied to the federal court for the District of Massachusetts without success to have subsequent suits of the railway restrained. Meanwhile the court enjoined the Interstate from operating without the necessary licenses. Now the Interstate has appealed to the Circuit Court.

Pasadena-Tierra Alta Line Authorized

A certificate has been granted by the Railroad Commission to Pacific Electric Railway for the operation of motor coaches between Pasadena and Tierra Alta, Cal., over the following lines, North Los Robles Avenue line, North Orange Grove Avenue-Center Street line, North Elmoreno Avenue line, North Hill Avenue line, North Stevenson Avenue line, North Lake Avenue-East Orange Grove Avenue line, California Stret-South Robles-South Raymond Avenue line, South Marengo Avenue-Glen Arm Street line.

Buses to Be Used by Willapa Railway

Buses eventually will be substituted for street cars for the Raymond-South Bend run by the Willapa Electric Company, Raymond, Wash. That is the decision of the State Department of Public Works. Some time ago the company asked for permission to substitute bus service for the railway between Raymond and South Bend. The Ocean Beach Transportation Company had filed a petition for a similar franchise. The Willapa Electric Company replied by asking for a franchise from South Bend to Pt. Ellis in competition with the Ocean Beach Transportation Company. By mutual agreement, it is arranged that the electric company have the South Bend-Raymond franchise and the Ocean Beach Company exclusive right to the South Bend-Pt. Ellis run, with permission to take through passengers to Raymond.

Another Bus Line in Tulsa.—The Oklahoma Union Railway has added a new bus line to its service in Tulsa. The new line starts at 21st Street and Harvard Avenue and extends to Waverly and to Admiral Boulevard.

Will Vote on Five-Cent Bus Line.—Citizens of Forest Hill, Ont., are to have a chance to vote on Oct. 30 on the proposal to make an agreement with the Toronto Transportation Commission, for a bus service through the village. At a special meeting of the Village Council it was decided to put the plan before the electors. The proposal is to have a fifteen-minute service supplied by one bus, at a 5-cent fare, the deficit to be met by the municipality. D. W. Harvey, general manager of the commission, estimates that the deficit may be between $2,500 and $3,500. The round trip could be made in half an hour, it is estimated.

Skip-Stops on Bus Lines.—The Los Angeles Motor Bus Company, a subsidiary of the Los Angeles Railway, Los Angeles, Cal., has received authority to reduce the number of stops on its bus and railway lines. Bus stop signs will be erected on all of the lines and then buses will stop only at such marked stops. Under the new scheme there will be from six to eight stops to the mile. The bus stop signs are triangular in shape, of enameled iron, and read "Bus Stop" in black letters on a yellow background, both sides of the sign being alike. Those used by the Los Angeles Railway read in addition "LARY."

Taxable Bus Operation Filed.—The Connecticut Company recently filed a tax list under protest at Hartford, Conn., to cover 26 buses it operates in that city. This was done by the company to avoid the 10 per cent addition for failure to file the tax. George D. Watrous, general counsel for the company, has stated that in his opinion the company is not subject to taxation of its buses by municipalities. The Hartford board, however, differs and informed the company that should the tax statement not be filed the company would be subject to the usual 10 per cent addition. This is the first year Hartford has included buses in its grand list. The city of Hartford bases the course it has taken on an act approved by the Legislature in 1925.

Bus Service Started in Vandergrift.—Two modern type Yellow coaches were operated recently in Vandergrift by the West Penn Railways, Pittsburgh, Pa. One of these vehicles is to be operated regularly between Vandergrift and North Vandergrift and the other to be kept in reserve to guarantee uninterrupted service and to provide additional capacity when needed. Each bus can accommodate 21 passengers. The service is operated under the name of the "Penn Bus Lines." Buses connect with the Leechburg and Apollo electric cars at North Vandergrift.

Railway Loses on Bus Issue.—The Public Service Commission on Sept. 27 denied the application of the International Railway, Buffalo, N. Y., for a rehearing on the petition of Zenos H. Hill for the transfer of his certificate to the Buffalo Valley Bus Lines, Inc., for the operation of a bus line from the hamlet of North Java to the city of Buffalo. No proof was offered at the hearing upon any question involved in the application which was not already covered by the company in the original petition.

Constructive Decision at Salt Lake

Utah Commission Decries Operation at Continual Loss to Company and Car Rider—Buses Substituted

The Utah Public Utilities Commission recently approved an application of the Utah Light & Traction Company which permits the company to abandon service between Centerville and Salt Lake City and to remove its trackage and other appurtenances. In lieu of the street car service the company is required to substitute buses. The company is planning to furnish a combined service consisting of the street cars to the city limits, which is also a fare limit, and to operate buses from this point to Centerville, 7½ miles from the north limits of Salt Lake.

The Centerville line, extending from the north city limits of Salt Lake City to Centerville, with a terminal in Davis County, parallels the state road or paved highway leading through Davis County to Ogden City, Weber County, Utah. The line was constructed in the year 1912.

The commission ruled that the operating revenues of the line for more than five years past have been insufficient to meet the operating expenses; that for the year 1925 its gross operating receipts were but $21,276, while its operating expenses amounted to $30,688; that the annual average rate of return for five years, from Jan. 1, 1921, to Dec. 31, 1925, based upon the valuation of the applicant's entire railroad system, as fixed by the commission in its order of Jan. 15, 1920, at $8,468,279, was only 2.82 per cent, and that the inventory value of the applicant's Centerville line, as found by the commission, was $180,178. The commission found that the revenue fares carried for 1925 were 347,764, against 324,495 in 1924 and 405,902 in 1923. That the total revenue fares carried on the applicant's entire street car system for the year 1925 was 30.245,423, of which the Centerville line carried 347,764.

It was the belief of the commission that from the salient facts found it was apparent that the Centerville line could no longer continue to operate under existing conditions and circumstances without incurring a loss of approximately $10,000 a year. Further, this loss must be sustained by the applicant, or it must be borne by the car riders of the entire railway system. The commission was convinced from the evidence that the territory served by the Centerville line had been, in a great measure, built up and improved by residents who had faith that the street car line under consideration would remain and serve them as a public utility.

Although counsel for protestants, the commission said, seemed to question the power of the commission to permit the applicant to withdraw its rail service in view of the franchise rights granted to it by Davis County and the city of Bountiful, not yet expired, such right has been repeatedly upheld by the courts of highest authority, both federal and state, when the continuance of a rail service would entail either heavy financial loss on the part of the applicant or else cause a great burden to be borne by the car riders on the entire railway system.

The commission felt, however, that the Utah Light & Traction Company owed something to the communities that had grown up and had developed in faith that the street car line would remain as a permanent convenience to meet their transportation needs. Accordingly the commission felt that the applicant should be permitted to discontinue its Centerville line on the condition that it, either by itself or through some subsidiary corporation, provide automobile bus service over the public paved highways between North Salt Lake and Centerville, including intermediate points, of equal frequency and at the same fares as were now being charged by rail lines. Provision should also be made for auxiliary or supplemental service in the morning and evening to the Val Verda district, as necessity may require. The commission reserved jurisdiction as to the adequacy, frequency and continued necessity of this service pending the trial of schedules offered by the railway.

The commission, however, did not assume to say what the cost of rendering bus service would be, but expected that it would be rendered safe, commodious and efficient, and at the same time would prove reasonably adequate to preclude, in a very large measure, the losses now incurred by rail service.

In conclusion the commission stated that "the conditions herein imposed upon and consented to by applicant are not to be regarded as merely temporary, but to remain permanent to meet the requirements of the communities affected and as the best interests of the general public shall demand." The application of the company was submitted on May 26, 1926.

$5,000,000 Preferred Issue to New Jersey Customers

The Public Service Corporation of New Jersey has announced plans for an offering to customers of $5,000,000 of 6 per cent cumulative preferred stock. Fifty thousand shares of $100 par value will be marketed on Oct. 1, at which time the company will open another customer ownership campaign by selling securities on installments.

The stock will be offered at par and accrued dividends, for cash or at the rate of $10 a share monthly. Interest at the rate of 6 per cent annually will be paid on installments and the purchaser will receive the accrued dividends when he completes his payments. Adjustments for interest will be made when the stock is delivered.

The company in previous campaigns has sold 7 and 8 per cent preferred shares to customers.

Details of Large Merger in Arkansas Practically Complete

The Arkansas Power & Light Company has been incorporated under the laws of Arkansas, with an authorized capital of 1,300,000 shares of common stock, 150,000 shares of $7 preferred stock and 100,000 shares of $6 preferred stock, all without par value. The new corporation is the largest public utility company ever incorporated in Arkansas. It is the intention to merge into this company the present Arkansas Light & Power Company, Arkansas Central Power Company, the Pine Bluff Company and East Arkansas Power & Light Company and other miscellaneous properties. These companies are now controlled by the Electric Power & Light Corporation and the latter company will control the new Arkansas Power & Light Company. The new company, in addition to supplying electric power and light service to a large area of Arkansas, will also supply electric railway service in Pine Bluff and Little Rock.

Stockholders of Arkansas Light & Power Company, Arkansas Central Power Company and the Pine Bluff Company will vote upon the merger at special meetings which it is planned to call soon. Providing the merger is voted upon favorably, holders of the present $7 preferred stock of the Arkansas Light & Power Company, Arkansas Central Power Company and the Pine Bluff Company will have the opportunity to exchange their stock, share for share, for the $7 preferred stock of the new Arkansas Power & Light Company.

Economy Program for Seattle Municipal Railway

Present prospects are that the proposed program of economy for the Seattle Municipal Railway, Seattle, Wash., outlined in the recent report of Clark R. Jackson, superintendent of public utilities, will be put into effect. The citizen's advisory committee, recently appointed by Mayor Bertha K. Landes, has declared its belief that the plan should be tried, and members of the City Council also favor the plan. Mayor Landes, however, said she would take no action until the return of D. W. Henderson, superintendent of railways, who is expected back from the East on Oct. 15.

Mayor Landes says that it will cost not more than $10,000 to make the necessary track changes to put the loop system into effect, whereas the estimated saving is placed at $50,000 a month. It is also estimated that $200,000 more can be saved by a reduction in the power rate and curtailment of services in a number of instances.

Mr. Jackson points out that the railway lost $27,215 on the five bus lines operated in 1924, exclusive of depreciation and interest; $44,012.39 on eight lines in 1923, two of which were oper-

Digitized by Google

ated only a few days, and during the first six months of this year lost $44,012. He said:

> We will soon be operating 33 buses on eleven routes. We own the buses, and it, therefore, seems necessary to operate them. I suggest, however, that a moratorium be declared on further extensions and that the system be adjusted in an attempt to reduce losses on the lines already in operation.

Under the new system it is planned to turn back at Pike Street all cars from the north and east which traverse the retail business district. All cars from the south also would be turned back at that point.

$784,000,000 for Rapid Transit in New York

Investment by the city of New York in rapid transit lines, in round figures, now amounts to more than $320,000,000 The grand total of investment by the city and the railways, including the investments of the latter for equipment and their contribution to the city's cost of construction, amounts to $615,540,000.

This does not include the investments made in the company-owned railroads—the old elevated lines—prior to the signing of the dual contracts on March 19, 1913. These elevated railroads, on the basis of the companies' books, represent original expenditures amounting in round figures to $169,000,000, thus making the cost of the whole rapid transit system of New York about $784,000,000.

The Interborough system of subways and elevated extensions of subways extends from the Bronx, through Manhattan and into Brooklyn and Queens. The Brooklyn company's system extends through Brooklyn, a part of Queens, into Manhattan and again in Queens, where use is shared with the Interborough of two lines in that borough. This dual system for the first time brought both companies into and through the community center of Manhattan, linking up four of the five boroughs of the city, and providing a maximum ride of nearly 17 miles at a 5-cent fare.

The dual contracts involve a number of financial arrangements other than those which relate merely to construction. The New York Transit Commission is charged with the duty of administering these contracts with the operating companies on behalf of the city. The commission is, in effect, the warden of the city's investment in the company-operated subway lines.

The accompanying tabulation shows the approximate expenditures to June 30, 1925, made by the city and the companies in connection with rapid transit lines. The amounts stated under contracts Nos. 3 and 4 and the related certificates are tentative and subject to the determination of the chief engineer.

CONTRACTS NOS. 1, 2, 3, 4 AND CERTIFICATES RELATED TO CONTRACTS NOS. 3 AND 4

City's and Companies' Investment—June 30, 1925		
City's Investment:		
Contracts Nos. 1 and 2	(a)	$61,000,000
Contract No. 3		103,250,000
Contract No. 4		156,500,000
Total, city (Rounded)		$320,750,000
Companies' Investments:		
Interborough Rapid Transit Company:		
Contracts Nos. 1 and 2	(b)	$46,000,000
Contract No. 3:		
Construction $57,821,100		
Equipment 48,487,000		
Additions to construction 221,000		
Additional equipment 10,061,000		
Total, contract No. 3		116,590,000
Certificates for company lines		44,158,00
Total, I.R.T. Company (Rounded)		$206,748,000
New York Rapid Transit Corporation:		
Contract No. 4 (City lines):		
Construction $14,191,000		
Equipment 31,184,000		
Additional equipment 2,771,000		
Total, contract No. 4 (city lines)		$48,146,000
CoWpany lines, contract No. 4, and related certificates		39,896,000
Total, New York Rapid Transit Corporation (Rounded)		$88,042,000
Grand total	(c)	$615,540,000

Notes:—The above figures in city investment include expenditures from proceeds of both corporate stock and revenue bonds:

(a) Does not include $5,500,000 for city's superintendence.

(b) Includes $9,000,000 excess construction cost of contract No. 2.

(c) Does not include any investment in company owned railroads prior to March 19, 1913.

Merger Reports at Lincoln

Gossip in financial circles in Lincoln, Neb., points to a possibility of a merger of the Lincoln Traction Company property with that of the Omaha, Lincoln & Beatrice Interurban, but the local officials insist they have no knowledge of any negotiations. The United Light & Power owns the railway system and the Robinson-Musser rubber interests in Akron hold the interurban, which operates between Lincoln and University Place and Lincoln and Bethany, both suburbs, 6 miles distant. The two corporations have got along amicably for years, the interurban buying its current from the other and leasing a portion of its tracks for traction use. The recent application of the interurban for permission to run buses that would tap the downtown district from which the traction company gets the cream of its traffic brought a protest from the latter. This collision of interests is believed to be responsible for the story that the compromise negotiations include a possibility of sale and purchase.

Purchaser Wanted for Ohio Road

Charles W. Eliff, attorney for the receivers of the Dayton, Covington & Piqua Traction Company, West Milton, Ohio, has announced that the line will be discontinued on Nov. 6. Judge Smith Hickenlooper has approved the petition of the receivers to discontinue service if there is not a purchaser before Nov. 6.

Permission to abandon the line was originally granted to receivers by the Ohio Public Utilities Commission on Nov. 28, 1925, but the line was kept in operation in the hope of finding a purchaser for it as a going concern. A sale was advertised to be held Feb. 13, 1926, but there was no bidder for the property. Moreover, there has been no organized response to attempts to interest groups of people served by the line in the purchase of the property. The company operates more than 30 miles of line.

More Passengers in Baltimore.—For the first eight months of this year the United Railways & Electric Company, Baltimore, Md., carried 148,870,529 passengers, against 148,298,370 for the similar period last year. For the first six months of 1926 and 1925 the passenger figures were 113,715,254 and 112,761,063 respectively.

Revenues Increase.—Total revenue of the Community Traction Company, Toledo, Ohio, in September was $258,919, compared with $255,550 for a similar month last year. The increase is in spite of open weather and is credited in part to improvements in service and the popularity of chartered bus service started Sept. 1.

Would Reduce Service.—The Cincinnati Street Railway, Cincinnati, Ohio, has petitioned the State Public Utilities Commission for permission to abandon the operation of the Bond Hill line during the major portion of the day. The company in its application proposed that four cars only be operated during morning and evening rush hours. The reason given for the application was that the line had been operated at a loss during the day; that Bond Hill was served by a bus line operated by the company, and that the car line did not actually reach the suburb. E. D. Gilman, Director of Public Utilities, will take the application under advisement.

Fights Higher Assessment. — The Washington, Baltimore & Annapolis Electric Railroad, with headquarters in Baltimore, Md., has filed a protest with the Appeal Tax Court of the city against an increase of more than $150,000 in the assessment against the company's property. In 1926 the assessment was $253,745, covering rights-of-way, tracks and bridges in the city. The assessors have proposed that the assessment for 1927 be $413,620.

Hearing on Petition Postponed.—The Public Service Commission recently announced that the hearing scheduled for Oct. 19 on the petition of the Hudson Valley Railway, Glens Falls, N. Y., for approval of the abandonment of its Lake George-Warrensburg line had been further postponed to Oct. 26 at Albany. At the same time the commission will hear the petition for abandonment of the company's Thomson-Greenwich line.

Service Discontinued.—The Depew & Lancaster Railway Corporation, Buffalo, N. Y., which operates between Buffalo city line at East Genesee Street and the villages of Depew and Lancaster, discontinued service on Sept. 23. R. C. Lenahan of Lenahan & Sons of Buffalo, who purchased the property at a bondholders' foreclosure sale five years ago, says he will scrap the line. The company has operated two cars, but the income was not sufficient to pay operating expenses.

Wind Up Railway's Affairs. — The sum of $7,425 will be distributed to the holders of the $102,323 in bonds of the defunct Phoenixville, Valley Forge & Strafford Electric Railway, Phoenixville, Pa. The filing of the auditor's report shows that there will be a dividend of 0.07256 per cent on all that remains of the line built and operated for the first time in 1911. The road was built by Thomas E. O'Connell, then

Digitized by Google

residing in Phoenixville, who also sold most of the bonds. In 1923 only one car was in operation on the line between Phoenixville and Spring City. In the year 1922 receivers were appointed. The line operated 5 miles.

Seeks More Money for Audits.—Increased appropriations will be asked by the Missouri Public Service Commission of the next Legislature which meets in January to finance audits of the accounts and physical properties of various public utilities throughout the State to determine reasonableness of existing and increased rates. The commission will ask for $453,300, compared with $301,200 for 1925 and 1926. The appropriation will be for two years.

Would Refund $844,500 Bonds.—The Interstate Public Service Company, Indianapolis, Ind., has presented to the Indiana Public Service Commission a request for authority to refund $844,500 of bonds of the Indianapolis & Louisville Traction Company. This is the balance of underlying bonds not refunded, it was explained. To care for the refunding, the Interstate seeks to issue the same amount in first mortgage refunding bonds to be sold at not less than 90 per cent of par. The company also seeks to sell $99,300 of its 6 per cent preferred stock.

Route Change Proposed.—The Washington Railway & Electric Company, Washington, D. C., has requested permission to abandon the Portland Street line from Nichols Avenue to the old steel plant in Anacostia. A public hearing will be held on the petition.

Will Vote on Stock Increase. — A special meeting of the stockholders of the Chicago Rapid Transit Company, Chicago, Ill., has been called by the board of directors, to be held on Dec. 9, for the purpose of considering and voting upon the question of increasing the company's capital stock from $25,330,500 to $30,330,500, such increase to be prior preferred stock. Customers of the company and employees are now large holders of this class of stock of the company under the stimulus of a passenger partnership campaign conducted several years ago.

Hears Track Removal Petition.—The Pennsylvania Public Service Commission heard on Sept. 22 the application of the Philadelphia Rapid Transit Company, Philadelphia, for permission to remove tracks on Catherine Street between Eighth and Ninth Streets and a curve at Ninth and Spring Garden Streets. C. C. Schaffer, traffic engineer of the company, said that these tracks have not been in use since 1913, when there was a rerouting of various lines. He said the company would remove the tracks as soon as the city was ready to repave these thoroughfares.

Would Abandon Unprofitable Sections.—The New York & Stamford Railway, Port Chester, N. Y., petitioned the Public Service Commission on Sept. 30 for approval of a declaration of abandonment of that part of its route on Westchester Avenue, South Regent Street and North Regent Street in New Rochelle. The petition alleged that these parts of its system were no longer necessary for the successful operation of the road or the convenience of the public.

Personal Items

Messrs. Knecht and Dubee Advanced

Careers Reviewed of Grand Rapids Railway Officials Recently Promoted Following Retirement of J. C. Madigan

Both John W. Knecht and S. W. Dubee have been promoted recently by the Grand Rapids Railway, Grand Rapids, Mich., as a result of the retirement of J. C. Madigan as superintendent. As noted briefly in the ELECTRIC RAILWAY JOURNAL for Sept. 4 Mr. Knecht succeeds Mr. Madigan and Mr. Dubee succeeds to the post made vacant by the advancement of Mr. Knecht.

J. W. Knecht

Mr. Knecht, new general superintendent, was born in Grand Rapids in 1888. He attended public schools there and was graduated from the Central High School in 1905. His first job was as a cash boy in a dry goods store during summer vacations. He also was messenger boy and news boy during vacations.

After graduating, Mr. Knecht worked for one year for the Pennsylvania Railroad (then the G. R. & I.). He entered Michigan State College in 1906, and was graduated in 1910 with an engineering degree.

S. W. Dubee

During college vacations he worked for the Grand Rapids Railway as draftsman. In 1911 he entered the employ of the company as assistant engineer and remained in this capacity until 1917, when he removed to Washington and entered the Bureau of Construction and Repair, Navy Department, serving under Rear Admiral Taylor. At the close of the war Mr. Knecht returned to the Grand Rapids Railway in the position of chief engineer, a post he held until he was appointed general superintendent.

Mr. Dubee has acted as assistant to Mr. Knecht in his former capacity of chief engineer. Mr. Dubee was born in Grand Haven, Mich., on July 9, 1894. He attended prep school at Beloit Academy in Wisconsin and spent two years in college at the same place. He attended the University of Michigan for three years and was graduated as a civil engineer. He then sold building material for a year.

At Camp Pike, Little Rock, Ark., Mr. Dubee was one of the five division engineers on construction. As a lieutenant in the Ordnance Department, he served a year and a half in the army, at Plant No. 1, Muscle Shoals.

After the war Mr. Dubee became superintendent of construction for the Fairbanks, Morse & Company plant at Beloit, Wis. He next spent a year and a half on public utilities valuation work for the state of Michigan and a year on special development and research work on certain automotive lines. He entered the employ of the Grand Rapids Railway on Nov. 1, 1925.

J. H. Alexander Made President of Cleveland Railway

Joseph H. Alexander was elected president of the Cleveland Railway, Cleveland, Ohio, at a meeting of the board of directors on Friday morning, Oct. 15, to succeed the late John J. Stanley. At the same meeting Ralph W. Emerson was elected vice-president and Paul E. Wilson was made vice-president and secretary. Mr. Alexander was formerly vice-president, Mr. Emerson general manager and Mr. Wilson secretary.

Burt Hamerstrom Heads New San Francisco Department

Working directly under the supervision of Samuel Kahn, executive vice-president of the Market Street Railway, San Francisco, Cal., a commercial department has been established.

Burt Hamerstrom has been appointed manager of the new department and charged with duties attaching to new business effort, public relations and advertising. As an initial step toward establishing closer relations with the

Digitized by Google

public, space is being used in the metropolitan newspapers to acquaint the people with the company's service.

Mr. Hamerstrom spent about ten years as a newpaper reporter and feature writer in San Francisco, Chicago and Seattle. For more than ten years he has been associated with public utilities, with the United Gas Improvement Company and Welsbach Company in Philadelphia and with the North American Light & Power Company—Illinois Power & Light Company—in Chicago, where he helped to direct the commercial, customer-ownership, public relations and advertising activities for properties in more than one hundred communities in several states.

William Petersen Made South Shore Traffic Head

William Petersen has been appointed traffic manager of the Chicago, South Shore & South Bend Railroad, Michigan City, Ind. Mr. Petersen has been assistant general passenger agent of the line with offices at Chicago. For several years previous to joining the South Shore Line organization he was general agent in the passenger department of the Chicago, North Shore & Milwaukee Railroad.

The new traffic manager has spent twenty years in various capacities of the railroad business, beginning in 1906 as a relief telegraph operator and later relief ticket agent with the Chicago & Alton Railroad. Later he served as auditor at the Chicago Union Station and also as assistant ticket agent. In 1915 he took charge of the traffic department of the Pullman Car & Manufacturing Corporation, and after serving with that company for four years became a traveling freight and passenger agent with the Southern Pacific Railroad.

John N. Cadby, executive secretary of the Wisconsin Utilities Association, has been named acting secretary of the Wisconsin Motor Coach Association following the resignation of Philip Litman, now connected with the Mohawk Stage Line, Davenport, Iowa. Mr. Cadby will handle the affairs of the association pending the selection of a permanent secretary at the association's annual convention in Madison on Nov. 9 and 10.

William W. O'Toole New Auditor of North Shore Line

William W. O'Toole has been appointed auditor of the Chicago, North Shore & Milwaukee Railroad, the North Shore Line, Chicago, Ill., succeeding Charles R. Mahan, whose promotion to comptroller was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 2, page 597. Mr. O'Toole entered the service of transportation organizations under the management of Samuel Insull and associates on March 1, 1914, when he joined the Chicago Elevated Lines as an employee in the payroll division of the general accounting department. He occupied various positions pertaining to payrolls and later was in charge of all labor distributions. Transferred to the general accounting division, Mr. O'Toole handled the abstracts of the auditor's entries, vouchers, bills and journal entries for the Metropolitan West Side Elevated Railway, the Northwestern Elevated Railroad and the South Side Elevated Railroad. He was later transferred to the voucher division in charge of all vouchers, bills and journal entries, also serving as assistant to the chief clerk.

In April, 1920, T. B. MacRae, auditor of the Elevated Lines, was elected auditor of the Chicago & Interurban Traction Company, and Mr. O'Toole was appointed assistant auditor, serving in this capacity until July 22, 1921, when he was elected auditor. Mr.

W. W. O'Toole

O'Toole remained in this position until Aug. 1, 1924, when he was appointed assistant auditor of the North Shore Line under Mr. Mahan. This position he held until his recent promotion.

Obituary

Simon Bamberger

Simon Bamberger, chairman of the board of the Bamberger Electric Railroad, died at his home in Salt Lake City, Utah, on Oct. 6, after an illness of less than 24 hours. The cause of his death was acute indigestion.

For many years Mr. Bamberger had been a prominent figure in the development of the West. He was born in Darmstadt, Germany, on Feb. 27, 1845. At an early age he came to America, first locating in Cincinnati, where he secured employment as pin boy in a bowling alley. He utilized every available moment to study English through the medium of books and newspapers. In his early manhood he, with his brother, established a small wholesale mercantile business in St. Louis. He later moved westward, engaged in the mining business at various locations, and finally settled in Salt Lake City, where he became interested in hotel ownership and mining.

In the early '90s he founded what was then known as the Great Salt Lake & Hot Springs Railway, a steam road. This road was completed into Ogden in 1908, and two years later was electrified. It is now known as the Bamberger Electric Railroad, a name adopted on Aug. 14, 1917.

In 1916 Mr. Bamberger was elected Governor of Utah, on the Democratic ticket. He served in this capacity for a period of four years. Under the leadership of Governor Bamberger Utah was in the front rank of the states in war work.

Mr. Bamberger was prominently identified with numerous business enterprises in Salt Lake City and the intermountain territory. Among them were the Bamberger Electric Railway, the projected Bamberger lines into the Uintah Basin, the Bamberger Coal Company and the operation of various mining enterprises. Despite his advanced age, he was very active in attending to business affairs almost up to the time of his death.

Z. E. Knapp

Z. E. Knapp, director of construction to the London Underground Electric Railways, died on Oct. 1 at the age of 59. When the great development of these railways was beginning, Mr. Knapp came to London from America in 1901. After being manager of the London United Tramways, he became in 1913 chief engineer of the underground railways. In 1915 he was appointed manager for maintenance and construction. In 1917 and 1918 he was general manager of Associated Equipment Company, the builders of buses for the London General Omnibus Company. At the end of 1918 he resumed his position on the underground railways. Three years later he was appointed director of construction, and was in charge of the extension of the London Electric Railway from Golder's Green to Edgware, the enlargement of the tunnels of the City & South London Railway, and the extension of the line to Morden.

E. W. Bowman, supervisor of insurance of the Philadelphia Rapid Transit Company, Philadelphia, Pa., and associated with Mitten Management properties for more than 30 years, died recently in Philadelphia. Mr. Bowman was 79 years old.

Charles S. Butts, engineer in the Department of Public Utilities for the city of St. Louis, Mo., for fifteen years, died on Sept. 21. In recent years he had been in charge of the railway operated by the City Water Works Department connecting Baden, the chain of Rocks water work stations and the Municipal Bridge and Dock.

Thomas A. Cole, former claim agent for the Los Angeles Railway, Los Angeles, Cal., died on Sept. 25. He first served as a conductor under J. C. Robinson, superintendent. When the cable lines were opened he was made inspector or supervisor and he held this position until 1896, when he was taken into the office as a clerk, where he worked mostly in the claims. After a year or two he was made regular claim investigator and adjuster and until he retired from the company in 1919 he acted as claim agent.

Guests of Lorain Steel

Mysteries of Steel Rail Making Are Mysteries No Longer to Railway Men Who Visited Plant Recently

It was indeed an interesting occasion out at Lorain, Ohio, on Friday afternoon of convention week in Cleveland. About 125 railway men accepted the invitation of the Lorain Steel Company to inspect its rail mill at the plant of the National Tube Company. The visitors were gathered up in special buses down at the convention hall just as the bell sounded the deathknell of the 45th annual convention. Transported to Lorain by means of a special train, the party enjoyed a tasteful buffet luncheon while en route. S. Cotsworth of the Lorain company played the genial host.

Upon reaching Lorain the assemblage detrained and began a walk through the plant, which consumed an hour and fifty minutes of time and showed practically every phase of the highly interesting manufacture of girder rails, and which gave more than a touch of romance to the frequently taken-for-granted trackwork. They saw the iron ore and limestone being unloaded from barges by means of huge hoists and traveling cranes. They saw the blast furnaces charged and, later, tapped. They saw the ladles of molten iron taken to the open hearth furnaces and there transformed to steel. Then came the rolling of the rails, the seemingly interminable back and forth through the rolls, the cooling, the straightening and finally the various orders marked and piled together for shipment. All of these processes and more were witnessed by the guests in the brief period of their walk through the plant.

The trip was possessing of much interest. More than this, it had the unusual feature of being run through on clock-work schedule. The guests of the Lorain company left the public auditorium at the appointed time and they were returned to their hotels at the hour which had been promised. Credit for much of this must go to W. L. Schaeffer of the National Tube Company, who arranged the trip.

$62,500 Improvement Plan in Toledo

Installation of a new grand union at Summit and Cherry Streets, the busiest intersection in Toledo, was started at midnight, Oct. 14, and for a month will be the cause of probably the greatest rerouting and diversion of all kinds of traffic in the history of the city. The corner is at the busiest end of the Cherry Street bridge on the main Cleveland-Buffalo highway, the only crossing of the Maumee River for several interurban lines. Seven city traction and bus lines and seven interurban lines will have to be rerouted for the installation.

The new special work built by the Cleveland Frog & Crossing Company weighs 235,000 lb. and is the largest of its kind ever turned out by the company. It will provide full clearance curves in all directions with standard 8-ft. devil-strip in place of the 8-ft. and 10-ft. combined at that corner at the present time. New track will be laid for one block on Cherry Street while the crossing is being installed. All joints in the new grand union are welded. The work is expected to cost $62,500 complete.

George Westinghouse Memorial Committee Appointed

A committee chosen from among executives of the Westinghouse corporations has been named to represent the enterprises founded by George Westinghouse in the work of erecting a memorial to him in Schenley Park, Pittsburgh, Pa., to perpetuate esteem for his life and work.

The committee consists of A. L. Humphreys, president of the Westinghouse Airbrake Company, chairman; E. M. Herr, president of the Westinghouse Electric & Manufacturing Company; F. A. Merrick, vice-president of the Westinghouse Electric & Manufacturing Company, and John F. Miller of the Westinghouse Airbrake Company, vice-chairman.

A shaded hillside near Panther Hollow in Schenley Park is to be the site for the memorial which will bear witness to the achievements of the man regarded as one of the most unique personalities and typical figures in the industrial life of his time.

General Electric Orders Increase for Third Quarter

Orders received by the General Electric Company for the three months ending Sept. 30, 1926, total $81,587,917, compared with $73,561,483 for the same quarter in 1925, an increase of 11 per cent, Gerard Swope, president, has announced. For the nine months of the present year, orders total $246,993,637, compared with $223,876,711 for the first nine months of 1925, an increase of 10 per cent.

Long Island Railroad Will Place Large Order for Rolling Stock

At a meeting on Oct. 7 of the board of directors of the Long Island Railroad authorization for the purchase of additional equipment for passenger and freight operations to cost approximately $3,300,000 was made.

This expenditure calls in part for the acquisition of 90 passenger coaches to be used in electric train service. Sixty of these will be equipped with motors and the remaining 30 will be of the trailer type. Contracts for the construction of the new cars will be let shortly. When delivered, early next year, the Long Island Railroad will have 1,189 all-steel passenger cars in service, as compared with 157 wooden cars, this being in line with the company's policy to retire gradually from passenger service all cars of wooden construction. The new passenger cars for electric and steam service will provide seats for about 8,000 persons and enable the company to build up to a maximum of eleven cars trains now operating with an overload.

Among the new freight equipment which will be purchased under the authority just given by the directors there will be three oil-electric locomotives. One of these units, similar to the three about to be ordered, has been in service on the Long Island lines since its delivery last December and has quite fulfilled the expectations of the railway officials.

Oil-Electric and Storage Battery Locomotives for C. & N. W.

A second oil-electric locomotive, similar in specifications to one ordered earlier in the year, was placed in service in the switching terminal of the Chicago & Northwestern Railroad at Chicago on Sept. 23. With the use of this locomotive all engine smoke on the north side of the Chicago River east of Wabash Avenue will be eliminated. The first oil-electric engine in this district has supplanted two steam locomotives and the new one just obtained will be substituted for the remaining steam locomotives used.

The railroad is also arranging for a try-out of a storage battery locomotive. Though equipped with an electric battery system, this type can also be used on an overhead trolley system, through the use of a pantograph. Such locomotives will be particularly useful in switching service over sidetracks branching out from tracks provided with overhead trolley and where the latter system does not extend. The storage battery locomotive would be available on the city's lake front in connection with the recently completed Illinois Central Railroad's electrified system.

Thirty Years of Steady Growth in Subdrainage Practice

"An Anniversary of Significance" is the title of a booklet published by the Armco Culvert & Flume Manufacturers Association of Middletown, Ohio, commemorating its 30th year of service in the fields of drainage and irrigation. The invention of the corrugated iron culvert, which was made in a small Middle Western community back in 1896, had a far-reaching influence in the development of culvert construction. The little booklet just issued tells in very interesting fashion of the most important events in the history of the corrugated culvert and the growth of

Digitized by Google

this new industry. Of particular importance was the development in 1901 of a metal which would effectively resist corrosion and at the same time stand up under the exacting conditions of service. This metal is well known as Armco ingot iron.

In 1906 the American Rolling Mill Company, which had developed this special iron, joined with the manufacturers of the corrugated culvert and the Armco Culvert & Flume Manufacturers Association came into existence. Formerly the attention of this association was devoted largely to manufacturing problems. Today it is actively engaged in research and educational work.

At the conclusion of the booklet comes a summing up of the various fields into which the use of corrugated culverts has been projected and a description of the most recent developments, including the use of perforated pipe for subdrainage by railways and in other fields.

Builders of Cleveland Exhibit Hall Get New Contract

A contract for the construction of a $160,000 carhouse and office structure for the Williamsport Passenger Railway at Williamsport, Pa., has been awarded to the H. K. Ferguson Company of Cleveland, Ohio, engineers and builders. The Ferguson company has recently attracted nation-wide attention in the electric railway field because of the efficient manner in which it has accomplished erection of the large exhibit hall which was used for the A.E.R.A. convention, Oct. 4 to 8.

The new building for the Williamsport Railway is to be one story, approximately 171 ft. x 261 ft., with a side aisle approximately 31 ft. x 132 ft. The front portion of the structure, 50 ft. x 139 ft., will be two stories in height and will be used for offices. Structural steel frame, concrete floors, with inspection and repair pits, cement tile roof and walls of brick and steel sash are features of the structure. It is said that the building will constitute one of the most attractive buildings of its sort and size in the country.

Rolling Stock

Dominion Power & Transmission Company, Hamilton, Ont., will place orders by Nov. 15 for 24 new cars for the Hamilton Street Railway.

Aronimink Transportation Company, bus operating subsidiary of the Philadelphia & West Chester Traction Company, Upper Darby, Pa., has ordered three six-cylinder street-car type buses from the Fageol Company, Kent, Ohio. These were equipped with Westinghouse air brakes.

Community Traction Company, Toledo, Ohio, will equip its cars with leather-upholstered seats in one of the first big moves toward complete modernization of the equipment, it was announced by James A. Greig, sales manager of the company. At a cost of approximately $50,000 the seats will be provided on 127 cars. Work is already in progress at the Central Avenue shops of the company, but as yet none of the cars has made its appearance on the streets. Possibilities of further additions to equipment may hinge on the reception the public gives to the newly furnished cars.

Seattle Municipal Street Railway will ask for bids from auto body building plants for the contract to construct bus bodies on four chassis recently purchased by the department. It is estimated that the bodies will cost approximately $9,700.

Track and Line

Washington Railway & Electric Company, Washington, D. C., has asked permission of the Public Utilities Commission to lay tracks in B Street between Ninth and Fourteenth Streets, N.W., to be operated by underground conduit.

San Mateo, Cal.—The construction of a car line between San Mateo and Palo Alto to serve as a feeder to its Santa Clara County transit system was suggested to the Southern Pacific Company recently by the Menlo Park Chamber of Commerce. This proposed 13-mile link would give continuous service from San José to San Francisco in connection with the present San Mateo interurban line of the Market Street Railway.

Los Angeles Railway, Los Angeles, Cal., has completed changes in overhead work on Glassell Avenue line. The maintenance-of-way department is now shifting the double tracks from 15 to 11 ft. centers. As soon as this is completed the company will construct concrete curbs along the right-of-way and concrete passenger landings. The company is renewing the special work and curves at the junction of North Broadway and Pasadena Avenue near the east end of the North Broadway bridge.

Worcester Consolidated Street Railway, Worcester, Mass., has completed the reconstruction of 344 ft. of double track on Salisbury Street between Highland Street and Armory Square at a cost of $7,500. The old rail was replaced with new 7-in., 103-lb. girder rail and the old wooden blocks were replaced with granite blocks. The company is relocating and changing the grade of track on Grafton Street between Hyannis Place and the city line in connection with the widening of the street on the part of the city. This work will cost about $25,000.

Metal, Coal and Material Prices

Metals—New York	Oct. 13, 1926
Copper, electrolytic, cents per lb	14.15
Copper wire, cents per lb	16.25
Lead, cents per lb	8.35
Zinc, cents per lb	7.65
Tin, Straits, cents per lb	70.00
Bituminous coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$6.00
Somerset mine run, Boston, net tons	2.00
Pittsburgh mine run, Pittsburgh, net tons	2.075
Franklin, Ill., screenings, Chicago, net tons	1.525
Central, Ill., screenings, Chicago, net tons	1.40
Kansas screenings, Kansas City, net tons	2.35
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$5.75
Weatherproof wire base, N. Y., cents per lb	17.75
Cement, Chicago net prices, without bags	2.10
Linseed oil (5-bbl. lots), N. Y., cents per lb	11.20
White lead in oil (100-lb keg), N. Y., cents per lb	15.25
Turpentine (bbl. lots), N. Y., per gal	$0.925

Power Houses, Shops and Buildings

Petaluma & Santa Rosa Railroad, Petaluma, Cal., is planning the immediate construction of a reinforced concrete passenger station, depot and freight warehouse in Santa Rosa, to cost approximately $35,000. The structure will be of Mission style of architecture with 175 ft. frontage on Fourth Street and 300 ft. on Wilson Street, occupying the entire block between Fourth and Third Streets. It will be of reinforced concrete and steel, replacing the present wooden structure.

Pine Bluff Company, Pine Bluff, Ark., and the Arkansas Light & Power Company, it is rumored, will erect an office building next year. New York architects are said to be drawing plans for the building, which is to be constructed in Pine Bluff. The plan would be to use it as general headquarters for the firm.

Montreal Tramways, Montreal, Que., has started the construction of a new terminal station at Cartierville. The fireproof building is brick exterior and will be heated during the cold weather. The work will be completed about Nov. 1.

Trade Notes

Chicago Pneumatic Tool Company will construct a new plant at Franklin, Ill., for the manufacture of Diesel engines, it is reported. Charles M. Schwab, a director of the Chicago company; H. A. Jackson, president, and W. H. Callan, vice-president, recently visited the site. Several hundred men will be employed in this plant, which is understood to entail an expenditure of approximately half a million dollars.

Walter H. Jones has been appointed engineer of the Auto Body Company of Lansing, Mich. Mr. Jones has had wide experience in the design and construction of bodies, both in this country and in England.

John C. Dolph Company, Newark, N. J., specialists in insulation materials, had treated several motors on the ill-fated submarine S-51 with waterproof varnish. These motors withstood the action of sea water in addition to 58 lb. pressure over a period of 9½ months. After being washed and dried the motors operated normally in every respect, it was stated.

New Advertising Literature

National Safety Council, Chicago, Ill., has published a directory of manufacturers and dealers furnishing equipment, service and supplies for accident and fire prevention, health, sanitation and industrial welfare generally. The title of the booklet is "A Buyer's Guide for the Safety Man."

Ohio Brass Company, Mansfield, Ohio, has issued a leaflet describing the principal features and advantages of O-B trolley catchers and O-B trolley retrievers.

Changes from Conventional Truck Design Are Attracting Increased Attention

DURING recent years many radical experiments in truck developments have taken place in Europe. Both in Germany and France marked changes from conventional practice have been incorporated in new equipment that has gone into service. Articles covering some of these designs have appeared in recent issues of this paper.

There is a growing feeling among equipment engineers in this country that further substantial improvement in car performance cannot be made without undertaking distinctly radical changes in truck and motor suspension design. The conviction is growing that the elimination of noise, improvement of riding qualities and reduction of wear on expensive track and special work are dependent on reducing the excessive unsprung weight in conventional design.

Removal of the motor from its present position on the car axle is a step in this direction. Application of this idea in Europe has been limited largely to single-truck cars. On double-truck equipment this construction offers additional problems, but these seem far from impossible of solution. At the present time there are under consideration in this country several experimental designs of this character. In most cases these go considerably further toward the adoption of automotive type spring suspensions and driving arrangement than do the foreign designs.

Various advantages seem to accrue from this general form of truck arrangement. In addition to the reduction of unsprung weight, which eliminates much pounding on track and special work, there is to be expected a marked reduction in gear noises through the provision of oil-tight housings in which the gears can be maintained in accurate alignment and kept immersed in an oil bath. Reduction of the mechanical strain on motor frames and of vibration, wear, tear and shock, resulting from the removal of the motor from the car axle, permits the use of increased armature speeds and reduced motor weight.

There are, of course, many problems of design to be worked out. Some of these will require heavy expense and considerable time for final solution. It is also probable that any such general change in construction will make running parts less accessible for maintenance, will require a more skillful class of maintenance workmanship and may prove more costly to repair in the event of mechanical failure. On the whole, however, the advantages which seem to be offered appear to outweigh the possible disadvantages.

Simplicity and ease of accessibility have been the principal advantages attaching to the present conventional form of truck construction and motor suspension. But on some properties where track is rigid and service severe, serious difficulties from broken armature shafts and open armature leads have never been successfully overcome. When the present form of single reduction gearing was adopted as the most reliable and simple construction for car propulsion, the general art of gear and bearing design was in a very rudimentary stage. The automobile has brought about a most remarkable development in gearing and anti-friction bearings. These now make possible changes in conventional car practice which would have been inconceivable in the days when the present form of construction was adopted.

Europe is apparently achieving a considerable measure of success with radical changes in truck construction. Some of the experiments in this direction have been in progress for a length of time to warrant more than passing attention on the part of every one in this country who is interested in car improvement. Now that the entire industry has become keenly alive to the advantage of both improved appearance and performance of its cars, it is to be hoped that some of the designs which have been contemplated for some time may soon be constructed and put into service.

Operating Men Have an Important Part in Stimulating Development

IN THIS era when high-class electric railway service is foremost in the thoughts of railway operating officials, it is quite natural and essential that many new developments should be proposed. Manufacturers who originate the improved equipment, of course, are anxious to have it tried so that any weaknesses which may develop can be corrected and so that general sale can be undertaken. The electric railways can help materially by trying out and testing new ideas.

The average electric railway man hesitates to put into service any new device which does not have the stamp of extended operating success. Installation of experimental apparatus often results in annoyance and considerable expense. If real results are to be obtained the trial must be watched carefully. Frequent inspections and adjustments may keep a car from service when it is needed urgently. Failure may also result in damage to another piece of equipment. These, however, are the contributions which electric railways must make to the industry in order to promote active development of many much-needed devices.

The duties of electric railway men should not end with a trial of a device which may result in failure. Further improvements should be suggested by the operators. Sometimes a failure is the only means of showing where weaknesses lie and what changes should be made. Some of our most useful pieces of equipment were only moderately successful at the start. Severe service was required to disclose weaknesses and the

This is the issue in October that is devoted essentially to maintenance and construction subjects

Digitized by Google

application of many minds was needed to produce necessary improvements.

Electric railway officials and manufacturers must co-operate to bring about the advances in equipment which are so urgently needed. Imagination is essential. Intelligent merchandising effort demands close study of the desires and preferences of the customer. Railway mechanical men must acquire this modern viewpoint regarding their work. We are living in an age of prosperity and all classes demand luxury. Car riders do not know that special spring combinations are needed to produce easy riding trucks or that certain features of track construction influence the amount of noise produced. When these improvements are effected, however, they must be of a nature to make the passengers sense the increased comfort that comes in their ride. Some suggested improvements may be visionary, but it is important that the railway man do his part in co-operating with the manufacturer by entering into the spirit of experimentation with a full realization that very often progress is made only after many preliminary and costly failures.

Good Will Thrives on Straightforward Human Relationships

TEAMWORK is an attribute which has never proved more valuable nor more practicable than at the present time. Between individuals it is useful. Between companies it is essential. Between railways and the communities which they serve it is utterly indispensable. In the whole field of track and paving work the possibilities of profitable co-operation between city engineering departments and the railways are limitless. Nor are the advantages all on one side, for the city may profit equally with the railway in laying out paving and track-replacement programs so as to avoid duplication of work. Strangely enough, when real co-operation exists between city officials and the transportation company, little is heard about the matter. Let a city and its transportation agencies work together on a smooth basis of mutual accord and few laymen are the wiser, save for a vague feeling that things seem to get along pretty well in their community. But let the municipal authorities, either through indifference or with seeming deliberateness, give no heed to the financial resources or physical abilities of the railway, or let the railway executives fail to lay their cards on the table and play fair with the city, then immediately there is a tumult and uproar in the community, which, sadly enough, usually seems to center over the heads of the electric railway men, regardless of their degree of innocence or of their culpability in the matter.

In communities where thinking along these lines is sound, arrangements have been made to confer on programs for track and paving work some time in advance of the date when operations are actually to be started, so that the two elements may be fitted together as effectively as possible. Under these conditions municipal authorities have shown a readiness to lend an attentive ear to expositions of the railway viewpoint, while the managers of the property have, for their part, overlooked no opportunity to accede to aldermanic requests whenever possible to do so. That the latter course is profitable is evidenced by the fact that municipalities have in several instances volunteered to stand the expense of paving the track strip in return for an evident desire by the railway to plan its track construction so as to tie in with the paving program of the municipality's street department.

Of course, co-operation in any form is largely a matter of human relationships, and it is well worth the effort on the part of railway men to make a careful study of the individuals with whom they must deal. Few men are so immersed in their own ego that they cannot be reached and influenced by a straightforward presentation of facts and a friendly and cordial attitude which does not savor of pandering.

It's Not the First Cost but the Upkeep that Determines

MAINTENANCE of electric locomotives may prove to be a determining factor in the selection of systems. From time to time the industry is apprised of new units of electrified railroads that have been put into operation, but the operating statistics are not so frequently made a matter of public analysis. In this issue, Dr. Neithammer tells of a 284-mile section between Stockholm and Göteborg, Sweden, recently electrified. He submits the statement that the single-phase system does not appear to be materially inferior to the direct current system of electrification.

What the industry needs are facts to determine whether one system or one type of locomotive has points of superiority over others. Unquestionably, the first cost is an important element, but the factor that will gain in weight as time goes on is the cost of maintenance. A study of the maintenance costs per locomotive-mile or per ton-mile for the electrifications in this country varies through astonishing ranges.

The difference in fixed charges between any of the major systems of electrification when reduced to cents per locomotive-mile would be small in comparison to the variation in maintenance costs that can be found between any of the major systems. In short, it is not the first cost but the upkeep that counts, and the sooner such maintenance cost differences are determined and capitalized the sooner opinions will give way to facts.

Kansas City Reorganization Gives a Fresh Start

RESTORATION of the property of the Kansas City Railways to its owners has been made and the receivership has been ended. The successor company is the Kansas City Public Service Company. It starts out under circumstances that seem to be propitious. To some the plan of reorganization appeared to be too drastic in that it wiped out equities which they felt were entitled to more consideration than they received. The scaling down of securities was drastic, but it has had the sanction of the courts.

In handling the property the receivers did well, as did also the operating organization which functioned subject to their direction. During the years of the receivership—and for one reason or another the receivership was a long one, but one not unduly protracted considering all the problems involved—much was done to restore the road to prestige. Much more remains to be done. The successor organization realizes this, and it has already started on a program of improvements based on a knowledge of the needs of the system and founded on the belief that the city is prepared to co-operate. That the municipality is so disposed is shown by the twelve-year extension of the company's franchise, making the term of that grant 30 years. This is a

Digitized by Google

period none too long. Meanwhile, the advisability of revising the terms of the grant are being considered so as to bring them more nearly in line with modern thought on grants of this kind.

The new company has at its command all the money turned over to it by the receivers, but this sum will be entirely inadequate to meet the costs of the $6,000,000 reconstruction program which is required. Concessions in fare have already been authorized. But the new company is pledged without reservation. It can do only certain things under the grant as at present extended. It cannot, however, do under these terms all the things that are possible under a modern franchise with provisions designed to give flexibility in meeting the exigencies of modern operating conditions. Lifting of the receivership is a highly desirable accomplishment. It marks, however, the beginning of a new period rather than the ending of an old one. And the course which events take in the future is as much in the hands of the city as in those of the management. The obligation is a mutual one.

Service Equipment, Too, Affects the Public's Opinion

KEEPING an eye on the things which appeal to the man in the street subconsciously rather than consciously is not the least important phase of transportation merchandising. For example, there is the matter of keeping the wrecking cars and trucks in first-class physical condition and fully stocked with all necessary tools and equipment. It cannot be gainsaid that this has a distinctly favorable psychological effect on public and employees alike. Likewise is it essential to have the wrecking crew fully organized and drilled with the precision of a fire department so that no time or motion will be lost in getting to the scene of trouble.

When a street car becomes involved in a street accident, for whatever reason, or succumbs to mechanical ailments, there invariably are native wits on the sidewalks to "wise crack" at its expense. As long as it remains thus exposed to public view the car forms a distinctly adverse object lesson for public observance and it therefore behooves the railway to remove it or repair it at the earliest possible moment.

Appearance of service equipment may at first glance seem secondary to the condition of passenger rolling stock. However, a well-painted, fully stocked wrecking car or truck appearing at the scene of an accident or breakdown cannot fail to impress spectators with the progressive, efficient attitude of the railway. Sometimes when a decrepit, unpainted, broken-down appearing service car clatters along the street, people are inclined to speculate as to which is the savior and which the saved.

Dollars and Sense the Measures of Co-operation

FOR every day use a good hypothesis would be one which states that the maximum of co-operation between maintenance and operating departments will bring a maximum return in dollars and sense. The latter is perhaps a poor pun. However, it at least suggests a corollary for the above hypothesis, namely, that the dictates of common sense should preclude any unnecessary abuse of rolling stock and other railway equipment. It is the job of the maintenance forces to keep cars and buses "up to scratch" in so far as physical condition and efficiency are concerned. It is just as much the job of the transportation department to see that this equipment is not subjected to greater punishment than reasonable service conditions require.

As a "horrible example" there is one electric railway property when the transportation men pride themselves on the fact that no allowances are made in the operation of equipment throughout the most adverse water and snow conditions. Regardless of the depth of water over the tracks the operators are permitted to send their cars through at speeds which literally invite electrical trouble. To no avail has the master mechanic torn his hair and presented report after report to show the very real cost of this foolhardy attitude. There have been times when a large proportion of the company's rolling stock has been waiting its turn in the shops, as a result of failure by the operating department to exercise a little judgment on where and how fast cars might be operated during the temporary existence of water obstacles.

Service maintained in the face of adverse weather conditions is, of course, one of the first principles of satisfactory transportation. It is a laudable ambition on the part of the transportation department to defy the elements in keeping its cars moving. But its responsibility goes further than merely running the cars. It is equally important that the greatest possible diligence be exercised in protecting the equipment by limiting speeds at bad spots, cutting off power when running through water and otherwise helping to prevent electrical trouble. To do otherwise is flirting with inevitable disaster and is not in keeping with the modern spirit of team work between departments. A little headwork at the proper time will save a lot of back work later, and, incidentally, many dollars.

Greater Interest Can Be Enlisted in Engineering Association Work

A GOOD start was made during the past year to bring about greater co-operation between the American Electric Railway Association and the various state and sectional associations throughout the country. This is undoubtedly a step in the right direction, which will tend to knit the industry closer together and to bring about greater co-ordination of effort in handling common problems.

Contact between the engineering association and the equipment, track and electrical men in sectional associations would likewise bring better understanding of common problems and greater unity of action. In the case of engineering association work, one of the greatest difficulties has been that of getting adequate representation of the industry on the various committees, and of bringing about general acceptance of recommendations and standards after they have been adopted.

In most sectional association meetings considerable time is devoted to the discussion of construction and maintenance subjects. Here there is an opportunity to discuss topics that are on the program of American Electric Railway Engineering Association committees. Membership on some of the more important engineering association committees might well be selected with a view toward having representation from the various sectional associations. Thus current subjects that are being studied could be taken up at sectional association meetings, and the assistance enlisted of those in charge of maintenance on many properties that are not directly represented on engineering committees.

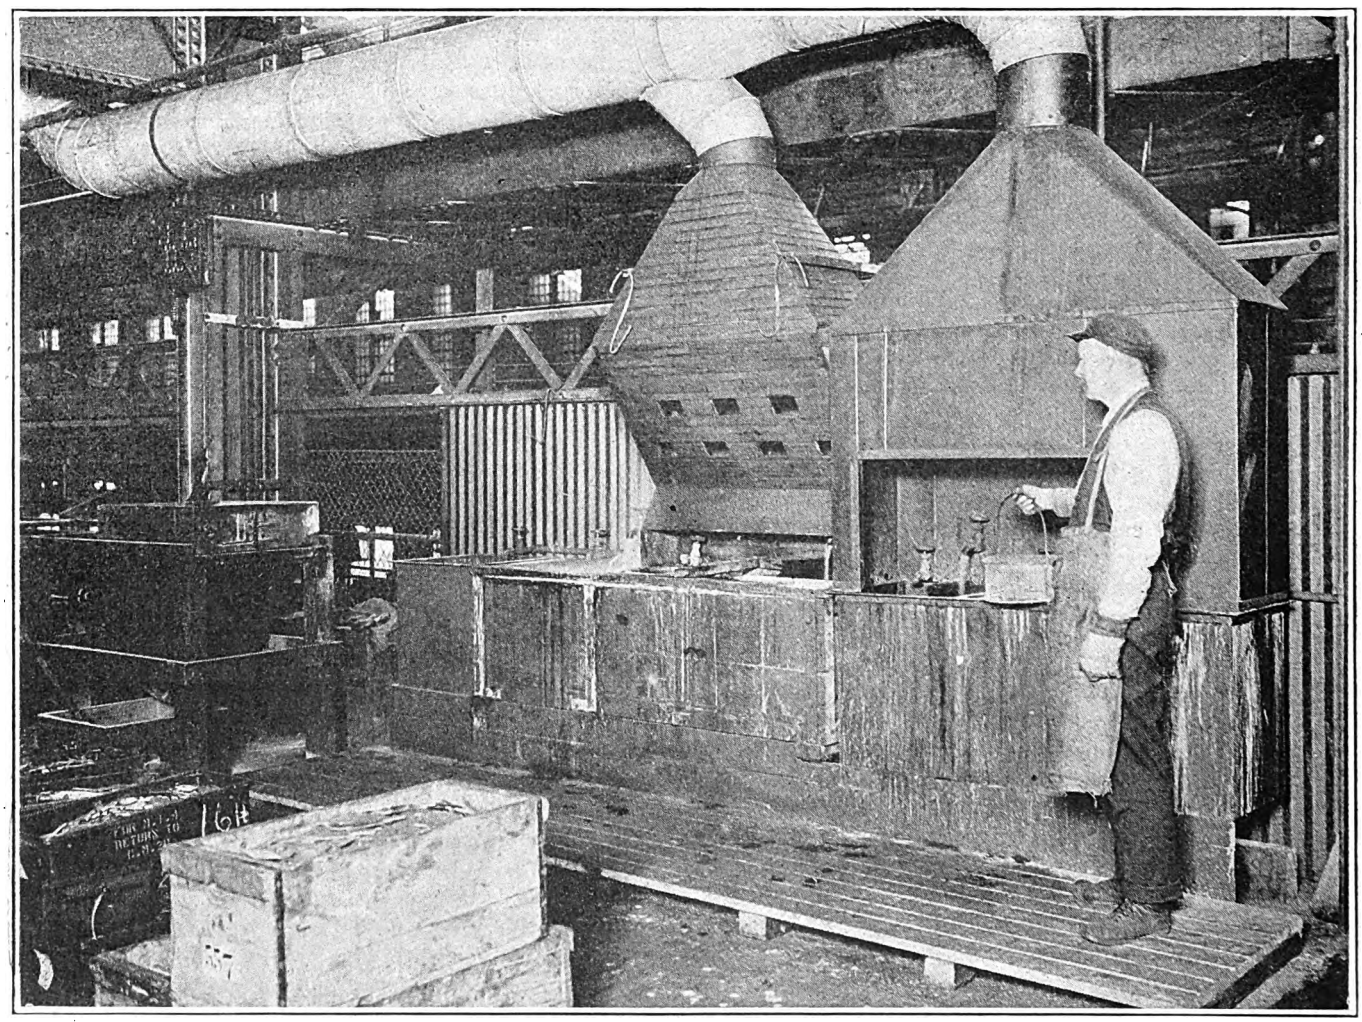
Important Considerations in Replacing Commutator Bars

Pure Hard-Drawn Copper Best for Commutator Bars and Section Should Be Same as Adjacent One—Each Individual Unit Should Be Placed on a Surface Plate to Determine Its Trueness and Be Straightened if Bent

By Jesse M. Zimmerman
Renewal Parts Engineering, Westinghouse Electric & Manufacturing Company



Cleaning Bath in Which Individual Copper Bars Are Dipped to Remove All Dirt and Grease

IN THE course of development of commutating machinery, various metals have been tried for commutator bars. These different metals range from silver, pure copper, both hard and soft, through various alloys and brasses, cast copper of various purities, aluminum, wrought iron and even cast iron. Experience has shown that all of them can be used in commutators if one is willing to pay for the high price of maintenance and unsatisfactory operating characteristics plus a higher first cost. The use of any other metal than pure copper or silver will mean a larger commutator. This in turn will mean an increased size of the machine.

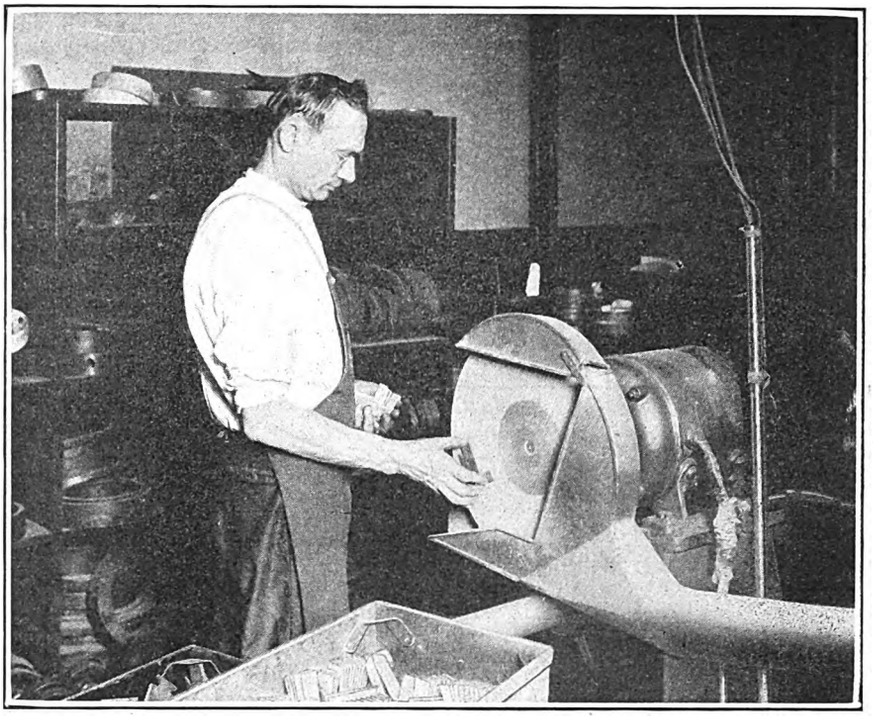
Iron bars were at one time used in a commutator for an electric railway motor. The commutator soon developed high mica, and the commutating surface became blackened and blistered. Sparking gradually increased until commutation reached a state where it was impossible to operate the motor. High mica was not caused by the metal wearing faster than the mica. It was caused by the contact surfaces burning away, leaving high mica.

Digitized by Google

Aluminum was then tried. It worked better than iron, in that burning, blackening and high mica did not appear so quickly. However, like iron, it did not take a polish and soon had a dull appearance, gradually turned black and burned badly. This, no doubt, was due to the high contact resistance of the aluminum oxide which formed on the surface, due to sparking.

Bronze, brass, cast copper and copper alloy were tried for commutator work. While they gave better results than aluminum or iron, the commutator would develop high mica more quickly than ones made of copper hard-drawn from pure ingot metal. This burning action is a function of the contact resistance, current density, non-burning and non-blistering qualities of the metal used in the commutator. Anything which tends to increase the heat-conducting properties of a commutator will tend to decrease the burning action. This has been clearly demonstrated in an elaborate test of carbon brushes on a collector ring, where the question of commutation could not disturb the conclusion. Such tests were made on cast iron, wrought iron, bronze, various alloys, including cast copper alloy, and pure copper. With high current densities, the burning and blistering action appears to depend on the ability of the metal to conduct the heat from the contact surface. The fusion of the metal on good heat-conducting materials will be so small that the polishing action of the brush will keep the surface in a smooth, glossy condition.

The electric conductivities of the metals and their mixtures in alloys bear a fairly close relation to their heat conductivities. Through extensive tests, it has been found that very little impurity in copper will reduce the conductivity to possibly one-third. Most of the alloys of copper have a very low heat conductivity compared with pure copper. Wrought iron or aluminum have a lower heat conductivity than copper alloy. According to this argument, silver should give the best commutation. It does, but is too expensive for this purpose.



Removing the Burrs from Both Sides of the Individual Copper Bars by Grinding

The use of copper alloy, which costs almost as much as hard-drawn copper, does not warrant the increased cost of maintenance and interruption of service. Furthermore, if a motor working at its maximum rating with a commutator made of pure copper has this removed and has substituted a commutator having copper alloy whose conductivity ranges from 50 to 60 per cent, it certainly will be overloaded.

From the foregoing it is evident that bars to be used in renewing a commutator should be of the same material and workmanship as the original copper bars.

The bars should be made from pure hard-drawn copper whose conductivity is not less than 98 per cent, 100 per cent being based on copper having a resistance of 9.59 ohms per mil-foot at 0 deg. C.

The bars should be made of hard-drawn copper having a Brinell hardness number of not less than 75 to 80. They should be able to withstand a fiber strain of 25,000 lb. per square inch in order to overcome the stresses due to centrifugal force and stresses caused by alternate heating and cooling of the commutator while in service.

The Brinell hardness number for cast copper bars which are later "drop forged" or "bumped" is from 50 to 55. Soft copper has a Brinell hardness number of 38 to 40. From this it can be seen that the hard-drawing process will produce better commutator copper.

The die through which the copper is drawn is called a section. The opening in the die conforms with the cross-section of the bar, as shown in an illustration. During the drawing process, samples are taken for analysis which include quality, hardness and gaging of the section. Gaging to see that the size of the bar remains uniform is a frequent operation.

The copper bar must not vary from the specified section to either of the drawn edges by more than plus or minus 0.001 in. The algebraic difference at the two

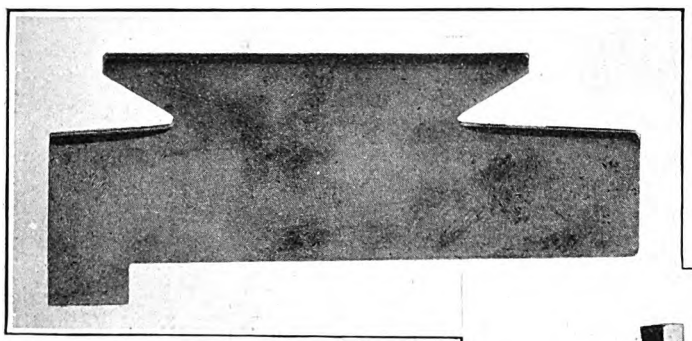
Copper Bars Being Straightened Before Building into an Assembled Set of Commutator Segments

Digitized by Google

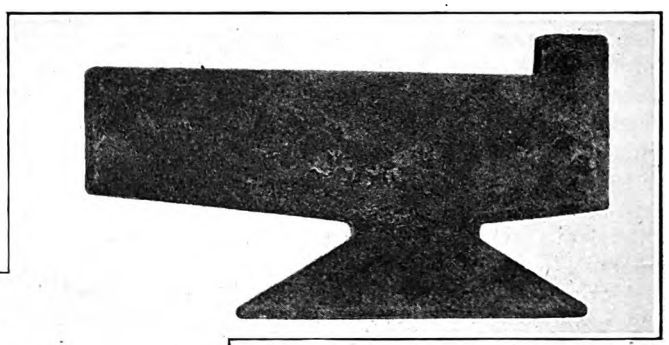
drawn edges must not exceed 1 mil. If this variation is not adhered to the distance from any bar to the corresponding bar under the next pole may vary more than plus or minus $\frac{1}{32}$ in.

The concavity of each surface of a bar must not vary more than 1 mil from the computed thickness, i.e., the gaged thickness at any point must not be more than 0.002 in. less than the computed thickness and the convexity of the surface must not vary more than 0.0005 in.

All bars should have a drawn radius at the bottom chord. When a $\frac{1}{32}$-in. mica extension is allowed in the bore, the combination of the two gives a large creepage between bars. On some motors the space between the bore of the assembled segments and the commutator spider is so small that it is necessary to machine the bore of the assembled segments. In such cases the drawn radius is of no value.

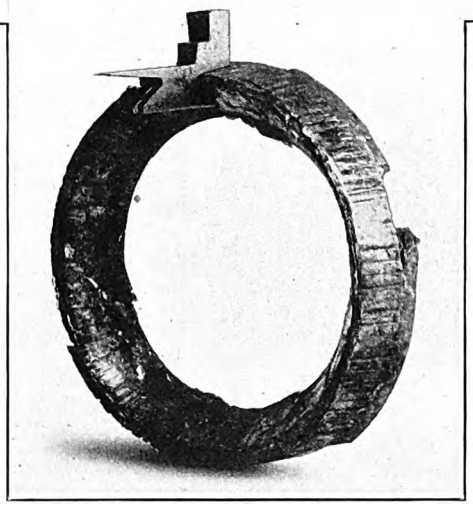


Hard Drawn Copper Bar as It Comes from the Die



Edges and the Sand Holes Remaining Cast Copper Bar, Showing the Rough

All commutator bars should be chemically cleaned to remove all grease and dirt. They should be free from roughness, cracks and laminations. The surface of each bar should be ground to remove the burrs caused by punching and sawing, as well as all foreign particles adhering to the copper. Each individual commutator bar should be placed on a surface plate and straightened by light hammer blows if bent or untrue.



Hard-Drawn Copper Bar After Years of Service

In the old days some of the motors had the commutator bars punched to size. It was thought the bars could be punched and then assembled. This did not work so well, due to the variation in the copper. If the copper ran heavy, the commutator gage diameter would be too large, causing an arch-bound commutator. Sometimes the gage diameter would be so large that the spider V's should not fit the copper V's at all. If the copper bars were thin, the commutator gage diameter would run small. When the commutator was assembled, open places between the bars could be found. After extensive tests, it was found necessary to machine the V's to an accurate gage diameter after the assembled segments were built up and held together by a clamping ring.

Bars for use in repairing commutators are supplied in two forms. They are, bars punched to an unfinished size and rectangular bars. Where a large number of bars are needed, a punching die is used to punch the bars to an unfinished size; that is, the V's are punched leaving $\frac{1}{16}$ in. for finishing. All repair bars for these commutators are supplied in this manner.

The sale of a great many motors is so small that it is cheaper to machine the V's from the rectangular bars after they are assembled than to make a punching die. These bars are sawed into lengths corresponding to the unfinished over-all dimension. These are called rectangular bars. For repair purposes rectangular bars should have the V's rough-sawed, leaving $\frac{1}{8}$-in. material for finishing.

Method Recommended for Replacing Spare Bars

After removing the damaged bar, an undamaged adjacent bar can be used for a pattern and a new mica strip can be cut to the same size as the unfinished bar. The mica strip can be fastened to the copper with a thin coat of heavy pure orange shellac. The unfinished bar should then be clamped in a vise with a pattern bar and trimmed to approximately the outline of the pattern. If the V's have been rough-sawed or punched, the amount of filing necessary may be reduced by taking an extra cut with a hack saw. The unfinished bar and the pattern should then be clamped in a vise with a mica strip between them and the V's of the new bar should be filed to the same size as the pattern bar. The radius in the V's can be finished with a small rat-tail file. The bars are then ready to be placed in the commutator.

When reassembling the commutator, all the bars and the V-rings must be in their proper places, with the commutator nut fairly tight. The commutator should be heated to 125 deg. C. in an oven, and while still hot a pressure of from 20 to 30 tons should be applied to the detachable metal V-ring as the commutator nut is turned home.

A good method of testing for loose bars is to tap on the face of the bars at the front and rear. If a bar is loose it will vibrate. Leads should be soldered in the commutator slots, the face of commutator turned and the mica undercut. Tests should then be made for grounds and short circuits.

The value of having all commutator bars made accurately to size cannot be overemphasized. Investigation of causes for commutator troubles has shown many that result particularly from use of mica V-rings which are scant in thickness or oversized. These have been used to compensate for the inequalities of the bars themselves. Many of the loose bar troubles will be overcome if care is used in selecting bars needed for repairs.

Remedying Radio Interference in San Diego

Low Pass Filters Are Being Used by the Railway to Eliminate Noises in Local Receiving Sets Caused by Motor Commutation—Exhaustive Series of Tests Was Conducted to Determine All Causes of the Disturbances

By G. W. SHAVER
Superintendent of Equipment San Diego Electric Railway

EIGHT months or more ago official complaints were made to the San Diego Electric Railway that it was producing severe radio interference. A committee composed of representatives of the Department of Commerce, the U. S. Navy Department, the Chamber of Commerce, the power company, the telephone company, the radio club and the railway made an investigation with portable radio receiving sets in an effort to prove whether the electric railway operation was actually causing this interference.

The interference under investigation was generally referred to as the "rock crusher." It is something like heavy static. The interference covers the entire broadcast frequency band, having a maximum at approximately 1,000 kilocycles (300 m.). The noise appears suddenly and lasts for intervals varying from a few seconds to several minutes, at the end of which time it might stop suddenly or die off slowly. It was much less severe after nightfall.

Investigation showed that the interference covered a very wide area. An increase in its intensity was noted as the portable set was moved under any wires, but was much more severe in the vicinity of the trolley wire. All efforts to connect the noise with the movement of individual cars was unsuccessful. It was decided that perhaps the interference noted at a given point was the result of disturbances set up by several cars which might be some distance away. To determine this, tests were made at night when there was only one car on the line.

At that time it was noted that the characteristic noise started and stopped in synchronism with the movement of the car with power on the motors. It was noted that the air compressor motor caused a continuous roar, although of but mild intensity, as long as it was in operation.

COMMUTATION THE MAIN CAUSE

Our investigation leads us to believe that the two principal causes of this interference are the commutation of the motors and sparking at the trolley wheel. These sparks set up highly damped oscillations which are conveyed to the trolley wire, which acts as an antenna and distributing system. Power and telephone wires pick up this interference by induction and reradiate it throughout the city. The reason there is such a reduction of this interference after nightfall is probably due to the increased absorbing effect of the comparatively large lighting load of all of the cars on the line, which forms a non-inductive path between trolley and ground.

Having determined the cause of the interference, the next step in the problem was to find and apply a remedy. Two solutions presented themselves; one, to improve commutation and reduce sparking at the trolley wheel and the other to prevent the disturbances set up by these causes from reaching the trolley wire. Since the commutation was considered very satisfactory from an operating point of view, it was decided that the latter solution would be attempted.

A low pass filter was designed and installed on the roof of a car for test. It consisted of a 300-micro-henry inductor connected in series with the trolley lead and an 8-microfarad electrolytic condenser connected between the car side of the inductor and ground. The theory of its action is to provide a low-impedance path for the direct current between trolley and car and at the same time offer a high impedance to the high-frequency currents between car and trolley and shunt them off to ground through the condenser.

The tests, made on a section of the trolley line which could be isolated from the rest of the system, showed that the filters eliminated about 80 per cent of the interference. It was observed that when a car without a filter entered this section of the line it caused severe disturbance all the time it was operating, although the car was at times more than 1½ miles from the observing point.

In order to facilitate further investigation a car was jacked up in the carhouse so that one pair of motors could be operated. A single-wire antenna about 40 ft. long parallel to the trolley and about 3 ft. from it was connected to a six-tube Atwater-Kent radio receiving set. Operating one motor at a time, it was observed that No. 1 motor caused severe interference when rotating in one direction and practically none in the other. On the other hand, No. 2 motor caused practically no interference when rotated in either direction. On examining the wiring diagram it was noted that the main series field of motor No. 2 was permanently connected between the armature and trolley. The main series field of motor No. 1 was permanently connected between armature and ground, but it was found that the commutating field was connected between armature and trolley when the motor rotated in the direction which caused no interference. As an experiment, the main series field of motor No. 1 was connected between armature and trolley. Under these conditions motor No. 1, and in fact both motors simultaneously, could be rotated in either direction with practically no interference. It is concluded that either the main series field or commutating field will act as a filter which prevents the commutator disturbances from reaching the trolley. It is impossible so to connect motors 1 and 3 with their main series fields between armature and trolley without adding another unit switch because of the system of tapped field control employed.

In preparing for the tests in the carhouse a new filter had been designed and constructed and installed on the car. This new filter was of a type similar to that described except that it had three stages; i.e., three 100-micro-henry inductors in series with the trolley lead and three 2-microfarad condensers connected respectively between the car end of the inductors and ground. The filter was very efficient, eliminating practically all noise from the main motors and from the compressor motor.

In order to make the test more conclusive this filter was installed on another car which was tested under operating conditions when it was the only car on the line. The filter was so installed that its various units could be cut in or out separately, permitting a number of comparative tests in rapid succession. The tests indicated that the more stages employed the more perfect the elimination of the interference produced by the

Digitized by Google

motors. It was also found that a large radio-frequency choke (all three inductors in series) without any condensers was quite effective, but not as good as when the condensers were used.

It so happened that the car used on this test had one trolley wheel which produced much greater sparking than did the other. One caused but little interference, but the other, which sparked badly, caused quite a considerable amount. A filter such as that described had practically no effect on the disturbances from this cause. It is believed, however, that if the interference from the motors is eliminated the sparking wheel will cause little or no trouble.

There was one effect noted which has not as yet been clearly explained and that is that there seems to be a certain amount of interference produced when the power is shut off a moving car and the brakes are applied hard, causing rapid retardation. There is little or no interference while coasting. If the trolley pole is pulled down there is no interference, even though the car is rapidly slowed down.

The same type of car was used in all the tests. It is equipped with four Westinghouse 514-A-3 motors with tapped field control. We have a number of two-motor cars which are also producing a considerable amount of noise. An examination of the car wiring diagram shows that the main fields of these motors are permanently connected between armature and ground. Even though it were possible to reconnect all the motors so that the main series fields were connected between armature and trolley, it is believed that better results could be obtained at lower cost by a good filter.

With the proper use of filters it has been found possible to eliminate the major portion of the interference caused by electric street railways. Our trial test was made just a short while ago, consequently we have not as yet installed these filters on our cars. The results of all our tests are now in the hands of G. W. Cattell, radio engineer of the U. S. Navy Department, who has co-operated and assisted us to the fullest possible extent in the investigation and solution of this problem. He is now designing the final form of filter, which will be built and installed on a number of our cars which operate on one line. Careful observations will be made of the results obtained to determine what action will be taken in regard to equipping the rest of the cars.

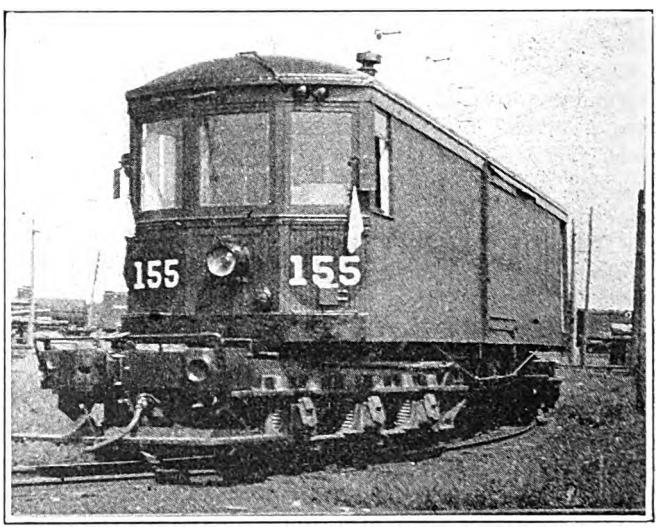
"Traveling Billboard"—Illinois Traction Advertising Medium

THE Illinois Traction System was well represented at the Greater St. Louis Exposition during the recent three weeks exhibit at Forest Park. Its booth was located on a prominent corner, and a background of an illuminated cyclorama showed the Illinois Traction System territory as well as a map indicating the advantage to automobilists of using the McKinley Bridge across the Mississippi River at St. Louis. The booth was in charge of representatives of the traffic department of the Illinois Traction System and of the St. Louis Electric Bridge Company. An odd method of advertising, this attraction was adopted by the Illinois Traction System, with the co-operation of the St. Louis Chamber of Commerce, in sending a special advertising car over the company's lines in Illinois. This car was covered with two 40-ft. signs and traveled more than 600 miles in Illinois. Upon arrival in a city or town the car was heralded by a special type of siren whistle, and the newspapers were informed about the car and its purpose.

Tractive Effort Increased with Three-Motor Truck

By E. B. Gunn

DUE to several heavy grades on the lines of the Western Ohio Railway, running between Piqua and Findlay, Ohio, this railway required heavier equipment than the present four-motor freight cars that are being operated. A new departure in truck building resulted when the Cincinnati Car Company built a truck with three axles so that three motors could be mounted on each truck, or six motors per car. In May of this year the railway started a test with this type of truck by mounting six Westinghouse 56 motors under one of its



Freight Car of the Western Ohio Railway Equipped with Six Motors and Twelve Driving Wheels

cars. These particular motors were available from some of the company's heavy interurban passenger cars.

The use of this six-motor equipment necessitated the design of a new controller with groupings to take care of the six motors. The General Electric Company brought out improvements to its K-64 controller to take care of this condition. A line breaker was added to take care of the increased current and to provide for breaking the circuit outside of the platform controller. A commutating switch was also added to change the grouping from low to high speed.

These equipments were placed in service under one of the company's regular freight bodies and have been working very satisfactorily. Through their use the car can pull two extra trailers over the severe grades. The energy consumption is very low, considering the length of trains that are being hauled, and this type of equipment has been found particularly easy on substations. The truck has been able to operate around short radius curves in an entirely satisfactory manner, and the added tractive effort has proved of great advantage. Couplers are mounted directly on the truck and therefore the center of the coupler is practically in the center of the track at all times. Brakes have been installed on all twelve wheels of the car, which makes for very effective braking.

Storage, Handling and Protection of Lubricants

Central Oil House Desirable Where Large Volume of Lubricants Is Handled—Proper Construction Makes Danger of Fire Almost Impossible—Location Near Railroad Siding or Street Reduces Handling

By Allen F. Brewer
Mechanical Engineer and Editor "Lubrication," the Texas Company, New York, N. Y.

MAINTENANCE of street cars and motor buses is far more of a problem than maintenance of steam turbines, engines, pumps, etc., in the power plant. With the latter, failure of bearings will, of course, be more costly from a replacement point of view, but attendant labor can be better supervised and more carefully trained to the importance of lubrication. The motorman or chauffeur, on the other hand, is left to himself on the road. If he profits by the teachings of the "chief," fine; if he is careless or negligent, the garage or carhouse mechanic will probably work overtime on bearing replacement, etc., which may send the cost of maintenance soaring, if enough of this occurs.

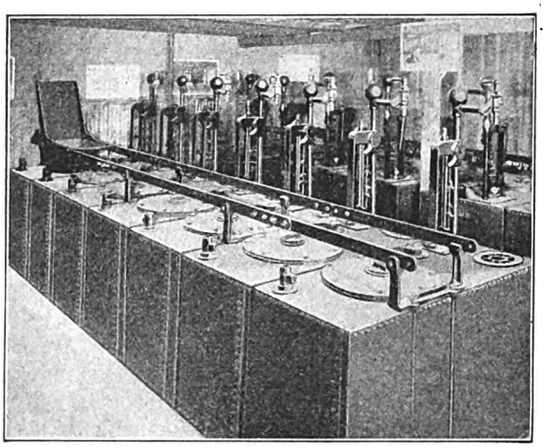
Effective lubrication starts with the methods and means of storage in the carhouse or garage. To direct our efforts toward the selection of the most suitable products, and then allow them to stand in open containers, exposed to perhaps the weather, and almost surely the dust, dirt and moisture conditions of the average shop, will be decidedly poor policy. For lubricants can only be dependable in proportion to their purity. As received from the refinery they are pure, if bought under a dependable trademark. It is, however, up to the consumer to keep them as nearly as possible in this condition, until used, and in certain conditions, during use. Proper storage equipment, well-defined oil-house rules, education of employees, and the use of certain oil purification equipment will be excellent insurance against the carelessness of operators or mechanics, and the possibility of the development of excessive maintenance costs.

Factors Involved in Handling Lubricants

In general, the storage and handling of lubricants will involve a number of factors which must be given consideration, such as: (1) The construction of the oil house or oil room; (2) the storage tanks and their accessory equipment, such as heating coils, etc.; (3) the equipment installed for the handling of the products and shipping containers; (4) the provisions for measuring oils in order to enable a suitable record to be kept; (5) the manner in which the oils are distributed; (6) the extent to which semi-solid lubricants are to be used; (7) the manner in which the oil house is to be managed, and the kind of records kept.

The primary requisite for any electric railway using a considerable volume of lubricants is a central oil storage house, or at least a special room in some part of the garage or carhouse from which lubricating oils and greases can be issued as needed, and in suitable though not excessive quantities. In turn, all new supplies of such oils should be delivered there for storage until required. Whether or not the expense of constructing an independent oil house is justified will depend largely upon the amount of rolling stock involved.

Of course, there will be considerable expense attached to such an installation. For this reason, therefore, many plants which are adjacent to oil supply depots frequently set aside a corner of the garage or carhouse for the storage of lubricants, and keep these latter in



A Battery of Lubricating Oil Storage Tanks with Barrel Truck Along Top and Measuring Pumps in the Rear

the shipping containers until they are empty, when they are forthwith returned to the oil dealer.

The natural objection to storage in this manner is that there will be considerable possibility of contamination of the lubricants. Such localities are often very carelessly hosed or cleaned out, with the result that dirt will be swept into the drip pans and measures. There will also be considerable chance for leakage and wasting of oils in such a room, unless an unusually careful employee has sole and complete charge and keeps it locked and inaccessible to others.

An oil house or oil room should, whenever possible, be of fireproof construction throughout, with brick, tile or concrete walls and floor and a tile, metal or slate roof or ceiling built on steel beams or rafters. The floor should be fitted with drains. The danger of fire in a modern oil storage house will usually be practically negligible; yet constructional features of fireproof nature are the best sort of insurance, and first cost, unless prohibitive, should not be dickered over.

In addition, cleanliness will be more easily maintained in such a building or room than in one where woodwork is used, which would soon become splashed and oil-soaked.

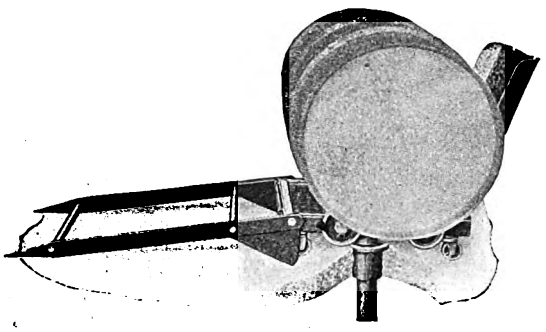
Doors and windows are another factor requiring consideration in oil-house construction. Best practice rec-

Digitized by Google

ommends as few of these as possible, and those that are necessary should be of steel frame or roller type, fitted with wireglass and automatic closing devices. Suitable fire-extinguishing equipment should also be installed.

Location of the Oil House

Considerable thought should be given to the location of the oil house or the part of the store-house or garage, etc., which is to be set aside for conversion into an oil room. An appreciable amount of time will always be



This Type of Skid and Barrel Drainer Is of Great Assistance for Emptying Contents of Barrels

lost in the laborious handling of heavy oil containers. There is also considerable possibility that damage will result both to lubricants and containers if the latter are rolled or tumbled about unnecessarily. So our first thought should be to locate the oil room or house as close as possible to the railroad siding, dock or street. Thus the containers will not be subject to any more handling than absolutely necessary in their transference from cars, boat or auto truck to the point of storage.

Where handling of filled containers from one level to another is involved, hoisting is necessary. Hoisting is expensive; in addition, it entails a certain amount of severe handling of the containers which may easily lead to contamination of oils or greases through sprung seams, etc.

Wood barrels especially will suffer, and warped and cracked heads, or the jarring loose of particles of the glue lining, will often occur. Any damage to the container which may break the seal and lead to contamination of the contents through entry of water or foreign substances is a serious matter.

To overcome these objections "one level" handling is advisable. In other words, the platform of the oil house or storage room should, as nearly as possible, be on a level with the car floors or dock, or, where containers are to be delivered by auto truck, on a level with the floor of the average truck.

As a result of such construction, containers can be rolled, trundled on hand trucks, or handled by a portable conveyor, directly from the delivering medium to the filling hatch of the storage tanks, where this is located at the floor level, or to the hoisting device about the tanks if they extend above the floor.

In any system the type, number and size of storage tanks that may be necessary will depend upon the volume and nature of the lubricants that are to be stored. In general, where a new oil house is to be constructed it will usually be practicable to build it with a basement, and provide for location of bulk storage tanks therein; the main floor in such a house would thus serve as the receiving and delivering room, the tops of the tanks projecting above the floor or not, according to the type of house.

The number of tanks required will depend upon the number of different grades of lubricants used. In every case the rate of consumption involved should be considered. Where, for example, only small quantities of certain products are to be stored for any length of time, in the interest of economy of space and expense, it will be best to keep them in the shipping containers over the period of storage, rather than plan to transfer them to more permanent tanks.

There are two general methods by which fluid lubricants can be delivered, and which must be considered when planning for storage tanks. They are: (1) Bulk delivery by tank car, truck or boat, and (2) package delivery in steel drums, barrels or cans.

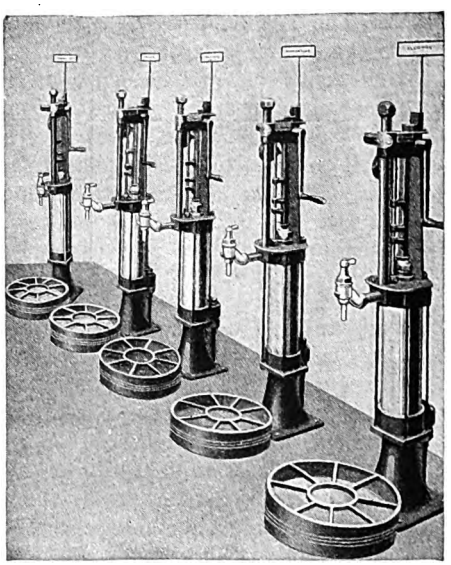
Where bulk delivery is involved, the location of the tanks with respect to the delivery level is naturally important. Usually in such plants the oil is transferred from the tank car or boat through a hose connection. To facilitate matters and reduce expense, gravity flow should be taken advantage of by locating the tank filling hatch below the level of the outlet valve of the tank car.

Care must be taken in the location and operation of valves, when pumping is necessary, inasmuch as where a number of tanks are involved there will be possibility of drawing some cheaper grade of oil into the suction line to contaminate a more highly refined product. Interconnecting valves should be tightly closed before pumping is begun.

Package delivery, as the shipment of lubricants in drums, barrels, or cans is usually termed, will also be facilitated if gravity is utilized to the fullest extent.

Temperature Control Desirable

Certain lubricants can be handled most effectively where absolute control of oil-house and tank temperatures is possible. Therefore, thermal conditions should



Ample Drains from Lubricating Oil Pumps Insure Cleanliness and Prevent Waste

be studied in planning storage-tank location in either an oil house or an oil room.

Wherever heavy, viscous products, such as greases or gear lubricants, are to be stored the oil house or oil room should be equipped with heating coils, especially where climatic temperatures may vary over a wide range. For this reason many storage tanks for lubricants are built similar to fuel oil tanks, with heating

Digitized by Google

coils within. In such installations the coils should always be composed of bent pipe, and no pipe junctions or fittings should be present within the tanks owing to the danger of water, or boiler compounds contaminating the lubricants in event of steam leaks at pipe joints, etc.

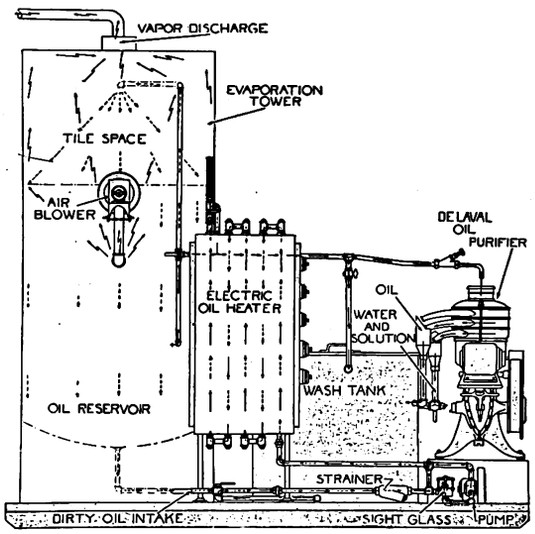
The better practice, however, is to install steam heating coils in the storage room itself or surrounding the tanks. Thus temperatures can be accurately regulated, overheating will not be so apt to cause damage to certain products, and heating can be economically carried out by the use of exhaust steam in many cases.

Horizontal location of all larger tanks will always be advisable. Thus the maximum distribution of load on the foundations will be obtained. The possibility of settling will thereby be decreased, and excessively heavy footings and foundations will not be as necessary to carry a load which is relatively widely distributed. This is assuming that the ground on which they are to be built is solid and not prone to settle.

To insure complete rigidity, the tanks should always be securely anchored to their foundations—never just rested upon the latter. This will be especially essential in localities where floods, earth movements or explosions, etc., are possibilities, the occurrence of which might disturb the location of tanks and cause broken pipe connections, damage to floors, and loss of oil through probable leakage.

In practically every storage room certain accessory equipment will be necessary for the handling of lubricant containers and the lubricants themselves. This will include pumps, meters or other measuring devices, portable elevators for hoisting or lowering drums, etc.

Measuring pumps will save considerable time and labor, will enable the oil-house or oil-room attendants to fill orders promptly, and will insure that the oils are kept free from contamination and in their original state

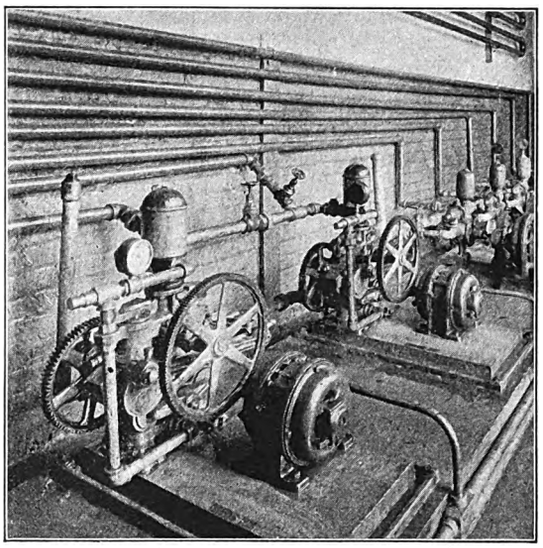


By Careful Heating, Washing, Evaporation and Centrifugal Action Oil Can Be Reconditioned for Reuse

of purity, until drawn into the distributing containers for use on equipment.

The value of orderly oil-house operation, and properly kept records of daily, weekly and monthly oil consumption cannot be underestimated. The effect on the morale of the personnel and the economies in consumption of lubricants that can be attained will be surprising where employees must follow a definite procedure in the obtaining of their necessary oil supplies and where an accurate record is kept of their consumption.

The hoisting of barrels or drums above storage tanks, or to emptying racks for transference of their contents, will render it advisable to install a portable elevator for this purpose, to eliminate handling and probability of damage as much as possible. Modern practice is to



Battery of Power Pumps for Handling Oils in Bulk

extend a suitable track along the tops of all tanks that are to be filled from barrels or drums, at a sufficient height above them to facilitate location of the bungs directly over the filling hatches, and reduce the possibility of waste. Containers can then be hoisted to this track level, rolled into position above the respective tanks to be filled, and emptied of their contents rapidly, completely and with comparatively little labor.

The manner of distribution of lubricants from the oil house or oil room to various parts of the carhouse or garage is important in that it involves the element of lost time on the part of the employees who are to deliver the oils and greases. So this should essentially be studied as a labor-saving problem; although, on the other hand, prevention of contamination must never be overlooked.

Where auxiliary storage in individual departments is to be maintained the type of containers used is important. Preferably they should be of the cabinet or portable filling station type of storage tank, fitted, where advisable, with a suitable hinged cover to afford the utmost protection of the contents. Usually such tanks are equipped with measuring pumps, and so built that any drip from the pump discharge drains right back into the tank.

The extent to which greases and gear compounds are used will be another factor that must be considered in planning the oil-house layout. In electric railway service straight mineral, non-fluid gear compounds will predominate. For the motor bus, on the other hand, greases of varying melting points according to the service required will be in the majority.

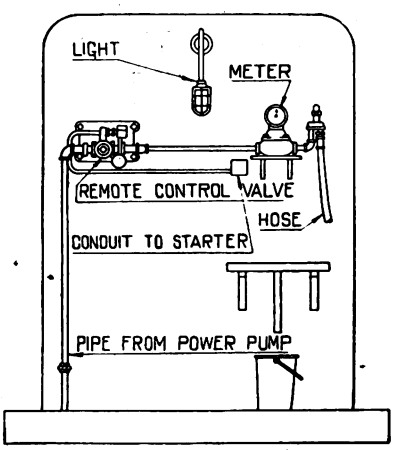
In purchasing greases, it should be a rule never to attempt to store any greater amount than actually needed, and to observe every caution to avoid overheating. It must be remembered that oftentimes the oil and soap constituents of certain greases will tend to separate more or less permanently if subjected to

Digitized by Google

abnormal heat. Of course, this will cause a decided decrease in the subsequent lubricating value of the grease.

Such of these products as can be rendered fluid through reasonable heating can be handled like oils, their storage tanks being built with similar filling hatches, rolling tracks and elevator equipment. Thus, upon receipt of new deliveries in large amounts, steam heat where available can be turned on in the oil room and barrels promptly hoisted for draining of their contents with a minimum of loss into the respective tanks set aside for their storage.

Here again it is well to emphasize the importance of accurate regulation of steam flow and oil-room temperatures, especially at such a time. When such lubricants are to be transferred from shipping containers to storage tanks, whatever the atmospheric temperature, it will be necessary usually to raise their temperature (through



Convenient Arrangement for Lubricating Oil Draw-Off in Storage Room of Electric Railway

indirect heating) often quite considerably in order to enable them to flow readily from the containers.

Certain gear lubricants which may be too heavy to flow with any degree of rapidity under such heating as is available must be stored in the shipping containers. In general they can best be handled by a suitable pump or a clean paddle or spoon, removing only a sufficient amount each time to fill the gear cases or lubricators.

To protect the contents of containers after the heads have been removed, and to prevent drying out of such products as greases a removable cover should always be kept tightly in place over the top. Sheet metal is considered the best material for such a cover and preferable to wood owing to its ability to insure a better seal, its resistance to warping and the ease with which it can be cleaned.

Lubrication Specialist Will Produce Many Economies

Greatest economy and efficiency in the storage, handling and usage of street railway and motor bus lubricants will be attained by placing the entire matter of lubrication under the supervision of a master mechanic or a capable lubrication engineer. Many larger roads have created the latter position in their mechanical engineering departments (though perhaps not in name), realizing that an able, technical petroleum specialist can save his salary many times over by reducing wastes of lubricants, loss of time, and cost of upkeep of rolling stock.

Such a job should include direct charge of the oil house or oil room. When necessary, a capable corps of assistants should be available in order that prompt deliveries and accurate records can be maintained. All lubricants should be issued on requisition only, signed by the foreman in charge of each phase of operation and maintenance, and should never be issued in excessive quantities, since this has been found conducive to waste in application, through careless handling.

Monthly oil records are of decided value and should be prepared by the lubricating staff and submitted regularly to the executives. By showing inventory of stocks on hand, and records of the amount of each lubricant used throughout the system, abnormal usage can be checked up without delay and steps taken, if necessary, to bring about correction.

Care and Handling of Containers

Unnecessary dropping of wood barrels will tend to promote leakage at the seams by springing staves or heads. Hence, it is best practice always to use some form of portable elevator onto which the container can be rolled and then raised to the level of either the storage rack or top of the storage tank.

Storage racks for barrels and drums, if used instead of main storage tanks, should be built of steel and in such a manner that individual containers may be removed independently as desired. Barrels of heavier compounds especially should always be stored in the oil house. Otherwise excessive cold may render emptying a difficult and tedious matter.

Both barrels and drums should be stored on the side or bilge with the bung down. It is usually inadvisable to use wood barrels for lengthy storage of high-grade lubricating oils, on account of the possibility of contamination or loss from leakage or evaporation.

In handling wood barrels it must be remembered that these latter have an appreciable salvage value, and in good condition they are returnable to the oil marketers or are in demand by cooperage firms. Care should therefore be taken to prevent damage while in the hands of the buyer.

Holes should never be bored in the heads for outlet of oil or inlet of air. A bunghole should never be reamed out since this will require the use of an odd-sized bung for the next shipment, thereby decreasing the value of the empty barrel. Likewise, a bung should never be driven entirely into a barrel as this may cause the bung stave to split, and entail the possibility of particles of glue or wood being jarred into the oil to contaminate it and cause serious trouble in subsequent lubrication.

Careful handling of wood barrels will not only result in the highest value from a resale point of view, but will insure that the lubricating oils will be in fit condition to meet requirements. Bungs should, therefore, be removed by a chisel or bung pick, after tapping the bung stave lightly with a wooden mallet or bung starter.

Empty barrels should be given the same consideration as filled barrels, to prevent damage and insure the receipt of the highest price when they are sold. Wood barrels, when empty, will always be subject to warping of the staves and heads if stored on end or if exposed to the weather. This will be prevalent especially if water is allowed to collect on the heads, or where the barrels are exposed alternately to the effects of the sun and excessive dampness. A wood barrel head will split and warp readily in such a case, causing the glue to loosen and necessitating complete reconditioning of the barrel before it can again be used.

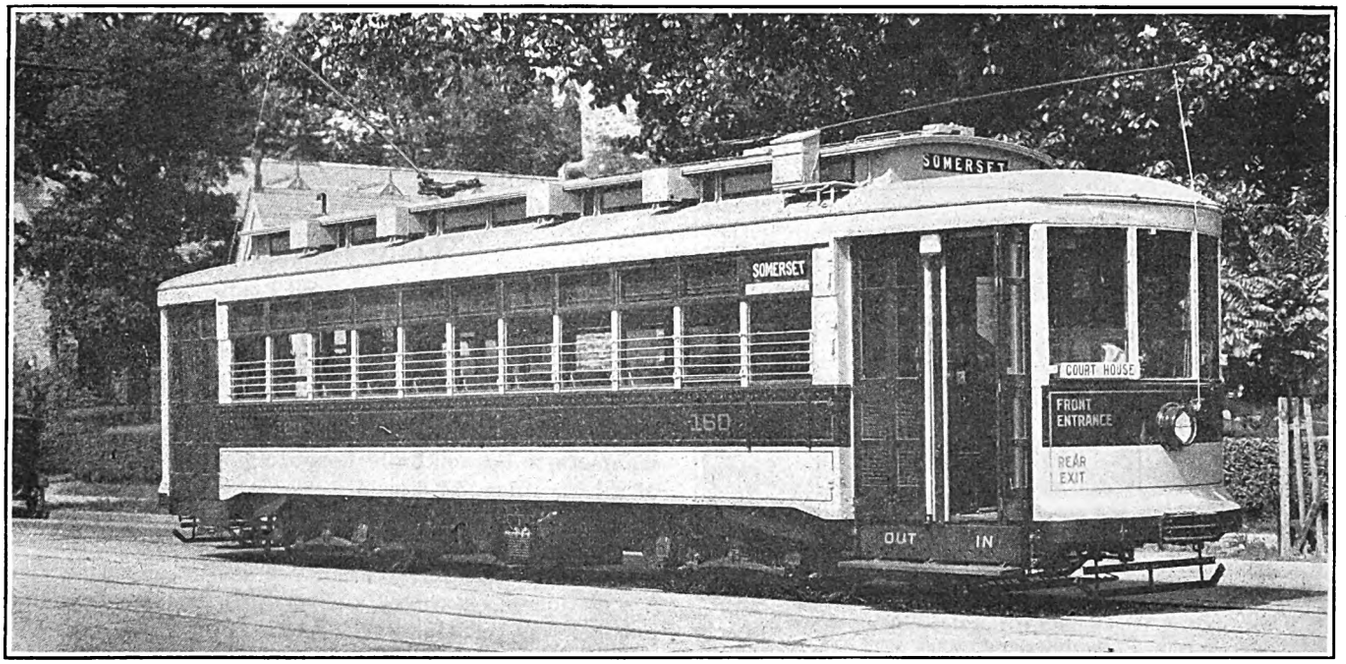
Washington Cars Embody New Color Scheme

Wisconsin Avenue Line Now Has Fifteen de Luxe Cars for One-Man Operation—No Expense Has Been Spared in Making These Units the Last Word in Modern Car Construction



Some Time Ago the Railway Officials Promised to Bring About an Improvement in Service. These New Cars Are Visible Evidence that Their Efforts Have Borne Fruit

FULFILLING a pledge made by W. F. Ham, president of the Washington Railway & Electric Company, to render a "real street railway service" to the citizens in the area served by the Wisconsin Avenue line, fifteen new de luxe street cars have just been placed in service over that route. This has been done in spite of the fact that the Wisconsin Avenue line has never proved to be a profitable one. It is anticipated, however, that the high type of service which the new cars will render will attract increased patronage.

Many attractive features mark the new equipment, not the least of which is the new cream and blue color scheme which has been adopted in decorating the Wisconsin Avenue cars. It is doubtful if any citizen of Washington could be unaware of the passage of one of these new cars down the street, as their cream painting surmounted with an encircling band of royal blue on the exterior makes a very striking sight. In this respect the cars are similar to the Air Line coaches the company is now operating on Rhode Island Avenue.

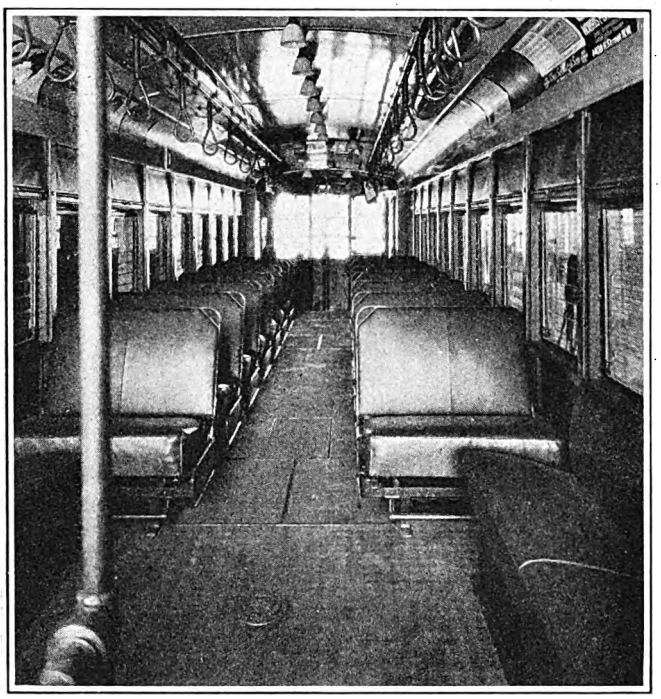
Built by the J. G. Brill Company of Philadelphia, at a cost of $15,366 each, the cars lack nothing in appearance or in comfort from the standpoint of the passengers. The interiors are finished in natural cherry, with white enamel and Quaker gray trim, and seem to radiate an air of cheery comfort. The broad, deep seats are of genuine leather equipped with cushion springs, providing comfortable riding space for two persons, while the aisle of the car is wide and easy of passage. The floor is covered with attractive rubber tiles in soft browns and reds, presenting a safe and comfortable footing for passengers and of an attractive appearance. The rubber tiling serves the further purpose of deadening truck and body noises and may be cleaned easily.

The cars seat 49 passengers and are equipped with semi-rigid handholds with brown enamel grip, to accommodate additional standing passengers. Ventilation of the cars has had very careful attention by the company engineers. Eight automatic exhaust suction type ventilators furnished by the Railway Utility Company have been installed to insure a full passage of clean air at all times. In winter the cars are heated with individual automatic heaters placed under each seat, and the mean temperature of the interior is regulated by thermostatic control.

Practically every type of safety device has been incorporated in these cars with a view to demonstrating that one-man operation is fully as safe and feasible as two-man operation. In fact, the Washington Railway & Electric Company was confronted with a storm of criticism some time ago directed at its one-man cars which were then in operation in the capital, and at that time the company offered to substitute fifteen of these latest type one-man cars in place of a similar

Digitized by Google

number then in operation. Thoroughly to convince the public of the efficacy of the new equipment, a souvenir leaflet was issued to all persons riding on the cars. This booklet, entitled "The Cream and Blue," thoroughly describes the construction and enumerates the advantages of the new cars and further goes on to emphasize the proper manner to board and leave the cars. It is the belief of the management that antipathy toward one-man cars is largely due to ignorance concerning their advantages and characteristics, and this ignorance the



No Lack of Attention to Detail Occurred in Designing the Interior Fittings

company has attempted to dispel by efficient publicity on the subject.

In addition to dead-man control, which is practically standard on modern one-man cars today, the new Wisconsin Avenue units are equipped with Westinghouse variable load brakes which automatically maintain an even braking effort regardless of the passenger load.

Wide, large doors permit of easy access at the front entrance of the car and provide an exit at the rear end through the operation of the automatic treadle which is used to operate the rear exit. Considerable emphasis has been placed upon the matter of front entrance and rear exit by the company, and it appears that the riding public is gradually becoming educated to this plan. The front doors are automatically controlled from the operator's valve handle.

The cars are provided with brilliant illumination, there being thirteen lamps placed in the interior and on the platforms, the latter providing a well-lighted space when entering and leaving the car, while an additional lamp is placed on the exterior of the cars at the doors to light up the step and additional roadway space when alighting at night. The latter feature is of considerable importance where vehicular traffic is heavy, since the light provides both a warning to passing motor cars and an aid to car riders.

The induction into service of the new cars is made coincident with the completion of the new trackwork on Wisconsin Avenue by the railway. This work covered the complete rehabilitation of the tracks on this avenue and entailed an expenditure totaling $285,000. The new equipment, costing approximately $231,000, added to the track rehabilitation costs represented a total outlay of $516,000.

The principal specifications on the fifteen new cars are shown in the accompanying table.

$12,654,135 in St. Louis Savings & Loan Deposits

REPORTS of the Savings and Loan Association affiliated with the United Railways, St. Louis, Mo., indicate continued activity during the year 1925, encouraging thrift and promoting home owning among the employees of the railway.

Real estate loans to the number of 285 were made to members to buy or build homes, this being at the rate of a loan a day, 5½ days a week.

Cash receipts of the association for the year were $2,476,646, or at the rate of $8,659 a day.

During the eleven years since its organization the association has received and handled deposits from its members aggregating $12,654,135.

It has financed the building or purchase of 1,017 homes by loans, aggregating $5,297,730; 659 of these loans, aggregating $1,664,048, or 31½ per cent of the total, have been paid off (notwithstanding employees are allowed 140 monthly installments or nearly twelve years to pay off, if they desire), leaving 1,258 loans, aggregating $3,633,682, still in process of payment.

The membership is now 5,662 (a net increase of 233 over a year ago); the assets, $3,660,575, with a contingent fund reserve of $156,354.

Dividends of 6 per cent compounded semi-annually amounting to $651,927 have been paid to members since organization, of which $165,413 was paid during the year 1925.

The authorized capital stock of the association is $10,000,000, represented by 50,000 shares at $200 each, of which there were outstanding on Dec. 31, 1925, 48,199 shares of a par value of $9,639,800.

PRINCIPAL SPECIFICATIONS OF WASHINGTON'S NEW CARS

Date order was placed	Feb. 17, 1926
Date of delivery	June 1 to 15, 1926
Seating capacity	49
Weights:	
Trucks	11,500 lb.
Total	40,200 lb.
Bolster centers	19 ft. 0 in.
Length over all	42 ft. 3 in.
Truck wheelbase	4 ft. 10 in.
Width over all	8 ft. 8 in.
Height, rail to trolley base	11 ft. 8½ in.
Body	Semi-steel
Interior trim	Natural cherry
Headlining	Agasote
Roof	Monitor
Air brakes	Westinghouse Traction Brake Co.
Axles	Hammered steel, annealed
Bumpers	Anti-climber, with pull socket
Car signal system	Faraday
Car trimmings	Statuary bronze
Center and side bearings	Brill
Conduits and junction boxes	Cable boxes
Control	K-31
Curtain fixtures	Curtain Supply No. 88
Curtain material	Pantastote, double faced
Destination signs	Keystone
Door mechanism	National Pneumatic
Fare boxes	Cleveland
Fenders	Providence
Hand brakes	Peacock staffless
Heater equipment	Railway Utility
Headlights	Crouse-Hinds WDF
Lightning arresters	General Electric
Motors	GE 265-A, outside hung
Paint	Hildreth
Registers	International
Sanders	Ohio Brass
Sash fixtures	Curtain Supply Co.
Seats	Brill 201-B
Seating material	Brown leather
Springs	Brill
Step treads	Brill
Trucks	Brill 76-E-1
Ventilators	Railway Utility
Wheels	Davis cast steel, 30 in.

Stockholm-Göteborg Electrification Recently Completed

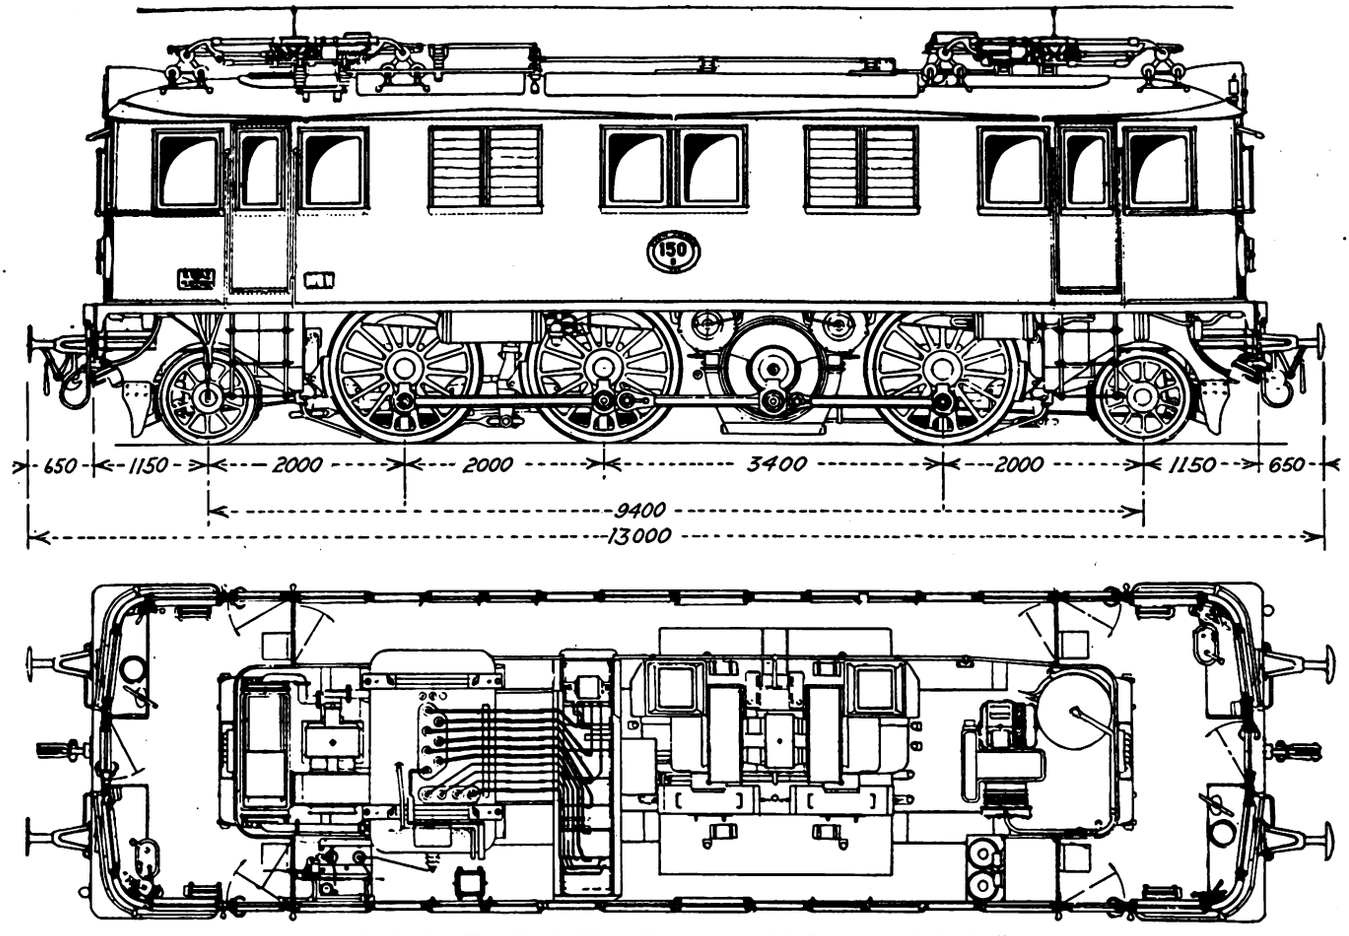
This Is the Most Important Railway in Sweden and Has Been Equipped with the 16⅔-Cycle, Single-Phase System—Power Is Taken from Existing 50-Cycle, Three-Phase Circuits and Transformed for Railway Use in Substations—Crankshaft Locomotives Are Used

By Dr. F. Neithammer
Prague, Czechoslovakia

ELECTRIFIED railway service between Stockholm and Göteborg, the two largest cities in Sweden, began operation the end of May, 1926, and I had an opportunity to study it thoroughly in June. This railway electrified a length of 458 km. (284 miles) with a ruling grade of only 1 per cent and a minimum curve radius of 500 meters (1,640 ft.).

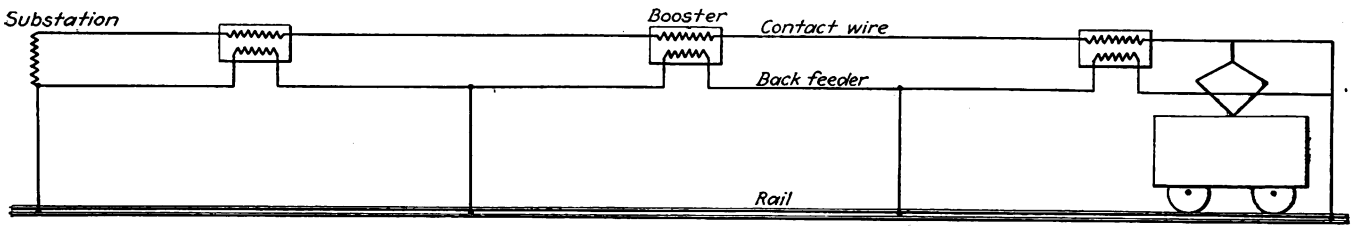
Power is obtained from hydro-electric stations at Trollhättan, Lilla Edet, Alvkarleby and Motala and from a steam station at Västeras. These are existing three-phase, 50-cycle stations distributing power for general commercial use over high-tension lines and are under the direction of the Royal Water Power Board. Energy from them is delivered at 50,000, 70,000 and 130,000 volts to railway substations, of which there are five between Stockholm and Göteborg. Here the electrical energy is converted by motor-generators to 3,000-volt, 16⅔-cycle, single-phase current which is stepped up for the trolley contact line to 15,000 volts. Two of these substations are equipped with three of these frequency changer sets, consisting of a motor rated 3,200 kw. at 70 per cent power factor, a single-phase generator of 2,400 kw. at 80 per cent power factor to stand heavy overloads and a static oil transformer of 2,400 kw. at 80 per cent power factor. The three other substations contain only two sets of the same size.

These sets, built by the ASEA Västeras, have only



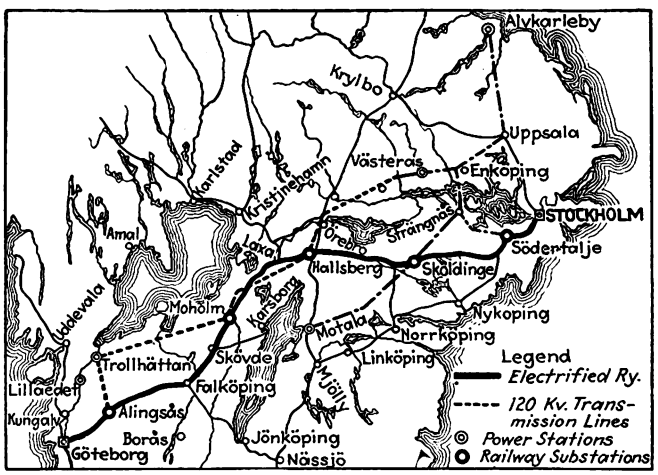
Standard 1,700-Hp., Single-Phase Locomotive, Göteborg-Stockholm Railway

Digitized by Google



Wiring Diagram Showing Use of Boosters for Equalizing Drop in Return Circuit

two bearings and possess a combined efficiency at full load as high as 87 per cent. The 50-cycle, three-phase machine has exactly the same outside dimensions as the single-phase, 16⅔-cycle machine, as shown in the substation plan, which gives the unit an excellent appearance. Possibly the single-armature Bergmann frequency changer with a single rotating field for 50 and 16⅔ periods would be even more advantageous.



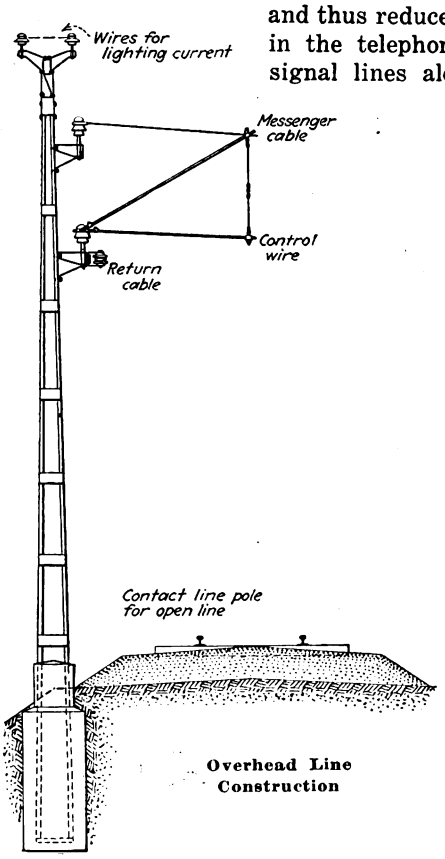
Map Showing Electrified Line, Generating Station and Substations

Catenary construction is used, with side brackets and hinged pull-offs for the contact wire, as shown in one of the illustrations. The catenary is fitted with counterweight adjustment. A lighting line is carried on the top of the pole, and further down is an insulated return wire which is connected to boosters or suction transformers and to the rails as shown in the wiring diagram. These connections to the rails are made alternately at distances of 1.4 or 2.8 km. to each rail and no rail bonds are used. These boosters equalize the voltage drop in the rails and thus reduce any disturbances in the telephone, telegraph and signal lines along the right-of-way. As a further precaution, 25 pairs of telephone and telegraph wires have been combined in a cable which has been laid underground.

Locomotive Equipment

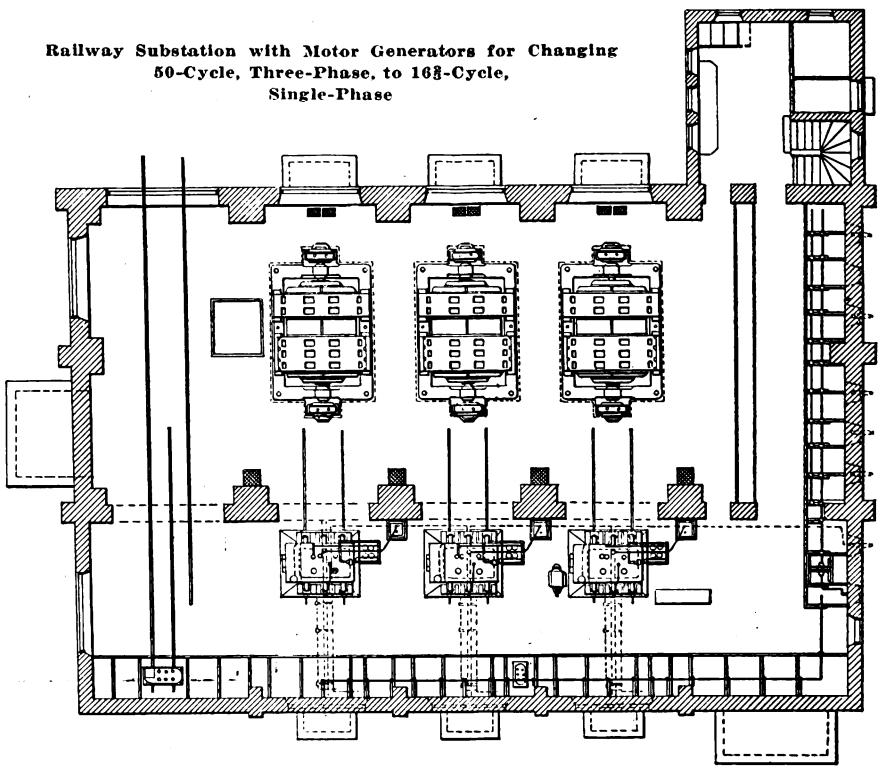
The locomotive equipment for the new electrified line consists of 50 ASEA units of the 1-C-1 type. Each has a total weight of 79.5 metric tons with a weight of 51 tons on drivers, and a capacity of 1,700 hp. The maximum speed is 90 km. (56 miles) per hour. The motor equipment consists of one pair of twin motors, geared to a jackshaft which drives the three axles by connecting rods as shown in the accompanying drawing. Tests with this simple method of drive show that a much greater train load is required to slip the wheels than with individual axle drive. The motors are of the straight series type with forced ventilation. The freight locomotives are identical in design with the passenger locomotives except that a different gear ratio is used.

The main transformer on the locomotive is of 1,490 kva. capacity. It is of the shell type with oil insulation and ventilated oil cooler, and reduces the voltage



Overhead Line Construction

Railway Substation with Motor Generators for Changing 50-Cycle, Three-Phase, to 16⅔-Cycle, Single-Phase



Digitized by Google

from 15,000 for the driving motors. Taps are provided giving from 168 volts to 840 volts for the main motors and 215, plus or minus 10 per cent, for the auxiliary motors. Multiple-unit control for the motors is obtained with electromagnetic contactors operated from a storage battery. I was informed while in Sweden that these single-phase locomotives cost no more than would have been charged for a corresponding number of 3,000-volt d.c. locomotives of the same capacity.

Departures from Prior Swedish Practice

In taking electric energy for the operation of the line from existing stations the railway authorities have departed from the principle followed on the Riksgräns Railway in the north of Sweden, which has its own power station. While results from this railway have been good, a notable reduction in capital cost follows the use of existing stations, and there is no reason to expect anything but satisfactory results. The station load factor is much better when the power is taken from central stations, and the load variation from railway operation has no disturbing effect on the rest of the output. In fact, the use of the synchronous machines in the railway substations should have a very favorable influence on the power factor of the general distribution system and may bring it up to about 90 per cent. This alone produces an advantage that should have great appeal to central station companies.

A gain of this kind has been found to follow the use of motor-generators for commercial service in Stockholm and Göteborg, in which cities three-phase current is changed to direct current for general distribution.

The Swedish Railway electrification seems to represent the most economical plan to follow in such installations where the single-phase system of distribution has been selected. From observation it does not appear to be materially inferior to the best direct-current electrification. Of course, factors may develop through the maintenance angle that will take some years to determine and which may prove to be important considerations.

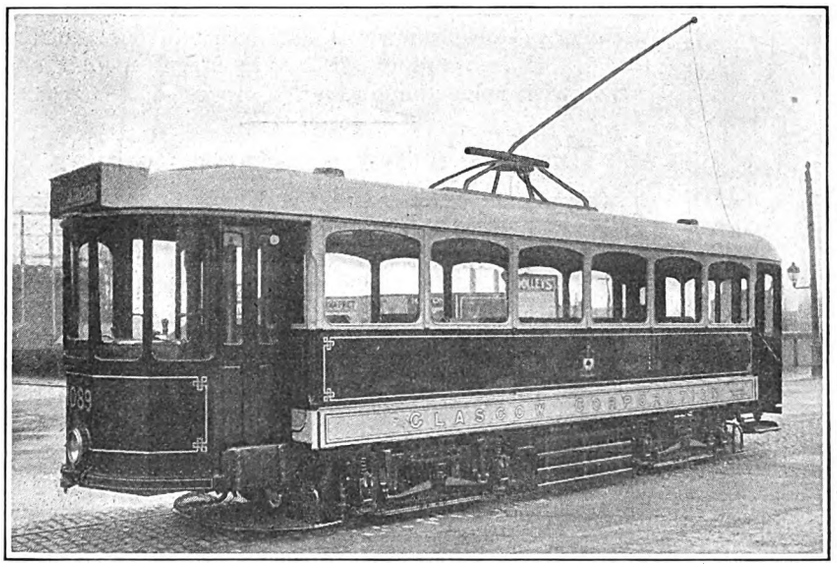
The Norwegian railways use the same electric system for the operation of the railways of that country as that in Sweden.

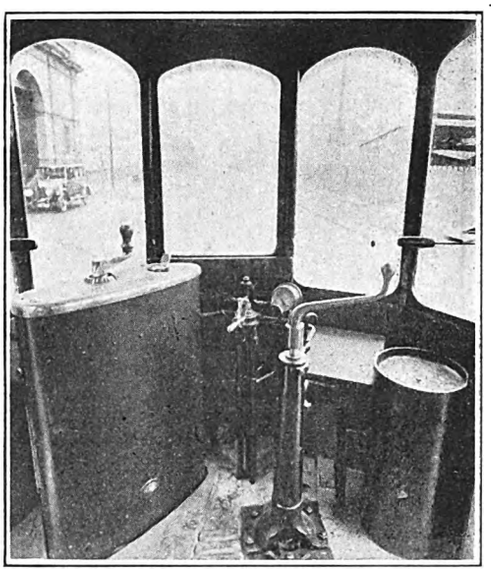
Experimental Car at Glasgow Follows American Design

Single-Deck, Double-Truck Car Is Equipped with Four Motors to Give Increased Speed and Combat Bus Competition

INCREASING pressure of bus competition, begun about two years ago, has led the Glasgow Corporation Tramways management to make several experimental departures from its usual practices. For years the four-wheeled, double-deck, top-covered car has been standard with practically no modifications. Recently, however, a single-deck, double-truck car has been built and three of the ordinary four-wheeled, double-deck cars have been equipped with different types of trucks and motors.

In the early days of electric traction in Glasgow a few single-deck cars, of a type now quite obsolete, were tried, but failed to meet with much public favor. Moreover, the double-decker had the advantage of being able to seat more people, and thus came into general use. The advent of the bus, however, has somewhat changed public taste in this matter, as many of the buses running into and out of Glasgow are single-deckers, and it has been decided to make a new trial of the merits of the single-deck tram car.





Many Features Characteristic of American Electric Railway Practice Are Embodied in the Design of This New Single-Deck Car of the Glasgow Corporation Tramways. At Right, Arrangement of Equipment on the Platform Follows the Usual American Practice

Features characteristic of American practices are found in the new car. General dimensions are as follows:

	Ft.	In.
Length over bumpers	32	6
Body length	22	6
Body width over all	7	2
Body width inside	6	10½
Body height inside	6	10½
Platform length	4	9
Bogie centers	13	0
Bogie wheelbase	5	4
Wheel diameter	2	2

The car is equipped with Brill 77-E trucks and four G.E. motors of 25 hp. each. It is anticipated that more rapid acceleration and greater speed will be obtained than in the case of the ordinary single-truck car.

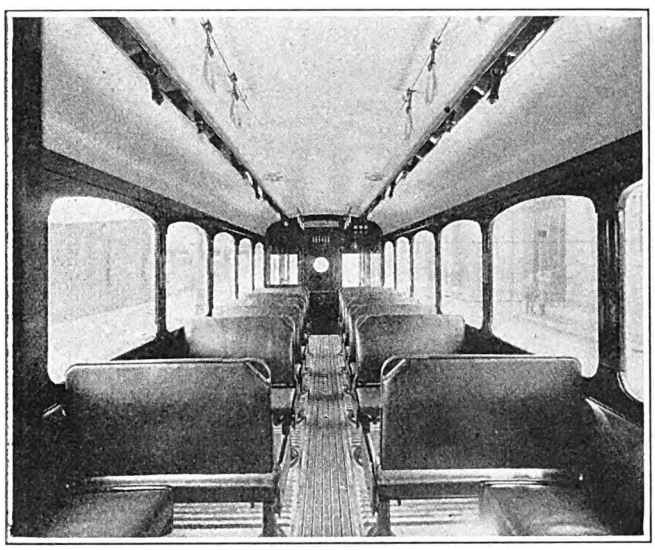
Besides the usual hand brakes, the car is equipped

Digitized by Google

with air brakes and one electro-magnetic brake. Power braking is rather a novelty for tram cars in Glasgow. Air brake equipment was supplied by the Westinghouse Brake & Saxby Signal Company, Ltd. In connection with the electro-magnetic brake, one pair of Metropolitan-Vickers 25-E magnets is fitted to each truck. There are four sand ejectors, two being operated by compressed air and two by pedal motion.

Luxuriously Finished Interiors Are Provided

Seats are provided for 36 passengers, of whom 24 are accommodated on cross-seats and the remainder on longitudinal seats at the ends. This arrangement allows standing room for about twelve passengers. In contrast to the bare wooden seats hitherto used, the new car has spring cushion seats upholstered in leather. The



Cross-Seats with Spring Cushions Upholstered in Leather Are an Innovation in the Design of Tram Cars in Glasgow

introduction of transverse seating is also new, as the longitudinal seat has hitherto been the rule in the lower saloon of double-deck cars, though cross-seats are employed on the upper decks.

Platforms are provided with double exits, the passengers entering at the rear and leaving by the front, or *vice versa*, whichever system is found to be the more efficient. This feature should give a much higher average speed. It is one of the great drawbacks of the ordinary double-deck British car that the passengers have both to enter and leave at the rear, thus greatly increasing the duration of stops. All exits of the experimental car are equipped with doors and folding steps. It will thus be seen that the designed has uppermost in his mind making the new equipment generally adaptable.

Experiments with Older Equipment

In connection with the other experiments, three standard double-deck cars have been slightly altered and equipped with different types of trucks and motors. Car No. 15 has had its underframe lengthened in order to accommodate a pair of Brill maximum traction trucks, type 39E. The driving wheels are of 26-in. and the pony wheels of 21-in. diameter. The motors are Metropolitan-Vickers No. 101-BR, of the lightweight, ventilated type. The trucks are equipped with electro-magnetic track brakes and there is also a complete air brake installation. The car seats 61 passengers, 38 on the upper deck and 23 on the lower. Longitudinal seats in the lower saloon have been removed and cross-seats substituted. The standard bodies are not wide enough to accommodate two passengers abreast on each side and the central aisle, so single seats are fitted on one side. There is, however, only one seat less than with the former arrangement. All seats are upholstered with air cushions.

Car No. 16 has been reconstructed and is now mounted on E.M.R. pivotal trucks. B.T.H. 502 motors and electro-magnetic track brakes are included in the equipment. The heating arrangement is similar to that of Car 15. Car No. 17 is being mounted on Brill 70E1 swing link trucks, with a wheelbase of 8 ft. and a wheel diameter of 26 in. Metropolitan-Vickers 101-BR motors are being fitted, as also are air brakes. Upholstered cross-seats are used on both decks.

One general disadvantage of the single-deck car, in the opinion of the Glasgow management, is that it has not sufficient seating capacity. The number of seats is little more than half that of the ordinary double-decker. It seems probable, therefore, that the ultimate decision of the Tramway Committee will be to utilize the double-deck rolling stock with larger motors and either with longer single trucks or with double trucks.

Duralumin Tokens Prove Popular

FOR a number of years the Union Street Railway, New Bedford, Mass., has sold 21 metal tickets for $1, the cash fare being 5 cents. At first paper tickets were used, but later, when Rooke automatic registers were introduced, these were replaced by metal tickets about the size of a 5-cent piece. In 1920 the unit of fare was set at 5 cents for a ride from either end of the city to the traffic center. There has been no fare increase since that date and metal tickets are still sold at the same rate. These metal tickets were replaced in 1922 by a light-weight, duralumin token. Front-page newspaper advertisements were used to promote the sale of tokens and in the spring of 1924 the company established selling agencies for these tickets at neighborhood drug stores. Previous to this, it was necessary for the purchaser to go to the ticket office in the center of the city. At no time have these reduced rate tickets been sold by the conductors on the cars.

Results attained under these various conditions are shown in the following table:

TOKEN USE ON UNION STREET RAILWAY

Years	Number of Metal Tickets Sold	Ratio of Metal Tickets to Gross Receipts, Per Cent	Per Cent Increase in Sale of Metal Tickets Since 1920
1920	538,382	1.89	.....
1921	670,087	2.56	24.4
1922	1,187,299	4.37	120.5
1923	1,774,425	6.41	229.5
1924	1,783,587	7.16	231.2
1925	1,835,627	7.37	241.1

While the gross receipts have slightly decreased since 1923, due to local mill depressions, the use of metal tickets has steadily increased, although the amount of saving made by metal ticket users was only 5 per cent. Use of metal tickets as ready fares has speeded up fare collections and has supplied the company with advanced revenue prior to the time that the tickets are used as fares. The company believes, also, that one of the benefits of metal tickets is that a person in possession of these tickets, already paid for, will ride much more frequently than one who has to pay a cash fare.

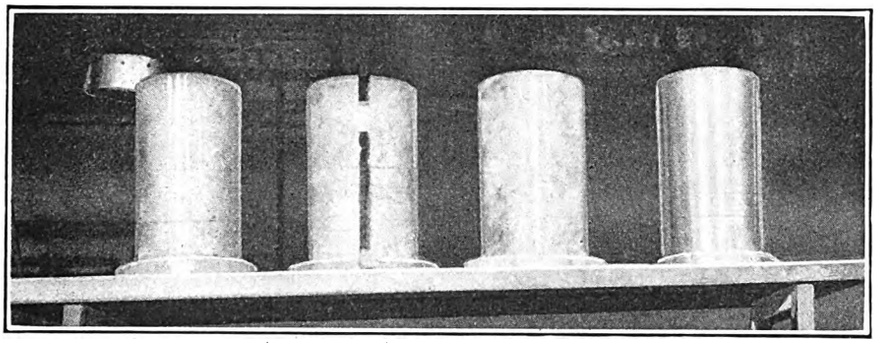
Maintenance Notes

Undersize Armature Bearings Reclaimed

BY THE adoption of a method for building up the worn external surface of armature bearings the New York Railways has been able to reclaim practically all worn bearings and, as a result, effected a very appreciable saving in armature bearing maintenance.



New York Railways Rebuilds Its Worn Armature Bearings

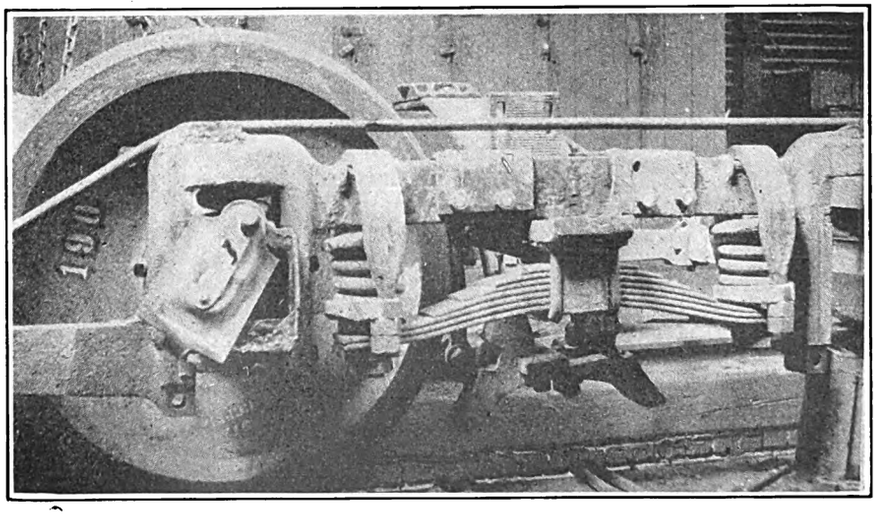
Armature bearing on the left is one with a worn external surface. Next is a similar worn bearing which has been split, spread and is ready for welding. Next is a bearing which has had the split welded. At the right is a welded bearing which has been turned and is ready for rebabbitting.

Bearings which show abnormal wear on the outer surface or are undersize are split longitudinally and spread such an amount as will permit of obtaining the proper outside diameter. The spreading is done cold by means of hard wood or steel wedges.

The opening left in the bearings after spreading is electrically welded with a bronze rod of about the same chemical composition as the bearings. They are turned to the standard outside diameter and the inside rebabbitted. The larger internal diameter is compensated by a thicker babbitt wall for the bearing surface. By use of this plan of salvage for worn bearings at least double life has been obtained.

Reinforcing Trucks for Heavy Duty

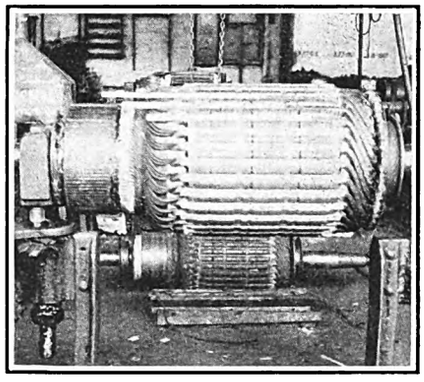
DESIRING to prepare a number of motor cars for operation with trailers the Portland Railroad, Portland, Me., found it necessary to reinforce the old 27 E-1 trucks with which the cars were equipped so that they would stand up under the heavier duty. As indicated in the accompanying illustration, both trusses and gussets were used to aid in supporting the heavy 201-G motors. Two of these motors were mounted on each truck, each motor being rated at 5 hp. The trusses and gussets used were sufficient to strengthen the trucks for the heavier load.



Gussets and Trusses Were Used in Reinforcing These Trucks

Wood Strip Prevents Injury to Armature Coils

WHERE the insulation of armature coils is unprotected and exposed to foreign material after rewinding it is very often punctured or damaged in transportation or handling. To decrease this possibility the New York Railways is installing a hard wood strip on top of each coil under the banding wire. This strip has not only practically eliminated mechanical injury to the coils during handling, shipment and installation in field frames but it has served as a protective shield to the coils in case the armature revolved on the pole faces or a banding wire becomes loosened. On account of the protective features of these strips the armature maintenance costs have been materially reduced.

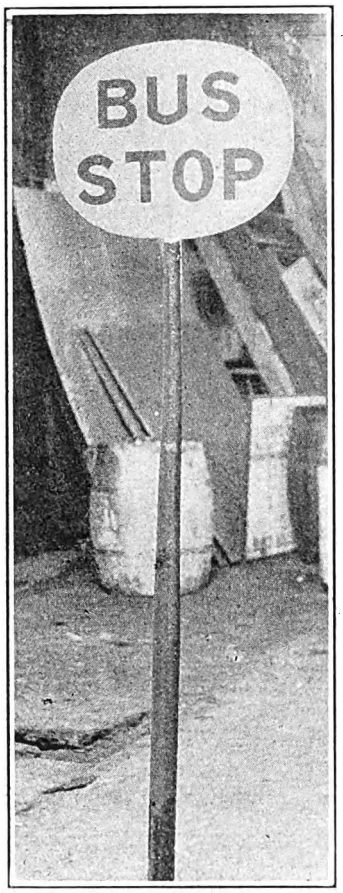


Hard Wood Strips in Place and Partly in Place on Top of Coil in Armature Core Slots

Bus Stop Signs from Trolley Poles

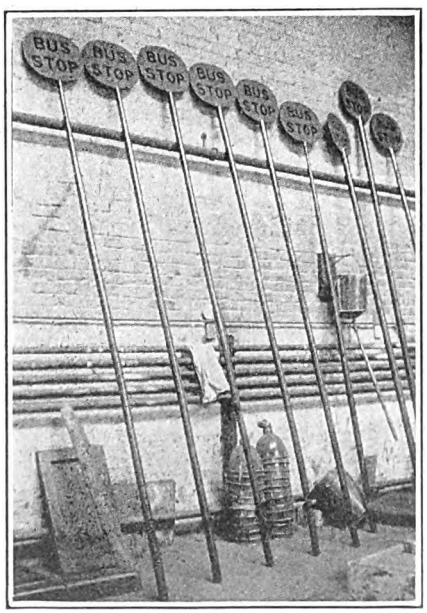
A PRACTICAL way of making use of old trolley poles has been hit upon by the Springfield Street Railway, Springfield, Mass. Needing a number of bus stop signs it was decided to trim several old poles to a

Digitized by Google



One of Springfield's New Bus Stop Signs

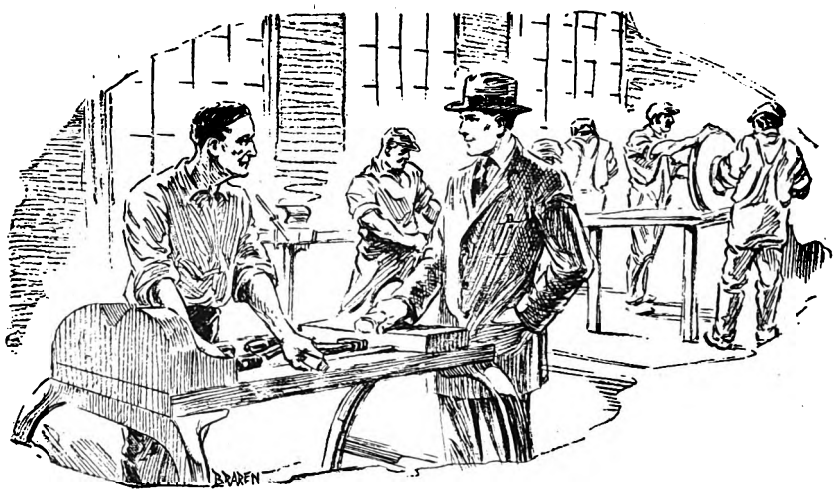
uniform length and then to weld oval sheets of metal to their upper extremities. Poles and signs were then given a coat of paint, after which the words "Bus Stop" were painted upon the metal background. The lettering is black upon a yellow background, thus making a striking appearance.



A Number of the Signs Which Were Made from Reclaimed Material

Dick Prescott Stops a Makeshift Job

And Embitters an Enemy



BY SOME of those peculiar combinations of chance which often bring about critical moments in men's lives, Dick Prescott, newly appointed assistant superintendent in the shops of the Consolidated Railway & Light Company, found himself frequently crossing the path of Pete Welcher, disaffected and envious shop inspector. Although Dick knew nothing of Pete's avowed determination to "show him up," there had on several occasions been something in the inspector's attitude and general demeanor that had raised a faint question in Dick's mind. He had, however, dismissed it without giving the subject much thought.

Pete was something of a mechanic. He loved to indulge a hobby of tinkering in the shop instead of attending to his work of checking up on repairs. Under the old shop management he had acquired some little reputation for inventiveness. This particularly pleased his vanity and gave him, he thought, a certain prestige in the eyes of the men. Though some of his products were crude substitutes for more efficient shop equipment sold by accredited manufacturers, they had been better than nothing and were used in various shop departments.

On one of his regular trips through the shop, Dick Prescott chanced to come on the inspector busily engaged in a corner of the machine shop.

"Hello, Pete," said Dick pleasantly, "what are you working on here?"

"Fixing up a commutator milling outfit," replied the inspector with an air of importance, pointing to an old lathe bed on which he had mounted some crude parts made in the blacksmith shop.

"Don't we have a commutator miller?" queried Dick, suddenly interested.

"Oh, yes, there's an old one in the armature room that I fixed up several years ago, but it ain't much good. This old lathe bed is just the thing we've needed right along."

"Well, if we need a new machine why don't we put in a requisition for one that's really designed for the job instead of wasting time and money trying to improvise one?" asked Dick.

"We're not wastin' money," exclaimed Steve sharply. "I can make one a whole lot cheaper than we can buy it and, besides, the only way we can get anything that we need around here is to make it."

"I can't quite see that," replied Dick. "In the first place you can't afford to be spending time away from your work doing this sort of thing. We're trying to get that pull-in record down, and the only way we're going to succeed is to have a check up on every job that goes through. It's far cheaper and better to buy a first-class machine than for you to putter around trying to make one. I'll see Bert Smith, the armature room foreman, and if we need a new miller, he can make out a requisition for one. The management understands that efficient tools are necessary to produce satisfactory work and keep down costs. You ought to be checking up on cars going through the shop instead of fooling with this."

Pete watched Dick as he walked toward the armature room. Then he slowly began to collect his tools, conscious that near-by workmen had overheard enough of the conversation to understand its import. With flushed face and averted eyes he finally left the machine shop, internally burning with rage and hatred.

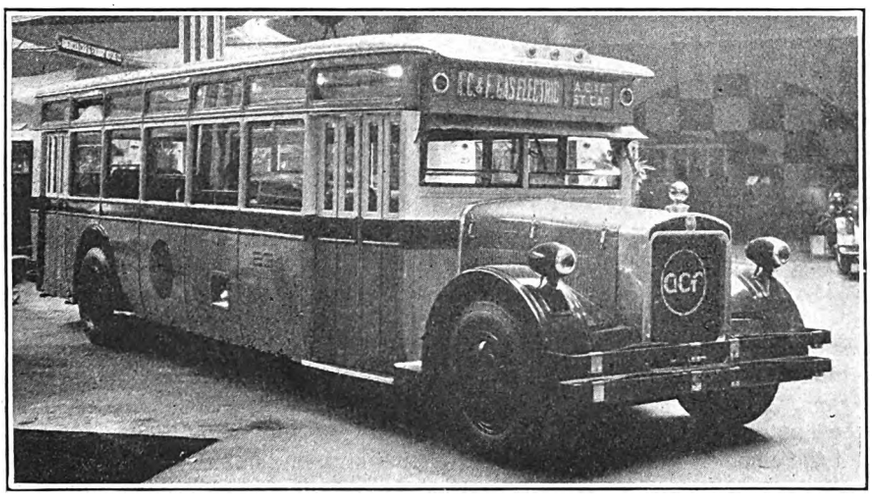
New Equipment Available

Hall-Scott Motor Used in "a.c.f." Six-Cylinder Bus

MUCH wider springs than have heretofore been customary practice have been incorporated into the design of the "a.c.f." coach, which was recently announced by the American Car & Foundry Motors Company of New York. In addition to being wider the springs are built with a fewer number of leaves and are so designed as to be flat under load for the maximum of easy riding. This effect is heightened by the unusual length of the spring, the front spring being 49 in. x 4 in., and the rear spring 64 in. x 5 in. This extreme length gives a very slow period of vibration and the periods of the front and the rear are as far apart as possible, so that the vibrations of one set of springs will not build up in the other and cause a galloping effect.



Easy Riding Qualities of This Six-Cylinder "a.c.f." Bus Are Enhanced by Long Springs

Several models of the "a.c.f." coach are now on the market. Standard body designs are as follows: 29-passenger standard car type, 26-passenger parlor car, 29-passenger urban parlor car, 22-passenger intercity or sedan type and 56-passenger double-deck.

The bus is an entirely new one, although it has been developed along lines suggested by experience which the American Car & Foundry Motors Company's engineers have had in the manufacture of other buses, and after a careful study of bus operating requirements throughout the country. The general chassis dimensions are as follows: Wheelbase 230 in., over-all length 357 in., tread, front, 70⅝ in., rear, 78 in., over-all width 96 in. The frame is of heat treated pressed steel, fish belly type, with a maximum depth of 11 in., tapering to 6 in. at the front and rear. It is stepped up over the front axle and arched over the rear axle, and has a 3-in. flange through the entire length.

The power plant is the standard six-cylinder Hall-Scott engine, with 4½-in. bore and 5-in. stroke. This engine is capable of developing more than 90 b.hp. at a governed speed of 1,750 r.p.m. The lubricating system of the engine is provided with a filter and a means of removing the condensed moisture and fuel dilution so that the crankcase oil does not need to be changed until it begins to break down.

Particular care was exercised in the design of the axles. The front axle is a special "a.c.f." Timken design, reinforced to withstand the strain imposed by the front wheel brakes. It is of the I-beam drop center type, with straight thrust roller bearings in the steering spindles and opposed Timken tapering roller bearings in the wheel hubs. The springs are carried on top of the I-beam.

The rear axle was built by Timken Roller Bearing Company on a design which was developed by the American Car & Foundry engineers. It is of the underslung worm type with the worm mounted between Timken tapered roller bearings, with a Hyatt roller bearing on the shaft. The springs are mounted beneath the rear axle.

Westinghouse steel shoe air brakes are standard equipment on all models. On the single-deck model these operate on the rear wheels only, with 16½-in. x 6-in. hardened steel drums. On the double-deck and gas-electric models Westinghouse air brakes are also provided on the front wheels, working in conjunction with the rear wheel brakes. The single-deck mechanically driven models are equipped with emergency brakes on the front wheels, these being of the Bendix three-shoe type operating in 16½-in. x 3-in. drums.

With the exception of the axle, the chassis is lubricated by the one-shot system with feed lines to all main lubricating points on the engine, clutch, drive line, spring ends and brake mechanism located on the frame. Lubricating points on the axles are equipped for the Zerk high pressure system.

Body framing consists of selected straight grain hard wood paneled with Plymetl. Upholstery is in genuine leather, the woodwork is mahogany, the trimmings nickel, and the exterior finish is Pyroxalin enamel. All models are lighted by means of a 12-volt electrical system, employing two three-cell batteries. Standard equipment includes ventilators and heaters, illuminated destination signs, bumpers, buzzer systems and emergency stop signals.

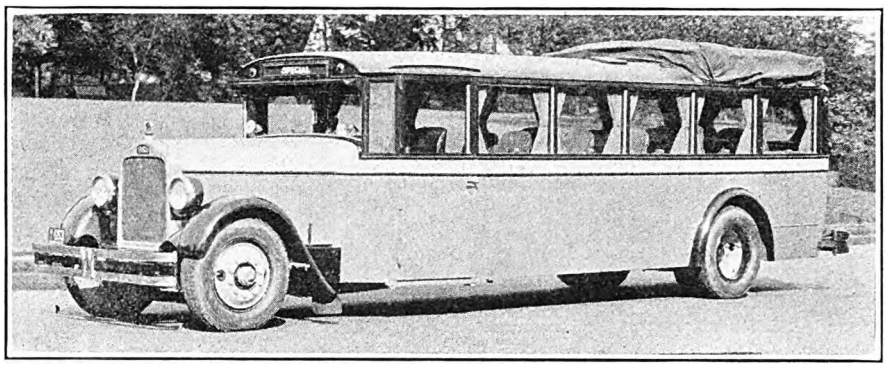
Low Pressure Tires Are Standard on White Six-Cylinder Bus

SAID to be the first bus to be designed completely from the ground up for the application of ballon tires and four-wheel metal-to-metal air brakes, the six-cylinder model 54 chassis has been placed on the market by the White Company. The chassis is intended for 18 to 29-passenger bodies and deliveries will start early in April, it is expected. From now on the company will manufacture a line of four and six-cylinder chassis to meet all types of service demands.

As in the case of the other White bus models, the new six-cylinder unit is being built only as a single-deck bus.

The engine delivers 100 hp. at 1,900 r.p.m. The length over the various bodies, including bumpers, is just under 28 ft., the maximum allowed in several states. The width can be kept

Digitized by Google



This White Six Cylinder Model Was First Exhibited at the Cleveland Convention

down within the 84-in. limit several of the southern states require, provided high pressure tires are used.

Efficiency and operating requirements have both been considered in working out the engine design. It is of 4⅜-in. bore and 5¾-in. stroke, giving a total displacement of 519 cu.in. Cylinders are cast in a single block to get rigidity and quietness of operation. Two spark plugs are used in each cylinder. Valve construction is of the overhead type, the valves being operated by push rods from the camshaft along the right-hand side. It is, therefore, possible to remove the head and grind the valves without retiming.

A Stewart-Warner vacuum tank of large capacity is used to supply fuel and no difficulty is experienced in obtaining fuel even when operating over the steepest grades.

The exhaust valves of the engine are of the internally cooled type, the hollow stem being filled with a potassium nitrate which carries the heat from the head of the stem and guide. An ejector type exhaust manifold is used and has resulted in a decided increase in engine power. In this the passages from each cylinder head are arranged so that exhaust rushing from one cylinder helps that from the next. Cooling is by a centrifugal pump, with temperature control by thermostat placed in the water outlet between the engine and radiator. This consists of a cast aluminum shell with removable core.

Standardization on balloon tires for the model 54 has led to a slightly narrower frame, of high carbon steel, heat treated. The 46-gal. fuel tank is mounted in a cradle which is bolted to the outriggers so that the tank can be dropped down without disturbing the body. Another feature of help to the body builder is the location of clutch pedal and steering gear; both are outside the left-hand frame rail.

The clutch is of the two-plate dry disk type, air cooled, the central member having impellers which give a positive circulation. From the clutch and four-speed transmission the drive is through a tubular shaft with three universal joints and S.K.F. center bearing to a spiral bevel rear axle. Normally this has a 4.5 to 1 reduction, although other ratios can be supplied to meet operating conditions. Transmission ratios are direct on high; 1.65 to 1 on third; 2.7 to 1 on second, and 5 to 1 on first, with a reverse ratio of 6.35 to 1.

Westinghouse air brakes of the metal-to-metal type are standard equipment and the chassis has been designed with their application in mind. The drums are high carbon steel and shoes of low carbon steel, the latter being of the one-piece type so that they can be thrown away when worn out. In addition to the automatic equalization of the air brakes, a slack adjustment is provided between the brake diaphragm and the cam. The compressor, which is of 6 cu.ft. per minute capacity, is directly lubricated from the engine and driven directly from the crankshaft.

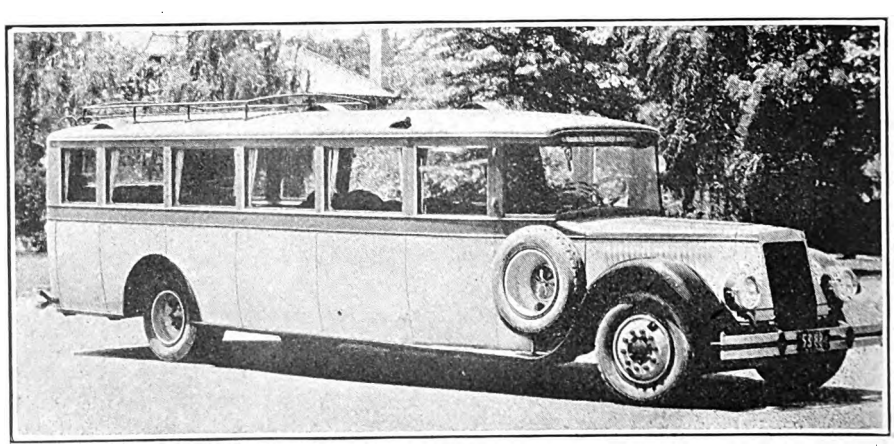
The compact instrument board which was first developed for the model 53 bus chassis is a feature of the new unit. An air pressure gage for the brakes is included on the model 54 board. On the board are the electrical indicating instruments for the two unit systems, consisting of a Leece-Neville 12-volt starting and lighting equipment with voltage regulator. The generator is rated at 30-amp. and the battery at 112 amp.-hr. at the 20-amp. rate.

Due to the use of low pressure tires as standard equipment a semi-center-point steering with inverted Ellicott type front axle has been adopted. The steering gear is of the Ross cam and lever type with a 16 to 1 reduction at the middle point. A device to prevent undue flexure or vibration at high speeds has been mounted on each end of both front springs. Front springs are 48 in. x 3 in., and the rear springs 64 in. x 4 in., the latter being of the two-stage type.

Mack "6" Has Made Its Debut

MANY of the practices followed in the standard model AB Mack bus have been repeated in the new six-cylinder model AL unit, but it has been necessary to effect certain departures to allow for the additional power output of the six-cylinder engine. Among the mechanical features which come under this category are the engine, a single plate clutch and the relocation of the transmission to a point amidships, thereby effecting a better disposition of the weight and increasing the accessibility of both transmission and clutch.

In outward appearance the new model resembles the company's other parlor car type bus until the hood is reached. Here the physical aspect has been changed somewhat by a new windshield known as the "clear-vision" type and a new radiator. This latter unit, having individual fins and tubes, is built up from four castings; the top tank, the



Principles of Shock Insulation Have Been Further Applied in This Mack Six-Cylinder Bus

Digitized by Google

bottom tank and two side plates. Over these is placed the radiator shell of sheet metal.

The AL is being built in two models, the 29-passenger parlor car and the 29-passenger city type bus, the latter being also obtainable with gas-electric drive, the same as in the AB city type buses. The only dimensional difference between the parlor and city type models is an additional eight inches on the over-all length of the parlor car, making it 341 in.

The six-cylinder engine has a 4½-in. bore and a 5-in. stroke, which is identical with that of the AB model engine. It is rated at 97 hp. at 2,200 r.p.m. The cylinders are cast en bloc with the removable heads cast in pairs, insuring against distortion on the cylinder head. The pistons are of magnesium aluminum alloy of the constant clearance type, with wrist pins clamped in the connection rod and free to rock in bronze bushed piston bosses. Four main bearings having a diameter of 3½ in. are employed. Forced feed and splash lubrication is employed as in other Mack engines and a special oil filter is provided in connection therewith.

A single plate clutch has been used to obtain greater simplicity and to eliminate clutch rattle, a frequent fault with multiple disk clutches in heavy duty service. A cushioning effect between transmission and clutch is secured by a device known as a torque insulator. The purpose of this unit, which is made up of four rubber blocks, is partly to absorb the initial starting torque and reduce the resultant strain on the drive line.

It has for some time been standard Mack practice to use blocks of live rubber for insulating the various units from the frame. This method of mounting springs, radiator and steering column has been elaborated somewhat in the AL model so that the engine, transmission and gasoline tank are now also thus mounted. This practice of rubber mounting, or "shock insulating" as it is termed, is said to result in a vehicle which is remarkably free from road shocks, vibration and noises incident to propulsion.

The transmission, especially developed for this chassis, affords four speeds forward and the ratios are proportioned to harmonize with the characteristics of the engine on the one hand and those of the chassis on the other. The conventional three-rod arrangement ordinarily employed with admiship gear boxes is dispensed with in favor of a single control rod. The reverse latch is released by depressing the control rod, no catches or buttons being used. The location of the transmission necessitates the use of one more universal joint than is employed in the AB model, consequently the drive line is equipped with five Spicer universals of the 500 series. Ball bearings are used throughout.

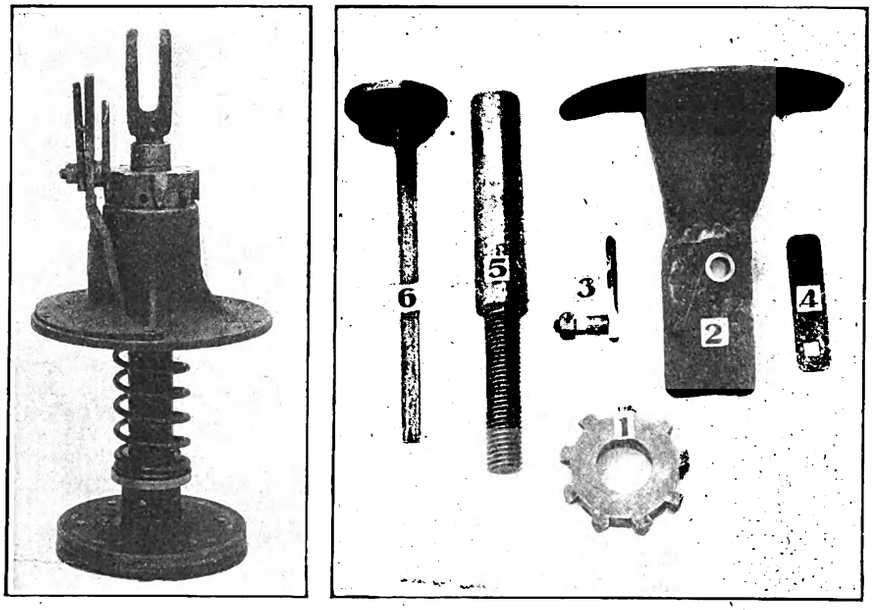
Springs are semi-elliptic throughout with 36½-in. x 2-in. auxiliary springs fitted to the rear springs to allow for variable loads. The frame is of pressed chrome-nickel steel, heat treated. The gasoline tank is mounted longitudinally along the left-hand side and has a capacity of 50 gal. Tires are 34 x 7 in. with duals on the rear wheels.

Slack Adjuster Attached to Brake Cylinder

FOLLOWING a successful test extending over several months on a car of the Scioto Valley Traction Company, Columbus, Ohio, a type of brake slack adjuster invented by W. S. De Camp will be manufactured by the Deschler Machine Works, Chillicothe, Ohio. This slack adjuster is intended for fitting to the brake cylinder on the non-pressure head. Movement of the piston beyond a predetermined travel produces a turning movement through a ratchet and pawl to take up slack in the brake rigging.

Accompanying illustrations show the slack adjuster attached to the non-pressure head of the brake cylinder and also details of the various parts. In the details part No. 1 is a ratchet which is attached to the end of a hollow piston. The pawl for engaging this ratchet is supported by a bracket bolted to the non- pressure head of the brake cylinder. This is shown as No. 2 in the detailed parts. The pawl which engages the ratchet is No. 3, and in order to insure that the pawl will drop whenever the ratchet goes beyond it in application position a weight lever, No. 4, is provided. In release position the pawl engages the ratchet and turns the piston in the cylinder ⅛ in., which makes the push rod ⅛ in. longer.

A screw piston with an oblong hole for application to an oblong push rod is shown as detail No. 5. The push rod slides in this whenever the hand brakes are applied. The oblong portion fitting into an oblong hole holds the screw piston while the piston in the cylinder is turning ⅛ in. in release position. A nut is bolted into the hollow piston to hold it when it is turned by the piston in the cylinder. The screw piston has two double threads to an inch. A washer with a key is shown as detail No. 6. This washer and key boxes the release spring and keeps it from turning the piston back in the cylinder. The washer fits over the hollow piston and the key slides in a bushing in the non-pressure head. If the release spring bore firmly against the non-pressure head the desired turning would not result, but with the spring against the washer the necessary turning movement is provided.



At Left, Automatic Brake Slack Adjuster Assembled on Non-Pressure Head of Brake Cylinder. At Right, Detailed Parts—(1) Ratchet, (2) Supporting Bracket, (3) Pawl, (4) Weight Lever, (5) Screw Piston, (6) Washer with Key

Association News & Discussions

More Detailed Annual Reports Urged

PUBLICATION of more information upon property valuation, details of mortgages and franchises, etc., by utility companies and especially by holding companies in the utility field to secure a broader public market for their securities, is urged in the last report of the Public Service Securities Committee of the Investment Bankers Association of America. This report was presented at the annual convention of the association, held in Quebec, Oct. 11-15. The annual reports of some of the leading utilities are models, says the committee, and while lacking in some of the statistical operating figures which feature the railroad reports and while not yet standardized, they nevertheless give an excellent statement of the company's affairs in a form well suited for the general public. With the broadening market for utility securities, however, the report points out, there will arise, particularly from savings banks and other institutions accustomed to give closer and more detailed scrutiny to the selection of their investments than the average individual, an increasing demand for data on these securities.

In the present policy of the formation of large operating utility systems, based on geographic lines, the committee sees a condition corresponding to that of the formation of our large railroad systems many years ago. The continual increase in the distance over which electricity can be transmitted economically has made such grouping not only possible but profitable, and in such a period the public utility industry and its bankers are urged to avoid many of the mistakes made in the railroad history. The reward, in the opinion of the committee, will surely be sufficient if the utilities can avoid the burden of public antagonism under which the railroads have labored so long.

The committee sees in the plans of the state of Oregon to construct, acquire and operate a state-wide electric generation, transmission and distribution system a proposal contrary to the soundest economic and governmental principles. It will put the public utility business under the management of five board members, subject to political election and without the necessity of having any experience or qualification for running such a business enterprise and with a pledge of the credit of the state for all examinations.

The committee sees in the passage of laws by the states of Massachusetts, Connecticut and New Jersey admitting public utility bonds conforming to certain specified requirements as legal investments for savings banks a step of very considerable importance to the industry. Such legislation, it says, affords the banks a proper and wider field of selection for their investments and makes available to a sound and essential industry large additional amounts of private capital. The committee points out, however, the practical difficulty of establishing any set rule by which to measure the safety or desirability of an investment security for any class of investors and urges that the restrictions be made not too narrow, but that the fullest extent possible be given to the institutions for the exercise of their own discretion and judgment. The committee declares the plan of the National Association of Railroad and Utilities Commissioners to secure the adoption of uniform state regulatory laws is desirable.

West Virginians Hold Convention

J. D. WHITTEMORE, vice-president and general manager Monongahela West Penn Public Service Company, Fairmont, was elected president of the Public Utilities Association of West Virginia, which held its ninth annual convention at Charleston last week. Others elected as officers were: A. M. Hill, Charleston; C. S. Dawson, Charleston, and A. C. Spurr, Wheeling, vice-presidents; A. Bliss McCrum, Charleston, secretary; G. B. Moir, Charleston, treasurer, and J. W. Cummings, Charleston, assistant treasurer.

Instructive as well as educational addresses were presented at the closing session. Chief among the talks was that given by N. M. Argabrite of New York, vice-president of the Appalachian Electric Company.

Addresses given included the annual talk by the president, W. R. Power of Huntington; Helen E. Steiner of Cleveland, chairman of the women's committee of the east central division, National Electric Light Association; George M. Chute, Jr., of Schenectady, N. Y.; A. M. Hill, vice-president and general manager of the Charleston Interurban Railroad and chairman of the bus division of the A.A.A., whose subject was "Transportation a Science"; D. L. Gaskill, Greenville, Ohio, secretary of the east central division of the National Electric Light Association, who spoke on "Public Relations, a Liability or an Asset," and former Governor E. F. Morgan, whose subject was "Citizenship."

At the annual banquet former Gov. W. A. MacCorkle was toastmaster and H. B. Flowers, president of the New Orleans Public Service, Inc., was the chief speaker.

"Advertising has been distinctly educational to the utilities as well as to their customers," delegates to the convention were told by Thomas D. Mays, president of the Mays-Williams Company, Inc., Charleston advertising agency.

A. M. Hill of Charleston spoke as follows, in part:

> We are living today in a great transportation era, particularly in our own great country where our people seem to have an insatiable desire to be always going somewhere or returning and in a considerable hurry at that. The public wants frequent, complete, safe, comfortable and fast means of travel, and if it gets what it wants it will pay the price.
>
> The story of the comeback staged by the electric railways is one in which fortitude, brains and nerve predominate, with fair-minded, open-handed salesmanship always in the foreground. A type of leadership was developed which tackled the problems confronting the industry according to new conceptions. They sold themselves on their jobs, then sold their employees, and finally went right to the people with their story, and sold them too.
>
> These men did not set their jaws and relentlessly fight the compelling advance of the motor bus. They were quick to recognize it as an ally if operated by them and a dangerous menace otherwise. Many companies have paid dearly for their early antagonism to the bus, but, I am glad to say, practically all of these have seen the error of their way and are turning their enemies into allies.
>
> While the condition of the railways is improved, there is still much room for further improvement. Although operating economies have been introduced, there is the possibility of greater economy. Better employee co-operation and understanding have been brought about. We must continue to advertise frankly our story to the public. Above all else, we must constantly strive for better service to the public.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Oct. 25-29*—Annual Congress and Exhibit, National Safety Council, Book-Cadillac Hotel, Detroit, Mich.**

***October 28*—New England Street Railway Club, regular meeting, Copley Plaza Hotel, Boston, Mass., 3:30 p.m.**

***Nov. 5*—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p. m.**

***Nov. 16-18*—Society of Automotive Engineers, National Transportation and Service Meeting, Boston, Mass.**

***Nov. 17-18*—Iowa Electric Railway Association, operating and maintenance section, annual convention, Fontanelle Hotel, Omaha, Neb.**

New England Street Railway Club to Meet October 28

ELECTRIC welding as used in the Springfield and Worcester car shops will be discussed by W. L. Harwood, superintendent of equipment of these companies, at the next regular meeting of the New England Street Railway Club, Oct. 28. The afternoon session will convene at 3:30 p.m. at the Copley Plaza Hotel.

Chicago Council Acts

Committee Orders Ordinance Framed to Embody Features Proposed by Eastern Bankers—Local Traction Man Attacks Plan

Before Nov. 1 Chicago will have a new traction ordinance presented for its approval which embraces the plan affecting the city's street car system brought forward by F. J. Lisman, New York, and associates.

The City Council committee on local transportation on Oct. 15 voted its approval of the Lisman plan after many days of dramatic debate and ordered Corporation Counsel Francis X. Busch to start preparing the ordinance immediately. Up to this time conferences between the city and the New York bankers have been based on a skeleton draft of their proposal. When the new ordinance is completed it will be sent back to the main committee of the City Council without discussion.

Prior to the acceptance of the principal points of the Lisman plan by the sub-committee, Major R. F. Kelker, Jr., city engineer, presented an analysis showing that without an increase in fares it would be possible to amortize in 30 years the $140.000,000 of first mortgage bonds proposed to be issued under the plan.

The enforced absence of several of the bankers and Surface Lines executives who are represented in the negotiations caused the postponement of the last scheduled conference of the Aldermen, the Surface Lines executives and local bankers. A report on the financial features upon which the new ordinance is to be based was to have been heard.

Perhaps the most pointed criticism against the Lisman plan was made by Leonard A. Busby, president of the Chicago City Railway, in a signed article recently appearing in the Chicago *Herald and Examiner*. Mr. Busby said in part:

> The plan is expressly conditioned upon its acceptance by the present security holders. Unless they voluntarily accept the proposition, the plan fails. Yet the plan offers to the present first mortgage bondholders only 5 per cent interest, while the new money is to get 5½ per cent and be underwritten at 91.
>
> Taking the bond interest into account, the proposition means that the car riders will pay on an average more than 6 per cent for the new money—an additional burden of $500,000 for twenty years, as against financing on a plan whereby the money could be procured on a 5 per cent basis. The junior security holders are offered an average return of 3.6 per cent during the first five years, compared with the 5 per cent they are now receiving and a 5 per cent return thereafter.
>
> The total amount to be paid the promoters under the Lisman plan is $82,040,000, or an average of $2,734,600 a year for 30 years. This will, of course, have to be paid by the car riders in addition to the $7,500,000 a year required for sinking fund purposes in order to turn the property over to the city at the end of 30 years for $1.

As Mr. Busby sees the Lisman plan, under it "the 20-year franchise is a bait to get control, if possible, of a sound business enterprise on a basis very profitable to the promoters."

Further Data on St. Louis Transit Needs Revealed

Rapid transit needs of St. Louis, Mo., require an immediate expenditure of $40,000,000 for the installation of five downtown subways, the erection of a three-story river-front structure to serve as a subway loop, storage grounds for street cars and a riverside driveway for automobiles, according to the final section of a report by C. E. Smith, consulting engineer for the city, and a special committee of the Board of Aldermen.

The second step in the development of rapid transit anticipates the extension of six radial subways from the downtown section half way to the city limits. The last step would carry the tubes or L lines to the city limits, or a total of 28 miles of rapid transit lines. Mr. Smith estimates that the complete rapid transit system can be built for $100,000,000.

Three ways of financing the subways and other rapid transit improvements were suggested.

Pending construction of the subways the committee recommends that service be speeded up by the installation of express service by street car and local service by bus.

On the subject of buses the committee specifically criticised the unregulated operation of buses in St. Louis and deplored the hardship this works upon the street railway.

The committee also reported in favor of neutral zones for street cars on wide boulevards. It advised consideration of the skip-stop plan in vogue during the war period.

Service to Argentine, Kan., Restored

Railway service over the Twelfth Street bridge into the Argentine district of Kansas City, Kan., was resumed on Oct. 14 by the Kansas City Public Service Company, pursuant to an order of Judge Kimbrough Stone in the federal court. The service was discontinued two years ago.

The line will be known as the Argentine-Twelfth Street line. The route is the same as that of the old Argentine line. Five-minute service is being given, beginning at 5:30 o'clock a.m.

Action of the new owners of the railway in restoring this service brought much favorable comment from the newspapers and citizens of the Argentine district and from the city commissioners of Kansas City, Kan.

Boston "L" Insistent

Trustees Want New Subway Finance Plan — Company Unwilling to Operate Extensions if Fares Must Be Increased

Correspondence between the Mayor of Boston and the board of trustees of the Boston Elevated Railway, Boston, Mass., makes it appear that the city has reached its limit in subway and tunnel extensions under the plan of financing followed up to this point. If the position prevails which the trustees have taken in this new controversy the Elevated will not obligate itself to support alone the financing of any future extensions. The trustees suggest a plan to divide the burden among the taxpayers, real estate owners and car riders.

The issue between Mayor Nichols and the trustees was brought to a head over the continued failure of the Elevated to sign a lease for the use of a proposed subway under Governor Square, where traffic congestion has become very serious. The Elevated took the view that the congestion is caused by automobiles and that the cost of the remedy should not be placed upon those who ride in the Elevated cars; further, that the Elevated can no longer finance such extensions without increasing the car fares.

Conclusive Answer Contained in Company Statistics

Former Congressman Samuel L. Powers, chairman of the Elevated trustees, concluded a letter dated Oct. 14 to Mayor Nichols as follows:

> In your letter you use the following language:
>
> "Let me ask you a blunt question. Is it because your company is unwilling to undertake any further rapid transit extensions until the settlement of public control by the Legislature?"
>
> I cannot but feel that the statistics I have given are a conclusive answer to your question. The question of extension of public control has nothing whatever to do with the attitude of the trustees relative to subway extensions.
>
> We fully appreciate the effort you are making to improve transportation facilities in Metropolitan Boston, and it is the desire of the trustees to co-operate with you as as far as they can consistent with their official duty as they see it. No one doubts that the extension of subways in certain localities would go a long way toward improving rapid transit facilities, and, as you say, such facilities are vital to the welfare of this community, but it is entirely evident that the extensions contemplated by you and by the Planning Board cannot be made as called for, at the expense of that part of our people who travel in elevated cars.
>
> It is self-evident that subway construction already completed has added millions upon millions to the value of real estate in Boston—undoubtedly more than the amount that the subways have cost. It is apparent that the increase of vehicular use of the streets calls for the expenditure of further millions, but it is equally apparent that until there has been adopted a different method of meeting the cost of construction of subways, either through general taxation or by the assessment of betterments upon those directly benefited, there can be no substantial advance in subway extension.

H. P. Savage Elected American Legion Commander

National commandership of the American Legion was conferred upon Howard P. Savage, superintendent of maintenance of way of the Chicago Rapid Transit Company, at the annual convention of that organization held in Philadelphia on Oct. 15. The election of Mr. Savage was made on the twenty-first ballot after the stiffest fight in the history of the Legion.

"High Power" Savage, as he is affectionately known to his fellows on the "L," was the first commander of the Chicago Elevated Post of the Legion. He is a past state commander of Illinois. Conspicuous among his achievements in Legion affairs have been his activities in securing the soldiers' bonus, his work in increasing Legion membership and his plans for a sound financial status of all posts.

He entered the service of the Metropolitan West Side Elevated Railroad, now part of the Chicago Rapid Transit system, as a track foreman. He was shortly promoted to track engineer, and later to his present position of general superintendent of maintenance of way of the elevated railroads.

During the war Mr. Savage served overseas as lieutenant in the 55th Engineers. On his return to Chicago he organized Chicago Elevated Post No. 184 of the American Legion.

When he stepped from the train in Chicago on his return from the Philadelphia convention, he was greeted by one of the largest crowds ever gathered in the vast Union station. Bernard J. Fallon, vice-president of the Chicago Rapid Transit Company and official spokesman of the occasion, proclaimed Savage a "credit to Chicago and a credit to the nation, the type of man Chicago needs."

Indianapolis Inciter Sentenced

Harry Boggs, former president of the Indianapolis union, who pleaded guilty some time ago to a charge of contempt of federal court in connection with the recent strike of trainmen of the Indianapolis Street Railway, has been sentenced to serve 120 days in jail by Judge Robert C. Baltzell in United States court.

During the testimony it was disclosed that Boggs had been in the employ of the Indianapolis Street Railway up to the time he fled the city. The contempt charge against Boggs was based on information by the district attorney in which it was alleged that Boggs had incited acts of violence among the strikers in violation of Judge Baltzell's injunction. Boggs fled from the city at the time federal authorities began an investigation of the strike. He has been in jail 44 days pending disposition of his case.

Boggs said that officers of the railway did not know that he advised striking employees to "cut loose" with acts of violence to impede operation of cars.

"I'll say frankly," interrupted Judge Baltzell, "I don't like the looks of things. I want the government to look into this."

"Are you trying to shield the railway?" inquired the judge of Boggs.

"No, sir," said Boggs.

"Why don't you tell the truth?" asked the court.

"I didn't want to tell the court I was playing both sides."

"You double-crossed them both, didn't you?"

"No, sir, I didn't double-cross the car company."

"Didn't you double-cross the company when you told the strikers there were too many cars running?"

Boggs did not answer.

"This man looks like a pretty dangerous citizen," said the judge.

Boggs denied that Robert P. Armstrong and John M. Parker, vice-presidents of the national organization and organizers in Indianapolis, had any knowledge that he was on the payroll of the company. He said they wished him to take charge of the strike.

He said that he was employed by the railway to bring about an amicable settlement if possible and to try to keep the men from damaging cars. He told the court on one occasion he called the police and told them of a conversation he heard in which it was planned to dynamite a car in the downtown district. The court said there was no doubt in his mind that Boggs's acts largely were responsible for the violence committed by strikers.

Judge Robert C. Baltzell of the federal court ordered a further investigation when he sentenced Boggs for contempt of court.

Electricity for Reading Suburban Lines

A survey of the system of the Reading Company, Philadelphia, to determine the feasibility of electrifying its suburban lines is now in progress. Charles H. Ewing, vice-president, in charge of operations, so announced on Oct. 21. He said a report from the engineers was expected within three months, but that then and only then could definite announcement be made of the plans for starting the work.

The same day E. B. Temple, assistant chief engineer of the Pennsylvania Railroad, declared that electrification of that road's line from Philadelphia to West Chester would be completed early in 1928.

Utility Speakers to Inform Students

Ohio students will learn the elements of economic life through public utility speakers. To this end Vernon M. Riegel, state superintendent of public instruction, has sent a letter urging all superintendents of schools to arrange for public utility speakers to address student bodies. He said it is always helpful to be able to give students in the latter years of school authoritative information about forces and factors which affect economic life. He feels the public utilities can furnish the information needed to dispel the general ignorance about the structure under which modern industrial society functions.

Service Restored in Pensacola

The railway lines of the Pensacola Electric Company, Pensacola, Fla., were forced to suspend while the storm raged on Sunday night, and there was a hurried order to return the cars to the carhouse. Practically all had been housed before the power plant went out of commission, and since the night of Sept. 19, or the early morning of Sept. 20, Pensacola has been without railway transportation. On Oct. 3 the statement was made that it probably would be a week or ten days before service could be restored.

Service on the line of the Miami Beach Railway, operating between Coral Gables and Miami, Fla., was restored on Oct. 3. All poles, wires and power facilities have been replaced, but several of the cars were damaged by water. Two cars are being operated every half hour between Ponce de Leon Boulevard at Coral Way and South Miami Avenue at First Street.

Mr. Mitten on Industrial Peace

Thomas E. Mitten, chairman of the Philadelphia Rapid Transit Company, Philadelphia, told the Congress of American Industry, in session recently, that "humanizing the capitalistic system has been fully accomplished, so far as the P.R.T. is concerned, the basis of its success having been built on a foundation of trust and confidence." Mr. Mitten was responding to the request of the congress that he show in what way the plan of industrial peace in use in Philadelphia had contributed to the industrial success of the nation. The points he covered were the conception of the plan, what it had done, why it had succeeded and what it could be made to accomplish. In concluding his remarks Mr. Mitten said in part:

America's best way to overcome industrial autocracy is to harness labor and capital into an industrial democracy for greater production, with proper distribution of the resultant profits, since labor, capital and consumer are all benefited through added production, which makes for lessened cost of living. When a physical merger of capital and labor is thus effected, so that they have only one interest instead of two, then only will they pull together. There can be no strikes then, because a man does not destroy his own.

America endeavored in Kansas to, by law, require arbitration of disputes between capital and labor, but failed in the attempt. Harmony of these interests cannot be enforced by law, nor can co-operation be secured by coercion. Recent labor legislation can produce only temporary peace with the railroads, which, however, cannot last longer than the time required to increase wages beyond the power of the industry to pay. Capital must encourage labor to produce by permitting its participation in the resultant profits. Labor must produce more to get more and in so doing should get its fair share of the profits.

If the employees in the anthracite fields were offered an increase of wages in proportion to their future increased production, it is reasonably certain that a sufficient increase would be forthcoming, to compensate labor, capital, management and consumer. Even if this increase should justify only 10 per cent a year and this amount be invested in securities representing ownership, the men would in ten years control the mines.

A similar condition could be brought about in the bituminous coal industry in fifteen years, and it is safe to say that if the employee-ownership principle were applied to all industry, America would within one generation become a strike-proof nation, its democracy would be industrial as well as political, and the capitalistic system would not only have been humanized, but would have reached its maximum of usefulness in the advancement of human progress and civilization.

Franchise Accepted in Louisville

Railway Agrees to Seven-Cent Fare with Transfer Privilege—Submits to Supervision of Board of Public Works—Initial Valuation Expense to Be Met by Company

THE Louisville Railway, Louisville, Ky., has formally accepted the provisions of the new franchise ordinance which was put through the City Council and signed by Mayor Will. Accepting the provisions of the ordinance was merely a formality as the company made a long struggle to get the ordinance through, agreeing to the few changes made just before its passage. The ordinance adopts general principles of regulation, fixes rates of fare and imposes certain duties upon the Board of Public Works.

Section 1 stipulates that the fare is to be continued at the present rate, namely, 7 cents for single-trip cash fare with general transfer privileges for two years or until appraisers report to the Board of Public Works and the Board of Public Works reports its findings to the General Council.

School Children to Ride at Half Fare

The company is ordered to establish a general transfer system under which the combined rides by street car and automotive units shall not exceed in price the fare charged for a ride upon automotive vehicles alone, and shall also afford transportation to school children at half fare, and to policemen, firemen and park guards, when in uniform, free, provided the fare charged for a ride upon automotive vehicle shall not exceed 10 cents during the two-year period.

The Mayor, with the approval of the General Council, will appoint a qualified appraiser whose duty it will be to value the property of the Louisville Railway. In addition an independent certified accountant will be employed to make a separate report. After the Board of Public Works has reviewed the valuation, the General Council will determine the value of the property used and useful by it in the public service and determine a rate of fare which will enable the company to earn a fair return on its property, this fare to be subject to readjustment from time to time.

The expense incurred by the city in making the initial valuation will be paid by the Louisville Railway, provided, however, that the company shall not be obligated to expend more than $50,000, which sum shall be charged to operating expenses.

In the exercise of its power to fix just and reasonable rates the General Council shall, after the report of the appraisers, modify, establish, adjust or approve rates so that the railway will, under economical management, earn an aggregate annual net operating income equal, as nearly as may be, to a fair return upon the aggregate value of the railway property. The General Council from time to time will determine what percentage of such aggregate property value constitutes a fair return. In making such determination, it will give due consideration, among other things, to the transportation needs of the city and the necessity of enlarging such facilities in order to provide the people of the community with adequate transportation.

Changes in rates initiated by the General Council will be made after reasonable notice to the company. The Board of Public Works will compile and keep all information up to date in respect to the value of the company's property and will report the findings to the Council for its full information and advice in fixing rates.

Should the company desire a change in rate it may file the proposed change with the General Council for its consideration and at the same time file a copy of the proposed change with the Board of Public Works. If within 60 days the petition has not been acted upon by the General Council the changes proposed shall take effect, but the Council shall have the right by resolution duly passed within such 60 days period to extend the time for any period fixed by it not exceeding 90 days. The General Council must neither disapprove nor modify the proposal of the company without according the company a full and fair hearing.

The company will report monthly to the Board of Public Works and on April 1 of every year file with the Board of Public Works and with the General Council a statement of the investment, revenues and expenses for the preceding calendar year.

The Board of Public Works will supervise the management of the railway. To enable it to do this, auditors, accountants and inspectors are to be employed as the General Council may, by ordinance, from time to time authorize. In order to defray the expenses of such supervision, the Louisville Railway, in lieu of any payments now provided for, will pay annually to the city of Louisville the sum of $10,000.

Section 9 states that the Board of Public Works shall have access to all books, records, correspondence, files, data and all other recorded information of any kind or character kept by the railway. The accounts are to be kept according to the rules promulgated by the Interstate Commerce Commission.

Company to Prescribe Rate of Depreciation

Section 10 states that the company shall, as an expense of operation, accrue adequate sums for depreciation and amortization and set up the same in the form of reserves. Subject to revision by the Council, it will have power to prescribe the annual rate of depreciation and the class or property to which it shall be applied, but until the valuation shall have been made the gross sum for depreciation will be $175,000 a year unless the Board of Public Works shall assent to a greater sum. Property becoming obsolete, worn out in service or abandoned is to be amortized over a period of fifteen years, unless some other period is agreed upon by the Board of Public Works and the company.

The company will issue no new bonds or other securities representative of funded debt without the assent of the Board of Public Works as to amount, interest rate, maturity and sinking fund provisions.

To obtain new money for improvements, extensions or for betterments the company may from time to time issue and sell new securities in such amounts as may be necessary under certain conditions provided. New money for such purposes shall be obtained by the company at as low a rate as practicable, and should the price of such new money as secured be unreasonably high, then and in that event the return upon the property represented by the new money shall be allowed only at a reasonable rate without respect of the actual cost of such money to the company.

The new ordinance states that the surrender by the company of any and all franchise terms in excess of the present constitutional limit of twenty years from Aug. 25, 1922, by its formal acceptance of Ordinance No. 330 is confirmed and all franchise operating rights that the company may own, have or possess extending beyond Aug. 25, 1922, are included in said surrender and any and all its franchise rights shall expire and determine twenty years from Aug. 25, 1922, provided the said surrender by the company will be without prejudice to any or all rights of any and all holders of any bond or bonds heretofore issued by it or secured by any of three mortgages now outstanding on the property and franchises of the company. The surrender shall further be without prejudice to the right of said company, with the assent or approval of the Board of Public Works, to continue the sale of its general mortgage bonds, putting the holders of said hereafter sold general mortgage bonds upon an exact parity with the holders of said general mortgage bonds sold prior to Aug. 25, 1922.

The company is required to construct and maintain the supporting substructures of the streets to the extent that its track or tracks are laid above them, and adjacent to its rails, is to construct and maintain a stringer not less than 4 in. wide to keep the top surface of its rails flush with the surface of the street. Wherever the construction, maintenance or operation of the railway results in damage to the street surface, the company is to make repairs at its own expense.

Nothing in the ordinance "shall be deemed to barter away or to impair the police or rate-making powers of the city of Louisville, but, on the other hand, the city expressly retains those powers free and unimpaired."

In the event the Louisville Railway fails or refuses to abide by the terms of the ordinance, it shall be subject to a fine of not less than $50 nor more than $100 for each offense, and each day's failure or refusal shall constitute a separate offense.

Resumption of Franchise Negotiations Planned in St. Louis

When negotiations are resumed on the terms of the franchise under which the reorganized lines at St. Louis, Mo., will operate, officials of the St. Louis Public Service Company, the successor to the United Railways, are prepared to advance further arguments in favor of a 7 per cent rate of return on their investment. Mayor Victor J. Miller has sought to limit the return to 6 per cent. Failure to agree on the rate of return for the company has delayed progress on the new franchise.

C. E. Smith, consulting engineer for the city, in an address before the Civitan Club, declared that under the franchise to be offered the company by the city the municipality will have the right to demand and direct the use by the company of any rapid transit facilities constructed by the city. Mr. Smith was explaining the recent report of a rapid transit committee of the Board of Aldermen recommending the construction of subways in St. Louis. He declared that the logical and economical arrangement would be to operate the subways in conjunction with the present surface lines, but said that should an impasse develop between the city and the railway a rapid transit system with a series of bus lines could be developed to furnish transportation.

Approval Sought for Kansas City Traffic Artery Plan

The Grand Avenue Association of Kansas City, Missouri, an organization composed of property owners and leaseholders on Grand Avenue from Sixth Street Trafficway to Twenty-seventh Street, will ask the Kansas City Public Service Company to remove its tracks on Grand Avenue. It is the plan of the association to make a 99-ft. traffic artery of Grand Avenue, unimpeded by tracks, through the heart of the downtown business district. Notices have been mailed to all property interests, asking their opinion of the proposed change. Negotiations will not be opened with the railway unless most of the property owners favor the plan.

"Chicago" in the Movies

The public is being told of the causes of delays and the efforts required to overcome them in a motion picture just released by the Chicago Surface Lines, Chicago, Ill. The picture is called "Carrying On." It shows typical blockades caused by broken-down vehicles on the tracks, flooded subways under viaducts, fires and snowstorms. The use of emergency equipment in overcoming these difficulties is graphically illustrated.

Another picture will be released by the Surface Lines shortly entitled "Arteries of City Life." It is directed against the parking evil and shows the congestion resulting from the parking of vehicles along main street car lines and too close to loading zones. It also shows how schedules are disrupted by blocked railroad grade crossings, and other interferences. A striking contrast between conditions as they usually exist in the Loop district, where parking is permitted, and as they were during the Eucharistic Congress, when parking was prohibited, is shown.

Inclusive Educational Program at Boston

Because of the continual demand for intellectual advancement among all classes of its employees the Boston Elevated Railway, Boston, Mass., will again offer an educational program with topics for courses selected from those which proved most interesting and profitable last year. The committee this year is confining the program definitely to five months, Nov. 1 to March 31, with provision for one general meeting, five sets of departmental conferences and the holiday season. Among the courses will be a reading course, the purpose of which will be to lay out fifteen minutes or more for daily reading. There will be a course in current events, public speaking, business English, interdepartmental accounts, automotive maintenance and electric railway law. The Boston Elevated Railway has issued an explanatory pamphlet on the educational program for the 1926-1927 season containing a valuable foreword by Edward Dana, general manager.

Ticket Bootlegger Caught in Portland

The Portland Electric Power Company, Portland, Ore., through its attorney, caused the arrest of a man charged with forging car tickets. The man was employed until recently in a local print shop. In his possession when he was arrested was found one of the supposedly forged tickets and a witness told of buying three books for $5 when the price of one is regularly $3.65. Evidence also showed that he had sold more than 1,000 tickets at 3 cents each, when the price is 8 cents. The man under arrest has been held in jail in default of bail set at $2,000.

Georgia Railway Burns the 164th Car

An indication of the extent to which the Georgia Railway & Power Company, Atlanta, Ga., is keeping its equipment and its service up to date is seen in the funeral pyre of the 164th car to be scrapped during the past three years.

Car No. 164 was a double-truck, four-motor car, built in 1902, and had seen 24 years of almost continuous service. The length of the car over all was 38 ft. 6 in., its seating capacity 40 passengers and its total weight complete, when empty, 44,740 lb. It was the last of 34 cars dismantled and burned during September.

Of the 164 cars destroyed in the last three years 130 were single-truck cars, eight were double-truck two-motor cars and 26 were double-truck, four motor street-cars. All had been in service for more than twenty years. Their value new was $597,000. The cars have been replaced by new, modern low-floor safety cars, each with a seating capacity of 48 and a complete weight of 37,380 lb.

Antiquated Cars Cast to Flames in Atlanta

Spreading the Story of "L" Service in Chicago

Employees of the Chicago Rapid Transit Company, Chicago, Ill., through the public speakers' organization, are doing good work in carrying the story of the company's service into public schools, clubs fraternal societies and similar organizations. Since the public speakers' organization was formed less than a year ago, 182 talks have been made to audiences aggregating more than 48,000. At the same time the first aid team has given 176 demonstrations before audiences totaling more than 83,000. Altogether the story of the "L" lines has been put before 358 separate audiences totaling more than 132,000 persons in the last ten months. These activities by the company have been the subject of comment before in the ELECTRIC RAILWAY JOURNAL.

Commission Wants Albany Earnings Segregated

The United Traction Company, Albany, N. Y., in its arguments for a 10-cent fare, must segregate its accounts in every municipality. George R. Lunn, Public Service Commissioner, so ruled at a recent hearing. The question upon which the previous hearing had closed was the admission as evidence of the traction company's valuation of the lines covered by franchises in Rensselaer and Troy. Mr. Lunn said:

> The commission will accept this evidence, but on the understanding that there must be segregation. The fact must be faced that the traction company must segregate its accounts in every municipality before the rates are fixed.

Public Hearing on "L" Lease Scheduled

The Public Service Commission of Pennsylvania recently ordered a public hearing in Philadelphia on Nov. 4 on the joint application of the city of Philadelphia and Philadelphia Rapid Transit Company for approval of the Frankford "L" lease. The lease providing a 30-year extension of the agreement with the Philadelphia Rapid Transit Company was signed by Mayor Kendrick on Oct. 13 despite a considerable amount of criticism. At the Nov. 4 session opposition to the lease will be renewed. Following the Mayor's approval the United Business Men's Association filed a petition with the commission protesting against ratification of the lease.

Future of Detroit's Business District Studied

J. R. Bibbins, consulting engineer, Washington, D. C., has been called to Detroit to undertake for the Detroit Edison Company a comprehensive economic survey of the future development of the rapidly growing business district and such other outside subcenters as are already taking form for the purpose of securing a fairly definite picture of the growth and needs of the present and future districts for central station utility service, particularly district steam heating. The period comprehended by the survey will be five-year intervals up to the year 1950, and an attempt will be made to visualize the portable building development block by block in these areas, taking into account such controlling factors as transportation, traffic, zoning, city planning, land values, living conditions, local trends, industrial employment and output, business population, etc., and the particular economic relation of Detroit as an industrial center to other contiguous or competing centers of the Middle West.

Detroit is rapidly developing its municipal railway and bus transportation system and its interurban facilities. It has ambitious plans for port development, has already developed a major highway plan for its rapidly enlarging suburbs and is entering upon active rapid transit development and facilities for transportation by air. Its municipal area now covers 139 square miles, as compared with 28 square miles in 1900, and its population has grown from 286,000 in 1900 to more than 1,300,000 in 1925, not including tributary suburban population outside of the city limits.

World's Series News Told by Grand Rapids Cars

PATRONS of the Grand Rapids Railway, Grand Rapids, Mich., were served with inning-by-inning bulletins during the world series baseball games. Plays were received by radio and the results by innings, including chief features, such as Ruth's home runs, placed on the bulletin boards of the new electric rail coaches as they passed through Campau Square. Many compliments were received by the company from patrons who enjoyed the games while they rode home.

Railway Proclaims World's Champions

"Rajah" Hornsby, the manager of the Cardinals, and the other members of the St. Louis team certainly received the plaudits of the populace of the metropolis on the Mississippi. It was a grand welcome that city accorded its world champions. Whistles blew, auto horns honked, and if the use of any other noise-making device were overlooked, history as written in the daily papers failed to record it. Many of the people of St. Louis remained up all night to celebrate. The expediency of this may be debatable, but it is a fact that they did it. Joy was unconfined. And when joy is unconfined in St. Louis it apparently knows no limit.

The ELECTRIC RAILWAY JOURNAL has already told how the United Railways did its part in transporting the fans to the baseball park. The company might well have remained content with this contribution to the affair, but it did not. Nothing like that for it. Of course, its men individually took cognizance of the fact that the world's championship pennant will swish in the breeze—when there is a breeze in St. Louis next summer—from the flagpole at Sportsman's park, but the company took official notice of the event in which Alexander the Great, Rog, Bell, Bottomley and others covered themselves with glory. Its most conspicuous contribution to the event was a car proclaiming the world's champions. This car, with its cardinal decorations, was operated over the system at night. It made a big hit. Incidentally the car and the signs it carried on either side conveyed to the public the fact that "corporations have a soul."

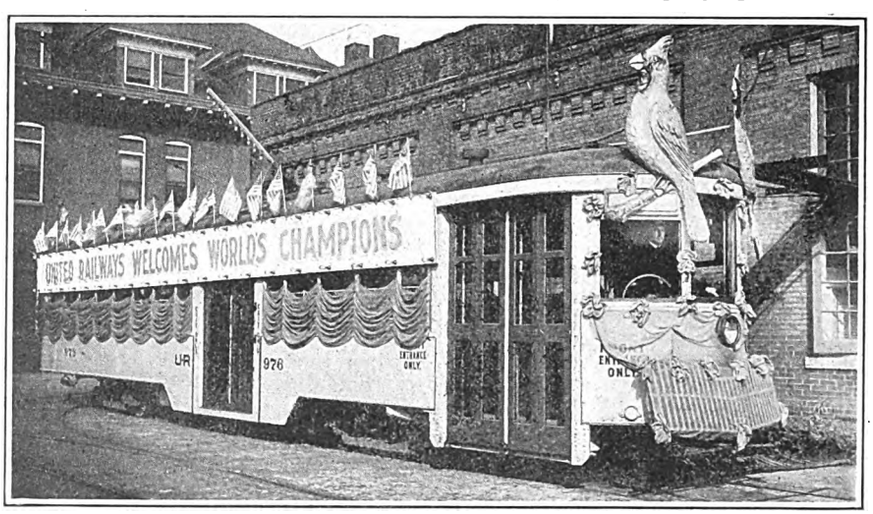
Prompt Decision Expected on New York Fare Referendum

The Court of Appeals of New York decided on Oct. 15 in Albany to hear arguments on Oct. 19 on the appeal in the taxpayer's action for an injunction to prevent the submission of the so-called 5-cent fare referendum in New York City. All other matters before the court will wait until after this issue and the one on the prohibition vote have been heard. It is expected that a decision in each case will be rendered before the date fixed for a recess of the court until after election.

Advertisements to Be Carried in Honolulu Cars

The Honolulu Rapid Transit Company, Honolulu, Hawaii, has voted to carry advertisements in its cars if an attractive bid is received. This reverses a policy of 25 years standing. The situation in Honolulu, with its hotels located 3 to 4 miles out of the city proper and its many tourists, is regarded as unusual. The city frowns on billboards, of which there are very few.

In 1925 the company carried 17,085,088 passengers in 71 cars. It is asking for bids and preliminary specifications for twelve additional cars. Advertising bids will also include the use of buses. The proposed contract is to run from March 1, 1927, for a period of five years. The advertising privilege is to include the use of the lower portion of the ceiling along either side of the car for card advertising. No other space in or out of the car will be included in this privilege. Bids are to be received by the company up to Dec 15.



Crowing About the Cardinals a la Railway

New Providence Plan Contemplates No Subways Now

Robert Whitten, city plan consultant, reported to the City Council of Providence, R. I., on Oct. 12. He advances plans involving an expenditure of $40,000,000 for the relief of traffic congestion in the city and calling for the construction of four 140-ft. boulevard highways across the city, the widening of more than 25 streets and the elimination of several grade street crossings by underpasses. In addition to providing additional street capacity, the plant proposes to create thoroughfares upon which a speed of 30 m.p.h. will be as safe as 15 m.p.h. is on the ordinary city street today. It is also designed to carry through travel around the congested down-town district instead of through streets already crowded.

Mr. Whitten put aside for the present a plan submitted last summer by William W. Lewis for a subway system of two tubes to carry street cars through the congested area as a means of easing the traffic situation. Mr. Whitten said that purchase of land for the widening of highways can be made much more economically now than will be possible 25 years from now, but subways, if needed then, probably can be built in 1950 as cheaply as now.

Dallas-Irving Franchise Extended

The Dallas Southwestern Traction Company was granted an extension of time until Dec. 31, 1927, for the construction of its line from Dallas to Irving by a recent action of the County Commissioners' Court. E. P. Turner, chairman of the board of the company, made the request. This line, it is proposed, will be an electric line connecting Dallas and the Irving territory. The promoters organized a company about fifteen years ago and several extensions of time under the franchise have been granted. E. P. Hopkins is president of the company.

News Notes

Fare Lowered to Stimulate Travel.—A reduction in fare between Harrisburg and Mechanicsburg has been put into effect by the Valley Railways, Lemoyne, Pa. Instead of three 8-cent fares only two will be charged. The new rate will be tried out until Dec. 31, and if increased revenues result the plan will be continued after that date.

Towns Celebrate New Electric Branch.—The first electric train passed through the newly electrified West Hempstead branch of the Long Island Railroad on Oct. 19. The train left the Pennsylvania Station at 2 p.m. and passed through Jamaica, Malverne, Lake View, Hempstead Gardens and West Hempstead to Mineola amid much celebration and cheers. Since 1893 the West Hempstead branch has had shuttle service by steam or storage battery cars between Mineola and Valley Stream connecting at either end with main line trains. The new electrification will mean through service to New York and Brooklyn. One year ago last May the electrification of the Montauk Division to Babylon was completed.

"Stars" Awarded in Atlanta.—Officials of the Georgia Railway & Power Company, Atlanta, Ga., have given out recently more than 600 "service stars," representing a total of 3,000 years of service by the 600 employees. Among the trainmen who received seven stars, having served more than 35 years with the company, are S. B. Lyon and W. B. Kirk. These men are also the oldest trainmen in the company from the standpoint of continuous service. A set of stars, one to be worn on each side of the uniform collar, is issued for each five years.

Fare Hearing Scheduled.—The matter of a 10-cent fare in Syracuse, N. Y., is up again. The Public Service Commission will hear the city's side of the case against the application of the New York State Railways at the New York City offices on Oct. 26. The company is seeking permission to charge a 10-cent cash fare and a 7½-cent ticket fare. The original petition was submitted nearly a year ago. Several hearings have already been held.

Council Blocks New Car Line.—The Common Council of Madison, Wis., passed an ordinance on Oct. 8, signed later by the Mayor, prohibiting the use of Regent Street from Breese Terrace to Prospect Avenue by the Madison Railways for a new car line. The action of the Common Council blocks the plan of the company to abandon its Harrison Street line in favor of the new line on Regent Street from Breese Terrace to Prospect Avenue. The Railroad Commission had approved the company's plan to lay new rails on Regent Street and counsel for the company had contended that under the franchise granted the company in 1892 it had the right to use any city street without first obtaining permission from the city. An appeal by the city from the order of the commission authorizing the abandonment of Harrison Street is now pending in Circuit Court.

Pittsburgh Officials Attend Utility School.—Officials of the Philadelphia Company and its subsidiaries, owners of public utilities in Pittsburgh, Pa., are going to "night school" at the University of Pittsburgh. Ninety men of the Philadelphia Company, including four vice-presidents, registered for the course in public utility administration. Classes are held each Thursday evening under the direction of Dr. Charles Reitell and will be continued throughout the school year. The faculty includes Dr. Reitell, Dr. John G. Bowman, chancellor of the university, and A. W. Robertson, president of the Philadelphia Company.

Railway in Laurel to Continue.—According to Barney E. Eaton, president of the Mississippi Power Company, plans for the rehabilitation of the railway at Laurel, Miss., are being completed. An unofficial announcement made some time ago was to the effect that the railway service of the Laurel Light & Railway Company would be abandoned in favor of buses.

Free Rides in Charleston. — The Charleston Consolidated Railway & Lighting Company, Charleston, S. C., was temporarily "bought" by Kerrison's Department Store on Sept. 25, for one hour and turned over to the public for free rides. This idea was conceived by the officials of one of the city's oldest firms in appreciation of the patronage the shoppers had given in connection with the 95th anniversary sale held in the store during that week. The watchword of the hour on Sept. 25 was "the rides are on Kerrison's, jump aboard."

Tickets in Atlanta Have New Color.—The Georgia Railway & Power Company, Atlanta, Ga., is discarding the green tickets and substituting pink ones. Fifteen pink tickets will be given upon submission of $1, just the same as fifteen green ones heretofore. Any green tickets which have been purchased will be honored upon presentation.

School Fare Ruling on Interurban. The Public Service Commission has approved a new tariff of the Schenectady Railway, Schenectady, N. Y., fixing regulations heretofore applicable on the Troy division only, which provide for the sale of 50-trip one-zone interurban school tickets at a price of $2 a ticket, applicable within zones 2, 3 and 4 on the Saratoga division.

More One-Man Cars in Service.—The number of one-man car lines operated in Milwaukee, Wis., was increased to six on Oct. 3 when the Milwaukee Electric Railway & Light Company placed one-man cars in operation on its Wells-Downer line. Twenty reconstructed cars newly equipped and refurnished were added to the line.

Resident Buyer in Birmingham for Illinois Traction.—The Illinois Traction System, Springfield, Ill., will open a branch office in Birmingham, Ala., according to O. L. Bunn, general manager of the Chamber of Commerce. Leander Poole will represent the company in Birmingham. The Illinois Light & Power Corporation, the principal holding company for the Illinois Traction System, buys heavily in the Birmingham district.

Dallas Railway Takes Interurban Rails in City.—Rails of the Texas Interurban Railway on St. Paul Street and Fairmount Avenue, Dallas, used for the last two years by the Dallas Railway & Terminal Company, are to be purchased by the latter company for a consideration of $46,620. Denton Interurban cars will continue to use the rails, which had been under a lease to the purchasing company that expired Sept. 30.

Coal Carrying Improves Business.—The Evansville, Suburban & Newburgh Railway and the Evansville & Ohio Valley Railway, Evansville, Ind., are hauling considerable coal at the present time, which will prove a good source of revenue for several months to come. Many of the coal mines in Warrick and Spencer Counties along these traction lines are resuming operation and a good many men are employed in mining. The transportation of the products of the mines furnishes one of the best sources of revenue that these lines have from year to year.

Recent Bus Developments

Pinchot Raps Commission

Pennsylvania's Chief Executive Sees Red at Steam Railroads' Proposals to Run Buses

Governor Pinchot of Pennsylvania announced recently that he refused the grant of charters to the Pennsylvania General Transit Company and the Reading Transportation Company, formed by officers of the Pennsylvania Railroad and the Reading Company, respectively, to operate bus and truck lines.

The Pennsylvania company asked for a charter covering 55 of the 57 counties of the state, the Reading for charter rights in 24 counties. The Reading's application was for a $1,000,000 corporation, while the capital stock of the proposed Pennslyvania Bus Company was half that amount.

The Governor said in part:

I decline to approve the charter applications of the Philadelphia & Reading and the Pennsylvania Railroads to operate bus and truck lines over the highways of the state, as recommended by the Public Service Commission, for the reason that these applications are the first steps toward securing a monopoly of bus transportation over the highways of this Commonwealth.

These charters appear merely to grant the right to run buses and trucks over the highways and stipulate that lines cannot be run over any definite route or routes until after the Public Service Commission has granted the right to operate in each individual case. In fact, they are the opening wedge in handing the highways of Pennsylvania over to the railroads.

Such blanket grants as these have never been made before. They can have but one purpose. It is no answer to say that other bus and truck lines might be permitted to operate. The history of similar cases demonstrates beyond question that competing lines would be crushed out or bought out (with increased charges to the public), that the railroads would absorb them as they did canals, and that the formation of a railroad bus and truck line monopoly would scarcely even be retarded.

If the present majority of the Public Service Commission could be trusted to protect the rights of the citizens of Pennsylvania against encroachment or extortion by railroads, street railroads, electric and other public utility corporations, the apparent safeguarding of public rights in those charters might have some meaning. Under the actual circumstances it has none. If I were to sign those charters, the commission could complete the railroad monopoly by granting certificates of public convenience without anybody being able to stop it. For this reason alone, even if these charter applications did not involve a fundamental public policy, which they do, they ought not to be approved.

The time to stop the intended control of our highways by the railroads is before it starts. These charter applications on behalf of the Pennsylvania and the Reading Railroads will be followed by similar applications from other railroads. Since the rights of our citizens are not otherwise protected, the Governor must protect them and so long as I am in office the Governor will, to the full extent of his power.

The commission's letter, stating the facts in the case, and signed by Chairman W. D. B. Ainey, was in part as follows:

The commission's approval of these applications merely clothes these companies with lawful authority to furnish service of this character if and when by subsequent order, the commission shall have determined that the public necessities require the furnishing of bus service as auxiliary or supplemental to service presently being furnished, whether by rail carrier or otherwise.

The commission's approval of these incorporations will in no wise relieve them, in seeking authority to operate over specific routes, of the burden imposed by law of affirmatively establishing by proper testimony that the particular service which they propose to furnish in any given case is necessary for the service, accommodation, convenience and safety of the public.

When such applications are presented the commission will require, as it does in all similar cases, that copies of the petitions be served upon all existing carriers engaged in furnishing a similar type of service in the territory, and these carriers will be afforded full opportunity to protest and be heard in public hearings.

At the present writing seven applications for operation over specific routes have been filed in the interest of the Pennsylvania General Transit Company and four in the interest of the Reading Transportation Company. Of the former, three have been approved, one refused and three are pending. Of the latter, all four cases are pending. The commission's refusal, above noted, was in the application for the carriage of persons between Waynesburg and Washington ,and its reason therefor was that reasonably adequate service of this character is presently being there furnished by an existing certificate holder.

The proceeding is of interest because of the point of view taken by the Governor, because the electric railways appeared in opposition to the plans of some of the applications, which appeared to threaten the entrance by the railroads' bus lines of territory in which trolleys were operating, and because of the pronouncement of the commission of its intention to protect the rights of existing carriers.

Would Operate Buses Only

The Omaha & Lincoln Railway & Light Company, Ralston, Neb., has asked the State Railway Commission for authority to tear up the last of its trackage, that between Omaha and Ralston. The company formerly operated cars to Papillion, but a year ago was allowed to abandon the track and service and substitute buses. A little later it was authorized to abandon railway service between Omaha and Ralston, save two cars a day, buses having been used for supplemental service for two years. Now the public authorities propose the reconstruction of a viaduct in Omaha over which the company's tracks run, and as this will call for an expenditure that the railway regards as prohibitive its officers desire to abandon railway operation and furnish transportation entirely with buses.

Doylestown Bus Project Argued

The application of the Philadelphia Rapid Transit Company, Philadelphia, Pa., for certificates of public convenience to operate bus lines from Philadelphia to Doylestown and to Cypress Avenue and Cadwallader Avenue, Montgomery County, was heard by the Public Service Commission on Oct. 19. The Bucks County application is new, but the Montgomery County application is for an extension of service already existing. The company in this has asked for approval of additional rights to permit the operation of its buses from Broad Street and Olney Avenue, operating over route V to Montgomery County. A. B. Millar, of the Philadelphia Rapid Transit Company, declared there was need for the additional line. The Bucks County line was opposed by the Reading Transit Company.

Agreement Reached on White Plains-Tarrytown Service

The Third Avenue Railway, New York, and the city authorities of White Plains have reached an agreement whereby buses will be run for five years on all routes now covered by trolleys. Buses will reestablish service to Mamaroneck from White Plains on a 20-cent fare, but trolleys will be retained to Tarrytown with fare increased to 10 cents.

Clang of the Gong Replaces Honk of the Horn in Alliance

The honk of the horn of the bus has been replaced by the clang of the trolley gong on local lines of the Stark Electric Railroad at Alliance, Ohio, for after nearly a year of operation the Stark Electric has abandoned its city bus lines.

When six new gray buses fresh from the factory were received in Alliance a year ago wheels were lifted from the ground and the high-pressure tires were replaced with balloons. Thus equipped, buses began operating. For making this experiment with balloon tires, the Stark Electric had a tire proposition from the manufacturers which was considered by company officials to be very reasonable.

It is true that the four buses which replaced the three street cars at Alliance took in more in gross than did the local trolleys, but the cost of operating the buses more than offset their added earning power. Not only that, but the Stark Electric had operated its local street cars over the route used by its interurban cars, so that there was an important element of economy here which worked to their benefit.

With two branches of car tracks in the city, it has now been established that street cars can be operated at a cost much less than that for buses. By rearranging schedules it was necessary to secure only three trolley cars to give local service over two lines. For this service one-man cars were leased. These cars do not represent the best of their type, but they are proving fairly popular with patrons. If the railway service as restored with one-man cars proves profitable Stark Electric officials plan to purchase new cars for the city service. Routes over which the buses operated ran the mileage for each bus up to about 40,000 miles in less than a year, a severe drain upon the physical equipment.

Buses Serve Davenport. — The Tri-City Railway of Iowa put into regular service on Oct. 3 the new buses recently purchased as an added improvement to the street transportation service of Davenport. Six Yellow coaches seating 21 passengers and two 25-passenger Mack gas-electric coaches are now being used. The fifteen drivers who are now operating the buses were put through a rigid period of training before the buses were put into public service.

Financial and Corporate

Receivership Ended in Kansas City

Deeds that passed on Oct. 14, terminated the receivership of the Kansas City Railways, Kansas City, Mo., and turned the property over to the new Kansas City Public Service Company.

To afford time for certain court orders to be drawn Judge Stone had fixed 2 o'clock Thursday afternoon as the hour for the delivery of the deeds. This ceremony marked the end of a receivership, in which adherence to a policy of public service rebuilt a property virtually bankrupt.

The document was executed by John T. Harding, special master commissioner, acting for the federal court, and by Powell C. Groner, Mr. Groner having acted as bidder at the foreclosure sale by the Kansas City Railways through the signature of Frank C. Niles, vice-president, and the Kansas City Public Service Company, which received title. Copies of the deeds were filed immediately in Kansas City, Mo.; Kansas City, Kan., and Independence.

The revenue stamps required reached the unusual total of $22,000.

The receivership having extended a month and a half beyond the date estimated when salary allowances were made, Judge Stone authorized payment to the receivers, Fred W. Fleming and Francis M. Wilson, and their counsel, James E. Goodrich, for the extra period. The receivers were paid at the rate of approximately $31,000 a year. Counsel received 20 per cent less.

To the Kansas City Public Service Company passed full possession of the property, subject to the supervision of the State Public Service Commission and to franchise conditions, such as provide for the board of control.

$300,000 Theoretical Deficit on Municipal Line

San Francisco Civic Body Recapitulates Figures of Local Railway on the Basis of Private Operation

An analysis of the monthly operating statements of the San Francisco Municipal Railway for the fiscal year 1925-26, contained in the *City*, issued by the San Francisco Bureau of Governmental Research, shows a book profit of $21,395. This is an increase of $15,009 over the preceding year's profit, for which reduced debt charges are largely responsible. The figures are contained in the accompanying table.

The total operating revenue was approximately $3,400,000. This is $132,000 more than for 1924-25. This was practically absorbed, however, by an increase of $125,000 in operating costs, $94,000 of which was for conducting transportation.

The bureau explains:

A change in the method of setting up reserve funds for depreciation and for accident and damage claims, effective during the last two months of the year, resulted in reducing by about $1,000 the amount which would have been set aside for these purposes under the old method.

Comparison charges, shown in the accompanying table, are taxes which the road would bear if privately owned but which the publicly owned road does not pay. The charter requires, however, that account shall be taken of these for comparative purposes. These charges are partly offset by bond redemption payments which a privately owned road would not ordinarily be called upon to make.

The table showing the operations of the system in detail is subject to adjustment after the accounts are audited which may make minor changes in the totals.

SAN FRANCISCO MUNICIPAL RAILWAY

Last two fiscal years ended June 30, 1925-June 30, 1926.
(Compiled by Bureau of Governmental Research from Official Monthly Reports.)

	1924-25	1925-26	Increase or Decrease
Passenger revenue	$3,268,383	$3,395,186	$126,803
Miscellaneous revenue	13,115	18,671	5,556
Operating revenue	$3,281,498	$3,413,857	$132,359
Operating Expenses:			
Ways and structures	115,074	136,604	21,530
Equipment	197,619	204,046	6,427
Power	464,990	488,812	23,822
Conducting transportation	1,600,499	1,694,960	94,461
Workmen's compensation	45,656	41,324	*4,332*
Other general and miscellaneous	149,417	152,006	2,589
*Accident and damage claims	121,247	102,010	*19,237*
Total operating expense	$2,694,502	$2,819,762	$125,260
Net operating revenue	586,996	594,095	7,099
*Reserve for depreciation	266,062	260,403	*5,659*
Reserve for accident and damage claims	.....	4,609	4,609
Total charges to reserve	$266,062	$265,012	*$1,050*
Operating income	320,934	329,083	8,149
Interest received on securities owned	44,495	43,718	*877*
†Compensation fund dividend	28,535	22,727	*5,808*
Total non-operating income	73,130	66,445	*6,685*
Gross income	$394,064	$395,528	$1,464
Interest on funded debt	186,678	177,133	(a) *9,545*
Surplus	$207,386	$218,395	$11,009
*Redemption of debt	201,000	197,000	*4,000*
Surplus	$6,386	$21,395	$15,009
‡Comparison charges—taxes unpaid	311,548	324,910	13,362
Theoretical deficit	$305,162	$303,515	*$1,647*

* B. P. W. accounts included in "Depreciation Reserve."
† Difference between reserve charges as operating expense and actual expenditures.
‡ Estimate by bureau.
(a) Approximately $17,500 of this amount was expended from 1910 and 1913 bond funds.

Valuable Stock Rights for Montreal Holders

The long-anticipated issue of new stock by the Montreal Tramways, Montreal, Que., has at last materialized. For every four shares now held the shareholders will have the right to subscribe for one new share at $125. The present common share capitalization of the company is $4,000,000; thus the new financing will increase the common stock outstanding to $5,000,000.

Payment for the new issue will be made in three installments: 25 per cent on Dec. 1, 1926, 25 per cent on Dec. 31, 1926, and the remainder on March 31, 1927. The new shares will carry dividends for the quarter ended March 31, 1927.

This operation marks the first financing by means of a stock issue in more than ten years. The last stock issue made was in the fiscal year ended June 30, 1916, when 10,000 shares were issued and allotted to shareholders at par, thereby increasing the issued capital to $4,000,000, at which it has remained up to the present time.

Last year the funded debt structure of the company was simplified by the authorization of $100,000,000 of general and refunding bonds. An issue of $17,826,500 series A, carrying 5 per cent interest, was made to redeem $17,650,000 outstanding debenture stock at 101, and an issue of series B to the amount of $2,500,000 was also made, the proceeds of which were used partly for capital expenditures and partly to replace $1,750,000 of first mortgage bonds. These issues and the issue of first mortgage bonds gave the company a total mortgage debt of $41,823,343 at the close of the last fiscal year.

The new financing will net the company $1,250,000 to be used in various extensions and other capital expenditures. Since 1920 the stock has been on an annual dividend basis of 10 per cent. The stock has been quoted recently around 170.

Rockford Properties Ordered Sold

A court order for the sale within 30 days of all properties of the Rockford City Traction Company, Rockford & Interurban Railway and Rockford, Beloit & Janesville Railway, all of Rockford, Ill., has been entered by Judge E. D. Shurtleff in the Winnebago County Circuit Court.

The petition for the order for sale was presented by the Continental & Commercial Trust Company, Chicago, trustees for first mortgage bond holders, and the order was issued without objection. Charles W. Ferguson, master in chancery, will be in charge of the sale of the properties. Milton Ellis, Beloit, Wis., railway banker, is expected to bid in the road, controlling as he does the majority of outstanding

Digitized by Google

bonds, for which he paid about 23 cents on the dollar for $1,300,000 of obligations. Simultaneous with the action in the Rockford courts, H. C. Van Oven, receiver for the Rockford, Beloit & Janesville lines, filed a petition for the sale of the northern interurban line. This plea was granted. That sale will take place at the same time as the other railway properties.

Foreclosure Sale for Norwich Property Set

Judge Jennings at a recent hearing in the Superior Court at Norwich, Conn., authorized foreclosure proceedings in connection with a mortgage against the Groton & Stonington Traction Company of that city. The sale under foreclosure has been set for Nov. 22 at New London to dispose of the property.

The sale is the outcome of proceedings started in December, 1924, by Ernest E. Rogers, state treasurer, as trustee for the owners and bondholders of the Groton & Stonington Traction Company, on bonds secured by a mortgage made on July 1, 1904.

Coral Gables May Purchase Its Railway

Plans are under way by the developers of Coral Gables, Fla., a Miami suburb, to divest themselves of certain properties there so as to secure funds for further new work on their part. The developers offer taxpayers the two street railway lines for $1,782,730; the golf clubs and courses for $1,750,000 and the Venetian Casino and pools for $300,000. In order to put through this program it is proposed by the city commissioners to hold an election to authorize an issue of bonds to the amount of $4,500,000, about $4,000,000 of the proceeds of the sale to go to the Coral Gables Corporation, developers of the resort, and $500,000 to be used for public improvements. George M. Merrick, president of the corporation, declared it to be his intention to use the money realized from the sale in carrying on a program of development. According to the Coral Gables Chamber of Commerce the City Commission favors the purchase of the utilities from the private owners and will meet during the week ended Oct 30 to take final action for the consummation of the deal.

California Beach Sale Under Way

Negotiations are under way for the sale by the Pacific Electric Railway, Los Angeles, Cal., of its resort properties at Redondo Beach. The impending sale was confirmed by D. W. Pontius, vice-president and general manager of the railway. He stated that the Charles G. Andrews Realty Company was handling the deal. It is reported that the deal, if consummated, will involve approximately $2,000,000.

The property is known as the railway's amusement holdings. It consists of a bathhouse, dancing pavilion, restaurant, and other buildings, as well as the land on which they stand.

The property passed to the railway from Henry E. Huntington about fifteen years ago when it purchased the Los Angeles & Redondo Railway. A portion of the property is under lease, but the company has been operating the pavilion and the bathhouse.

Improvement Noted in Evanston Operation

For the year ended Dec. 31, 1925, the Evanston Railway, Evanston, Ill., reports a balance of $70,458, against $59,095 for 1924. The accompanying table shows revenue and expenses for last year compared with the year previous. The Evanston Railway operates 10 miles of line, controls and operates the North Shore & Western Railway and connects with the Chicago Surface Lines.

EARNINGS STATEMENT OF EVANSTON RAILWAY

	1925	1924
Gross operating revenue	$306,178	$290,607
Other sources	8,152	4,137
Total revenue	$314,331	$294,745
Operating expenses	184,132	181,005
Taxes	28,423	24,363
Total expenses	$212,555	$205,368
Gross income	$101,775	89,376
Interest on funded debt	30,355	28,252
Interest on floating debt	540	1,669
Miscellaneous	422	360
	$31,317	$30,281
Balance	$70,458	$59,095

Changes in Penn-Ohio System Being Worked Out

Revamping of the corporate structure of the Penn-Ohio system, announced in the last annual report of the Republic Railway & Light Company, New York, is proceeding rapidly. Upon completion of these plans there will be only one holding company for the system, instead of three as at present. This holding company will control four main operating groups: Pennsylvania Power for the electric properties in Pennsylvania; Pennsylvania - Ohio Power & Light for the Ohio electric properties; Ohio River Edison, operating the most important power-producing units of the system, and a fourth company to have charge of the railway properties formerly owned by the several holding companies.

According to the *Wall Street Journal* much progress has been made on consolidation and simplification of the subholding companies and of operating companies looking toward the ultimate goal of four main operating companies. Pennsylvania-Ohio Power & Light has eliminated properties operating in Pennsylvania and now has only electric properties in Ohio. The newly formed Pennsylvania Power Company now operates the electric properties in Pennsylvania. These two companies, comprising the Penn-Ohio system, receive the majority of their power from Ohio River Edison.

The majority of the electric railways are now controlled by one company, Pennsylvania-Ohio Electric Company. Possibly in the distant future these traction securities will be distributed to Penn-Ohio Edison stockholders, thus eliminating all but electric power companies from the system.

Benefits from this consolidation program have already manifested themselves through ability of the operating companies to finance on favorable terms. Last summer Ohio River Edison was able to place an issue of $4,000,000 5 per cent bonds to yield 5.50 per cent, and Pennsylvania Power placed $3,800,000 30-year 5 per cent first mortgage bonds to yield 5.13 per cent.

Quarterly Earnings Reports Likely from Insull Railroads

Quarterly earnings reports to stockholders may soon become a fixed policy of the managements of the Chicago Rapid Transit Company; Chicago, North Shore & Milwaukee; Chicago, South Shore & South Bend and Chicago, Aurora & Elgin Railroads—the four electric railroads in the Chicago district controlled by Samuel Insull and associates.

The policy of all these companies heretofore has been to issue only annual reports, but the issuance on Oct. 18 of a quarterly statement with the dividend checks of the Peoples Gas & Coke Company is regarded in financial circles of Chicago as significant of a new program presently to be adopted with regard to the corporate publicity of the Commonwealth Edison, Public Service of Northern Illinois, Middle West Utilities and Midland Utilities companies as well as that of the electric railways.

Change Effected in Capital Structure.—The Danbury Power & Transportation Company, Danbury, Conn., formerly the Danbury & Bethel Traction Company, has been authorized to change its capital from $500,000 to 5,000 shares of stock of no stated par value.

Authorizes Sale of Land.—Robert W. Perkins, receiver of the Shore Line Electric Railway, New London, Conn., has been authorized to sell six tracts of land owned by the company in Essex, Preston and Norwich. The sale is the result of action brought by the United States Trust Company, New York, and the Old Colony Trust Company, Boston, Mass.

Revenues Show Gain.—Revenues of the Community Traction Company, Toledo, Ohio, in September showed a gain of more than $3,400 over those for the corresponding month last year. Total revenue in September was $258,919 compared with $255,550 for a similar month last year. The gain was made in spite of "open weather." Mr. Johnson said the improvement was due, he thought, to continual improvements in service and the chartered bus service which has proved popular since its installation on Sept. 1.

Net Income Increases.—For the three months period ended Sept. 30, 1926, the total operating revenues of the Brooklyn-Manhattan Transit System, Brooklyn, N. Y., was $11,673,905, against $11,228,732 for a similar period ended Sept. 30, 1925. Total operating expenses increased from $7,338,227 to $7,442,816 for a similar period this year. The net

Digitized by Google

income after the consideration of income deductions amounted to $1,732,554 for the three months period ended Sept. 30 this year, against $1,490,688 for the similar three months period of 1925.

Seattle Not Liable to Tax Portion.—Contending that the city of Seattle, Wash., is not liable to any portion of the 1919 street railway taxes and cannot legally pay such taxes from either the general fund or any special fund, Corporation Counsel T. J. L. Kennedy and his first assistant, Ray Dummet, recently argued the city's appeal in the tax case before the United States Circuit Court of Appeals. James B. Howe, counsel for the Puget Sound Power & Light Company, which won a decision in the District Court to the effect that the city is obligated to pay three-quarters of the 1919 tax, approximately $543,000, argued that the city had agreed by ordinance, held valid by the State Supreme Court, to pay its portion of the taxes. Taxes and interest on the street railway for the year 1919, totalling approximately $650,000, were paid by the company under protest. The company is seeking to have the city pay three-quarters of this amount, or the taxes for the nine months of 1919 that the city had possession of the carlines.

Short Massachusetts Line Suspends.—The Templeton-Gardner Street Railway operated its last car on Oct. 9. The service was replaced by buses on Oct. 10. The railway has been in existence since 1900. The road was finally acquired by the Northern Massachusetts Street Railway and thence passed into the hands of the present company to include only the East Templeton to Baldwinville and Gardner to Riley's Switch routes. The East Templeton to Baldwinville line was abanboned last summer.

Surplus Lower.—For the period from Jan. 1 to July 31, 1926, the gross earnings of the Lake Shore Electric Railway, Sandusky, Ohio, were $1,873,262, against $1.852,849 for a similar period in 1925. Operating expenses and taxes increased from $1,512,120 in 1925 to $1,606,916 in 1926. After the consideration of interest, the surplus for the period from January to July, inclusive, was $13.244, against $84,959 for a similar period last year.

Seeks Permission to Sell Bonds.—Authority to issue and sell $56,000 of first and refunding 5 per cent bonds has been asked of the Indiana Public Service Commission by the Evansville & Ohio Railway, operating railway lines from Evansville, Ind., to Mount Vernon, and Henderson, Ky. G. R. Millican, vice-president and general manager of the company, said the money will be used to pay for general improvements and for six new interurban cars which were bought some time ago.

Service Discontinued.—The Huntingdon, Lewiston & Juniata Valley Traction Company discontinued service on Oct. 7 in the borough of Huntingdon, Pa., on its line, which is 1.7 miles long. The service ended with F. Blair Isenberg, general manager, announcing plans to tear up and scrap the track, property and all holdings.

Personal Items

Personnel of New Kansas City Company Announced

When Judge Stone had approved the transfer of the Kansas City Railways, Kansas City, Mo., to the Kansas City Public Service Company on Oct. 14, W. C. Woolfolk, president of the new company, announced the following operating staff, with various advances in title and increased authority:

F. G. Buffe, vice-president in charge of operations.

J. A. Harder, secretary and treasurer.

L. M. Boschert, assistant secretary.

Neal S. Doran, comptroller and assistant treasurer.

Charles L. Carr, general solicitor in charge of legal and claim department.

D. L. Fennell, general superintendent of transportation.

R. W. Bailey, general superintendent of maintenance.

E. E. Stigall, purchasing agent.

E. B. Sanders, manager commercial department.

A. T. Bagley, superintendent department of personnel.

J. D. Cornell, freight traffic manager.

D. E. Druen, superintendent of power.

H. W. Smith, superintendent of way and structures.

C. A. Kincade, superintendent of distribution.

R. S. Neal, superintendent of equipment.

F. C. Lynch, superintendent of bus maintenance.

I. R. Carson, assistant superintendent of transportation.

H. M. Smith, assistant superintendent of transportation.

H. H. Cloyd, assistant to Mr. Buffe.

A separate construction department is being organized, with A. E. Harvey as superintendent of construction.

Senator Francis M. Wilson and Col. Fred W. Fleming, co-receivers, have, of course, relinquished their duties. Colonel Fleming will assume management of the Central Surety & Insurance Corporation, of which he is president. He is also vice-president and treasurer of the Willock Realty & Loan Company and president of the Golden Rule Baking Company.

Senator Wilson plans a hunting trip in Platte County, the first real vacation he has had for thirteen years. During the period of the receivership, Senator Wilson was away from the office only 60 days, 30 of which were spent in pursuit of bus knowledge. After Jan. 1 he expects to open a law office in Kansas City, "a modest sort of an office where if any client should come, he would be courteously received."

W. J. Wright a Public Service Corporation Counsel

Wendell J. Wright has been appointed assistant general counsel of the Public Service Corporation of New Jersey and its subsidiary companies.

Mr. Wright in 1898 became associated in his New Jersey and New York law practise with Edmund W. Wakelee, now vice-president of Public Service in charge of law. Later he founded the firm of Wright, Vander Burgh & McCarthy, with offices in Hackensack.

In 1905 Mr. Wright was appointed counsel to the Bergen County Board of Freeholders and in 1909 was appointed by Governor Fort first judge of the First District Court of Bergen County. Later he became prosecuter.

Mr. Wright was one of the organizers of the Closter National Bank, of which he was a director. He also is a director of the North Jersey Title Insurance Company and its general counsel.

John S. Bleecker—Public Utility Consultant

John S. Bleecker is leaving Day & Zimmermann, Philadelphia, Pa., to establish offices at 910 Finance Building, that city, as industrial and public utility consultant, but will retain certain connections with the industrial management department of Day & Zimmermann. Mr. Bleecker has been connected with Day & Zimmermann for the last two years, but was associated before that with the Indianapolis, Columbus & Eastern and the Columbus, Newark & Zanesville lines, operated jointly for the bondholders by the Day & Zimmermann organization. Of these roads he was general manager. Mr. Bleecker was formerly manager of the New Orleans Railway & Light Company, New Orleans, La.; the Columbus Electric Company, Columbus, Ga., and the Columbus Railroad. In addition to serving Stone & Webster on the Columbus properties he was affiliated with that concern in its home office in Boston and at Seattle, Paducah and Houghton.

Elmer Ambrose Sperry, Electric Railway Pioneer, Honored

Elmer Ambrose Sperry, New York, inventor and early builder of electric railways, has been awarded the John Fritz Gold Medal for 1927 for the development of the gyro-compass and the application of the gyroscope to the stabilization of ships and airplanes. The award was made unanimously on Oct. 15 by the board of sixteen representatives of the American Societies of Civil, Mining and Metallurgical, Mechanical and Electrical Engineers. The presentation of the medal will take place on Dec. 7, in New York, at the annual meeting of the American Society of Mechanical Engineers.

Shortly after Mr. Sperry's early successes in mining machinery he founded the Sperry Electric Railway, Cleveland, Ohio, built electric railway motors and controllers and installed several of the early electric railways put in operation in the later '80s. Subsequently he sold his electric railway patents to companies now represented by the General Electric Company.

Digitized by Google

Mr. Sperry is a charter member and one of the founders of the American Institute of Electrical Engineers and the American Electrochemical Society. He is also a member of the American Society of Mechanical Engineers, American Chemical Society, Society of Naval Architects and Marine Engineers, Society of Automotive Engineers, and many others.

Cleveland Officials Advanced

Col. J. H. Alexander, the New President, and P. E. Wilson and R. W. Emerson, New Vice-Presidents, All Men of Long Experience Schooled Under Late Mr. Stanley—Their Careers Reviewed Briefly

COL. JOSEPH H. ALEXANDER, newly elected president of the Cleveland Railway, Cleveland, Ohio, succeeding the late John J. Stanley, takes at the age of 42 one of the most important public utility posts in the country. At 35 years of age he was advanced to the position of vice-president of the company, similarly one of the youngest ranking officials in such work. Responsibility is nothing new to Colonel Alexander. The very year of his graduation from the Case School of Applied Science at Cleveland he took a job with Tom L. Johnson's Municipal Traction Company at Cleveland as chief engineer, a sizable job for a youth of 22 years.

The following four years witnessed in Cleveland a bitter struggle for supremacy between rival railway systems, several in number, and in that conflict Mr. Alexander first came into prominence. Standing loyally beside Johnson and his chief aid, the late Fred Goff, young Alexander fought courageously. That historic fight terminated in 1910 with the adoption of the Tayler grant, a document of great merit, the provisions of which still govern railway operation in Cleveland.

At various times during the railway fight Mr. Alexander prepared for Johnson numerous surveys of the various competing car systems and made many tests of their facilities and equipment. Shortly after the franchise settlement in Cleveland the young engineer went to Pittsburgh. There, at the age of 26, he became assistant to the general manager of the Pittsburgh Railways. Two years later, in 1912, he was back in Cleveland as chief engineer in the office of Peter Witt, then the city's traction commissioner.

Mr. Alexander proved an invaluable aid in the commissioner's office and in so doing attracted the attention of Mr. Stanley. So in 1916 Mr. Stanley made him assistant to the president. His progress was rapid in this new position and it wasn't at all surprising when in April, 1919, there was another promotion. At that time he was elected to the office of vice-president.

Less than a year after going with the railway in 1916 the Colonel responded to the nation's call to arms, receiving an appointment of major in the administrative section of the construction division of the United States army. He entered service on Nov. 1, 1917, and continued in the army until November, 1918. Early in 1918 he was promoted to the rank of colonel.

A page from war records might serve best to describe Colonel Alexander's work as a member of Uncle Sam's fighting forces. Here it is:

He established and approved all labor rates and supervised all labor matters and conditions on all army construction projects in the United States and Porto Rico, on which as many as 400,000 laborers were engaged at one time and which in the construction division alone numbered approximately 500 and aggregated $1,400,000,000 in value.

He conferred with labor delegations, determined prevailing union rates and conditions, interpreted labor agreements, conferred with the war labor policies board, co-operated with the United States employment service in the procuring and distributing of workmen on the various projects and imported approximately 13,000 Porto Ricans and 2,600 Nassauans on ships which were assigned to and operated by the construction division.

He conferred in an advisory capacity for many months with the cantonment adjustment commission (later known as the emergency construction wage commision), and thereafter was made the army representative on the emergency construction wage commission and on the general committee of war labor adjustment.

At the time of the signing of the armistice he had been nominated by representatives of labor and by representatives of employers as chairman of the national committee on standardization of wages for building trades employers. He made approximately 300 speeches on 100 total jobs to approximately 200,000 workmen.

In substance, he established and supervised the carrying out of the fundamental standards and policies for the general administrative work of the construction division of the army.

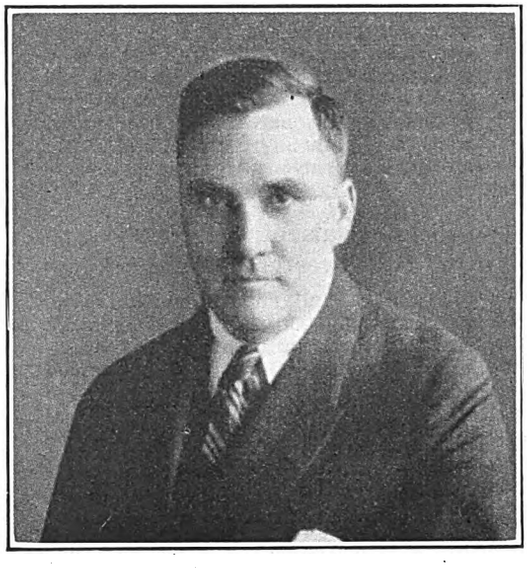
The foregoing leaves no doubt as to the splendid war record made by Colonel Alexander. He returned to Cleveland shortly after the war and was back at his job of assistant to Mr. Stanley for only a short time before he was elevated to the vice-presidency. As stated previously, he was 35 years old when he ascended to the office of vice-president, and now at 42 years becomes president.

In 1925, when buses were added to the service of the Cleveland Railway, Mr. Stanley assigned to Colonel Alexander the job of directing their operations. Today the bus is one of the chief cogs in the system of the Cleveland Railway.

As a boy Colonel Alexander was sent to a preparatory school in Canada. Some few years later he went to the University of Minnesota. After three years of study there he enrolled in the Case School of Applied Science, Cleveland, to complete his technical education. That was in 1901. In 1905 he was graduated with a degree of B.S. in mechanical and electrical engineering, and the following year the same institution conferred a fellowship upon him.

He is president of the Ohio Safety Council and likewise president of the Cleveland Safety Council. It might be

R. W. Emerson



J. H. Alexander

P. E. Wilson

Digitized by Google

well to point out that largely through his efforts the annual International Safety Congress, with its 10,000 delegates, met in Cleveland last year. He is an ex-president of the Cleveland Engineering Society and long has been prominent in civic movements here.

PAUL E. WILSON

Other important changes in the organization were the advancement of Paul E. Wilson to the post of vice-president and of Ralph W. Emerson to a similar office. Mr. Wilson previously was secretary of the company and Mr. Emerson general manager. Each of these officials retains his former title in addition to the new one. Mr. Wilson has been secretary of the company since 1921. In that post he succeeded the late Henry J. Davies. Before that he had been assistant secretary of the company for two years and previous to that, from 1910, had been secretary to Mr. Stanley. While he was still attending high school Mr. Wilson worked for the railway as office boy and clerk for two summers. Upon his graduation he was for three years clerk to the superintendent at the operating headquarters of the company. He attended law school at Western Reserve University for two years and did newspaper work for the Cleveland *Leader* and the Cleveland *Press* for two years before becoming secretary to Mr. Stanley. Mr. Wilson has long been the point of contact between the company and the public through the press, although the other officers of the company were always accessible to the newspapers. Mr. Wilson is not yet 40 years old.

RALPH W. EMERSON

Mr. Emerson has been general manager of the company since 1922. In that year he succeeded in that post the late George L. Radcliffe, who had been vice-president and general manager. Before that, from 1915 on, he had been assistant superintendent of the company. Mr. Emerson's experience in the railway field has been varied and rather unusual. He was graduated in 1906 from the Case School of Applied Science as a mechanical and electrical engineer. Immediately thereafter he joined the engineering forces of the Cleveland Railway. In 1910 he resigned from the service of the company to install and operate the power plant of the New York & North Shore Traction Company at Roslyn, L. I. When this Long Island road was placed in service Mr. Emerson was made general superintendent. He continued in that capacity until 1915, when he rejoined the forces of the Cleveland Railway. He is 41 years old.

The promotions by the Cleveland Railway advance to the principal operating and executive posts of the company men all of whom are young, but officials well versed in the affairs of the company who in addition have the confidence and the respect of the public of Cleveland gained through years of operation under the late Mr. Stanley and fostered by each of the operating officials that served with him in directing the property.

A. C. Mellette, investigator for the claim department prior to his resignation early this year, has returned to the Los Angeles Railway, Los Angeles, Cal., and will once more act as an outside investigator. Since leaving the company Mr. Mellette has been with the claim department of the St. Louis & San Francisco Railroad at Memphis, Tenn.

New Claims Attorney for All Insull Railroads

G. T. Hellmuth, for many years chief counsel for the Chicago, North Shore & Milwaukee Railroad and more recently of the Chicago Rapid Transit Company, has been appointed general claims attorney for the entire group of Insull transportation companies in and around Chicago. He will have complete supervision over the claims departments of the Chicago, North Shore & Milwaukee, Chicago Rapid Transit, Chicago, South Shore & South Bend and Chicago, Aurora & Elgin Railroads. His office will be located in the general executive headquarters of the four companies at 72 West Adams Street, Chicago. Mr. Hellmuth is a graduate of the John Marshall School of Law in Chicago and the greater part of his business career has been spent with the North Shore and Rapid Transit lines in various legal capacities.

Officials of Cleveland-Southwestern Advanced

Frank E. Hull, superintendent of the northern division of the Cleveland, Southwestern Railway & Light Company, Cleveland, Ohio, has been named superintendent of the southern division of the system. John Nester, general superintendent, will take over the superintendency of the northern division. H. A. Humphrey, train dispatcher of Elyria, also has been promoted to trainmaster.

Paul A. Beique has been appointed a member of the Montreal Tramways Commission, Montreal, Que. In this capacity he succeeds the late Paul E. Mercier, who had occupied the position for only about four months. Mr. Beique is a civil engineer.

Howard Wright, formerly of the claims department of the Puget Sound Power & Light Company, Seattle, Wash., has been appointed safety engineer for the Southwestern District to succeed the late Capt. David J. Kinzie.

J. D. Whittemore, vice-president and general manager of the Monongahela West Penn Public Service Company, Fairmont, W. Va., was elected president of the Public Utilities Association of West Virginia at the ninth annual meeting of that body, held recently at the Hotel Kanawha, Charleston, W. Va.

E. B. Gunn, superintendent of transportation and equipment of the Western Ohio Railway, Lima, Ohio, is resigning his position after a service of eight and one-half years with that property. His office was located at Wapakoneta. In the past few years the Western Ohio Railway introduced many economies in the mechanical department, reducing the cost of maintenance, increased its freight business and strived with success for a clear record in the matter of accidents. In all of this work Mr. Gunn took an important part.

Obituary

R. E. Breed

Richard Edwards Breed, well known in public utilities circles, died on Oct. 14 in Roosevelt Hospital, New York City. Mr. Breed, who was born in Pittsburgh, came to New York twenty years ago at the age of 40. Although a prominent figure in the entire utility field he was affiliated more particularly with the light and power industry. He was a director of the American Light & Power Company, the Electric Light & Power Corporation, the Carolina Power & Light Company, the Wheeling Bank & Trust Company and many other concerns.

Adolphe Alfred Dion, president of the Moose Jaw Electric Railway, Moose Jaw, Sask., died recently in Ottawa. He was one of Canada's most prominent electrical engineers and was recognized as an authority on electrical development. Mr. Dion was 67 years old.

Paul E. Mercier, a member of the Montreal Tramways Commission, Montreal, Que., since April, 1926, died recently when making a survey for the St. Regis Paper Company. In 1895 he was engaged as chainman on the Montreal Park & Island Railway and in 1896 and 1897 was identified with the Canadian Pacific Railway in the Quebec district. He served in many other engineering capacities in Montreal and Quebec. Mr. Mercier was born 49 years ago in St. Hyacinthe, Que. He was educated in engineering at the Polytechnique School, Montreal.

Frank W. Remick, member of the banking house of Kidder, Peabody & Company, Boston, Mass., died on Oct. 16 at the Massachusetts General Hospital. Mr. Remick's business connections were extensive and diversified. In the street railway industry he was well represented, being a director of the Boston Elevated Railway, the Middlesex & Boston Street Railway, the Puget Sound Electric Railway and the Puget Sound Power & Light Company. Mr. Remick was born in Boston in 1861. He received his education in the Boston public schools. In 1879 he entered the employ of Kidder, Peabody & Company, and had been connected with the concern continuously since that date. He became a member of the firm in 1905.

Capt. David J. Kinzie, for the past several years safety engineer for the southwestern district of the Puget Sound Power & Light Company, Seattle, Wash., is dead. The captain was noted for carrying on in the Tacoma public schools the safety educational work sponsored by the Safety Council. Captain Kinzie was born in Boston. His early business career was spent in Alaska, where he had charge of personnel and safety work in several large mines. During the war he was located at Camp Lewis, where he was chief personnel adjutant. At the close of the war he joined the forces of the company, where he served until his death.

A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Baltimore to Have Interesting Tests on Pneumatic Car Wheels

A test set of pneumatic street car wheels has been prepared for the United Railways & Electric Company of Baltimore, Md., by the Hatfield Resilient Wheel Company, the J. G. Brill Company, the United States Rubber Company and the SKF Industries. One of these wheels was on exhibit in the J. G. Brill Company's space at the Cleveland convention. The theory of the wheel as worked out for application to railway usage is an adaptation of the Hatfield resilient wheel previously developed for truck and bus operation. Two pneumatic tubes are inserted into the circumference of the wheel to absorb all shocks and vibration before they reach the axle. These rubber pneumatic cushions are protected from all dirt, oil and heat by steel cover plates, the latter, however, allowing complete freedom of movement in a vertical direction.

The pneumatic tubes are bolted around their inner rim to the center steel section of the wheel and around their outer rim to the steel bearing surface which is applied to the rails. It is upon these bolted sections that the greatest strain will come in actual operation, due to braking, rapid acceleration, etc. If the pneumatic cushions are capable of withstanding the severe torque which will be applied to their rims the numerous advantages of the wheel will recommend it to widespread attention in the railway field. The test to be conducted in Baltimore will, therefore, be watched with considerable interest.

The air pressure in both tubes is equalized by dual connections from an air locking valve stem. The two tubes are placed side by side and are of equal cross-sections. The only metallic connection between the outside wheel surface and the inner wheel section is a ground connection of flexible wire.

Templeton, Kenly Company Stages a Prize Letter Contest

An opportunity to gain a little extra Christmas money has been offered to roadmasters, supervisors of track, their assistants and track foremen by the manufacturers of the Simplex jacks, in the way of a prize contest for letters telling about the use of Simplex tie-spacing shoes.

For ten letters that best describe and explain the different kinds of work done with the tie spacers, and which also tell how they were used and the results obtained, cash prizes from $100 to $10 will be awarded.

There are no special conditions to be followed. Letters may be written in pencil, ink or on a typewriter, and one contestant may write and submit as many letters as he wishes.

The contest closes Dec. 1 and the judges, who will be three maintenance of way engineers, will select the winners before Christmas. Details of the contest may be obtained from Templeton, Kenly & Company, Ltd., Chicago, Ill.

Widespread Use of Timken Bearings in Buses

An interesting point was brought out by the Timken Roller Bearing Company of Canton, Ohio, when a check-up by that company's representative indicated that of the 85 buses of 21 different makes displayed at the Cleveland convention of the American Electric Railway Association Timken bearings were included as regular equipment in every bus. The company states that this has also been true at other recent shows where buses have been exhibited. Efforts are now being made to bring about a widespread adoption of Timken bearings in electric railway cars, for both passenger and freight service.

F. H. Shepard Comments on Pennsylvania Railroad Order

Announcement was made in the issue of ELECTRIC RAILWAY JOURNAL for Oct. 9 of the large equipment order just placed with the Westinghouse Electric & Manufacturing Company by the Pennsylvania Railroad. It is considered to be of outstanding interest by railway and electrical equipment men because of its value in indicating the trend toward heavy traction electrification by the major railroad systems.

Commenting on this recent order, F. H. Shepard, director of heavy traction operation of the Westinghouse company, said:

> This commitment and the announcement of the plans for this important work by the Pennsylvania Railroad presages one of its most important activities since the war and indicates the time when New York will be linked to Philadelphia and Washington by electric service. The railroads have been making great strides in efficiency since their return from government operation, and traffic handling within the past month exceeded all previous records in America. And this with a freedom of movement and efficiency undreamed of during the dark days of the war and subsequent thereto.
>
> It is confidently believed that railroad conditions, as well as business generally, are reaching their normal stride and that the increment of growth may now be expected to follow year after year just as obtained before the war. This means provisions for increased capacity for traffic movement, and in many cases electrification to enable the increased service to be undertaken where physical restrictions make increased tracks and facilities impossible.
>
> It is well known that electrification will double the capacity over steam operation, and the last evidence of this is the example of the Virginian Railway, which completed the extension of its electrification to Roanoke, Va., last week. Here train operation under mountain grade conditions and for fast freight train service are demonstrating the maximum realized in the world today, 9,000-ton trains being hauled by a single locomotive at 28 miles an hour and mountain grade operation accomplished with 2,000 hp. per single train, more than double any performance accomplished by steam.

Chromium Corporation of America Has Been Formed

A company known as the Chromium Corporation of America has been organized to take over the patents of the chromium plating process developed by the Chemical Treatment Company and the Chromium Products Corporation, the latter a subsidiary of the Metal & Thermit Corporation. This new company will have plants and branch offices in most of the leading industrial centers.

John T. Pratt, president of the Chemical Treatment Company, will continue in that office and also be chairman of the board of the new corporation, of which Dr. F. H. Hirschland will be president. The latter is also president of the Metal & Thermit Corporation. Vice-presidents in charge of operations will be Louis C. Owens, Jr., Dr. Erich A. Beck, and Richard Loengard. In addition to the above officers, the directors will consist of a prominent and financially strong group of men.

In announcing the formation of the new corporation, Mr. Pratt made the following statement:

> Manufacturers of metal products have followed with the greatest interest the rapid development of chromium plating during the past few years. Knowing the properties of chromium, particularly its extreme hardness and ability to resist acids, high temperatures and all sources of tarnish, corrosion or discoloration, they have felt that it would only be a matter of time before chromium plate would become a standard finish for many types of metal products.
>
> The new corporation will take over and operate the Chromium Products plant in Jersey City and the Chemical Treatment plants in New York and Waterbury. Plans are also being formulated for the opening of new plants at Carteret, N. J.; East Chicago, Ind., and South San Francisco, Cal., in each of which the Metal & Thermit Corporation now has plants, as well as in Chicago, Detroit, Cincinnati, Akron, Philadelphia, Pittsburgh and Cleveland. The company's expansion program contemplates a national service within two to three years.
>
> Having taken over from the Chemical Treatment Company its trade name, "Crodon," which will hereafter stand for chrome plate as applied by the Chromium Corporation of America or its licensees, the company will inaugurate immediately an intensified selling, merchandising and engineering campaign which will cover manufacturers of certain types of metal products throughout the country. The Chemical Treatment Company policy of limiting the use of Crodon to manufacturers of quality products will be rigidly adhered to. At the same time, the educational advertising, designed to inform manufacturers, the trade and the public of the many advantages of Crodon will be intensified.

Credit Where Credit Is Due

The Cutter Company, Philadelphia, Pa., appreciates its employees. Furthermore, it does not hesitate to express that appreciation in some tangible way. Recently the company published a handsome little volume entitled "Experience Is Master." In this book are pages and pages of pictures and interesting little sketches of the many members of the Cutter organization who have helped to build up the company's prestige as a manufacturer of circuit breakers and other electrical protective devices since 1888.

Only men who have served the Cutter organization for ten years or more are introduced to the readers of the book. But there are many of these, and in looking over the various sketches it is possible to obtain a very good idea of the spirit which imbues all of the members of the Cutter organization.

Comfort Features Are Provided in New Ruggles Bus

Service on long interurban runs and special tours has been particularly considered by the Ruggles Motor Truck Company of Saginaw, Mich., in designing its new 26-passenger touring coach, which has just been placed on the market. Heretofore one of the drawbacks in using motor buses for long-distance runs has been the lack of comfort facilities for the passengers. The Ruggles company has attacked this problem by installing complete lavatory and toilet facilities in its bus.

The body is mounted on the standard Ruggles model 70 coach chassis, with a 236-in. wheelbase, powered with a 105-hp., six-cylinder motor, with double reduction drive. The bus is equipped with 34x36-in. pneumatic cord tires, with dual rear tires on Budd steel disk wheels. Gruss transport type air springs are used on the front.

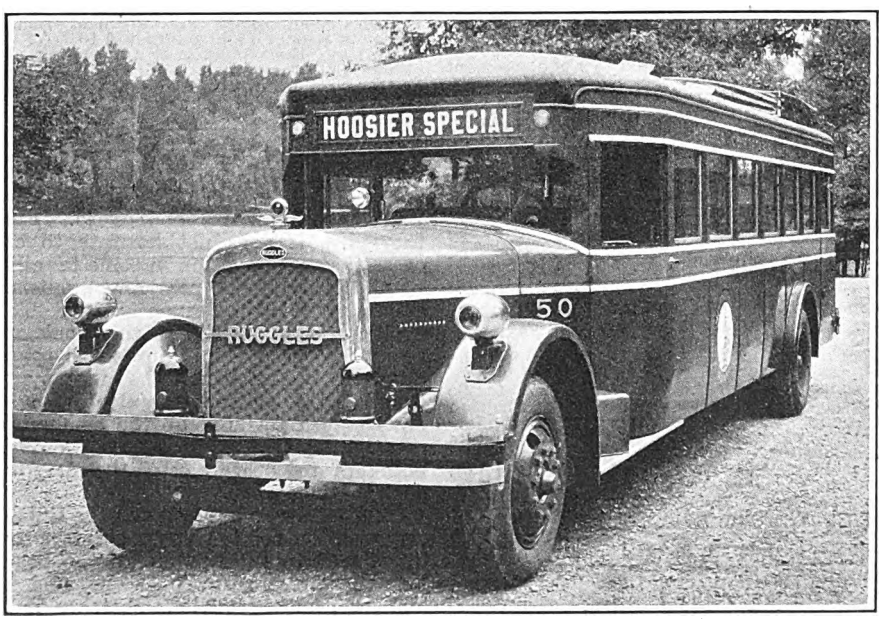
Sufficient headroom has been provided in the interior arrangement of the bus to allow the average person to walk through the aisle without stooping. Pullman seats with arms and special backs have been installed. These are covered with a high grade of striped mohair. The window sashes are of brass construction, Pullman type, with maximum openings. The floor is covered with battleship linoleum and over this covering, in the aisle, is Wilton carpet. Pillar mirrors are installed between the windows, together with double coat hooks and combination ticket holders. All dome lights are protected with non-glare shields. Over the rear wheel housings are built side seats with ample space between the seats for a portable lunch or card table. An electric buzzer system, electric clock and adjustable driver's seat are other standard equipment featured.

Running the entire length of each side of the interior and above the seats of this bus are individual luggage racks. They are nickel-plated and placed high enough to be out of the passenger's way, yet easily accessible for handling small baggage parcels and heavy wraps and small grips. Space is provided on the roof for taking care of large luggage requirements.

Comfort Is Carried to the Point of Luxury in the Interior Fittings

The lavatory is situated in the right rear side of the bus and is finished in mahogany paneling. It is economical in the space it consumes and is built under strictly sanitary conditions. The lavatory includes toilet, ice water tank, large mirror or heavy plate glass and a porcelain wash bowl with running water. The installation of this lavatory relieves the necessity of providing the necessary long rest period which has heretofore been given in long distance operation.

The new bus was on display at the American Electric Railway Association convention which was held in Cleveland, Ohio, Oct. 4 to 8. Visitors at the convention were given an opportunity to inspect every new detail of its construction.



New Ruggles Coach Which Was on Display at the American Electric Railway Association Convention in Cleveland

Fifth National Power Show to Be Held

The Grand Central Palace in New York City will be the scene of the Fifth National Exposition of Power and Mechanical Engineering, to be held from Monday, Dec. 6, through Saturday, Dec. 11. On exhibition there will be heat and power generating apparatus, hoisting and conveying equipment, power transmission equipment, machine tools, refrigerating machinery and heating and ventilating machinery.

In addition an elaborate program of the latest films showing engineering and industrial progress will be displayed.

The fifth exposition will include exhibits of 500 manufacturers and will occupy four floors in the Grand Central Palace, the largest exposition of its kind ever held in this country. The American Society of Mechanical Engineers will hold its annual meeting in the Engineering Societies Building on dates included by those of the Power Show, as will also the American Society of Refrigerating Engineers.

Electric Locomotives for Rack Railroads

Several electric locomotives of a new type, intended for use on rack railroads, are at present in course of construction at the works of the Brown-Boveri Company in Mannheim, Germany. A number of these are intended for service on a section of the Andes railroad, operated by the Chilean Transandine Railway. The engines for this line weigh 85 tons and are fitted with six motors, each capable of developing 235 kw. for one hour, with a continuous output of 195 kw. These units will operate on 3,000 volts d.c. With a total hourly capacity of about 1,400 kw., these locomotives are claimed to be the most powerful of their kind so far constructed.

The remainder of the locomotives now being built are intended for service on the Asui Pass in Japan. The section includes a ramp about 600 yd. in length with a gradient of 6.7 per cent. Direct current at 600 volts is supplied by means of a third rail system. The engines are equipped with three motors having a one hour capacity of 200 kw. and a continuous capacity of 160 kw.

Work is being rapidly pushed on all of these units with a view to delivery in the near future.

Electric Railway Orders for Haskelite and Plymetl

In the recent issue of "The Lightweight Champions' Record," published by the Haskelite Manufacturing Corporation, Chicago, Ill., the following orders for Haskelite and Plymetl received from electric railway companies were listed:

Rochester & Syracuse Railroad—Plymetl to replace steel on a 45-ton interurban car.

Indianapolis Street Railway—Haskelite for headlinings of twelve cars.

Houston Electric Company—Plymetl for side panels.

West Penn Railroad — Plymetl for side panels in rebuilt cars.

Chicago, Milwaukee & St. Paul Railroad—Haskelite for interior trim in five gas-electric cars.

Twin City Motor Bus Company—Plymetl for side panels.

Peoples Motor Bus Company—Haskelite for roofs and headlinings in 25 double-deck buses.

Every One Has a Good Word for Cleveland Exhibit

Manufacturers Were Not Loath to Demonstrate Their Faith in the Industry by Making Possible the Largest Display Ever Staged—Total Registration 8,623; Total Indoor Space Sold 119,007 Sq.Ft.

AND still the figures go up. This year there were 119,007 sq.ft. of exhibit space sold at the Cleveland convention of the American Electric Railway Association. Oddly enough, the total amount of space available for exhibits came to the same total of 119,007 sq.ft. Nor was there any lack of manufacturers, who, like the famed virgins of Hebraic times, had failed to safeguard themselves by making advance preparations, and found at the last moment that the doors were shut to them. As a result of this year's work the crown of Fred Dell, director of exhibits, might be said to bear many jewels. Brightest of these is the sparkling record of 41 street cars and other rolling stock which was placed on exhibit. Twenty-six were for passenger service and the remainder consisted of freight and service equipment.

The best that had ever been mustered in previous exhibits was 11 cars. And yet in the first half of this year the purchases of rolling stock had reached a low ebb. It seems that the manufacturers have set up against this a high tide of enthusiasm, for no cost was spared in preparing the exhibits at Cleveland.

Registration Sets New Record

This year the total registration at the convention was 8,623 and the total number of manufacturer members listed was 423. Both of these figures surpass by large margins any records which have been set up in the past. A comparison of these various totals for the past six years might be interesting:

Year	Where Held	Registration	Sq.Ft. of Space Sold	No. of Mfg. Co.
1921	Atlantic City	1,189	No exhibit	225
1922	Chicago	4,200	61,895	244
1923	Atlantic City	4,404	75,681	274
1924	Atlantic City	5,804	86,349	330
1925	Atlantic City	7,147	100,030	371
1926	Cleveland	8,623	119,007	423

Naturally it was impossible, with the tremendous amount of material on display, to consolidate all of the exhibits on one floor, or even in a single building. But the co-operation of the city authorities in Cleveland made it possible to have available a supplementary building, known as the West Wing, by the time the exhibits began to arrive. Most of the bus and bus equipment manufacturers were assigned space in this wing but there were also many trackwork, steel castings, and similar displays there. Then there was the regular exhibit hall downstairs in the auditorium building, which housed most of the balance of the indoor exhibits. There were a few large booths on the arena floor proper.

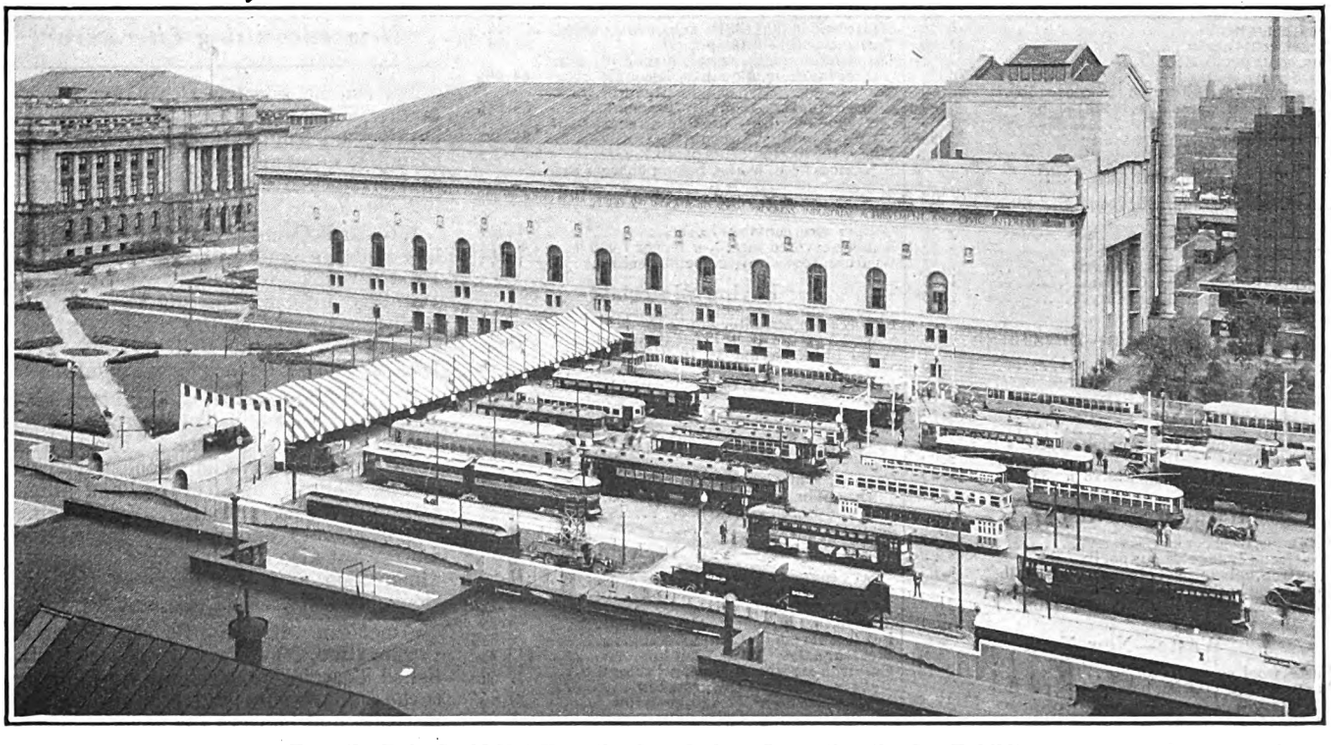
Much to the satisfaction of the exhibitors the crowds circulated very well during the several days of the convention and the fears which had been expressed by some that they would be overlooked due to their locations in the west wing or in the downstairs exhibit proved ill founded. Mr. Dell sent out a questionnaire to the various exhibitors recently to get the reaction of each company to the convention as a whole and to the general arrangements and handling of the exhibit. Replies from these sources have been most enthusiastic. Exhibitors were particularly impressed with the excellent facilities which Cleveland had available for handling shipments of display material and for setting up and generally facilitating the progress of the show.

It has been said before that one of the most outstanding features of the whole exhibit was the generous display of rolling stock, both passenger cars and freight and service equipment. It does no harm to emphasize this point by occasional repetition. The cars were not only conspicuous by their numbers; they indicated such strides forward in appearance, comfort, reduction in weight, and in general operating efficiency that they could not but prove of monumental inspiration to the railway men there assembled.

Many Unexpected Lines Represented

But the many other features of the exhibit were not without their own significance. When one stepped into the west wing he was literally dazzled by the display of buses—bodies, chassis and complete units. Certainly the last word in the artistic as well as in sturdy dependability was very much in evidence there.

Almost every conceivable line of railway supplies was represented in the Cleveland show. And there was a surprising array of materials which would not, at first glance, strike one as being subject to great demand in this industry. All of which goes to prove that the electric railway field is being looked upon with increasing favor by manufacturers in general as one worthy of thorough exploitation and development as a major channel for marketing goods.



Even the Rain Could Not Keep the Crowds from Inspecting the Car Exhibits

Digitized by Google

Rolling Stock

Boston Elevated Railway, Boston, Mass., has purchased eight 29-passenger city type Mack buses. Two of these units will be used between Allston and Cambridge and the remaining six are classed as "extras."

Honolulu Rapid Transit Company, Honolulu, Hawaii, is asking for tentative bids and preliminary specifications for twelve additional cars. This will bring the total of cars owned up to 83.

Los Angeles Railway, Los Angeles, Cal., received six new buses from the Fageol Motor Company of Oakland, Cal. during the month of August. Among these were included one four-cylinder street car type bus, four six-cylinder street car type buses and one double-deck bus. All but the four-cylinder unit were equipped with air brakes.

Hamilton Street Railway Company, Hamilton, Ont., Canada, is preparing to order 24 new double-truck street cars, according to an announcement recently made by the Dominion Power & Transmission Company.

Chicago & Northwestern Railroad, Chicago, Ill., has placed an order for five 72-ft. gas-electric rail cars with the Electro-Motive Company. These units will be practically identical with the three cars which were delivered to the railroad in May. They will have seats for 42 passengers, and in addition each will have a 15-ft. railway post office and a 16-ft. 8-in. baggage compartment.

Maryland & Pennsylvania Railroad, Baltimore, Md., has ordered one 72-ft. gas-electric rail car for all-passenger service from the Electro-Motive Car Company. This car will be equipped with a model No. 120 power plant.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has purchased one six-cylinder parlor-car type Fageol bus equipped with Westinghouse air brakes for use in suburban service out of Milwaukee.

Track and Line

Virginia Electric & Power Company, Richmond, Va., is making rapid progress on the extension of its Norfolk trolley line to Port Norfolk and Pinners Point and expects to have the improved service in operation early in October. A part of the old line is being double-tracked and a single-track extension for some distance is being laid. Total new trackage is around 15,000 ft. The company will improve its High Street lines, laying 12,200 ft. of new trackage.

Los Angeles Railway Corporation, Los Angeles, Cal., has applied to the Railroad Commission for permission to construct a double track in Leonis Boulevard between Pacific Boulevard and Downey Road in the city of Vernon.

Pacific Railway, San Jose, Costa Rica, will be electrified, according to a recently approved contract between the government of Costa Rica and the Allgemeine Elektricitäts-Gesellschaft of Berlin. The electrified portion of the railway will extend from San Jose to Punta Arenas, the Pacific port.

Honolulu Rapid Transit Company, Honolulu, Hawaii, was given authority by the Public Utilities Commission to spend $31,124 in double-tracking Punahou Street from Wilder Avenue to below Dominis Street.

Gary Railways, Gary, Ind., has started laying a second track on its Hammond line in Eleventh Avenue, Gary, for a distance of ½ mile between the Pennsylvania Railroad crossing and Rutledge Road. The work will be completed in about two weeks. At the request of residents along Eleventh Avenue the company has willingly agreed to remove its poles from the center of the street and to erect poles near the curb line from which the trolley wires will be suspended. The cost of the entire undertaking, including the realignment of poles, is estimated at $25,000.

Trade Notes

American Brown Boveri Electric Corporation, Camden, N. J., announces that four district offices of the company have now been established. These are located at 165 Broadway, New York City; 842 Summer Street, Boston, Mass.; 922 Witherspoon Building, Philadelphia, Pa., and 230 S. Clark Street, Chicago, Ill.

American Steel & Wire Company, Chicago, Ill., has announced that the scope of its Birmingham, Ala., office will be enlarged to cover all of the products manufactured by the company. J. J. Gilmore has been promoted to be manager of sales in the Birmingham district, covering Alabama, Mississippi and Louisiana.

J. H. Bunnell & Company, Inc., New York, N. Y., announced the removal of its factory location to new and larger quarters at Pearl and Prospect Streets, Brooklyn, N. Y. The main office and warehouse will continues to be located at 32 Park Place, New York City.

New Advertising Literature

Martindale Electric Company, Cleveland, Ohio, has issued its most recent catalog on commutator, slotting and grinding equipment and various motor maintenance specialties. This is catalog No. 7.

J. G. Brill Company, Philadelphia, Pa., has issued a leaflet describing the Brill 177-E truck for light-weight cars. Detailed information on the various component parts of the truck is given. Dimensions for the Brill 177-EX, 177-E1X and 177-E1 trucks are included.

Wright Manufacturing Company, Lisbon, Ohio, has published a new catalog, No. 11, which is said to be one of the most comprehensive handbooks on chain hoists, trolleys, hand cranes and allied equipment ever prepared. It contains not only cuts and general descriptive matter but also line drawings giving all dimensions and clearances of the various products.

American Brown Boveri Electric Corporation, New York, N. Y., has published descriptive circular No. 200 on turbo-compressors and blowers. Compressors and blowers for various industrial applications are listed.

ELECTRIC RAILWAY MATERIAL PRICES—Oct. 19, 1926

Metals—New York

Copper, electrolytic, cents per lb.	14.15
Lead, cents per lb.	8.35
Nickel, cents per lb.	35.00
Zinc, cents per lb.	7.68
Tin, Straits, cents per lb.	70.50
Aluminum, 98 to 99 per cent, cents per lb.	27.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	63.00
General service	32.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$6.50
Somerset mine run, Boston	2.20
Pittsburgh mine run, Pittsburgh	2.225
Franklin, Ill., screenings, Chicago	1.525
Central, Ill., screenings, Chicago	1.45
Kansas screenings, Kansas City	2.35

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, Pittsburgh base, cents per lb.	2.90
Tie plates (flat type), cents per lb.	2.30
Angle bars, cents per lb.	2.75
Rail bolts and nuts, Pittsburgh base, cents, lb.	4.20
Steel bars, cents per lb.	2.00
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.65
Sheet iron (24 gage), cents per lb.	3.00
Sheet iron, galvanized (24 gage), cents per lb.	3.85
Galvanized barbed wire, cents per lb.	3.35
Galvanized wire, ordinary, cents per lb.	2.50

Waste—New York

Waste, wool, cents per lb.	12–18
Waste, cotton (100 lb. bale), cents per lb.:	
White	13–17.50
Colored	10–14

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	11.2
White lead in oil (100 lb. keg), cents per lb.	15.25
Turpentine (bbl. lots), per gal.	$0.90
Car window glass, (single strength), first three brackets, A quality, discount*	84.0%
Car window glass, (single strength), first three brackets, B quality, discount*	86.0%
Car window glass, (double strength) all sizes, A quality, discount*	85.0%
Putty, 100 lb. tins, cents per lb.	5.25–5.50

* Prices f.o.b. works, boxing charges extra.

Wire—New York

Copper wire, cents per lb.	16.25
Rubber-covered wire, No. 14, per 1,000 ft.	$5.75
Weatherproof wire base, cents per lb.	17.75

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$147
Wood block paving 3½, 16 lb. treatment, N. Y., per sq. yd.	$2.70
Paving brick 3½ x 8½ x 4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4 N.Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu. yd.	1.94
Cement, Chicago consumers' net prices, without bags	2.10
Gravel, ¾-in., cu. yd., f.o.b. N. Y.	1.75
Sand, cu. yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.50
Light copper, cents per lb.	9.75
Heavy brass, cents per lb.	7.25
Zinc, old scrap, cents per lb.	4.25
Lead, cents per lb. (heavy)	6.875
Steel car axles, Chicago, net ton	$17.25
Cast iron car wheels, Chicago, gross ton	14.75
Rails (short), Chicago, gross ton	16.75
Rails, (relaying), Chicago, gross ton	28.50
Machine turnings, Chicago, gross ton	6.50

Volume 68 New York, Saturday, October 30, 1926 *Number* 18

The Bus Case Is Sound Provided Its Import Is Understood

REPRESENTATIVES of the Bus Division of the A.A.A. have recently submitted to the Interstate Commerce Commission their views regarding the principles that should govern interstate bus regulation. Boiled down, these include two primary contentions: First, that interstate bus operation is essentially a local matter and should be regulated by the state commissions in the states affected; second, that bus transportation is an industry in its own right, that it is an addition to the sum total of transportation facilities offered the public and that it should be regulated regardless of its effect on existing carriers.

Most transportation men are agreed with the first principle set down, namely, that interstate bus operation in its present stage of development is essentially a local matter and of interest primarily to the states concerned. It is also probable that bus operation of the scheduled common carrier variety will always remain largely a local service. Although long distance operations may be expected to expand in the next few years, these operations will be of the special party or tour variety rather than regularly scheduled common carrier service. In this form of bus operations the elements of pleasure and sightseeing are large factors in determining the character of the service rendered. Time and cost are secondary rather than primary factors. Such service, if properly developed under competent and responsible management, offers an attractive substitute for tours in individually owned machines and may be expected to draw its passengers from that source rather than from existing common carriers. Thereby it fulfills the primary requirement for being considered a transportation service in its own right. It offers an entirely different character of service at rates needed to maintain quality and reliability. Such operations seem to fall outside the classification of common carriers on fixed schedules and routes.

In considering bus operations which fall within the limits of common carrier service the question of whether these operations should be judged on their own merits without regard to existing carriers depends entirely on what the nature of the operations is to be. If the bus service is merely a duplication of the rail service on highways, both in the character of operations and rates of fare, then the bus contention is entirely unfounded and the existing carriers should most decidedly be considered in judging the necessity for the new service. Under such conditions bus operations are merely a duplication of existing facilities and represent an economic loss to the community.

When two vehicles are operated where one was operated before, with no corresponding increase in traffic, some one stands to pay the piper, and that some one is the man who buys transportation service. Under such conditions the bus does not offer something new, but merely tears down something which already exists. Only when a rail carrier is consistently operating at a loss, and when it is established that such operations cannot be made profitable, is the substitution of buses for rail service justified. Surely bus men are themselves in a delicate position when advocating that no consideration be given the existing carriers in determining the necessity for a new bus line, for what is sauce for the goose is also sauce for the gander. If the mere desire for more transportation is to become ample basis for granting certificates to operate, then the holders of existing certificates of convenience and necessity are indeed the possessors of nothing more than scraps of paper. Carrying this reasoning to the *reductio ad absurdum*, a maximum amount of service would be provided on a given route by granting operating rights to all who applied.

But would it? What about the character of the service rendered? And what about the cost of giving the service? That is where this reasoning falls down, for duplication of service in kind represents economic waste, and when there is economic waste in rendering utility service the user pays the bill, either in his fare or in being forced to put up with an inferior ride.

Bus operations may be considered in their own right without regard to existing carriers only when the service rendered is of an entirely different character at rates high enough to insure maintenance of the quality. When the bus service offers a different *character* of service at distinctive rates it represents an addition to transportation facilities and not a duplication. Under such conditions the bus creates its own patronage instead of drawing from the riders on the existing carriers. *And the rate of fare charged is the key to the situation.* With the rate of fare sufficiently higher than railway rates and with both regulation and competition operating to keep the character of service rendered up to the level of the rate charged, then the bus, even when operated parallel to an existing carrier, seems to have some claims for being considered a transportation agency in its own right.

The bus men cite the example of telephone and telegraph service as precedent on which to base their own case. Consideration for a moment of the difference in the character of these services and of *the rates charged* shows the situation in its proper light. Though these are both communication services the telephone has not attempted to duplicate the telegraph, but provides a service that is entirely different in character at an entirely different rate. The bus has before it a wonderful future, provided that its own advocates rise to their opportunity. It is high time that bus men stopped thinking in terms of railway passengers, railway rates and railway replacement and devote themselves to building what they claim to represent—an industry in its own right.

Plans for Next Year's Convention Should Be Made Early

NOW while the thoughts of the 45th convention are still fresh in mind, it is a good time to think about the 46th. In previous years, the location has been decided some time during the late winter or spring, leaving only a short time before active work commenced.

Many companies, both manufacturing and operating, are making their budgets for next year. The location of the convention has a decided bearing on such estimates. Then, too, the work of several committees of the association, such as that on membership, will find it advantageous to approach prospective members with definite plans.

Few people realize the great volume of work behind the preparation of a convention having the enormous proportions as that just witnessed in Cleveland by more than 8,000 delegates. That, of course, is a compliment to those who prepared it. Nevertheless, besides the work of the convention committee and the director, there is much necessary work on the part of manufacturers that could in a measure be better directed if focused on a definite objective.

Also, the date bears some thought. The first week of October has for years been chosen. The reason for this seems to be tied into the more or less stereotyped Atlantic City schedule, fitting in with hotel accommodations, etc., following the season's rush to that resort. In Cleveland these factors did not prevail. The accountants, principally, are affected, since the first of the month is obviously the busiest time for them and this has been a factor that has been responsible for preventing many delegates of this important association from attending.

With the ever-growing size of the annual convention and its increasing importance in this period of the industry's recovery it seems particularly advisable to plan earlier that we may plan better.

Make Better Use of Existing Streets Before Spending Money to Widen Them

IMMEDIATE widening of roads in and about the large cities of the United States is being vigorously urged by the American Road Builders Association as a means of relieving traffic congestion. The enormous expenditure necessary for such an undertaking is justified, it is claimed, because the cost of traffic delays is greater than would be the cost of widening and improving the roads. Despite the plausibility of this argument considerable uncertainty exists as to the actual measure of relief that would be afforded by simply increasing roadway areas. So far as city traffic is concerned, experience shows that additional street space is absorbed as rapidly as it is provided without any marked diminution of congestion. Before spending vast sums to widen the streets, careful consideration might well be given to the possibilities of making better use of those we already have.

Observation clearly shows that the actual capacity of existing streets has by no means been reached. The volume of traffic that can be moved over a given route in a given time depends on the effective width of the roadway and the average speed of vehicles. Generally speaking, both can be increased with comparative ease.

On our busiest streets parked automobiles often occupy anywhere from a quarter to two-thirds of the roadway. Angle parking and double parallel parking are permitted in the very cities where the gravest concern is felt concerning the traffic situation. Huge vans back up to the curb and spend hours loading or unloading regardless of the extent to which they block the movement of other vehicles.

To make matters worse the average speed of vehicular movement in many streets has become so slow that the horse is replacing the automobile for certain kinds of trucking in our large cities, because the cost of waiting is thereby reduced. A tremendous number of unnecessary delays occur. Time and again a single vehicle making a left-hand turn blocks two or three lines of moving traffic. Policemen frequently exercise poor judgment in controlling traffic at busy intersections. On the other hand, automatic synchronized signal lights often hold large numbers of vehicles motionless although there is no cross traffic moving.

Whether or not a program involving wholesale widening of roads is desirable is not for the electric railway industry to say. In the cities, however, results are likely to be disappointing if it is undertaken on the theory that traffic congestion will thereby be substantially relieved. Unless provision is made to restrict the use of widened streets to traffic movement rather than the storage of vehicles, there will be an increase in storage space but little real improvement in facilities. Making more efficient use of the existing roadway, rather than building more roadway to use inefficiently, offers a quicker and better solution of the problem.

Light for Electric Railways in Professor Ripley's Criticisms

THE latest article in the series by Prof. W. Z. Ripley on corporate finance published in the *Atlantic Monthly* appears in the November issue of that magazine and undertakes to throw light on the financial practices occasioned by the rapid growth of the power and light industry. Approaching this question from the standpoint of the public's interest, Professor Ripley confines his discussion to the holding company. After setting up what he considers the weaknesses and dangers attending the rapid growth of these organizations, the author deserts his customary high plane of scientific inquiry and yields to the temptation of becoming rhetorical. This is done by inferring that some of the conditions described are sufficiently general to warrant federal investigation. That is obviously unfair. To an industry which has made such phenomenal progress there is bound to be attracted the speculator who stretches the limits of sound practice. There is ample evidence—and the author cites some of it—to indicate that those engaged in building for the future as well as the present have decried some of the very practices which are criticised.

Although discussing primarily the power and light industry, and particularly the situation of the holding companies, the article touches a few points of interest to electric railway men. Little cause to quarrel can be found with the professor in contending that sale of stock direct to customers carries with it the assumption of increased responsibility by the utility and that this activity should be properly safeguarded in the public interest, as well as in the interest of the utility itself. But in the case of the electric railways there is little danger for some time to come of "overselling" securities direct to the public. At the present time the principal problem of the electric railways is that of re-establish-

Digitized by Google

ing their credit. However, this is a good time for the industry to fix in mind the responsibilities as well as the advantages that attend the sale of stock to its patrons.

Electric railways have had considerable experience with the evil results of inadequate provision, during a period of adequate rates and profits, for depreciation and obsolescence. During periods of prosperity, when there is no question of increased rates involved, there is a natural disposition on the part of regulatory authorities to permit adequate reserves to be set up. The precedents thus established are extremely important to the preservation and development of the industry in leaner years. There is now a growing realization in the electric railway industry that failure to set aside adequate depreciation allowances in the past is responsible for the large amount of obsolete equipment on its hands today. Now that there is strong evidence of steadily improving conditions it is important that a definite policy be adopted as rapidly as possible looking to the establishment of adequate renewal reserves. Only in that way can the industry hope so to preserve its plant and equipment as to meet effectively the conditions set up by modern transportation requirements.

New York Five-Cent Referendum Act Defective

ELECTION day in New York, Nov. 2, will not see the question of a 5-cent fare referendum submitted to the voters. The Court of Appeals has effectually squelched any such proposal. The matter had been passed upon before by the lower courts, but only as to the regularity of the proceeding, not on any of the technical points involved.

So an end has been put to an obnoxious piece of legislation sired by former Mayor Hylan and nurtured by former Comptroller Craig. Although these gentlemen were anathema or worse one to the other in office, they appeared in the rôle of Damon and Pythias in this little piece of hokum, which fixed the citizens' attention upon the 5-cent fare alone. The unrevealed effect, however, would have been to prohibit action by the authorities, thus making transit contracts immune to change.

The opinion of the court was to the effect that if there was a shred in the law that could be saved, it was not worth saving. Consequently it declared it to be folly to submit this "maimed and worthless thing" to the voters. In other words, as it now stands revealed the legislation was an attempt to fool the public into the belief that a vote was merely a vote for or against the 5-cent fare. This deceit was continued even in the form of the question to be printed upon the official ballot which mentioned only the fare.

In New York there has never been a clean-cut expression of public opinion on the vitally important questions of an independent subway system and municipal operation. By this bill a neat trap was laid to trick the people into a vote that (without their knowing it) meant an independent system and municipal operation, because with agreements between the city and the existing companies practically prohibited, no other course than municipal operation would be possible. The bill that the courts have scotched by their action would have perpetuated the present transit conditions in New York, made intolerable by the very people who, not content with their work of opposition while in office, sought by this impudent means to bedevil things still further.

All the Noise Is Getting Nowhere

ANY disposition, if such there really be, by the two major steam railroads of Pennsylvania to enter into competition in kind by the operation of buses in territory already served by the electric railways or by other legalized carriers deserves to be condemned, but it does seem that the over-zealous Governor Pinchot, in refusing to sanction charters for subsidiary bus companies sponsored by these railroads, has gone out of his way to malign the Public Service Commission. The Governor pretends to foresee the steam carriers swallowing up the present highways to their own aggrandizement, and then proceeds intemperately to lash the Public Service Commission.

Off hand, the correspondence between the Governor and the commission over the matter might make it appear that the controversy is a purely local one, grounded in a manifest disapproval of the personnel of the commission as now constituted, but it really goes deeper than that. It is an indirect attack on regulation itself. The commission appears to be cognizant of the need on its part to protect the existing carriers from encroachment one upon the other. The Governor says, however, that if he were to sign the railroad bus subsidiary charters, the commission could grant certificates of public convenience without anybody's being able to stop it. There has, however, been no evidence of this. Any such action on the part of the commission would probably be in direct violation of the rights of the existing carriers, provided, of course, that these carriers are prepared to meet their contractual obligation.

Still the fear that the Governor purports to feel is shared in other quarters. This is made plain in a statement by Powell Evans, president of the Schuylkill (Electric) Railway, Girardville, published on Oct. 20. Reference to this statement is made elsewhere in this issue. It deserves careful attention not only in Pennsylvania but in other states. Mr. Evans says that the electric railways urged the facts upon the steam railroads patiently and temperately before the bus programs of these companies were finally adopted, but without effect, "whereupon protest was made to the Governor, the Public Service Commission and the courts, with the result that the charters were denied." He says that the electric railways throughout the state "propose to resist to the utmost the unjustifiable aggression initiated by the steam lines against established, responsible and equally legitimate local competitors."

In other words, here is a situation in which a Governor pretends that the members of the Public Service Commission cannot be trusted to protect the rights of the small against encroachments by the large corporations, in which the commission says that each applicant for the right to operate must prove his case, and in which the electric railways have been unable to impress the steam railroads with a point of view they rightfully regard as reasonable. With due respect to all the parties involved, it certainly would seem that nothing can be gained by further blind adherence, particularly on the part of the steam railroads, to the policies that have so far marked the progress of this controversy. The very mutuality of their interest ought perforce to bring the steam railroads and the electric railways together to devise a plan eminently fair to each. It is not the first time this has been found to be the only adequate way to avoid consequences terrible alike to the carriers and the public.

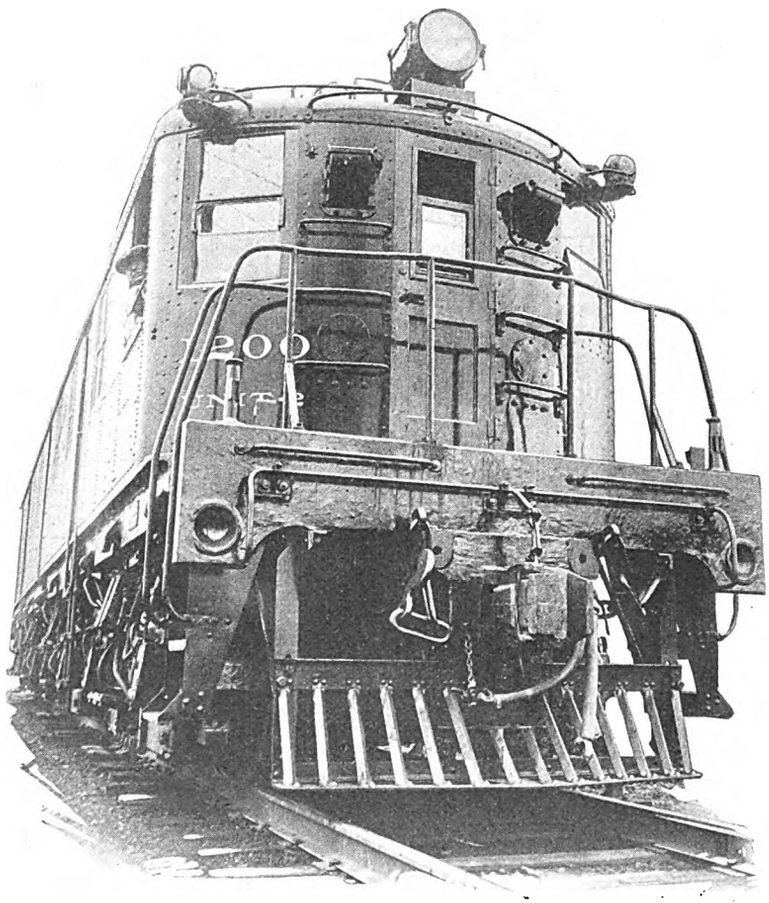
New Electric Freight Locomotive Placed in Service by New York Central

Two Units Just Received Perform Well Within Specification Limits—Designed to Operate from Third Rail or Overhead Construction of Present Type or that Contemplated on West Side Tracks—Three Running Connections Are Provided with Two Steps of Inductive Field Shunts, Allowing Nine Running Speeds with Full Load Varying Between 4 M.p.H. and 24.8 M.p.H.

By Edwin B. Katte
Chief Engineer Electric Traction, New York Central Railroad

THE New York Central Railroad's new electric freight locomotives are designated as Class R and will be used for hauling through freight on the electric division and west side freight tracks in New York City and vicinity.

These engines, two of which have been purchased, differ from any previous electric locomotives of the company in that they are built in two nearly identical units. The units are connected by a special coupling and can be separated for shop purposes, but are numbered alike and will not be separated in service. The designed weight was 170 tons, the actual scale weight of the first locomotive is 353,600 lb., all on the drivers. In an illustration is shown the general outline of the locomotive and the principal dimensions.



More than 100 Cars Weighing 3,000 Tons Were Hauled by This New Engine Between New York and Harmon at Varying Speeds up to 34½ M.p.H.

Each unit consists of a box type cab mounted on two four-wheel swivel trucks, not articulated. The floor frame is a single steel casting, as shown in an accompanying illustration. This use of large steel castings for underframes and truck frames is the most notable mechanical feature of this locomotive and simplifies the construction by eliminating great numbers of bolts, nuts and small parts. Extending longitudinally through the middle of the underframe casting is a large duct for conveying air from the blower above, through the centerplates to the traction motors. Lugs for lifting the cab from the trucks, buffer beams with push pole pockets, convenient attachment for couplers, for truck safety chains, etc., and side steps are cast integral.

The truck frame is an integral steel casting and embraces side frames, end frames and transom. The transom is cast hollow, to conduct the air which passes downward through the large centerplate opening to the motors. Lugs for spring nose suspension of the motors are cast on the transom. The cast frame is supported at the middle of each side on a semi-elliptic spring, the ends of which are carried in cast steel spring hangers, swung between two equalizer bars. The equalizer bars are cushion-supported on each journal box by a nest of helical springs, which adds very materially to the good riding of the locomotive. The journal boxes are made of cast steel with brackets projecting from the under side for the support of the third rail shoe beam. The wheels, which are all drivers, have cast steel spoke centers and steel tires. The journals are 7 in. x 14 in.

PRINCIPAL DIMENSIONS AND WEIGHTS OF NEW YORK CENTRAL LOCOMOTIVE

Length over coupler faces	68 ft. 2 in.
Length of each cab	29 ft. 0 in.
Truck centers	16 ft. 0 in.
Spread of third rail shoes	49 ft. 0 in.
Height of floor over rails	5 ft. 4¼ in.
Height of roof over rails	12 ft. 7⅞ in.
Height of trolley retracted	14 ft. 7 in.
Width over cab sheets	9 ft. 10 in.
Width over all (over eaves)	9 ft. 11½ in.
Wheelbase, total (both units)	55 ft. 3 in.
Wheelbase, each unit	24 ft. 3 in.
Wheelbase, truck	8 ft. 3 in.
Weight, total	353,600 lb.
Weight, per axle	44,200 lb.

Controller Development and Wiring Diagram of New York Central Road Freight Locomotive, Two of Which Have Just Been Received

Eight traction motors of standard geared railway type, with commutating poles and forced ventilation, are mounted on the axles. The motors are designated as GE-286A and are identical, except for gear ratio, with those used on the Class Q switching electric locomotives. The same type will also be used on the oil-electric locomotives now under construction. The pinion on the armature shaft has twenty teeth and the spring gear on the axle 69 teeth, giving a ratio of 3.45, as compared with 4.235 on the Q locomotive. The motors are insulated for 1,500 volts for possible future use, two in series.

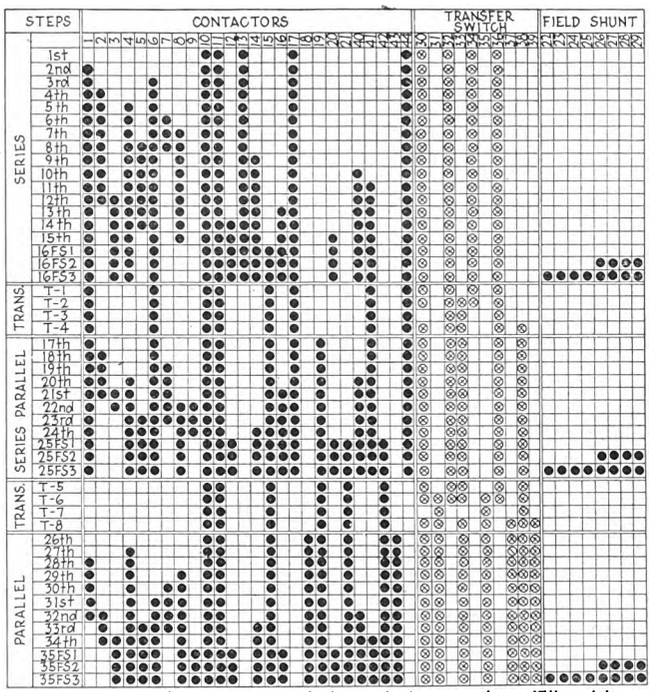
The four motors on each unit are connected in series, series-parallel and parallel, at successive controller positions. At any running position a separate handle on the controller can be moved to either of two positions, known as FS-2 and FS-3, to obtain higher speed by weakening the motor fields by means of inductive shunts.

The GE-286 motor is rated at 415 hp., 575 amp., on the standard one-hour basis, with a temperature rise of 120 deg. C. and a voltage of 600. The continuous rating is 332 hp. at 460 amp. The one-hour rating of the locomotive is 3,320 hp. At 20 per cent adhesion between wheels and rails, based on 170 tons weight, the locomotive develops 68,000 lb. tractive effort. The speeds to which this tractive effort can be exerted at 575 volts are: Series, full field, 4.0 m.p.h.; series parallel, full field, 9.6 m.p.h.; parallel, full field, 20.0 m.p.h.; FS-2, 22.5 m.p.h.; FS-3, 24.8 m.p.h.

Each motor was given a rigid shop test. The resist-

Digitized by Google

ances of fields and armature were measured. Two motors were coupled mechanically and run for two fifteen-minute periods in each direction, each machine running alternately as motor on rated current and as generator discharging into a water rheostat. Each motor was given a high potential test of 4,000 volts. Sample motors were also run at various loads and voltages to check the characteristics. Commutation was practically sparkless at all loads. Heat runs were made under various conditions, blown and unblown, full and shunted field and voltages running from 300 to 750 volts to check the ratings. The characteristic curves of the motors and the tractive effort curves of the locomotive are shown herewith.



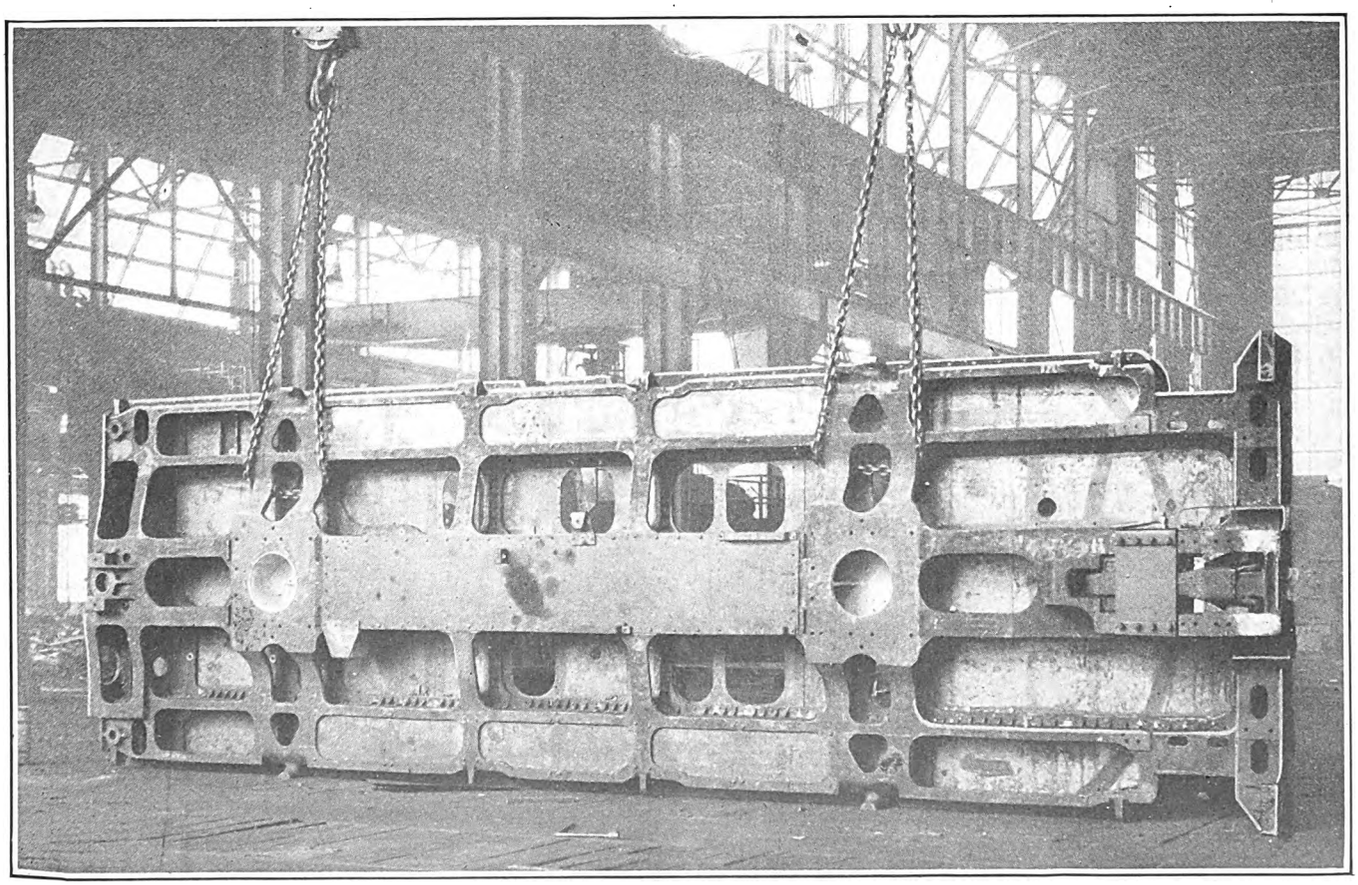
When operating with motors cut out, line contactors come in on 17th notch

Sequence Diagram Showing Operation of Control and Contactors for New York Central New Road Freight Electric Engine

The cab of each unit is divided by a transverse partition into an operating cab at the outer end and an apparatus space occupying the remainder of the cab. An aisle extends along each side from a door in the partition to a middle door at the other end for communication between units. The blower for the traction motors, the air compressor, hand brake, air brake apparatus, etc., are located on the floor between these aisles. The control apparatus, including contactors, circuit breaker, relays, reverser, series-parallel switch, fuse boxes for auxiliaries, etc., is arranged in two rows in a compartment next to the operating cab and is accessible both from the outer aisles and from a short center aisle opening into the operating cab. The grid rheostats are located just above the floor, below the control apparatus, in this compartment and are ventilated through flues to the roof. The estimated height of the center of gravity is 59 in. above the top of the running rails.

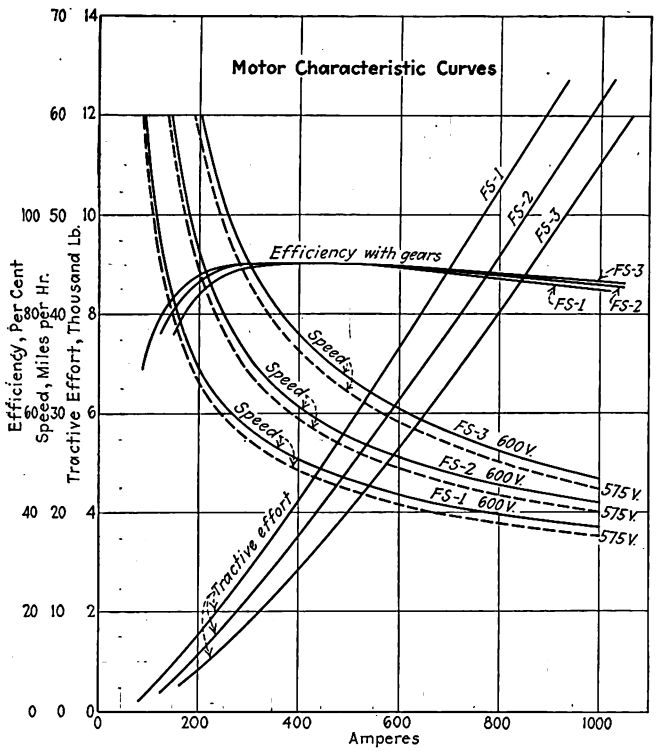
Both units are wired alike except for the battery and battery accessories, as illustrated in the schematic diagrams reproduced herewith.

The control apparatus is of the PCL electro-pneumatic type. The contactors, reversers and series-parallel switches are operated by air cylinders. The air for operating each cylinder is controlled by a magnet valve



One of the Innovations in This Electric Locomotive Is the Cast-Steel Floor Frame Type of Construction. This Eliminates an Expensive Assembly Job Using Structural Shapes and Rivets

Digitized by Google



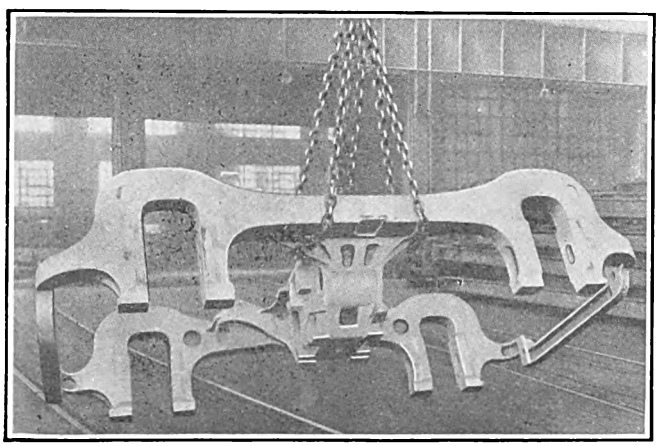
Characteristic Curves of the General Electric 286 Motors Rated at 415 Hp. on 575 Volts. Eight Motors on Each Complete Locomotive Are Used, Making the One-Hour Rating of the Engine 3,320 Hp.

energized from the master controller. The series-parallel switch consists of a group of ten contactors operated by a camshaft controlled by four magnet valves. A 32-volt, 150-amp.-hr. storage battery, charged in series with the blowers, is used to furnish current for the motor control circuits, lights and control of all auxiliaries.

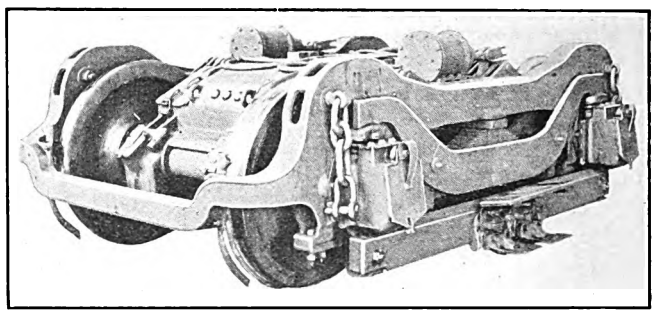
All auxiliaries, including pantographs, blowers, compressors and lights, are controlled by push button switches located convenient to each engineer's position.

A blower to provide forced ventilation for the traction motors is located on each unit. Also on each unit is a two-stage air compressor, having a displacement of 150 cu.ft. of free air per minute that supplies air for the air brake system, motor control and auxiliaries, including pantographs, whistles, sanders, etc.

Each locomotive is equipped with eight third-rail shoes on each side for operation on the standard New York Central third-rail. In addition four pantographs are provided which will collect current from either the overhead third rail at a height of 15 ft. 3 in. or on the contemplated overhead construction on the west side tracks at a height of 17 ft. 4 in. A bus line between units was not considered necessary.



Cast-Steel Truck Frames Ready for Assembly. New York Central Has Just Received Two Road Freight Locomotives Equipped with These Trucks



Cast-Steel Truck Frames Are Used with Two 415-Hp. Motors Mounted on Each. Two Trucks Non-Articulated Comprise a Half Unit of the Locomotive and Two Units and Four Trucks the Complete Assembly

The locomotive is protected from lightning by an aluminum cell lightning arrester. The motor circuits are protected by a high-speed circuit breaker which opens on excessive current and can be tripped by an overload relay in each motor circuit or by a switch placed convenient to the engineman.

The locomotive is capable of operating with a train on a curve of 230-ft. radius and of running at a speed of 60 m.p.h. Under test with special gears this unit has been run at 86 m.p.h. The locomotive is designed to haul a train of 3,000 tons weight, consisting of 75 per

All Weight Is on Drivers and Evenly Distributed, as Shown in This Drawing of the First of Two New Electric Road Freight Locomotives Recently Received by the New York Central

cent empties and 25 per cent 50-ton loaded cars, at a speed of 32 m.p.h. and with 575 volts at the motors.

The service capacity of the locomotive was defined in the specifications by a requirement that in a continuous series of runs between 79th Street (west side) and Harmon, hauling the train just mentioned, making four intermediate stops of two minutes duration on each trip, accelerating at 20 per cent adhesion and having a layover of twenty minutes at each terminal, with voltage at 575, the temperature rise in the motors should not exceed 140 deg. C. measured by change in resistance or 120 deg. C. by thermometer.

Acceptance Tests Well Within Specifications

An acceptance test of one of these locomotives was run recently to ascertain whether the locomotive conformed to the requirements of the specification. A train of 108 cars, including cabooses, with the proper proportion of loads and empties, weighing 3,006 tons, was assembled. A caboose containing instruments to indicate and record voltage, amperes and speed was coupled to the locomotive and the instruments connected into the locomotive circuits by cables carried temporarily over the roofs. It was intended to run three round trips with this train in about 7½ hours, but due to accidental uncoupling of cars and other operating delays the test was terminated after nine hours, near the end of the second round trip, after making 95 train-miles. The number of stops, exclusive of terminals, was seventeen. The maximum speed was 34½ m.p.h. The amount of energy consumed by this locomotive in hauling the 108-car train under the described test conditions was 26.3 watt-hours per trailing ton-mile.

The maximum motor temperature rise observed was 90 deg. C., which, taking into consideration all the conditions of the test, indicates that the temperature rise would be well within the limit of the 140-deg. requirement in the specification.

Changes in Passenger Traffic in London Since 1913

COMPARISON of the numbers of passengers carried by the rapid transit lines, buses and tramways of Greater London in 1913 and 1925 discloses an interesting change in the relative importance of these three modes of transport. The volume of traffic carried by each of the three has greatly increased during the interval of twelve years, but the growth has been uneven and the buses and rapid transit lines have overtaken the tramways, which in 1913 occupied the first place.

	Passengers Carried	Per Cent of Total	Rides per Capitum
Tramways, 1913	812,000,000	36	110
Tramways, 1925	979,000,000	27	128
Buses, 1913	736,000,000	32	100
Buses, 1925	1,671,000,000	45	218
Rapid transit lines, 1913	725,000,000	32	98
Rapid transit lines, 1925	1,049,000,000	28	137

From 1913 to 1925 the total volume of traffic increased by 63 per cent, but the tramway passengers increased only 21 per cent. The bus passengers increased by the phenomenal figure of 127 per cent, while the rapid transit passengers increased by 45 per cent. The result has been that the tramways have fallen to the bottom of the table while the buses have risen to the top. Meantime the rapid transit lines advanced to the second place.

Educational Opportunities for Philadelphia Employees

MANAGEMENT representatives of the Philadelphia Rapid Transit Company, Philadelphia, Pa., will devote much time this fall and winter to educational courses designed to give to P.R.T. employees opportunity for a broader understanding of the principles underlying the co-ordinated transportation system and its varied activities. The courses are under the direction of men who are not only versed in the theories of their subjects but in their practical application as well.

Courses 1 and 2 at the William Penn High School are open to all. Courses 3, 4 and 5, applying more specifically to P.R.T., are held entirely under P.R.T. auspices at company locations.

1. *Public Relations with a Background or Transportation and Public Utility Economics—J. M. Shaw.* Held at William Penn Evening High School, Fifteenth and Wallace Streets, 7:30 to 9:30 p.m., Tuesday evenings, from Sept. 14 to Dec. 14, inclusive. Topics will include:

1. Origin and development of co-ordinated transportation as a public service.
2. Owner, manager, worker, consumer — four wheels whose alignment is necessary to progress.
3. Monopoly vs. competition.
4. Relation of fares to service.
5. Production and participation—the heart of the industry.
6. The new science of public relations.
7. Developing public contacts.
8. Service as a molder of public opinion.
9. Public ownership of public utility securities.
10. The technique of complaint adjustment.
11. The newspaper.
12. Some advertising mediums for a co-ordinated transportation system.
13. General review.

2. *Handling Men—E. J. Benge.* Held at William Penn Evening High School, Fifteenth and Wallace Streets, 7: 30 to 9: 30 p.m., Monday evenings, from Sept. 13 to Dec. 13, inclusive. Topics will include:

1. The problem of handling men.
2. Stimulating subordinates.
3. Control.
4. Discipline.
5. Appeals for better work.
6. Rivalry and other incentives.
7. The force of habit.
8. Training insures careful work.
9. The supervisor's job.
10. Difficulties with subordinates.
11. Combating negative traits.
12. Difficulty with superiors.
13. Responsibility and authority.

3. *Electric Railway Industry*—Held at Luzerne Auditorium, 7: 30 to 9: 30 p.m., Thursday evenings, from Oct. 7 to Jan. 6, inclusive.

1. Development of street railway industry, W. K. Myers.
2. Public relations, J. M. Shaw.
3. Importance of employees in public utilities, A. A. Mitten.
4. Transportation and traffic, W. J. Beadle.
5. Generation and distribution of power, H. G. Werner.
6. Maintenance of equipment, G. H. Stier.
7. Construction and maintenance of way, J. H. M. Andrews.
8. Materials, W. E. Scott.
9. Finance and accounting, C. E. Ebert.
10. Legal, C. J. Joyce.
11. Claims, J. J. K. Caskie.
12. The motor bus, J. A. Queeney.
13. General discussion, J. E. Whiting.

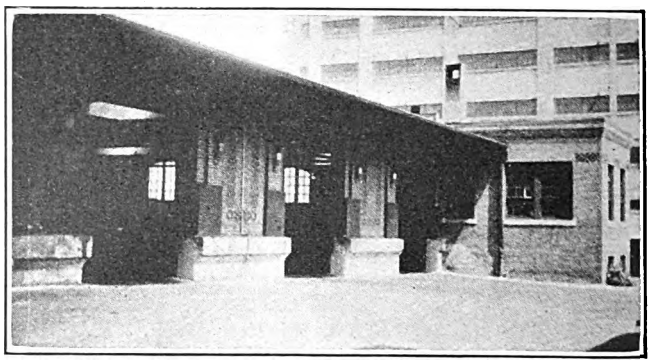
4. *Supervisory Problems—Messrs. Andrews and Beadle.*—A discussion group open only to superintendents, foremen, supervisors, department heads and others in equivalent positions. Held at 1520 Spruce Street from 7:30 to 9:30 p.m. on alternate Wednesday evenings. Six meetings: Sept. 22, Oct. 6, 20, Nov. 3, 17, and Dec. 1.

5. *Public Speaking and Parliamentary Procedure—Mr. Holt.*—A practical group consisting of ten meetings at Luzerne Auditorium, 7: 30 to 9: 30 p.m., Monday evenings, from Sept. 20 to Nov. 22.

Express Station Converted Into a Garage

SEVERAL years ago the Union Street Railway, New Bedford, discontinued its electric express business when connecting trolley lines leading to two of the principal shipping points, Boston and Providence, were discontinued. The general increase of motor trucking also proved to be too great a competitor. A centrally located modern freight station, representing a large investment, then yielded no income.

With the establishment of the motor coach service by the railway a garage where the coaches could be suitably housed and repaired had to be provided. As this express station was located less than ¼ mile from the



Union Street Railway Now Uses This Former Freight Station to House Twelve Buses

New Bedford terminal of the New Bedford-Fall River-Providence motor coach line, it was considered an excellent location for a garage. Little remodeling of the building was necessary. As about two-thirds of this building had been previously leased to a local distributing agency, only the remaining third was converted into a garage. Should the company deem it advisable to increase motor coach operation at any time the remaining part of the building can be remodeled as a garage extension.

Reconstruction consisted mainly of installing garage doors, laying a concrete floor with safety bumpers, providing a washing and draining system and piping and wiring for heat and light. Air pumps, machines and benches were also systematically installed. The office at the end of the building was converted into a combination office and stock room.

Railway Information Published in Cincinnati Telephone Directory

IN CINCINNATI, OHIO, a city and suburban telephone directory is no longer complete without information on the street railway companies. The summer, 1926, classified directory, with valuable information of the railway and bus routes of the Cincinnati Street Railway is proof of this innovation. A full page map shows the co-ordinated service as of April 1 and a second page contains data on car lines, route numbers, fares and transfers, as well as diagrams of boarding and alighting points. For the resident of the city of Cincinnati this directory will be helpful, but for the strangers in the city it will serve as an invaluable guide.

Baltimore in Campaign to Increase Traffic

Many Notable Improvements, Including the Addition of Modern Rolling Stock and Methods for Making Higher Schedule Speed, Have Won Increased Patronage—The Company Has Also Actively Participated in Civic Movements to Improve Street Conditions

LOCAL public carrier transportation is sometimes called a monopoly, but the United Railways & Electric Company of Baltimore realizes that the modern story of a street railway is a story of competition. It believes that only by popularizing the service and making the public realize the necessity for favorable operating conditions can an electric railway do its full share in local transportation.

During 1924 and the early part of 1925 the company suffered a decrease in revenue passengers carried, as compared with the previous year, and while changes in zones made this decrease appear greater than it really was, predictions were not wanting from persons hostile to the company that street cars were becoming obsolete and that Baltimore's mass transportation would be handled before long entirely by buses.

Today the situation is quite different. Since January, 1926, both gross revenue and revenue passengers have not only exceeded the figures for 1925 but those for 1924, before the changes in zones already mentioned were made. March, April and May were the most profitable months the company had had since 1920, the peak year in the street railway industry in the country. For the six months ended June 30, 1926, revenues increased 2.5 per cent over a corresponding period for 1925 and revenue passengers increased 3.6 per cent. What is equally, if not more, important, suggestions in the daily newspapers that street cars are out of date have disappeared, and the public attitude toward the company has greatly changed. The most important factors, in the opinion of the company, for this change are:

1. Open and vigorous advocacy by the company of the interests of the car riders of Baltimore in all traffic discussions.

2. Proof by the company of its sincerity in this advocacy by actual diligent attention to the car rider's comfort and convenience when on the cars or buses; in short, painstaking service.

3. Getting rid of old-fashioned cars and substituting bigger and better ones, substantially increasing bus

Digitized by Google

operations, practical and successful work on the rush hour problem; in brief, "new service for old."

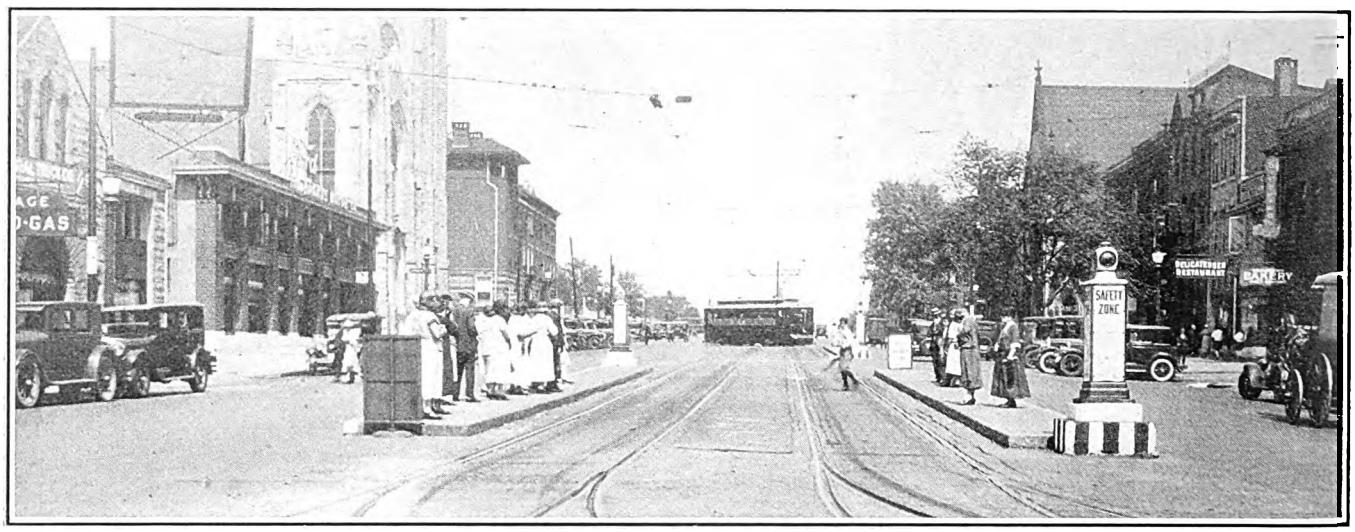
4. Frankly selling this service in the open market against competition by newspaper advertising on a large scale.

5. A definite policy of self-criticism and consistent co-operation with public criticism for the good of the service.

6. Constant reiteration to the public of the principle that the good street car system, properly augmented by buses, cannot be improved upon for public transportation; earnest efforts to prove this by service, and publication of the proof whenever possible.

7. More than ordinary eagerness to co-operate with the Baltimore people and groups—to be a part of the life of the city — to put the whole car system on the side of sound movements involving the general public welfare.

Some steps in this campaign, such as the advertising campaign, which was distinguished by a series of very striking full-page advertisements in the Baltimore local papers, have been described in the ELECTRIC RAILWAY JOURNAL, as in the issue of March 27, 1926, page 551. This article touches briefly on other steps in the program, as mentioned in the company's brief in the Coffin award contest.



Some of the Streets in Baltimore Are Equipped with Raised Platforms. The Entering End of the Platform Is Protected with a Safety-Zone Light Post, with Conspicuously Marked Base, and the Leaving End with a Substantial Frame Containing a Safety Poster. This View Is on North Charles Street

SUPPORTING THE INTERESTS OF THE CAR RIDERS AND PUBLIC POSITION OF THE RAILWAY

This is the first factor mentioned in the list and is perhaps best illustrated by action taken on the conclusions given by Kelker, De Leuw & Company in a traffic survey report for Baltimore made by them during the early part of 1926. One of the recommendations in this survey was the elimination of parking, both partial and complete, in congested districts. This conclusion was attacked by the traffic committee of the Baltimore Association of Commerce, which was composed of business men and industrial interests and included a representative of the railway. The majority report of the committee opposed prohibition of parking on the ground that customers of the local stores used automobiles in their shopping trips rather than the railway. The representative of the railway presented a minority report, pointing out that the merchants would oppose their own interests if they adopted the majority report, since most of the shoppers shopped by street cars, and speedier street car service was more necessary than the right to park automobiles indiscriminately.

To prove this contention, the company arranged to make a check of the customers arriving at three prominent downtown stores—one of the largest department stores in the city and two smaller stores. This check showed clearly that for three days less than 5 per cent of the customers of the big department store came by automobile, and on one day the percentage was only a little more than 3 per cent. The result of this survey and other data which the company was able to offer was that the board of directors of the Association of Commerce voted unanimously to reject the report of its own traffic committee and to support the recommendations of the traffic survey as far as possible.

INCREASED EFFICIENCY IN OPERATION

This is the factor mentioned second in the list given. It is obvious that the company's success in gaining public good will in Baltimore would not have been possible without, first, proof of its sincerity in advocacy of the car riders' rights by substantial improvement of its service and, second, frank and vigorous efforts to sell this service in the open market against competition. Proof of improvement in the service is shown by the fact that since September, 1925, a total of 95 more or less obsolete cars have been dropped from the company's equipment, and as a result of an intensive car construction program, coupled with a scientific study of each of the company's 36 lines, there have been:

1. Substitution on one important line of cars seating 47 passengers for cars seating 36 passengers.

2. Substitution of 36-seated cars for 30-seated cars on two important lines.

3. Doubling of the number of 60-passenger trail cars on one important line.

4. Adoption of a system of interline operation during rush hours which the company believes to be unique, resulting in ability to make double use of many cars when most needed, less crowding of riders during peak periods, greater frequency of service, decreases in deadhead or "light" mileage and increases in receipts per car-mile.

Digitized by Google

5. Increases in speed on many lines.

6. Adoption of express service on suburban lines, materially reducing the difficulties presented by requirements for long and short haul service on the same line.

7. Completion of 26 articulated two-car, three-truck trains, a boon during peak hours, since they double the capacity of the lines on which they operate, and are a popular improvement with riders.

8. Greater use and increase in the number of permanently coupled two-car trains, which have proved invaluable, especially for heavy movements to and from places and events that attract crowds.

Of the 95 cars dropped as obsolete, 87 were single-truck closed cars, seating 30 passengers each; one was a single-truck convertible car, seating 28 passengers, and seven were single-truck one-man cars, seating 22 passengers each. In all cases the substitution of bigger cars for smaller ones meant semi-convertible cars with cross seats in place of double-truck closed cars with longitudinal seats. One line on which this was done runs through a territory largely occupied by automobile owners, and the old cars did not attract them, while the new ones did. In the first five months of 1926 this line showed an increase in earnings of 7 per cent over the corresponding period in 1925.

How Greater Speed Has Been Obtained

The adoption of the recommendations in the traffic survey will help to increase the speed of both street cars and automobiles in Baltimore. In the meantime the company has introduced several other changes which help in this direction.

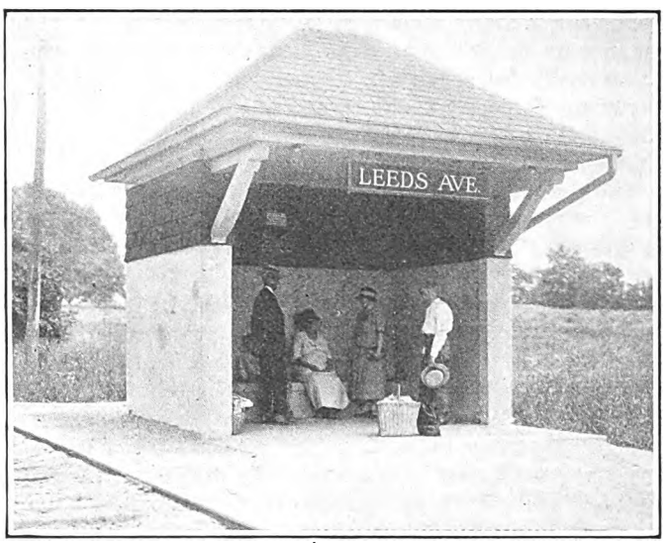
Its service includes that by both single cars and two-car trains, but it was found that during the rush hours the two-car trains, whether made up of motor car and trailer or multiple-unit cars, were slower than the single cars because of the larger number of stops made to receive and discharge passengers. In consequence, a skip-stop plan for these trains was put in effect during rush hours so that the two-car trains were at once put on an equal footing, as regards schedule speed, with the single cars. Decreases in running time resulted, the amount saved on one line between the center of the city and the line's northeastern terminus, a distance of approximately 6 miles, being six minutes. The adoption of the plan only during rush hours seemed to avoid many of the objections to the old-fashioned plan of "skip-stop." In fact, so successful was the change that beginning June 1, 1926, the company has used its "limited stop" plan on three other lines, whose operation was not complicated with the mixture of two-car trains and single cars. In these cases, stops are skipped during rush hours only. Stop poles in Baltimore carry a white circle, as is usual, to identify them, and under the new plan the poles not used during rush hours have a distinctive marking to distinguish them from those where stops are made at all hours.

Sequel to the Traffic Survey

It might be appropriate here to mention briefly the sequel of the extended traffic survey, completed last March and published in abstract in the ELECTRIC RAILWAY JOURNAL for May 22 and May 29, 1926. The opposition against the parking recommendation in this survey, brought by the traffic committee of the Baltimore Association of Commerce, has already been mentioned, but, as explained, this opposition later was withdrawn. Other opposition developed to certain of the rerouting recommendations, and the recommendations as a whole are now being considered by the Public Service Commission. The company is helping to assist in the adoption of the improvements recommended in the survey by stressing its willingness to bear the initial cost of changes in its track required, by the supply of pertinent data and in other ways.

Car Fare Carriers Improve Speed

A small but effective step which has resulted in improving an increasing car speed is the issue of a small metal container to hold the tokens used for fare in Baltimore. These containers have a capacity of fourteen tokens each and are sold with thirteen tokens for $1. They cost the company 4 cents each, and since the token fare is 7½ cents, their price to the public under this plan is 2½ cents. The carriers are well advertised and their help in speeding up the boarding of passengers is considerable. It is expected that this effect will be even more marked as the distribution of carriers increases.



Neat Waiting Stations Have Been Erected for Passengers on Suburban Lines

The number of banks, business houses and stores at

Digitized by Google

which tokens are sold has been increased. There has also been an increase in the number of uniformed men stationed at busy loading corners, theaters, baseball parks and railroad depots, who offer car checks for sale to riders before they board the cars.

CHANGES IN TRANSFER METHODS

Two other methods for increasing the speed of cars adopted during the past year are the elimination of the rule that junction points must be punched on transfers during rush hours and allowing transfer passengers to board their cars at either front or rear doors. When presented at the front doors motormen accept the transfers. Since conductors have ceased to punch junction points on transfers issued during rush hours and have been relieved of much transfer collection, they have been able to shorten the length of passenger stop.

Another gain in speed has been secured by establishing express service on some of the long suburban lines, namely, cars which do not stop on the outbound trip until a certain point has been reached except to receive passengers or inbound beyond a certain point except to discharge passengers. Still another type of "express" service inaugurated last year is known as the "two-fares-as-you-enter" plan on a line that carries many riders well into the second fare zone in the country. On these cars all riders pay both the city fare and the first country fare on entering. This automatically excludes all city riders and leaves these cars to the homegoing suburbanites.

ARTICULATED CARS FOR RUSH-HOUR SERVICE

One of the most popular improvements in the equipment adopted by the company recently is the articulated car—a two-car, three-truck train, motorized throughout. Fourteen cars of this type were constructed during the past year, making a total of 26 now in service, and six more were being built at the company's shop and were to be ready for service in September. Each articuated car seats 87 persons and an account of it, as well as of the multiple-unit train of the company, appeared in the ELECTRIC RAILWAY JOURNAL for April 11, 1925.

The articulated car is operated as a single "pay-as-you-pass" unit, the conductor standing at the front end of the rear half of the unit where he controls all exit doors.

These cars are operated during rush hours on two very heavy traffic lines, and as the schedules on these lines at the extreme peak call for a 3 to 1 ratio or more, there is no waste of cars. The practice followed is for the base crews on certain single cars used during the day to change to the articulated cars as they pass the operating carhouse. This essentially doubles the capacity of the line with no increase in platform men. The single cars turned in by the base crews are then used by the tripper crews, tripling the capacity of the line.

Steam and Electrics Co-operate in Indiana

FREIGHT shipments, both carload and less than carload, are being handled by the Union Traction Company of Indiana between all points on its line and all points on steam railroads south of Louisville, Ky., and the Ohio River, according to F. D. Norviel, general passenger and freight agent for the company. He stated that this means that shipments might be routed by electric railway and reach their destination in from one to four days less time than by an all-steam routing. An example of the fast transit afforded by the interurban line occurred recently when a shipment from Indianapolis was only four days in transit to Atlanta, Ga. According to Mr. Norviel, the electric railway handling to Louisville greatly expedites freight movements between Indiana and the Southern states.

Bus Legislation in Victoria, Australia, Proves Effective

JUST as almost everywhere throughout the world, the arrival of the motor bus in Australia was followed by a weed-like growth and attempts to encroach upon established rail services in preference to developing new areas. In the case of the Melbourne & Metropolitan Tramways Board, the management had been forewarned by its close knowledge of bus and jitney operations in Great Britain and America. Hence less than two years elapsed before effective legislation was secured.

In December, 1923, during the fiscal year ended June 30, 1924, when the board reported losses from wildcat buses, it also secured the right to operate motor buses for "aiding or relieving" traffic on the tramways, in addition to the original right of operating motor buses for "stimulating or developing the traffic of any tramways." This change gave the board the opportunity to discourage wildcat operators and also to start services other than those of the thankless pioneering kind.

At that time the maximum license fee for a bus was about £10; buses paid no road maintenance charges; buses could run over tramway-maintained paving if they chose; nor were they subject to the wage and working conditions imposed on the board as a tramway operator.

These inequalities have been wiped out to a degree by Act 3378 of Dec. 30, 1924, and Act 3439 of Dec. 31, 1925. Buses are now required to pay an average fee of £3 10s. (approximately $17) per seat per annum, yielding about £115 (approximately $558) from a 33-seater. This money goes into the "Metropolitan Roads Fund" for the "Metropolitan Area," which means the city of Melbourne and the vicinity within 8 miles from the corporate limits.

Buses may ply only on routes which are approved by the Minister of Public Works. Such routes are not granted where he considers that adequate tramway or railway facilities exist, or where the roads cannot withstand motor bus traffic. Before deciding upon an application the route is reported upon by an advisory committee of five members, representing the railways, the tramways, the municipalities, the provincial government and the bus proprietors.

The board now operates 56 buses, including those which are used while cable routes are being electrified. Such temporary operation in a wildcat bus territory was inaugurated on Jan. 3, 1925, from the first fleet of 45 buses. These buses pay the prescribed taxation just like those owned by private operators.

By July, 1926, there were only 80 privately owned buses. These compete with the tramways and railways to a very small extent. As the cost of maintaining these buses is increasing, no new ones are being put on the roads. With the present high cost of bus operation and maintenance and the rather strict regulations now in force, it seems certain that in the future the use of the bus in Victoria will be confined to routes and service for which it is especially adapted.

Latest Type Open Car of the Honolulu Rapid Transit Company with Center Aisle Has a Seating Capacity of 56

Railway Prospects Bright in Honolulu

Earnings Are Good and the Operating Ratio Is Low in the Metropolis of the Mid-Pacific—Buses Are Used as Feeders to the Rail Lines —System Dates Back to Grant from the Kingdom of Hawaii

By A. E. Kirk
Assistant Manager Honolulu Rapid Transit Company

IN HONOLULU all classes of the population are street car riders. It is not unusual to see a car carrying Americans, Hawaiians, Japanese, Chinese, Portuguese, Filipinos, Koreans and negroes. No racial distinctions are made, and the various nationalities travel together without friction. Transportation service in this thriving city of 105,000 people is rendered by the Honolulu Rapid Transit Company, which operates some 35 miles of electric railway track and 6.5 miles of bus line. In almost every year since its organization the company has been able to pay its stockholders an 8 per cent dividend.

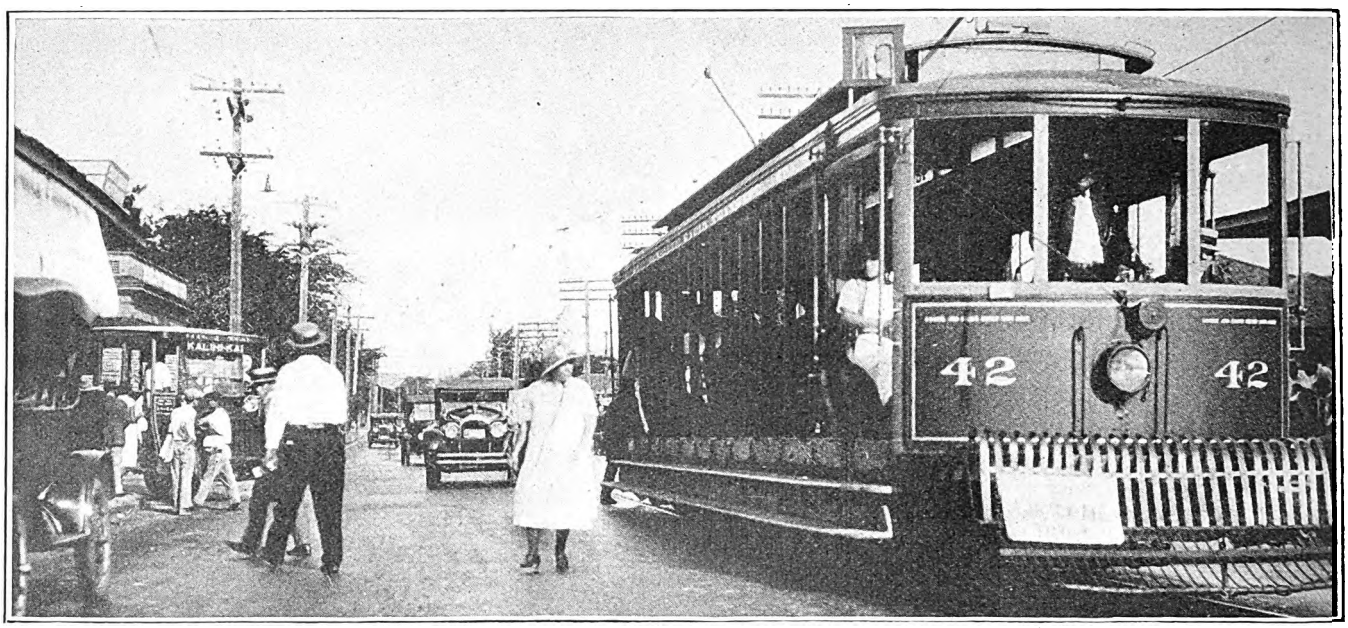
In 1894 the Hawaiian Tramways Company began operation of a horse car system under a franchise granted by the Kingdom of Hawaii. The horse cars were operated on headways of 20 and 30 minutes, which at that time were deemed sufficient. No effort was made to increase the service as the city grew, and in a short time people began to demand some faster and better means of transportation. In 1898 the Legislature granted a franchise to the Honolulu Rapid Transit & Land Company, which began operation of electric cars on Aug. 31, 1901. As the horse car company had rights for the use of all the more important streets, the Rapid Transit Company in 1903 bought out the franchises, property and other interests of the Hawaiian Tramways for $300,000.

Ever since the purchase the company has endeavored to keep pace with the growing community. In 1923 a large improvement program was undertaken. The lines to Waikiki Beach, Kaimuki, Fort Shafter and on Lilliha Street were double tracked, using 122-lb. grooved girder rail. This has made it possible to give better service on these lines and has enabled the company to handle large crowds very expeditiously.

Four years ago the company's name was changed to the Honolulu Rapid Transit Company. A new franchise placed it under jurisdiction of the Public Utilities Commission of Hawaii. Appeals from the decisions of the commission, however, may be taken to the territorial courts. The property was valued at $3,219,000 and capitalized at $2,500,000, all common stock, every share of which is owned in the territory. A return of 8 per cent is allowed by the commission, and until 1924 this was paid regularly. In that year 3 per cent was paid, and in 1925 the dividend was 7 per cent. The Legislature of 1925 abolished the former 2½ per cent tax on gross revenue for a period of four years, with the proviso that an increase in the dividend rate will automatically restore the tax.

Prior to October, 1924, the fare was 5 cents cash and 2½ cents for school children. After the valuation referred to in the preceding paragraph the rate was increased to 7 cents cash, 6¼ cents token, and 3½ cents for

Digitized by Google



Connecting Point of the Kalihi Bus Line and the Fort Shafter Street Car Line

school children. The average fare is now 6.09 cents per revenue passenger. Earnings of the system are 42.28 cents per car-mile, and expenses are 27.72 cents, making the operating ratio 65.55 per cent.

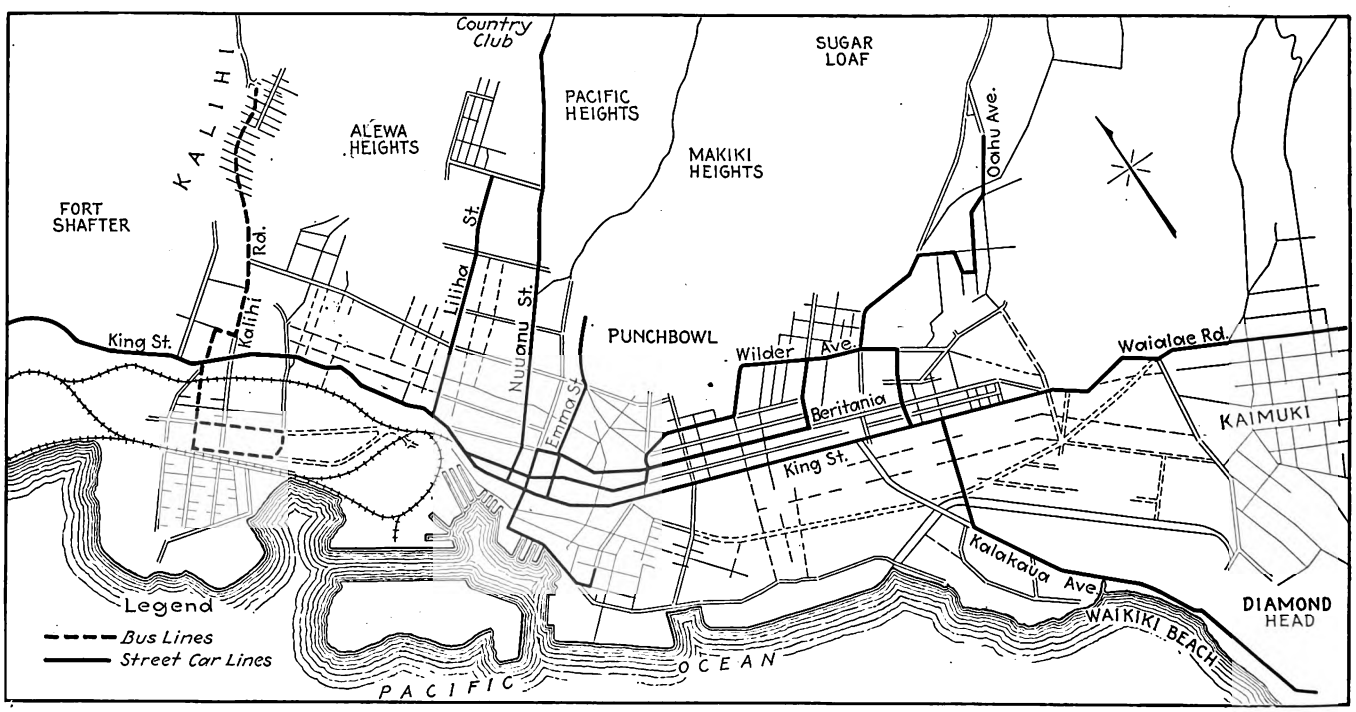
Railway equipment of the Honolulu Rapid Transit Company consists of 71 cars, of which six are semi-closed pay-as-you-enter type, and the remainder are open cars with center aisles, having an average seating capacity of 56. One-man operation is already in effect on one line, and it is expected that this will soon be extended to about half of the system. Bids have been asked for on twelve one-man two-man cars.

For six months in 1915 the company attempted bus operation, but was forced to give it up because of the poor condition of the roads. Packard buses were used at that time. In 1923 bus operation was resumed with Federal buses. Later, a Reo bus was added.

Bus operation was undertaken primarily to give service to outlying districts not reached by the car lines. In 1925 this feeder service netted a profit of $88. The company has carefully considered the bus question and does not contemplate the substitution of buses in place of cars. Future extensions, however, will probably be made with buses, and the feasibility of sightseeing tours is being studied.

Serious operating difficulties are met in some places, as the streets are so narrow that an automobile cannot pass between a parked vehicle and a street car where there is double track. The average schedule speed of cars is 10 m.p.h. and that of the buses 12 m.p.h. The bus operation, however, is outside of the congested district.

Automobiles, of which there are 17,000 in the city of Honolulu alone, have made considerable inroads in the revenue. The number of passengers carried in 1925 was 17,607,737, a decrease of 2,200,000 from the num-



Transportation Needs of Honolulu Are Well Served by 35 Miles of Electric Railway Track and 6.5 Miles of Bus Route

Digitized by Google

ber carried in 1924. The first half of 1926 showed a further decrease. Traffic checks show an average of 1.98 passengers per automobile during rush hours, while the street cars average about 70 passengers. The management believes that the low ebb of traffic has been reached and that an increase may be expected in the near future.

Energetic methods are used by the company to encourage riding. Attractive advertising folders have been prepared and placed on all steamers touching at Honolulu as well as in the tourist hotels. The pamphlets point out the advantages of the street car in reaching various points of interest. When the United States fleet was in port in 1925, more than 20,000 folders were distributed to the sailors. Concessions are made for the convenience of tourists. For example, on days when Canadian Pacific steamships are in port, the company accepts Canadian money at par.

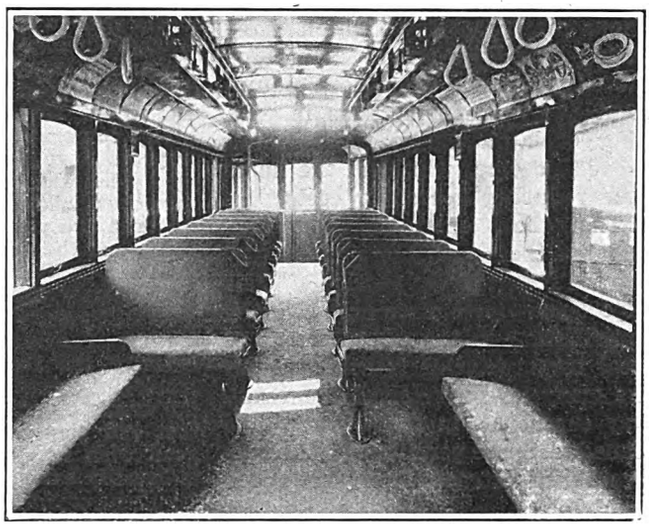
In spite of the large number of automobiles, and the fact that much of the equipment is of the open running board type, the Honolulu Rapid Transit Company has one of the lowest claims and damage ratios in the United States. The amount paid in 1925 was only 1.68 per cent of the gross income. This is the highest it has ever been and may be attributed to the increasing street congestion.

The company has enjoyed remarkable freedom from labor difficulties, in spite of the fact that the employees belong to a wide variety of races, including Americans, Hawaiians, Hawaiian-Chinese, Portuguese and Hawaiian-Japanese. All employees are covered by group life insurance to a maximum of $2,000. Disputes are settled by an employees' council, composed of nine employees from all departments, elected yearly. The employees have a benefit association, to which the company regularly donates substantial sums.

Gratifying evidence of the sound condition of the property is found in a recent report by Richard Sachse and Bruce W. Campbell, consulting engineers, Los Angeles, who made an extensive survey of the system. Their investigations showed a relatively high operating efficiency and a sound and satisfactory financial condition.

Cincinnati Rebuilds Cars for One-Man Operation

AUTOMATIC treadle exits at both front and rear ends are features of a group of single-end cars recently rebuilt by the Cincinnati Street Railway for use on Route 43, operating between the Central Union Railroad Station and the hotel and business district. Full safety and interlocking devices have been installed. Other improvements include electric heaters, window wipers and a new lighting system. The latter consists of twenty frosted lamps so wired that each is independent of the others. Seats are attractively upholstered in washable suede.



Seats of the Rebuilt Car Have Been Upholstered in Washable Suede

Outside the cars are finished in the new standard colors of this company—burning brush orange below the belt rail and locust cream above, applied by the Duco spray process. Bumpers are made of single pieces of pressed steel, and the rear bumper is painted with aluminum for the express purpose of giving increased visibility.

Prominent Executives Commend the New Spirit Annual Convention Issue of

THE Annual Convention Issue of ELECTRIC RAILWAY JOURNAL, dated Sept. 25, was entirely devoted to the subject of "Making Transportation Pay." Most of the articles in this issue were written by executives in charge of the operations on properties which have demonstrated by actual experience the effectiveness of modern equipment and modern methods in winning back patronage through improved service, while at the same time reducing operating costs.

That these operators, who contributed their valuable time to giving the industry the results of their experiences, have made a noteworthy contribution to the advancement of local transportation is evidenced by the many letters received from railway executives in this country and Canada. Space permits only the publication of extracts from these comments.

Harry Reid, president Interstate Public Service Company, writes as follows:

I have read the Annual Convention Issue of ELECTRIC RAILWAY JOURNAL with a great deal of interest and find it contains much advance and comparative news, showing much time and thought had been given to editing.

The articles are varied and interesting. The advertisements are not only attractive but full of up-to-date knowledge. I surely congratulate you upon this issue, and not only this issue but all issues.

From **F. G. Buffe,** vice-president Kansas City Public Service Company, came this letter:

Please accept my hearty congratulations on the excellent Convention Number of the JOURNAL.

Inasmuch as I was unable to attend the convention, it was doubly interesting to me. The advertising pages were exceptionally interesting, and I do not believe I ever saw a better prepared and more attractively designed and printed advertising section in any magazine.

T. H. Tutwiler, president the Memphis Street Railway, comments in part as follows:

It is a pleasure to me to acknowledge the valuable contribution and stimulus to the electric railway industry which your Convention Issue of Sept 25 supplies.

In reading the several pages of editorial matter, as well as the various articles of the issue dwelling upon the value of proper equipment as agencies for promoting street railway traffic, my impulse is quickened by the thought that we should strive the more zealously to make street car riding more attractive; and that, with lines and rolling stock thoroughly modernized, we should seek to merchandise our service through intelligent sales effort.

"Surely," as your opening editorial states, "the road opens ahead" for us; and we of the industry who are so vitally concerned with its success and progress have reason to feel encouraged that the gloomy clouds which have overshadowed our business during the past five years or so are breaking away, and the dawn of a brighter day seems to be at hand.

Your very worthy journal has been a distinct agency in bringing to the attention of executives throughout the industry the facts upon which more successful operation may be based, and the means by which policies looking to that end may be carried out. Every good wish for your continued success is heartily extended.

Arthur W. Brady, receiver Union Traction Company of Indiana, had this to say in part:

I have carefully examined the Convention number of the JOURNAL, just received. It is an unusually valuable one, dealing as fully as it does with what is being done throughout the country to make travel by electric railroad more inviting and at the same time to reduce costs and improve service. The industry is indebted to the JOURNAL for having so thoroughly covered the field.

C. D. Emmons, president the United Railways & Electric Company of Baltimore, says:

I wish to congratulate you on the Annual Convention Number of the ELECTRIC RAILWAY JOURNAL, which I have looked over from cover to cover and find much of interest, not only in the reading matter but in the advertising matter itself. It is a most attractive publication and you are entitled to great credit for it.

A letter from **J. K. Punderford,** president and general manager the Connecticut Company, reads in part:

This issue is particularly useful and informative both in the articles and advertising showing the trend. The JOURNAL staff deserves much credit for its contribution to the industry through this useful publication.

D. W. Pontius, vice-president and general manager Pacific Electric Railway, made this comment in his letter:

There is a great deal of interest to the industry in each issue of your publication, and it appears that the Convention Number contains some particularly good material.

I am unable to offer any suggestion which would be of any assistance in making the JOURNAL a better paper, because my judgment is that you are now furnishing a first-class, up-to-date publication.

F. D. Burpee, vice-president and manager the Ottawa Electric Railway, Ottawa, Canada, writes in part:

I have thoroughly enjoyed the Convention Number of the ELECTRIC RAILWAY JOURNAL. I have taken great pleasure in showing it to several of my friends who have dropped into my office, as an example of how well the street railway industry is looked after by its technical press. I particularly enjoyed the advertising matter. In fact, I am at a loss to suggest any means by which the Convention Number could have been improved. Please accept my sincere congratulations. I am sure I am only one of thousands of street railway men who find the JOURNAL a constant help in their every-day work.

A letter from **H. J. Sheeran,** president New York Railways Corporation, contains this comment:

To my mind this issue is the best and most comprehensive number ever published of this extremely interesting and efficient magazine. The articles, without exception, are splendidly written and well illustrated. That entitled "Surely the Road Opens Ahead" is most encouraging to those of us who have been confronted with varying degrees of adversity in recent years.

We are particularly interested also, at this time, in the comment on better results obtained through the use of up-to-date equipment, as well as in the news pertaining to buses.

Calvin A. Owens, president Florida Interurban Rapid Transit Railway, has this to say about the issue:

Permit me to congratulate you on your latest Annual Convention Issue of the ELECTRIC RAILWAY JOURNAL, which is a real contribution to the industry.

It is unfortunate that in the present era of prosperity constructive organizers are compelled to devote their attention to the subject of "Making Transportation Pay." Your splendid handling of the problem is set forth in a very interesting manner and I have no thought or criticism to add in any connection. I think you are to be congratulated in the amount of support you have secured from the advertisers, as most of their copy is enlightening to the reader, regardless of it being paid space.

Digitized by Google

of the Industry Reflected in the the JOURNAL

A. R. Myers, president Erie Railways, writes as follows:

A copy of the Convention Issue has just come to my attention, and after a hurried perusal I can have nothing but praise for the efforts you have put forth, and the results obtained in building an issue that is not only attractive but filled with inspirational material that should be of great value.

The manufacturers are to be complimented on the ingenuity displayed in the presentation of their message, and I believe this issue could well be filed as a catalog of the products used in the industry.

Letters from many other executives contain similar comments regarding both the articles and advertising in this issue. Excerpts from some of these are printed below:

Walter H. Burke, manager Northern Texas Traction Company:

I want to congratulate you and the members of your staff on the 1926 Convention Issue of the JOURNAL. In my opinion it is the best of the many good issues you have published.

There no longer is much doubt in the minds of transportation men that "modernizing, popularizing and merchandising" offer the way out of the troubles the business has been through in the past ten years. This issue of the JOURNAL, along with the very successful convention at Cleveland, will surely go a long way to give added impetus to this idea.

S. B. Irelan, vice-president and general manager St. Joseph Railway, Light, Heat & Power Company:

Your Annual Convention Number this year of the ELECTRIC RAILWAY JOURNAL is, in our opinion, one of the best issues you have ever put out.

The featuring of the single subject "Making Transportation Pay" and making that the keynote for all of the comments and discussions of the various leaders of the industry in all parts of the country gives recognition to its importance and is impressive.

Today the transportation problem is perhaps in a little more critical state for all medium-sized cities than it is in the larger cities. It is our hope that you will continue to treat of the particular phases of the transportation problem in these cities as well as the larger systems.

R. R. Smith, vice-president and general manager Chicago, South Bend & Northern Indiana Railway:

Each year I look forward with anticipation to the receipt of the Annual Convention Number of the JOURNAL. I have never been disappointed in it.

This year the convention issue is exceptionally interesting and the outstanding problem of the day, "Making Transportation Pay," is presented in a very striking manner. The whole industry is indebted to you for this issue.

H. A. Nicholl, general manager Union Traction Company of Indiana:

This year's issue is a masterpiece and you have certainly handled the subject of "Making Transportation Pay" in an able manner. The men who wrote the various articles for you are all high-class operators and know what they are talking about, and if those executives who are in a position to follow the examples set for them do not take advantage of the situation they are not doing all they should for their properties.

The advertising matter in this issue alone contains a liberal education on electric railway and bus operation.

J. J. Coleman, operating vice-president and general manager Scranton Railway:

You have put out a splendid issue, and I think any railroad man will find his time profitably spent in going over it carefully.

A. C. Spurr, general manager Wheeling Traction Company:

You are certainly to be complimented on the Convention Issue of the ELECTRIC RAILWAY JOURNAL. It is indeed a handbook on making transportation pay and a ray of hope to many of the operators struggling with a collection of antique facilities.

My sincere hope is that you have a large circulation among those financially interested and responsible for street railway transportation.

I have no suggestions to offer on the make-up of the JOURNAL, as I believe you are doing an outstanding work in revivifying an industry that for a time lost its confidence. You are indeed builders of morale.

V. R. Powell, general manager the Peoples Railway:

You are indeed to be complimented on the thorough manner in which the industry is exploited in this Convention Number.

We think so much of the ELECTRIC RAILWAY JOURNAL that we have recently interested our company in buying three additional subscriptions in order that each head of a department may be favored with a free subscription. We find that this is money well spent. With these three additional subscriptions we now have six subscriptions, each department head receiving a separate copy. We find that these are passed out to pivot men and foremen and that they are pretty well worn by the time they are returned for filing, which would indicate that those receiving them were very much interested and took advantage of the opportunity to acquaint themselves with the different angles of the industry in which they are employed.

John F. Collins, vice-president and general manager Michigan Electric Railway:

I think the issue is A-1 in every respect and I greatly enjoyed reading it. I have no suggestions to make regarding improvements.

W. H. Evans, manager of railways East Penn Electric Company:

Your Annual Convention Issue of the ELECTRIC RAILWAY JOURNAL is the best ever. While I have not had time to look at it from cover to cover, I assure you that it has been a great pleasure for me to read several of the articles which appeared in this issue.

It has also been an extreme pleasure to note how well the advertising pages have been prepared, and I wish to congratulate every member of the ELECTRIC RAILWAY JOURNAL staff, as it surely does show that some wonderful work has been done with untiring efforts.

G. W. Comfort, general manager Poughkeepsie & Wappingers Falls Railway:

While I have not as yet had an opportunity of reading this issue over thoroughly, I have glanced through same and herewith wish to compliment you on its compilation. It certainly is an issue which is a real inspiration and deserves commendation.

W. W. Foster, general manager Rochester, Lockport & Buffalo Railroad:

I have received a copy of your Annual Convention Issue and consider it a work of art, and as an ordinary layman can find no fault with it and cannot see where it could be improved, and I wish to congratulate you.

ELECTRIC RAILWAY JOURNAL takes this means of publicly thanking those railway executives who made this issue so successful by contributing of their time to tell the industry the results of their own experiences in "Making Transportation Pay." At the same time the JOURNAL wishes to acknowledge these many letters of friendly comment and to thank its readers for this evidence of interest and co-operation.

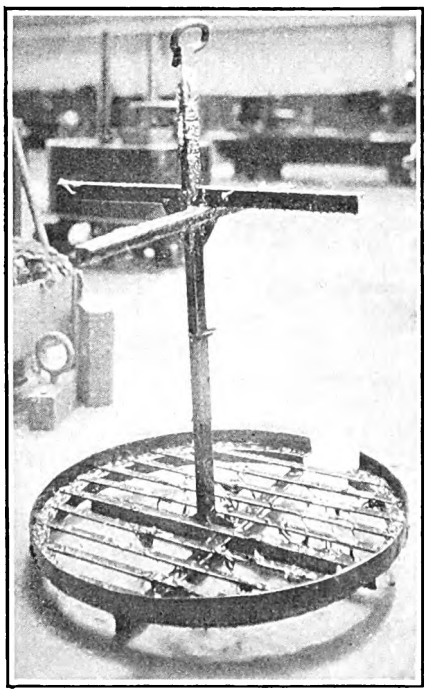
Maintenance Notes

Handy Tree for Dipping Small Coils

VARIOUS devices have been used to facilitate the dipping of a large number of small coils at one time. A device which has been found to work out very successfully in the department of electrical repairs of the Brooklyn-Manhattan Transit Corporation is shown in the accompanying



Field and Other Small Coils Are Dipped Conveniently by Using a Device as Shown

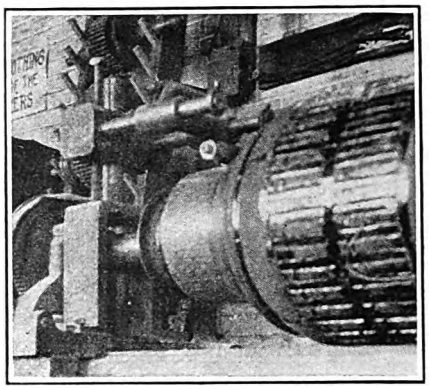
illustration. This consists of a circular base with straps across to support small pieces of equipment and a vertical post with two cross-arms arranged so that coils can be hung on these. The circular bridge is constructed with two 1½-in. x 1½-in. angles as the outside supporting ring. Cross-straps 1 in. wide x ¼ in. thick are riveted to the circular rim. As a further support two 1½-in. x 1½-in. angles are placed underneath and the upright, which is a 2-in. x 2-in. angle, is riveted to this. The cross-arms at the center part of the upright are 1½-in. x 1½-in. angles and are 3 ft. long. The opening in the outside rim of the base, as seen in the illustration, is so that this will fit over a pipe connection inside the tank as the various equipment is being dipped. In ordinary operation coils are hung on the cross-arms and other coils are placed on the bottom circular support. A ring at the top provides for convenient handling with overhead hoist or crane.

The rattle of the armature windings, like the rattle of a snake, should be a warning. "Operators, why not 'dip and bake'?"

Old Lathe Bed Serves as Base for Commutator Slotter

SLOTTING commutators with a home-made apparatus has proved very satisfactory in the shop of the Berkshire Street Railway, Pittsfield, Mass. Possessing an old lathe bed and a small motor of fractional horse-power it was decided to rig up a slotting mechanism which could be adapted to commutators on any of the armature sizes in use by the railway. The motor is accordingly mounted on the wall directly in the rear of the slotter and connected thereto by a flexible shaft which transmits the torque from the motor to the shaft on which the slotter is mounted.

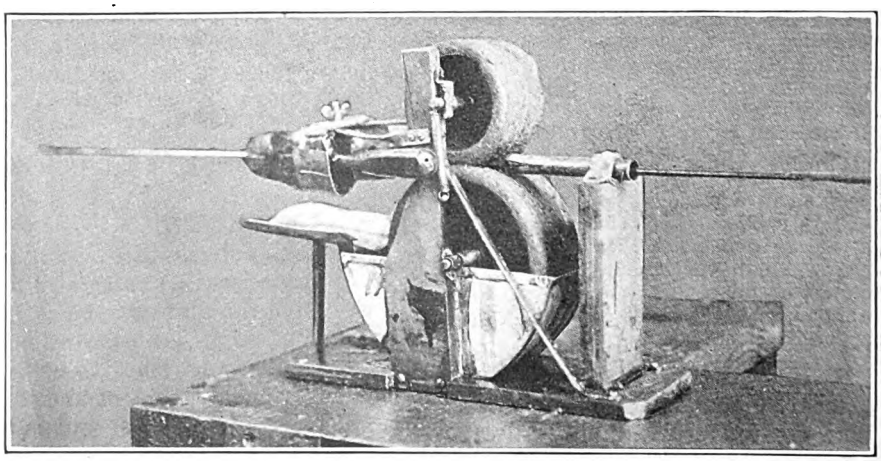
As indicated in the accompanying illustration, both horizontal and vertical adjustment in the slotter may be accomplished, the first by moving the collars on the rods shown above the slotter blade back and forth in a direction parallel to the armature shaft, while the latter is effected by simply raising or lowering the slotter mechanism on the vertical shafts shown directly above the end of the armature shaft. Movement of the slotter is easily controlled and it is possible to slot an entire commutator in a very few moments.



Slotter Is Here Shown Suspended Directly Above a Commutator Which Is Ready for Slotting

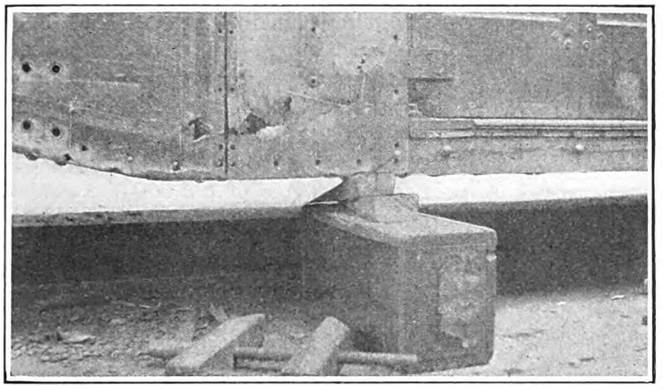
Window Stripping Quickly Varnished in Cleveland

SMALL wood strips used for molding or for holding the glass in place in car windows are quickly stained or varnished by the machine illustrated, which was recently constructed in the Harvard shops of the

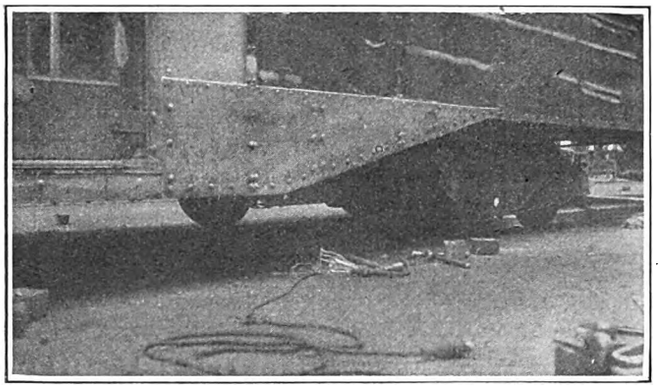


Window Strip Quickly Painted by Machine in Cleveland Railway Shop. Felt-Covered Wheels Cover the Strip with Stain or Varnish as the Material Is Pushed Through

Digitized by Google



This Car Side Has Been Entirely Rusted Through by the Water Encountered in Operation



The Unsightliness of the Rusted Side Is Obviated Through the Use of Steel Plates Similar to the One Pictured Here

Cleveland Railway. The strip to be painted enters through the core of the machine from the right-hand side and passes through two felt-covered wheels, one of which dips in a tank of stain or varnish at the bottom. When the strip emerges from these rolls the paint material is thoroughly rubbed in by the brushes supported on the left in the view. This also removes the surplus material, which drops into the trough below and then runs back into the supply tank.

While the brushes used are of the ordinary commercial type, it is planned to have one specially constructed to do this work.

Repairing Car Sides Which Have Become Badly Rusted

CONSIDERABLE difficulty has been experienced by the Portland Railroad, Portland, Me., with rusting out of steel car sides. Unusually severe water conditions are encountered in Portland and it is also necessary to use a large amount of salt in keeping the switches clear. Thus a continual spray of semi-frozen brine is thrown upon the car sides, particularly between the sills and the car floors. This results in a severe rusting of the steel sheathing from the inside.

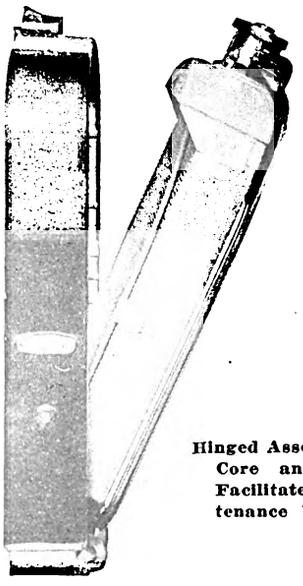
To meet this condition the railway uses four steel plates, similar to the one shown in the right hand illustration, to cover the rusted portions of the car sides. The most serious rusting always occurs near the middle of the car and it is seldom necessary to do more than to add the triangular plates at each side of the center doors. If it is necessary to attach a single plate the three other sides are similarly equipped regardless of the degree of rust at those points. This is done to preserve the general well-balanced appearance of the car. Steel plates of ½ in. to ⅝ in. thickness are used for this purpose.

New Equipment Available

Radiator Core Easily Removable

EXHIBITED on the chassis of the Liberty Motor Vehicle Company at the Cleveland convention was a specially designed Perfex radiator, built by the Racine Radiator Company, Racine, Wis. Several newly developed features were incorporated in the design of this radiator.

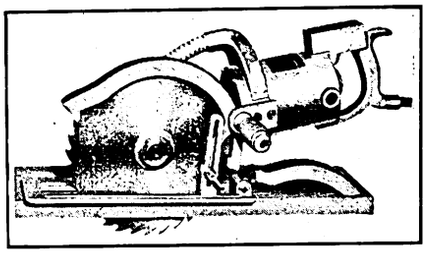
The shell is permanently bolted directly to the dash and fits snugly up against the hood. The core and tank assembly is hinged at the bottom, so that the core may be quickly and easily removed by taking off two nuts at the top and two at the bottom. It is not necessary to disturb the shell at all. Both top and bottom tanks are cast material, built to withstand every vibration and road shock to which a bus might be subjected. The core is a standard bronze unit design used by Perfex. The shell is cast duralumin, polished and enameled to withstand corrosion and wear.



Hinged Assembly of Core and Tank Facilitates Maintenance Work

Convenient Electric Hand Saw

PORTABILITY is the feature of an electric hand saw weighing about 24 lb. that has been brought out by the Wodack Electric Tool Corporation, Chicago, Ill. The motor with which this tool is equipped is sufficiently large to drive an 11-in. circular saw and yet may be operated from the ordinary electric light socket supplying 110 volts. The saw is capable of cutting a 4-in. x 4-in. timber in less than two seconds and is of particular value in doing rough carpentry work where speed is the primary requisite.



This General Utility Power Saw Saves Much Time. It Is Readily Adjustable

The saw is fitted with a depth gage, so that it is necessary only to cut through a timber to the depth required. In addition to regular carpentry work the saw is well adapted, due to the depth gage feature, for use in opening shipping boxes and crates, it being possible to saw the exact depth of the board or box cover, thereby preventing any injury to the contents of the box.

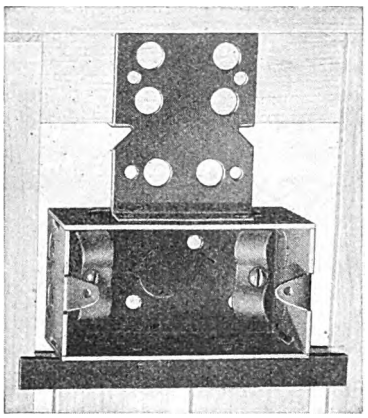
Switch and Receptacle Boxes

FOUR-INCH switch and receptacle boxes, suitable for wall bracket outlets due to their larger size, have been developed by the Chicago Fuse Manufacturing Company, Chicago, Ill. These boxes are obtainable in both the "Gem Locktite" and "Gem Bracket" types.

The Gem 4-in. Locktite box has the same steel supporting bars as the standard boxes of this type developed heretofore. This makes it well adapted for quick, secure mounting. It may be installed in



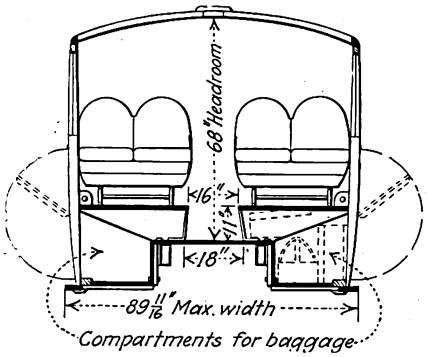
Four-Inch Locktite Box

either the perpendicular or horizontal position and is provided with knockouts for loom, sheathed cable, flexible and rigid conduit. It has a provision for a fixture stud in the bottom of the box.

The 4-in. bracket boxes are similar in design. The bracket attachment makes installation easy and quick, no mounting bars being required. The ears in both these boxes are turned in so that the center distance between the drilled and tapped holes is the same as for standard boxes, and all switch and receptacle plates may be used.

Bus Body with Baggage Compartments Under Seats

CONVENIENCE of entrance, ease of walking down aisle and provision for storage of baggage below the center of gravity of the chassis feature a new intercity bus body the Lang Body Company, Cleveland, Ohio, has just brought out. This provides space so that some 40 pieces of baggage can be carried in receptacles under the seats which are in locked, water-proof and dirt-proof compartments controlled by the operator and easily accessible at all times. The over-all height of this



Cross-Section Showing Compartments for Baggage and Seating Arrangement

bus is less than that of similar bodies with baggage racks, and this construction insures a comfortable seat in all positions of the bus with a clear and pleasing road vision.

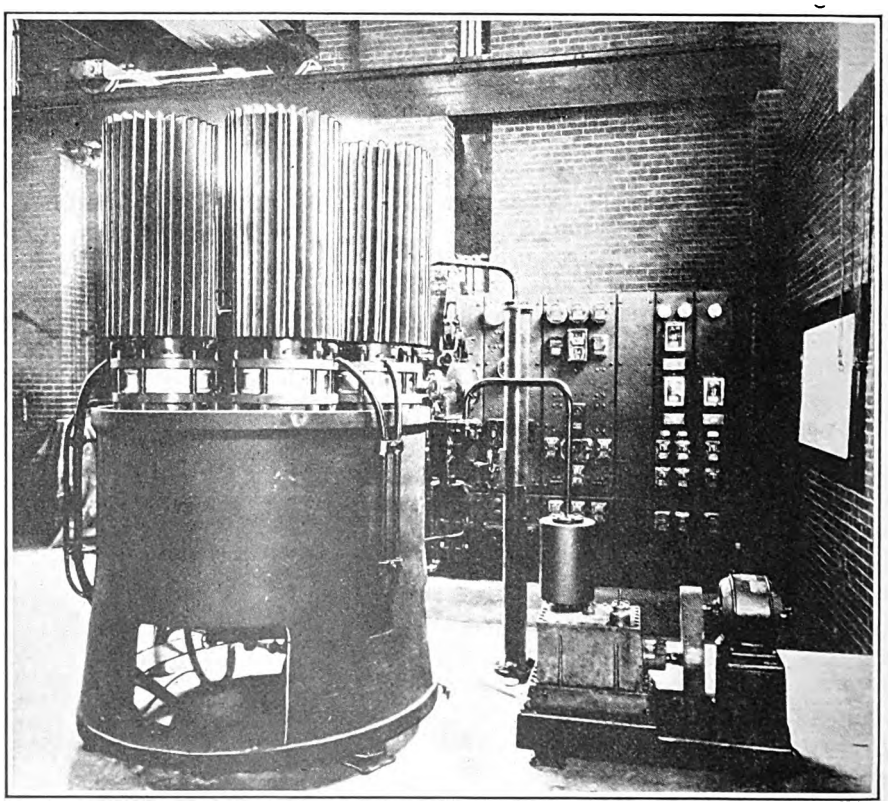
The body has been built for and is mounted on a new Mack AL six-cylinder chassis.

Another Type of Mercury-Arc Rectifier

THE appearance of a new design of mercury-arc rectifier in the booth of the Westinghouse Electric & Manufacturing Company at the Cleveland convention marks the first time that this company has put forward this equipment to the industry. The design of the Westinghouse company in outward appearance resembles those of other manufacturers of arc rectifiers. It operates on the same principle as the glass mercury-arc rectifiers which have been used for battery charging and similar applications for a number of years. The inner steel tank is vacuum tight and capable of retaining a degree of vacuum of 1/1,000,000 atmosphere. Vacuum pumps and gages form a part of the equipment.

The unit shown in the Cleveland exhibit was an exact duplicate of the unit which has been placed in service in substation No. 16 of the Cleveland Railway, as shown in the accompanying illustration. Rectifiers of this design are commercially practicable for power conversion for voltages of 500 d.c. and over and for currents of 500 amp. or greater. They are thus particularly practicable for railway service. The same unit can also be applied for a wide range of voltage applications when used with the proper ratios of transformers. The current capacity decreases slightly with higher voltages, but the efficiency raises as the voltage increases.

The rectifier holds some advantages over the synchronous converter, such as improved full load efficiency, correspondingly higher efficiencies at low loads and the absence of moving parts except in the motor-driven pump, which is operated intermittently. The lighter weight of the rectifier generally will permit economies in substation construction.



Mercury-Arc Power Rectifier in Service in Substation No. 16 of the Cleveland Railway

Association News and Discussions

Utility Commissioners Meet Nov. 9-12

WILLIAM A. PRENDERGAST, chairman New York Public Service Commission, will deliver one of the principal addresses at the 38th annual convention of the National Association of Railroad and Utilities Commissioners, to be held at Asheville, N. C. Mr. Prendergast is chairman of the association's public utility rates committee, and in addition to delivering an address to the convention will submit the report of his committee. Regulation of interstate motor vehicle carriers will be one of the chief topics of discussion at the convention this year. Water power and its regulation, which, when the association was formed, was considered far beyond its jurisdiction, also will be a leading topic for the consideration of the convention.

The convention will last from Tuesday, Nov. 9, until Friday, Nov. 12. There will be special addresses by Commissioner John J. Esch of the Interstate Commerce Commission, M. H. Aylesworth, former chairman of the Public Utilities Commission of Colorado; John A. Small, president of the National Rivers and Harbors Congress; Alexander Forward, formerly a member of the Virginia Corporation Commission; C. C. McChord, former chairman of the Interstate Commerce Commission, who will speak on the subject of "Regulation of Interstate Motor Vehicle Carriers"; Edward W. Bemis, public utility expert of Chicago, and H. A. McKeown, K. C., chief commissioner of the Board of Railway Commissioners for Canada, who will speak on the subject of "Regulation in Canada."

The convention sessions will be held at the Battery Park Hotel, which is also to be the headquarters of the association.

S.A.E. to Discuss Bus and Truck at Meeting Nov. 16-18

TRANSPORTATION — the latest methods of passenger and freight carriage by motor—will be delineated in the national meeting of the Society of Automotive Engineers to be held on Nov. 16-18 in Boston, Mass., at the Copley Plaza Hotel.

The meeting will be divided into five technical sessions, at which some of the most interesting subjects to railway men will be the presentation of the following: "Economics of Co-ordination of the Railroads and Highways" by W. J. Cunningham, professor of transportation of the Graduate School of Business Administration of Harvard University; "Motor Coach and Railroad Operation, Co-ordinated" by A. P. Russell, president of the New England Transportation Company of Boston; and "Economics of Motor Vehicle Transportation Correlated with Steam and Electric Railroads" by G. L. Wilson of the Wharton School of Finance and Commerce of the University of Pennsylvania.

Another session will be devoted to freight handling. F. I. Hardy, assistant to the chairman of the executive committee Boston & Maine Railroad, will discuss "Co-ordination of Railroad and Trucking Operations." W. P. Kellett, consulting engineer of Brantford, Ontario, will talk on the "Co-ordination of the Container with Rail and Road Transportation Facilities." At the motor coach and truck operation session, G. T. Seely, vice-president of the Chicago Motor Coach Company, will talk on "Modern Motor Coach Operation."

American Association News

Committee on Education Urges Co-operation

EDUCATIONAL directors of electric railway properties are urged to cooperate with the committee on education of the American Electric Railway Association by sending in their names to Edward Dana, the newly-appointed chairman of this committee, who is compiling a directory of such data. In order that every railway company may be represented in this new compilation, this information is requested promptly.

Replies should be directed to Edward Dana, general manager Boston Elevated Railway, Boston, Mass. Information is desired in the following form: name of director, name of company, address, title of director.

Public Service Section Opens Season

WITH more than 400 railway men of New Jersey attending, the Public Service company section of the American Electric Railway Association held its first fall meeting Oct. 21 in the auditorium of the Montgomery Street carhouse in Jersey City. The A.E.R.A. members were the guests of the Boosters Club, a get-together organization of railway men in the Hudson Division of Public Service. Robert Hoos, president of the Jersey City Chamber of Commerce; Joseph F. Autenreith, president of the State Board of Public Utility Commissioners, and Edmund W. Wakelee, vice-president in charge of law, Public Service Corporation, were the speakers.

David Alberts, president of the Boosters Club, opened the meeting and then turned it over to A. T. Warner, president of the company section, who presided and introduced the speakers.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Nov. 5—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p. m.

Nov. 9-12 — National Association of Railroad and Utilities Commissioners, annual convention, Battery Park Hotel, Asheville, N. C.

Nov. 16-18—Society of Automotive Engineers, National Transportation and Service Meeting, Boston, Mass.

Nov. 17-18—Iowa Electric Railway Association, operating and maintenance section, annual convention, Fontanelle Hotel, Omaha, Neb.

Nov. 17-18—Central Electric Traffic Association, regular meeting, Fort Wayne, Ind., Keenan Hotel, 9 a. m.

Dec. 6-9 — American Society of Mechanical Engineers, annual meeting, New York City, Engineering Societies Building.

Metropolitan Section to Continue Activities

RELATIONSHIP between transportation and community development will be the subject of discussion at the second meeting of the season of the Metropolitan Section, A.E.R.A., to be held Friday, Nov. 5, at the Engineering Societies Building at 8 p.m. A Dutch treat dinner will be held at 6 o'clock at Friedlander's restaurant, on 39th Street opposite the meeting place.

The program for the evening includes addresses by L. S. Miller, president New York, Westchester & Boston Railroad, on "Team Work Between Transportation Companies and the Communities They Serve," and C. S. Ching, supervisor of industrial relations United States Rubber Company, on "The Transportation Man in Civic Affairs." High spots of the Cleveland convention will be the subject of remarks by Guy C. Hecker. Officers for the ensuing year will be elected at this meeting. The usual entertainment features will be part of the evening program.

Helpful Hints on Electric Railway Advertising

ELECTRIC railway men interested in advertising may get helpful suggestions from the 2,000 ideas presented in a looseleaf folder prepared by Labert St. Clair, director of advertising of the American Electric Railway Association. Complimentary copies of this booklet are available to each member company upon request. Non-member companies may receive them upon payment of a small fee. Mr. St. Clair points out that there are enough definite advertising suggestions in this compilation to last the average company at least five years.

The News of the Industry

Franchise Discussion Renewed in Kansas City

About 50 petitions for a referendum on the extension of the present railway franchise were placed in circulation in Kansas City, Mo., on Oct. 22.

This action was started to nullify the approval by the City Council of an ordinance extending the present franchise for a period of twelve years in favor of the Kansas City Public Service Company, the successor under foreclosure to the Kansas City Railways.

The petitions, to become effective, must bear something over 12,000 signatures of voters.

In the meantime, a committee of the Council appointed to consider plans for an entirely new franchise is meeting at intervals with William G. Woolfolk, president of the new company, or with his representatives, in an effort to complete the tentative draft of the new franchise document within the next 30 days, if possible.

Chicago Traction Ordinance May Be Made Political Issue

The first real indication that a political issue will probably be made of the pending traction ordinance in Chicago came to light at a conference on Oct. 20 between the City Council and Chicago Surface Lines officials. Patrick J. Lucey, attorney for the Chicago Rapid Transit Company, insisted that the home rule provision in the proposed franchise be dropped.

"The traction referendum is coming very near a mayoralty election, and if we drop the home rule feature it will be the issue of every candidate for Mayor and the Council," Alderman Jacob Arvey explained to the elevated lines' representative.

Asked by other Aldermen if he thought any ordinance would be passed if it left control of the transportation companies with the Illinois Commerce Commission, Mr. Lucey replied that, in his opinion, local regulation was passing and the public did not care so much about who runs the street cars as it did about good service.

D. S. McKinlay, chairman of the traction sub-committee of the City Council, declared that the city was approaching a settlement by agreeing to a terminable permit. He believed, however, that the provision for home rule by a city commission must be adopted in the ordinance in spite of the risk that the Legislature may fail to pass enabling legislation and so nullify it.

At another meeting, on Oct. 22, Leonard A. Busby, president of the Chicago City Railway, submitted figures showing that the companies have spent $1,700,000 in the twelve years ended Jan. 31, 1926, for track changes due to street widenings and regradings. He held this to be an unjust burden on the car rider.

Corporation Counsel Francis X. Busch held, on the contrary, that it should be retained in the ordinance. If the division of costs is left to the courts, he said, the resultant legal red tape would jeopardize all future street improvements.

In the new ordinance, a draft of which is now being prepared by Mr. Busch, two controversial points are to be left open, namely, the evaluation of the systems and the amount to be allotted for maximum capital expenditures.

Eight-Cent Cash Fare in Duluth

Litigation between the Duluth Street Railway, Duluth, Minn., and the city of Duluth took on a new turn recently when the Minnesota Railroad and Warehouse Commission issued an order increasing fares in Duluth from 6 cents straight to a cash fare of 8 cents with the option of purchasing tokens good for one ride at the rate of five for 35 cents.

The fight for an increased fare on the part of the company began in 1921 when it sought to boost a 5-cent fare to 6 cents. The Railroad and Warehouse Commission granted the 6-cent fare, but provided that if tickets were purchased the rate should be five rides for 25 cents. The company obtained an injunction from the federal court against the enforcement of that portion of the order which called for a 5-cent rate for five rides. The appeal of the city and the state from the decision of the federal court is now pending in the United States Supreme Court.

Cleveland Welcomes Its New Traction Chief

The directors of the Cleveland Railway chose the logical man to succeed the late John J. Stanley as president—logical not so much because Joseph H. Alexander was next in line for the office as because the new chief by character, training and hard experience had specifically fitted himself for it. Both in private practice of his engineering skill and in war service Alexander has shown his ability to handle the kind of problems that the directorate now give him to solve.

With Stanley passed the old régime in local transportation. The new comes in with Alexander. The late president, climbing by the ladder of hard knocks, made himself a figure in the community. His successor, with more training on the technical side, has an even better opportunity. Cleveland welcomes the new traction chief.—*Cleveland Plain Dealer.*

Five-Cent Fare Referendum Barred in New York

The proposed referendum on a 5-cent fare cannot go on the ballot in the coming New York City election on Nov. 2. The Court of Appeals so decided in an opinion handed down on Oct. 22. This decision reversed the opinion of the lower courts.

The 5-cent fare referendum was adopted as a local law by the Municipal Assembly under the city home rule law and signed by Mayor Hylan on Sept. 17, 1925. The local law made it illegal for the Board of Estimate to authorize or effect any change in rapid transit contracts for the purpose of increasing the fare above 5 cents, or to grant any bonus or subsidy, or to consider such a proposal until after it had been submitted to the voters upon a referendum and had been approved by a majority.

The law also provided that such a referendum could not be submitted to the voters unless a petition had been filed signed by 15 per cent of the voters at the last previous state election.

It had been hoped to place such a referendum before the voters at the 1925 elections, but Frank J. McCabe, a taxpayer, the relator in the suit just decided, brought a similar action in 1925 for the same purpose and the court decided there were not the required 90 days between the date of the passage of the referendum resolution by the Municipal Assembly on Sept. 17, 1925, and election.

The latest action was an application for an injunction restraining the Board of Elections from submitting the proposed referendum to the voters at the coming election.

Birmingham Goes After Coffin Award

Officers of the Birmingham Electric Company, Birmingham, Ala., through the *Buzzer* announce the impression made upon them by the exhibits at the recent convention of the American Electric Railway Association of the railway companies which competed for the Charles A. Coffin award, won by the Pennsylvania-Ohio Electric Company. H. E. Cox, assistant general manager at Birmingham, states that the existence of cordial relations with employees, public and management went far in aiding the company to win the honor of being the most distinguished contributor to the industry in 1925-26.

Mr. Cox recommends a union of efforts in Birmingham in co-ordinated teamwork so that next year the record of the Birmingham Electric Company will be foremost among the competing companies. He urges all alike to make a good job of it and thereby help to win the Coffin award.

Mass Carriers Found Supreme in Chicago "Loop" Traffic Check

In a report following a ten months study of street traffic conditions recently completed by Miller McCormick, director of the Albert Russel Erskine Bureau for Traffic Research, and submitted on Sept. 24 to the Chicago Association of Commerce it established that the downtown streets of Chicago carry 846,753 persons and 314,610 vehicles on an average week day, a greater traffic density than in any other city in the United States.

This congestion is made worse, Mr. McCormick points out, by horse and buggy parking practices, a lack of wide streets and high speed arteries, too much jaywalking, and archaic traffic laws.

In co-operation with the department stores, banks, restaurants, and other business institutions, a cordon count of the "loop" district was made last June. More than 96,000 shoppers were interviewed on a typical week day to secure information on the transportation which these store visitors utilized in coming to the "loop." The check-up showed that only 8 per cent drove their cars into the central business district and a bare 1.57 per cent left their cars at the curb to add to the disastrous street conditions which now prevail in the "loop." In other words, the practice of parking accommodates only 15 out of every 1,000 shoppers, while the overwhelming majority of 985 are, as a result, jammed at street intersections, delayed on street cars and buses and otherwise so discommoded as to drive them to the neighborhood stores.

In no loop business house did the percentage of car-parking patrons exceed 3.2 per cent, said Mr. McCormick, in commenting on the talley. He said:

> From this study the conclusion is warranted that curb parking is not supplying a considerable part of the patronage of business houses in downtown Chicago. As a matter of fact, interviews with 96,082 patrons show that more than 19 per cent came to the "loop" on suburban trains, 33.8 per cent on elevated trains, 26.2 per cent on street cars, 11.4 per cent on buses, and slightly more than 1 per cent arrived in taxicabs. From these figures it will be seen that the largest feeders of loop patronage are the mass carriers and not private automobiles.

Among the recommendations for relief which the Association of Commerce contemplates making to the City Council as a result of this $50,000 traffic survey are drastic curtailments in, if not entire elimination of, parking, new arteries, more light controls and other traffic regulations.

Seattle Recommendations to Become Effective

Mayor Bertha K. Landes of Seattle, Wash., has instructed David W. Henderson, superintendent of the Seattle Municipal Street Railway, to put into effect, as soon as practicable, recommendations in the Jackson street railway report which it has been estimated will result in reducing expenses approximately $100,000 a year. The report was prepared by Clark R. Jackson, superintendent of utilities, and deals mainly with elimination or curtailment of shuttle car service. No conclusion has been reached, the Mayor said, regarding the proposal to establish a loop system, the chief recommendation in the report, which it is estimated would save $500,000 a year. The Mayor states that more time will be devoted to a study of the loop plan, and that while it might not be possible to adopt the proposed program in its entirety, it may be used as a working basis in making changes that would materially reduce operating costs.

Kansas City Valuation Discussed

Approximately a $25,000,000 Price Put on Properties by Dean Riggs—Service-at-Cost Plan Recommended

Dean H. E. Riggs of the University of Michigan, appearing on Oct. 22 before the special Council committee at Kansas City, Mo., placed the value of the properties of the Kansas City Public Service Company at approximately $25,000,000. He said that if Kansas property of the local company were to be included the valuation should be set at $28,000,000.

Having valued the railways property for the federal court in 1925, Dean Riggs was invited to appear at the committee meeting. He said that he had not been in touch with the property for several months and that he had been admonished by the federal court not to state his personal opinion of the valuation of the property, but to consider the situation from all angles, submitting reports of valuations based on the various theories used by engineers in making previous valuations.

Mr. Riggs pointed out that while his report had been submitted to the court in August, 1925, it was based on the value of the property as of Dec. 31, 1924, and that he was not in a position to discuss the matter of property additions since Jan. 1, 1925.

The valuation at that time, made on bases of historic cost at the time of initial investment, cost of reproduction at the latter date and on various intermediate bases, ranged from $24,216,884 to $48,985,402 for property in Missouri only.

In replying to a question as to what valuation he would suggest be written into the new franchise at this time, Mr. Riggs said:

> For these negotiations the figure would lie between $20,500,000 and $34,500,000, or about $25,000,000 to $26,000,000 for rate-making purposes. This includes only the property in Missouri, but as this will have to carry the burden of the property in Kansas, that also should be taken into consideration. In that event, I would place the value at somewhere in the vicinity of $28,000,000.
>
> If the property in Missouri is put into good shape it should be able to carry a valuation figure of about $25,000,000.

Professor Riggs recommended the service-at-cost plan as beneficial in arranging a new franchise grant. He expressed himself averse to the indirect taxation features of the present Kansas City franchise, providing for the paving between car tracks and the payment for use of viaducts and for street cleaning by the operating company. He intimated the exclusion of such demands in the new franchise might tend to reduce fares under a service-at-cost plan.

An ordinance which excluded these provisions from the franchise was killed by the local Council previous to the passage of the twelve-year extension of the present franchise. At the time the view was expressed that the operating company should continue to pay such assessments or charges.

Dean Riggs warned that to fix the valuation of the property at a figure too high would, in his opinion, merely cause the company to revert to receivership at some later date. He thought a minimum return of 8 per cent fair.

William G. Woolfolk, president of the Kansas City Public Service Company, and Timothy F. Mullins of Chicago represented the new company at the hearing. Mr. Mullins was appearing in the absence of Bennet C. Clark, who was ill in St. Louis at the time.

The committee meeting was adjourned until Oct. 28.

More Antiquated Cars Burned

Ten obsolete cars of the Key System Transit Company, Oakland, Cal., have been burned on the Key Mole and 31 more are to follow. These cars have been replaced by an equal number of modern type on the lines of the system. They were removed from active service some time ago.

The metal parts, motors, headlights and other useful portions were removed before the cars were towed to the Keel station on the mole, where the torch was applied. Thousands of people watched the unusual sight of the burning vehicles. As the cars were towed to their final destination on their own wheels wreckers tipped them off into the marsh where they were burned one after another.

No ceremony attached to the cremation, but one enterprising East Bay newspaper took movies that were later shown at an Oakland theater.

Increase in Fare Asked in St. Louis

Early action is expected by the Missouri Public Service Commission on the application of Receiver Rolla Wells of the United Railways, St. Louis, for permission to raise fares from 7 cents pending an audit of the company's books. This latest application for higher fares does not stipulate the rate desired, but suggests a rate that will enable the company to meet operating expenses and pay a fair return on at least the 1919 valuation.

Receiver Wells filed his application on Oct. 23. He asserted that since June, when the company filed a prior application for an increase in fares to 8 cents, or two tokens for 15 cents, the company has lost $506,000 and that revenue will fall about $116,000 short of expenses of operations each month the present fare of 7 cents is continued.

The new petition further sets forth that in 1925 the company earned less than 5.2 per cent on the valuation of $51,781,348 as of Jan. 1, 1919, fixed by the commission, and that since that time $4,948,787 had been spent for additions and betterments. For the year ended on Aug. 31, 1926, the railway system earned less than 5.4 per cent on the 1919 valuation.

Mayor Victor J. Miller and other city

Digitized by Google

officials are expected to oppose any immediate increase in fare. When the application was filed last June the city insisted that the commission defer hearings on the petition until an audit had been made of the company's books. The request was also made that the accounts of the city and county lines be separated.

Recently Mayor Miller is said to have informed company officials that he would not consent to an immediate increase in fares even of a temporary nature, but would insist on delay until the audit had been completed. Auditors of the state commission are now at work on the company's books.

It has been the policy of the commission to grant temporary relief where losses are apparent.

St. Petersburg Road Up to Date

Small Municipal Line a Model, but Is Run at Loss—Large Sums Spent on Improvements—Bus Lines Supplementing Railway Service

ST. PETERSBURG'S railway system has entered the eighth year of public ownership under supervision of Director R. E. Ludwig, head of the public utilities department. Additional improvements in the plant, rolling stock, rail extensions and general equipment, authorized in the sum of $400,000 by the bond issue voted last fall, are now under contract and construction.

During the seven years that the railway has been under municipal operation the receipts have amounted to $1,410,236. The record of receipts follows:

1919-20	$89,302
1920-21	127,628
1921-22	151,582
1922-23	179,114
1923-24	218,570
1924-25	270,819
1925-26	373,218

During the last fiscal year, ended June 30, 1926, the railway showed operating profits of $54,397, an income of $373,218 and assets of $855,477, but an actual net loss of $19,405 was caused as the result of costs of extensions and improvements and deductions for interest on bonds which amounted to $73,803.

Details of New Bond Issues

At the original sale of the old lines, the St. Petersburg & Gulf Railway was taken over for $165,000 by a group of Northern capitalists who held mortgages on the property amounting to $250,000. Under an agreement with an option to purchase, the city of St. Petersburg began operation of the lines July 1, 1919. By a vote of 350 to 103 on a referendum election, citizens authorized a bond issue of $250,000 for the purchase of the railways Aug. 30 of that year. They bought eight street cars, four of which are still in use as work and repair cars, and lines to Gulfport, the Jungle, Big Bayou and the North Shore, with cars operating on a two-hour schedule, compared with the ten and twenty minute schedules now adopted. Of the original bond issue voted for the purchase and reconstruction, $22,000 was devoted to equipment, $28,500 for repairs to roadbed and tracks and $175,000 for the right and title to the old railway.

During the first five months of operation by the city, other bond issues totaling $480,000 were voted for the purchase of rolling stock, construction of extensions, double tracking and general improvements. Since that time many other improvements and extensions have been made.

All general improvements and operation of the railways have been handled as direct charges against revenue funds without taxes and with no increase in the fare of 5 cents. In addition the municipal railways division of the public utilities has provided for a sinking fund, depreciation charges and interest on bonds.

Provision for further improvements in the local municipal railways system were made in a bond issue voted last November which authorized an expenditure of approximately $400,000. Much of the work has already been completed, while the balance is either in the course of construction at this time, as at the new carhouse adjacent to Ninth Avenue north, or in preparation under specifications now being drawn up.

The new improvements include:

The purchase of eight double-truck cars, $100,000.

Reconstruction and extension of tracks, including special work and passing tracks for necessary improvement of schedules, replacement of light rails by heavier, $19,650.

Extension on Ninth Avenue north, $59,230.

Erection of carhouse, including paint shop and offices, together with repair pits and equipment, $105,284.

Construction of track from Ninth Street north to shops, $55,739.

Tracks in yard at carhouse for material storage and track usage, $31,977.

Extension of tracks to create a loop up First Avenue north to Ninth Street, $15,000.

In addition to the amounts voted for actual railway improvements $235,000 was allowed for the purchase and installation of two new units at the municipal power plant.

During the last three months the transportation system has been supplemented with two lines of buses operating eight 21-passenger coaches north and south through the main traffic lanes of the city not reached by the electric cars.

The railway as now run comprises 27 miles of line.

Railway Seeks to Justify Refunds

A special hearing was held at Kansas City, Mo., on Oct. 16 before three federal judges on the application recently filed by the receivers of the Southwest Missouri Railway, Joplin, Mo., for a restraining order to prevent the Interstate Commerce Commission from enforcing its order issued against the company last August.

The commission's order forbade the receivers of the railway paying fees to truckers hauling ore from mines to the cars of the company. The commission in issuing the discontinuance order contended that the payment of such fees amounted to a rebate to the mines of a portion of the freight charges, a practice forbidden by the commission.

The receivers of the railway contend that payment of the fees in question is necessary to the prosperity of the road, much of the revenue of which comes from ore shipped from lead and zinc mines in Missouri, Oklahoma and Kansas.

"Two-Bit" Football Tickets for Pittsburgh's Sixteens

What does it matter that the day of the 5-cent shave has gone forever, when a new era has dawned in 25-cent football games. In Pittsburgh, boys and girls who are sweet sixteen and proud possessors of quarters are sitting on top of the world, namely, Forbes Field, yelling

PI-TT-PITT
PI-Double T
PITT

While Baltimore debates over the propriety of donning spats to welcome a queen, New York shakes the greasy hand of its latest aquatic marvel and Philadelphia cogitates the practicability of a 1927 Sesqui, Pittsburgh has suffered the little children to come unto it and they have found the Kingdom of Heaven. Their good fortune came about through a plan developed by the Pittsburgh Railways, the Pittsburgh *Post*, the University of Pittsburgh and the Carnegie Institute of Technology to make the school-less Saturday a real holiday. The idea embraced transportation to the football games and back home, as well as admission into the huge athletic bowl reserved for their exclusive use, and all this for 25 cents.

The special football-street car pass is good on all lines of the Pittsburgh Railways except the interurban lines (Washington and Charleroi) between the hours of 1 p.m. and 6.30 p.m. on Saturdays. It is available at all offices and news agencies of the *Chronicle Telegraph*, the Pittsburgh Railways' 30 ticket agencies and the Equitable Sales Company offices. More than 3,500 youngsters swamped offices to procure combination pass and admission tickets for the Tech-Adrian game on Oct. 9. These grid fans swelled the receipts of the Pittsburgh Railways by $450. On Oct. 16, when the University of Pittsburgh played Colgate, it is estimated that the youthful fans turned in $800 to the local property. On this day the usual "kick-off" thrill was enhanced by the assigning of a corp of special cheer leaders recruited from the university staff to the children's sections. Records do not show how many of the youthful spectators decided on that day just what their life work would be, but judging by their enthusiasm for the art of cheering and their ability to translate their ardor into husky yells the universities will not lack for any such boosters when a few more autumn solstices come around.

Pitt Stadium will again welcome the juvenile members of the Post Athletic Club on Oct. 30, when Pitt meets Westminster, and again on Nov. 11, for the Tech-Juniata game, proving that in Pittsburgh, anyway, at least four thrills come in a lifetime. Of course, the same reservations hold good—you must be still sixteen if not sweet, and you must have that good old quarter or five nickels.

Through British Eyes

A Recent Interested Observer of American Affairs Was Mr. Bellamy of Hongkong

L. C. F. Bellamy, a delegate from Hongkong to the convention in Cleveland, took advantage of his trip to the United States to visit a number of properties other than that at Cleveland. From Cleveland he went to Philadelphia to study co-ordinated transit, but more particularly to study the trackless trolley line in that city. There is agitation at Hongkong for transportation by bus, but Mr. Bellamy does not look with sympathy on that vehicle for use there. Many difficulties would attend the operation of gasoline passenger vehicles in public hire there, but the principal objection to the use of the bus is on the basis of the cost of petrol. The price of this fuel in Hongkong is about three times the price in England, and that price, as is well known, is much more than the price in the United States.

On the other hand, Mr. Bellamy is not completely sold on the trackless trolley, but he favors that form of transport under the conditions at Kongkong, and he may so report to his directors. His visit to the United States is a flying one and before the end of the month he expected to be on his way across the Pacific. His plan was to stop in Chicago to watch again the operation of the system there, but he did not intend to visit New York, in which conditions on transport are regarded by him to be abnormal—abnormal in that they do not represent average conditions.

Mr. Bellamy is very well informed on American political conditions, both national and local, and manifested the Briton's natural curiosity about the effectiveness of prohibition enforcement with all its anomalies. As a boy he visited the United States with his father, who was then a British municipal tramway operator, but he remembers distinctly that at a meeting at that time at which his father spoke surprise was manifested that politics was not allowed to enter into consideration in the operation of the municipal undertaking. He is interested in the operation of the Detroit and Seattle municipal systems, and was curious to know how such operation, unusual in the United States, was working out.

He was greatly impressed with the exhibits at Cleveland, particularly the car exhibit, and he carried away with him many new thoughts on modernization. Of course, modernization is with him more an economic study than an actual problem, but he is not without economic problems, although the making of money is not one of them. His system has no securities outstanding except common, or ordinary shares, as the English say, and last year paid a dividend of 20 per cent. The operating ratio at Hongkong is much less than 50 per cent. The platform labor problem does not bother him much. but about a year ago, at the time of the Hongkong uprising, he was required to recruit a new operating force. Along these lines Mr. Bellamy said that he was following with great interest the attempts being made by Mr. Mitten to mutualize the Philadelphia system. He expects to report personally to his board in London next year. This he does every third year.

Rail and Bus Fares Increased in Norfolk

The Norfolk, Va., City Council passed two ordinances on Oct. 26 granting the Virginia Electric & Power Company, subsidiary of Engineers Public Service Company, increases in bus and trolley fares to a 10-cent cash fare, 8¾-cent ticket rate and $1.50 weekly pass. The ordinances also provide for partial rerouting of the transportation system for the purpose of unification and improved operating economy.

Seattle Survey Report Nearly Ready

The financial survey of construction costs of the proposed project of linking the municipally owned lines of Seattle, Wash., with a system of rapid transit is now nearing completion, according to a report of the transit committee of the Seattle city planning committee. Engineers of the Seattle Municipal Street Railway are also engaged in checking figures of the original report which was compiled by the transit committee after more than a year of exhaustive research into nation-wide street railway transportation conditions. Members of the committee point out that while the plan of Superintendent of Utilities Jackson has its advantages, such as cutting down expenses in elimination of certain duplicating routes and non-profitable lines, it cannot assist in building up patronage. Superintendent Jackson's plan calls for turning cars back at Pike Street.

White Car in Joliet Urges "Safety First"

In the hope of lessening the number of street accidents, Joliet, Ill., has launched a "safety first" campaign, and is constantly operating a street car, painted white, which carries numerous safety slogans, calculated to arouse adults and children to the necessity for thinking before crossing a street, or taking any other step in which the element of danger enters. It is believed that this campaign has had excellent effect.

Cash for Suggestions on Puget Sound Property

As a result of the interest taken by employees of the Puget Sound Power & Light Company, Seattle, Wash., in the suggestion contest which closed on June 30, it has been decided again to offer prizes aggregating $1,000 to be completed for during the period from Oct. 1, 1926, to May 1, 1927. This competition will be open to every employee.

The prizes will be awarded by a committee consisting of the vice-president, the seven district managers, the manager of the auxiliary operations, the manager of securities company and the personnel officer. The prizes follow:

First prize	$400 in cash
Second prize	250 in cash
Third prize	200 in cash
Fourth prize	100 in cash
Fifth prize	50 in cash

Suggestions or plans submitted are to cover subjects which are of such a practical nature that adoption by the company would probably result in an increase of gross earnings or a decrease of operating expenses, or a well-defined company policy which will clearly indicate increased efficiency throughout the organization or better relations with the public in the territory served.

City Rehabilitates Phoenix Railway

Gradually the railway system in Phoenix, Ariz., is finding itself again. The system, now under municipal control, is to be improved, both as to rolling stock and schedules, just as soon as possible. The policy of the city administration is to furnish the very best service possible commensurate with a policy of economy, according to City Manager Rieger. The system is now being operated on a 5-cent fare.

The entire property, including rolling stock, right-of-way, machinery, equipment and real estate, was purchased outright by the city from the former owners for a lump sum of $20,000, which has been paid in full. The purchase followed appraisals made by the city and the then owners of the railway. The sale was the climax to a long, perplexing period in which no solution could be found for putting the railway, loaded down with paving and other requirements, on its feet. The problems in that city and the subsequent sale were referred to previously in the ELECTRIC RAILWAY JOURNAL.

Car Line to Toronto Island Favored

Although the stage has been set for some time for the taking over of the Island Ferries by the Toronto Transportation Commission, Toronto, Canada, the Board of Control is in favor of a continuation of the service furnished by Lawrence Solman until the end of the year. Meanwhile how to make the Island of Toronto, across the bay, more accessible to the people living in the city is one of the questions being debated along with radials and one-man cars. Several representatives of public affairs in Toronto have approved of an electric railway line, although there is a difference of opinion over the question of admitting buses through the construction of a proposed boulevard. It is maintained by some that the proposed extension of the Lake Shore Boulevard to the island would be too costly and that motor traffic would impair the safety and quiet of the resort. Comptroller Joseph Gibbons favors the operation of street cars if the government constructs a bridge at the channels. George Wilson, president of the Board of Trade, is of the opinion that a railway and a boulevard around the island should be constructed in the future. John O'Connor, at one time a member of the Harbor Commission, says that discontinuance of the ferry service would take away from the island one of its greatest attractions.

Rules for School Tickets at Ottawa Reiterated

To guard against the abuses which tend to rob every privilege of its value, the Ottawa Electric Railway, Ottawa, Ont., has been compelled to insist on the fundamental condition under which school tickets are issued, namely, that there be an adequate certificate to the fact that the intending passenger is a pupil at a recognized school and under fourteen years of age.

The company reminds its patrons that the person best qualified to give this certificate is the teacher at the school, but there are occasions when it is more convenient for one of the parents to call for the ticket. The company will in future accept the certificate of the parent in lieu of that of the teacher.

School tickets at Ottawa are valid only between the hours of 7 a.m. and 5 p.m. At all other times the regular fare must be paid, according to the height of the passenger.

Advantages for Employees in Insurance Plan

Co-operation between the management and the personnel of the New York Railways Corporation, known as the "Green Lines," New York, N. Y., has resulted in the adoption of a program which is expected to cover between 2,000 and 2,500 employees of the company for more than $2,000,000 of life insurance, as well as health and non-occupational accident protection. Each employee participating in the group plan receives $1,000 life insurance. In case of sickness from any cause, or injury while away from work, he will receive, under the health and accident policy, a weekly benefit. These payments will start on the eighth day of disability and will continue for a maximum of thirteen consecutive weeks. The life insurance also creates a temporary fixed income for the employee himself if he becomes totally and permanently disabled before age 60. Such employee will receive the full amount of his insurance in monthly installments. During the disability period premiums will be waived by the Metropolitan Life Insurance Company, which is underwriting the group plan.

Progress on Everman Plan Made in Dallas

The Dallas Railway, Dallas, Tex., has completed practically 50 per cent of its improvement program, ordered under the Everman Plan. Started only five months ago, the work of relaying tracks, extending car lines and carrying out other improvements has already been accomplished. The improvement program, recommended by Mr. Everman, city supervisor of public utilities, calls for an expenditure of $1,450,000.

News Notes

Fund Will Pay for Route Changes.—The United Railways & Electric Company, Baltimore, has provided a fund to pay for the construction work necessary to carry out the route changes which have been recommended by the Baltimore Traffic Survey Commission and approved by the Maryland Public Service Commission. The cost of construction work will be about $15,000. The changes are embodied in the first group considered by the commission. Five additional groups, each involving numerous changes, are to be acted upon later.

Men Protest One-Man Cars in Montreal.—Employees of the Montreal Tramways, Montreal, Que., have registered a protest against the new one-man system and have authorized the business agent of the Montreal Tramways Employees' Union to draw upon union funds, if necessary, for a campaign in the press and elsewhere against the cars. The protest is being sent to the company.

One-Man Cars in Heart of Berkshires.—The Berkshire Street Railway began the operation of one-man cars between Pittsfield and North Adams, Mass., and north to Bennington, Vt., on Oct. 16.

Rapid Transit Over Steam Tracks Under Consideration. — The Boston Elevated Railway, Boston, Mass., is considering plans to operate a rapid transit line over the tracks of the Boston & Maine Railroad from North Cambridge to Somerville Junction. This is the present right-of-way of the Central Massachusetts branch of the Boston & Maine, which is being diverted to another route. The idea is similar to the arrangement now in use on the Shawmut branch of the New York, New Haven & Hartford Railroad through Dorchester and Ashmont. The system suggested would operate from Somerville Junction through Somerville to connect with the main line of the Boston Elevated at Lechmere Square.

Damage to Havana Railway Negligible.—Speyer & Company, New York, have received advices from Frank Steinhart, president of the Havana Electric Railway, Havana, Cuba, that the company is again in full operation. Only negligible damage to the railway was caused by the hurricane.

$10,000 Music Appropriation Goes for Transit. — Mayor Kendrick of Philadelphia, Pa., will get the $10,000 he requested to engage J. Rowland Bibbins as expert in transit matters to advise him in the proposed negotiations with the Philadelphia Rapid Transit Company for a lease of the Broad Street subway. The finance committee has approved the appropriation and reported a bill to the session of Council. The $10,000 was found nestled in an item of $34,925 unused for music the past summer by the Park Commission. The Park Commission wanted all the money transferred to other park needs, but the finance committee appropriated the $10,000 and let the commission have the remaining $24,000 for uniforms, supplies and labor.

Terminable Permit Hearings to Be Resumed.—Senator Richard J. Barr, chairman, has called a meeting of the Illinois legislative terminable permit investigation committee to convene at the Palmer House, Chicago, on Nov. 8 to resume its hearings.

Grade Crossing Elimination Work to Start.—Immediate steps are to be taken by the Board of Public Works in Louisville, Ky., looking toward the elimination of grade crossings in that city. Members of the board have been in conference with Mayor Will discussing plans for speeding up this work. Edward J. Miller, chairman of the board, said that the board was becoming impatient at the long delay in action on the part of those who are blocking the work. Disagreement over rerouting of cars of the Louisville Railway has been partly responsible for the delay.

Course in Traffic Management. — A course in "Traffic Management" has been started by the Pacific Electric Railway, Los Angeles, Cal., under the tutorship of E. W. Hill, educational director. Each Wednesday from 7 to 9 p.m. a limited number of employees will learn the principal phases of traffic management, including classification, tariffs, rates and claims, with the practical side expressed by the men engaged in that work. As planned the course will run to June next.

New Edition of Boston Guide Book. —A new edition of the familiar and useful Guide and Information Book, issued originally in 1924, is being prepared by the Boston Elevated Railway, Boston, Mass. The general plan of the new edition is the same as that of the old one, but the cover and maps are in colors. The use of different colors for the several kinds of transportation lines will make it easier for employees to explain to patrons how to get from place to place.

Would Cancel Franchise.—The Buffalo City Council has voted to revoke the franchise of the International Railway, Buffalo, N. Y., for the operation of cars in Grant Street between Hampshire Street and Military Road, a distance of almost 2 miles. The resolution for revocation of the franchise was introduced by Mayor Schwab because of the alleged failure of the company to repair its tracks and roadbed in the street as ordered by the Public Service Commission. The company questioned the authority of the state utilities board to issue such an order and now the International is questioning the authority of the City Council to revoke its franchise in the street. The legal department of the company indicated it would apply to the courts for an injunction if the city makes any attempt to remove the tracks. The city already has authorized contractors to start repaving the street. The present move is in effect merely another attempt by the Mayor to embarrass the company.

What Leaders Think of Georgia.—"A Welcome Awaits You in Georgia" is the assurance given by the Georgia Railway & Power Company, Atlanta, Ga., in a 60-page pamphlet expository of the public sentiment in Georgia toward new industries and citizens as expressed by business and industrial leaders, newspaper editors, public officials and others.

One-Man Cars Under Fire in Toronto.—Agitation is prevalent in Toronto, Ont., against one-man car operation, but D. W. Harvey, general manager of the Toronto Transportation Commission, says if one-man cars are not run fares must be increased to give a service similar to that now in effect. On the other hand, if service had to be reduced, as it would under two-man operation, there would be a corresponding decrease in revenue. He says that safer and more convenient service can be rendered with one-man cars than with two-man cars and that several recent fatalities with one-man cars were not indicative of their being dangerous to operate. Following his report, however, operators recited dangers encountered during rush hours. Members of the local division of the Amalgamated reiterated their opposition to the one-man car and executives were instructed to act to protect the interests of the men.

Starts Eight-Car Trains on Another Branch.—Eight-car train service, replacing four and six-car local expresses, during the rush hours on the Lake Street division of the Chicago Rapid Transit Company, Chicago, Ill., was started on Oct. 1. The change as effected will give residents of the adjacent communities of Austin and Oak Park faster elevated service than they have had since the line opened in 1893. The new service is a part of a program of speeding up on the entire Rapid Transit system, the longer train operation having been made possible by reason of the platform extension work which has been under way for several months. The first eight-car trains of the Rapid Transit Lines were placed in operation on the Evanston-Jackson Park division early last spring.

Foreign News

London Bus Restriction Held Invalid

By a vote of two to one the Ealing Bench of Magistrates, London, England, recently dismissed a summons against an independent bus owner for alleged failure to comply with the restrictions on operation along Uxbridge Road between Shepherd's Bush and Uxbridge. An account of the promulgation of these regulations by the Minister of Transport acting under powers conferred by the London traffic act of 1924 was published in ELECTRIC RAILWAY JOURNAL for April 10. The defendant acquired a bus in March, 1925, and was assigned to this route by the Ministry of Transport. Later, he was excluded by the new regulations. He admitted, however, that before commencing operation he had been warned that such an outcome was likely. Counsel for this operator, however, contended that the Minister of Transport had exceeded his authority in attempting to enforce these rules. The regulations, he said, were unreasonable, unjust and involved a gratuitous interference with the rights of citizens. After a short consultation, the magistrates announced their decision dismissing the summons. It is expected that an appeal will be made against the decision. Meanwhile, the independent bus owners have decided to continue operation of full service between Uxbridge and Shepherd's Bush.

Rome to Have Subway

Construction of 27 miles of subway lines will soon be under way in Rome. A commission appointed by the Italian government has just completed the plans, after a thorough tour by it of the city in order that archaeological ruins may be conserved for future generations. The first unit of this underground project will be completed within the next ten years. The two principal lines will cross each other at the Piazza Santi Apostoli, the first one running in an east-westerly direction from the railway station quarter of the city to the Prati and the St. Peter Square and the other one from the Via Flaminia to San Paolo, the starting point of the electric railway to Ostia. In the future a line to cover the south of Rome will start from St. Peter Square to Janiculus and Trastevere, crossing River Tiber at the Sublicius bridge and extending by way of San Paolo, the Square of Laterans and the Porta Maggiore to San Lorenzo and the Cemetery.

Electrification in Switzerland Progresses

Operation of the new electric road connecting the four Swiss cities Basle, Brugg, Baden and Zurich will begin in November. The time for the express trains between Basle and Zurich will be reduced by eighteen minutes and that of local trains by 29 minutes as a result of the change from steam to electricity.

Approximately one-third of the Swiss railroad system is now electrified, or 590 miles out of a total of 1,828 miles. This is following out a still more extensive program which has been discussed in earlier issues of this paper. One of the chief factors for transition of systems is shown in the following table of increase in traffic during the last few years:

	Freight, Metric Tons	Passengers Carried
1925	16,436,630	101,827,814
1924	16,599,201	96,486,306
1920	15,829,742	86,080,314
1913	14,614,781	91,649,336

Railroad Electrification Work in Austria Progressing

Progress is being made with the electrification of the Austrian Federal Railways. Freight trains at the present time travel at a speed of 20 m.p.h., compared with 9½ miles in the era of steam transport. Great acceleration of traffic has also been accomplished in the case of passenger trains, although electricity has not yet been fully used owing to the short lengths of the lines which so far have been electrified. The Innsbrück-Bludenz line, for example, is only 85 miles long and the changing of locomotives causes a considerable loss of time. The lines that are now being constructed are Salzburg-Worgl, Kufstein-Worgl and Innsbrück-Brenner, which measure a total of nearly 190 miles (double track), with the exception of the single track Kufstein-Worgl line (9 miles). Current is supplied to these lines by the Mallnitz and Stubach electrical power stations. Some 47 electric locomotives have so far been ordered, all from Austrian firms.

Railway Progress in India.—The Great Indian Peninsula Railway has completed its harbor branch from Victoria Terminus to Thana. Progress is reported, too, on the main line running between Sandhurst Road and Kalyan, which will be completed by the end of next year. It will provide through electric service from Victoria Terminus to Kalyan. The plans as outlined provide for electrification of this line as far as Poona by 1929 and to Igatupuri in 1930.

Manchester's Anniversary Shows Many Improvements.—Since the first electric car ran in Manchester, 25 years ago, there have been put into service 903 cars and 58 buses. To house 230 of these cars the City Council is erecting a new shed which will cover 4¾ acres and is estimated to cost £170,000. During the last six years an increase of 38 miles of track has been made to the 212 miles of the tramway system.

Shops for Liverpool.—Liverpool City Council is now constructing tramway repair shops at a cost of £385,000 to occupy 9 acres.

Recent Bus Developments

Steam and Electric Road Opposed

Proposal of Railroads in Pennsylvania to Run Buses in Electric Railway Territory Brings Protest

Powell Evans, president of the Schuylkill Railway and the Schuylkill Transportation Company, Girardville, Pa., published a statement on Oct. 20 in opposition to the plans of the Pennsylvania Railroad and the Reading Company for establishing bus service in 55 and 24 counties, respectively. Besides putting out of business existing transit and bus lines, Mr. Evans points out, the railroads will probably increase their rates.

According to Mr. Evans steam railroads in Pennsylvania are prohibited by state laws from operating directly or indirectly either passenger or freight service over the public highways. He says that if the Pennsylvania Railroad and the Reading Company are permitted to carry out their programs for operating bus lines in a large number of counties in the state, the result will be the absorption by the steam lines, on their own terms and values, of virtually all competing local and bus transport throughout the state.

Mr. Evans' statement may be regarded as a spirited reply to a statement issued about a week ago by the Reading Company in an attempt to justify its ambition to run buses. Governor Pinchot recently refused to approve charters giving subsidiaries of the Reading Company and the Pennsylvania Railroad the right to operate buses on the state's public highways. In reply to this, the Reading Company declared that the railroads had just as much right as any one else to use these roads, inasmuch as they, the railroads, contributed to the support of the highways. In the meantime, the Reading Company is proceeding serenely with its plans for bus operation, apparently awaiting the day when Governor Pinchot shall have passed out of office.

In explaining the trolley and bus situation in Schuylkill County in particular, and throughout the state in general, Mr. Evans stated that the Schuylkill Company has experienced since the war a constant shrinkage in receipts and a constant increase in expense caused by automobile use and "below-cost railroad competition" from the steam railroads. The Schuylkill Company, he says, was established in 1892 and operates about 50 miles of trolley and bus routes through the upper two-thirds of Schuylkill County and serves about 180,000 population from Pottsville north. Its total capital is $2,500,000, or less than the appraisal accepted by the Public Service Commission for a rate basis, and it is almost entirely owned by residents of Philadelphia and eastern Pennsylvania, who receive barely 3 per cent per annum on their investment in the property. He declares that the trolley and bus lines both pay their full share of taxes and their security holders are as fully entitled to protection and support in their rights and investments as are those of the steam lines. Further Mr. Evans said:

> The steam lines are prohibited by Pennsylvania laws from operating directly or indirectly either passenger or freight service over the public highways, while to the contrary trolley lines are expressly empowered to do both. The Public Service Commission by its actions and decisions throughout its existence has consistently prevented unnecessary duplication of public service facilities and protected those it regulates from destructive competition; and the steam lines themselves have protested against such duplication in their own field, as witness the present fight against the proposed new Harriman steam line across this state, and their constant opposition to all bus applications.

In the next paragraph Mr. Evans calls attention to the fact that the Schuylkill Company in 1922 organized the Schuylkill Transportation Company as a bus subsidiary, and that the two companies have continuously provided throughout their community economic and efficient unified trolley and bus service of high quality and at reasonable rates. In fact, Mr. Evans adds, they have assisted the Reading Company upon request.

Finally, Mr. Evans says that the Schuylkill Company and generally the trolley and bus companies throughout the state "propose to resist to the utmost the unjustifiable aggression initiated by the steam lines against established, responsible and equally legitimate local competitors."

Councilmen Oppose Buffalo Bus Project

The City Council of Buffalo, N. Y., has failed to approve Mayor Schwab's plan for the extension of municipal bus lines. The commissioners indicated they would not vote for the expenditure of additional funds until the Mayor supplied detailed information regarding the costs and the terms of agreements he had proposed to make with various automobile companies and bus corporations.

The only information contained in the Mayor's municipal bus resolution called for the purchase of passenger buses from the Reo Motor Car Company at $5,525 each, buses from the White Motor Car Company at $10,887 each and also buses from the Dodge Company at $4,337 each. The contracts were to be somewhat similar to the Detroit rental-sale plan. The city was to pay the companies at the rate of 20 cents per bus-mile and guarantee each bus 100 miles a day, this sum to apply on the purchase price. In addition the city was to furnish gasoline and oil, pay for the driver and supply fire, theft and liability insurance.

A conspicuous opponent of the municipal bus plan was Commissioner Frank C. Perkins, the Socialist member of the Buffalo City Council, who for years has been advocating municipal ownership of all utilities.

Shore Line Would Purchase Calumet Coach Company

Permission for the purchase of the Calumet Motor Coach Company by the Shore Line Motor Coach Company, a subsidiary of the Chicago, South Shore & South Bend Railroad, is asked in a petition filed recently with the Indiana Public Service Commission by the railway subsidiary. The petition states that the coach lines operated by the two companies are in close proximity in the Calumet district and that "the interchange of traffic is such that public convenience will be served better if the operation of the routes is carried on by a single company." The purchase will make the Shore Line company one of the largest coach companies operating both interurban and city coaches in that section of the country. A total of 23 routes will be operated out of Gary, to Chicago and Grand Rapids, the northern terminus.

The capital stock of the Calumet Motor Coach Company was purchased last July from its former owners by the Midland Utilities Company, an investment company interested in other utilities in the district served. It holds a franchise to furnish motor coach transportation in Hammond. The Calumet company also operates two routes from Hammond, Ind., to Chicago. The Shore Line company operates through service connecting Chicago and Benton Harbor and Grand Rapids, Mich., also connecting Chicago and Gary and Valparaiso, Hammond and Chicago Heights and other northern Indiana points. The company has its headquarters at Gary. Both lines also operate an extensive chartered car service.

There will be no change in the personnel of the present Calumet company.

Combined figures of the unified coach company will show the following totals: 125 coaches, five garages, 318 employees, nearly 15,000 coach-miles operated daily, with approximately 25,000 passengers carried daily.

The petition also asks the right to issue no par value common stock to cover the cost of the motor coaches and equipment purchased by the Shore Line company. In a separate petition filed jointly by the Gary Railways and the Chicago, South Shore & South Bend Railroad, each of which already owns approximately half of the issued stock of the Shore Line Motor Coach Company, the two railroads ask the right to purchase equal portions of the new stock to be issued by the Shore Line Motor Coach Company.

The Place of the Bus Defined

Buses never will supplant street cars for mass transportation in St. Louis or any other city, in the opinion of the special committee on subways of the Board of Aldermen of St. Louis, which has been rendering all-embracing views upon subjects related to rapid transit for St. Louis, after a study of conditions in many large cities of the United States. In general the committee finds:

> The consensus of opinion seems to indicate that there is no place in any city, except possibly the few very largest cities,

Digitized by Google

for the bus in competition with street railways, because such competition inevitably renders adequate service by the railway impossible, if it does not actually ruin it, while after the ruin takes place the bus cannot handle the load, particularly during the rush-hour peak. Competition might, however, be justified where the street railway is backward and will not keep up with modern developments.

There is a sociological question involved in the difference between a 7-cent car fare and a 10-cent bus fare. The difference between these two rates means an average increase for transportation of about $50 a year a family. No doubt in any community 5 or 10 per cent of the families can easily absorb such increase, but the great multitude of the families cannot contemplate or undertake with equanimity an increase of $50 in the family budget; to avoid that the cheaper means of mass transportation by street cars in the larger cities must be continued in full vigor and at the least cost. This cannot be done if they be subjected to unregulated competition of favored, subsidized motorbus lines.

The extent to which buses in St. Louis have been favored and subsidized is indicated by the fact that they are permitted to charge a 10-cent fare while the railways are limited to a 7-cent fare; the railway company contributes to the city about 12 per cent of its gross revenues in various forms of taxation and paving costs, the bus company approximately 4 per cent; the bus company is not compelled to provide any particular quantity of service during the rush hours, but is permitted to choose the number of passengers for which it is willing to provide seats; the railway is compelled to provide a fixed number of seats and a fixed area of standing room for all the passengers and carries the burden; the buses wear out pavements provided by others; the railway pays for pavements used by others. There is no obligation on the bus company to continue service on any line.

Bus Must Prove Its Right to Exclusive New York Street

The Park Avenue Association of New York City has announced the appointment of the engineering firm of Fisk & Roberts, New York, to report on bus operation proposed on Park Avenue by the Board of Transportation. This association, on behalf of its members, has consistently opposed the granting of a franchise for a bus route on Park Avenue and has now retained its own experts to analyze the advantages and disadvantages of the city's plan for a route between 45th and 96th Streets on Park Avenue.

Terminal Urged for Manhattan

The building of a terminal for interurban buses in New York City, many of which are now run into the Times Square area, to lessen street congestion, was urged on Sept. 19 by the Forty-second Street Property Owners and Merchants Association. According to a survey made of mid-town Manhattan there are about 50 interurban bus companies sending between 500 and 600 buses daily into the Times Square area and out of it.

The study revealed the fact that throughout the day there is generally a minimum of 50 buses standing still in the streets. At certain hours the number reaches to almost 100.

Edwin W. Forrest, secretary of the Forty-second Street Property Owners and Merchants Association, said that the interurban bus had developed to the point where, unless it were controlled, preferably by the bus companies, it would interfere with other interests, which would not be slow to object.

Football Followers Handled by Buses in Bethlehem

Roomy buses are being used at Bethlehem, Pa., to meet the need of congested traffic and suddenly mobilized crowds of passengers. Bethlehem is an old city with narrow streets. Its planners evidently missed the fact that future years were to bring an amazing volume of automobile and trolley travel. It happens also that Bethlehem is the seat of Lehigh University and is a collegiate and scholastic sports center of considerable renown.

Bethlehem is served by the Lehigh Valley Transit Company, which covers with its lines a great area in eastern Pennsylvania. When a hill-to-hill bridge was completed last year, with its spans extending octupus-like in five directions to touch important sections, the railway, lacking permission to lay tracks, organized the Lehigh Valley Transportation Company as a subsidiary and established a fleet of ten buses.

With the coming of the football season it was found that terrific congestion occurred every Saturday and Sunday afternoon between the hours of 1 and 6 p.m. Lehigh University stadium attracts its thousands, the Bethlehem High School field is the Mecca for additional thousands and professional Sunday football, played on the Bethlehem Fabricator field, in a somewhat isolated section of the city, and several blocks removed from the nearest trolley line, has many followers.

The Lehigh Valley Transit Company officials met with the executives of Bethlehem and offered a plan of running buses in place of trolleys during these rush periods. It met with instant approval. The Public Service Commission agreed to the proposal. As a result ten buses now serve the passengers whenever an event of any magnitude is held. They are diverted from the hill-to-hill bridge runs for the extensions to the playing fields, during periods when the crowds are going to the fields and returning. Traffic congestion is in consequence tremendously relieved. Patronage is always at capacity. When the main crowds have been taken care of the buses are returned to their usual runs. The ten routes are designed to cover every important part of the city.

Bus Service Arranged for Vancouver, Wash.

Bus service in Vancouver, Wash., will be operated by T. L. Lineham and associates, who have been granted an exclusive franchise by the City Council. A 30-minute schedule will be maintained. The fare will be 10 cents for adults, 5 cents for children under seven and 5 cents for school children on school days. The fare from any section of Vancouver to Portland by bus and street car will be 25 cents and by stage to Portland 30 cents.

Following favorable action by the State Department of Public Works on a petition of the Clark County Development Company to discontinue railway service between Vancouver and Sifton, the cars have been taken off this run. The order releasing the company has been signed by the Clarke County Commissioners. The franchises canceled were granted the Vancouver Traction Company on Jan. 15, 1909, and taken over by the present company on Feb. 15 of the same year. Service will be continued in the city until bus lines are established.

Both Companies at Lincoln Get Permits

The City Council of Lincoln, Neb., has voted to give each of its railways, the Lincoln Traction Company and the Omaha, Lincoln & Beatrice Railway, an interurban, what it wants. The interrurban made the first request, which included a loop that kept it within its old downtown business section boundaries. Later it amended this, at the request of business men, to make a wider detour, entering what the traction company officials say is the cream of its territory. The traction company then asked for permission to run bus lines into the suburb of University Place, which has just been taken into the city, and which is the starting point of the interurban buses. The interurban protested against this, saying it had not sought to invade traction territory, and the traction company replied with a challenge of this statement. The interurban has buses on the ground and started them, after permission had been granted, but without changing the downtown routing. The traction company received the permit and will have its buses in operation soon.

New Service to Picturesque Poconos

A drastic change will be made on Nov. 1 in the operation of one of the most unusual railways in the United States. This is the line run by its employees, who leased it a year ago from the Bangor-Nazareth Transit Company.

The road extends from Pen Argyl to Nazareth, passing through Wind Gap. It caters mostly to passengers who make short trips to the resorts in that section during the summer. The most notable of these places is Saylor's Lake, near Delaware Water Gap and the Poconos.

The employees now intend to discard the three trolley cars remaining in service and will install a bus line. Two buses have already been received for operation over the splendid cement highways spread over the entire region. Service will also be instituted to Bangor. The bus line will make connections with the Lehigh Valley Transit lines at Nazareth and transport passengers into the Pocono foothills on hourly service.

Bus Field Left to Railway

The petition filed with the Public Service Commission of New York by the County Transportation Company, Inc., for permission to operate bus lines in White Plains, the villages of Scarsdale, Elmsford and Tarrytown and the town of Greenburgh, Westchester County, has been withdrawn by the petitioner and the records closed with the commission.

Digitized by Google

This company obtained local consents in all municipalities except in the village of Elmsford. Consents of the city of White Plains and the village of Scarsdale were not to become operative unless consents were obtained from all other municipalities and operation commenced within 60 days and in the village of Tarrytown within 30 days.

The proposed route would follow the line of the Westchester Street Railroad, and the application was opposed by the receiver of that company. Subsequently this line was acquired by the Union Railway, which also opposed the petition. Several hearings were held and on Sept. 15 the attorney for the petitioner withdrew the application.

Buses Into the Saucon Valley

A bus line may replace the trolley service of the Bethlehem Transit Company, South Bethlehem, Pa., across the Lehigh mountains and into the Saucon Valley. This particular branch of the Bethlehem Transit Company lines serves a widely scattered community, in which traffic at certain times is almost nil, so that the possibility of running trolleys on a faster schedule or providing better service by car are discounted. Private individuals are seeking permits from the Public Service Commission to serve this territory, but the Bethlehem Transit Company will doubtless file a petition of its own.

Weekly Passes on Lordship Bus Routes

The Connecticut Public Utilities Commission has granted permission to the Lordship Railway to institute a system of weekly passes on its bus route between Lordship and the Plaza, Bridgeport, with the limitation that the weekly passes will be issued for a trial period of one year. The finding of the Public Utilities Commission allows the company to issue weekly passes at $1 each for use on the bus route between the Plaza at Bridgeport and Lordship or Avon Park in Stratford, and passes at 50 cents for use between Hollister Bridge and Lordship or Avon Park. The new system will go into effect Nov. 1.

The Lordship Railway operates a bus line from the Plaza, Bridgeport, to Lordship in Stratford, or Avon Park in Stratford, a round trip to either point covering a distance short of 9 miles.

Would Consider Bus Request.—The Milwaukee Electric Railway & Light Company has taken under advisement the request of the West Racine, Wis., Business Men's Association asking for the extension of the railway's bus system to serve West Racine, a rapidly developing suburb now without any form of transportation service. The proposed line would also touch Mygatt's Corners, where 115 families have signed a petition signifying their intention to support bus service.

Service Increased in Evansville.—Bus service in Evansville, Ind., supplied by the Southern Indiana Gas & Electric Company for the past six months, has met with considerable success, so that the company has put on four new buses to connect with the city cars in remote sections of the city. The new buses have a capacity of about 35. They will not be assigned to any particular routes, but will be used to handle peak crowds.

Lines Extended Into New Territory.—Two suburban bus lines have been extended into growing residence districts by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis. The bus line which operates as a feeder to the Third Street line at the end of Green Bay Avenue now operates ½ mile beyond its former terminal. Under the new plan buses will operate until midnight instead of discontinuing service at 10 p.m. The Clement Avenue bus line, a feeder to the Oakland-Delaware line, has been extended from its former terminal at the Nash Motor plant to St. Francis and Second Avenues in St. Francis. The new areas served are sparsely settled.

Bus Line Planned. — The Gardner-Templeton Street Railway, East Templeton, Mass., is being discontinued and the directors have sold the rails and wire to a Gardner junk dealer. The management will put on a bus service to replace the trolleys.

Specific Stopping Places for Boston Buses Wanted.—Edward Dana, general manager of the Boston Elevated Railway, Boston, Mass., is seeking a revision of the city traffic regulations to designate specific stopping places for buses operated by the company. At a recent conference with the Boston Street Commissioners, Mr. Dana suggested that buses should be provided with certain exclusive stopping points for the convenience of patrons. At the present time there are points where it is almost impossible for the buses to take on passengers because of private autos parked in the way. It has been necessary for the buses to stop in the midst of moving traffic to allow patrons to alight.

New Bus Fare in Effect.—The fare on the Riverside Drive bus line of the Los Angeles Motor Bus Company, Los Angeles, Cal., was made 6 cents without transfer privileges, effective on Oct. 7. The former fare of 10 cents with transfer privileges to and from the Los Angeles Railway and Pacific Electric Railway lines remains the same.

Purchases Jitney Lines.—President W. Scott Eames of the New Haven & Shore Line Railway, Guilford, Conn., has announced the purchase of the operating rights of the Waterbury Jitneys & Taxis, Inc., operating a bus line between New Haven and Saybrook. The additional line will be absorbed in the regular operating schedule of the Shore Line. The New Haven & Shore Line Railway operates 37 miles of line.

Would Investigate Interurban Bus Status.—The St. Louis, Mo., Board of Public Service has instructed Director of Streets and Sewers Brooks to investigate the status of interurban bus lines now using the streets of the city. Numerous complaints have been made that many bus lines are operating without city permits. A city ordinance requires all bus lines to obtain city permits which specify what streets they may use. When this ordinance was originally passed seventeen bus line permits were taken out, the majority for the People's Motorbus Company. Several permits have been issued since that time, but many bus companies have come into the city without making an attempt to comply with the ordinance.

New Bus Service Started. — The Hamburg Railway has started the operation of five de luxe passenger buses between Buffalo and Hamburg, N. Y., under a certificate of convenience and necessity granted by the Public Service Commission. This is the first of three bus lines to be started by the Hamburg Railway between Buffalo and suburban points in western New York and is known as route A-1. Motor coaches will operate on an hourly schedule. No local passengers will be carried in the city of Buffalo. The buses have a capacity of 29 passengers. The round trip is 75 cents, with a one-way fare of 40 cents. Commutation books will be sold on a basis of 30 cents a trip.

Bus Routes Authorized.—The Scranton Bus Company, a subsidiary of the Scranton Railway, Scranton, Pa., has received a certificate from the Public Service Commission to operate buses from Dunmore Corners through Green Ridge Street to Providence Square. This is a crosstown bus line serving citizens of Dunmore and north Scranton. A certificate has also been secured to extend the bus line now operating from the Throop Boulevard section to the center of the city, through Wyoming Avenue to Lackawanna Avenue.

Prohibits Restraining Orders Against Independents.—A writ to prohibit Judge William Kittinger of the Circuit Court at Anderson, Ind., from issuing restraining orders, injunctions or contempt of court citations against four independent bus operators in Muncie, Ind., has been issued by Judge David A. Myers, chief justice of the Indiana Supreme Court. The petition follows a controversy between Arthur W. Brady, receiver for the Union Traction Company, and the Muncie bus operators. The traction officials asserted that the Muncie operators are running illegally. Attorneys for the bus men declare they carried the matter to the Supreme Court because they feel that court action should be in Delaware County, where the buses are operating, and not in Madison County, where the receivership was established.

Extension of Service by Buses.—The Northampton Street Railway, Northampton, Mass., has been granted authority by the towns and cities involved to run buses between Northampton and Williamsburg. Between Leeds and Williamsburg buses will be operated entirely and the trolley service will be abandoned. Between Leeds and Northampton buses will be used to cooperate with the railway service. The Aldermen of Northampton granted licenses after some dispute regarding the fare. The licenses issued also include an order for a reduction in fare between Northampton and Williamsburg as offered some time ago by the Northampton Street Railway.

Financial and Corporate

Interborough Gross and Net Up

Increase in Net Corporate Income for Year Ended June 30 Was $2,278,253 —Earnings Statements Compared

Gross operating revenue of the Interborough Rapid Transit Company, New York, for the year ended June 30, 1926, was $61,708,815, compared with $58,418,991 last year, a gain of $3,289,824, or 5.63 per cent, the result of a gain on the subway division of $3,213,036, or 8.15 per cent, and a loss on the Manhattan Railway division of $76,788, or 0.40 per cent. The gain in the revenue from the transportation of passengers was $2,047,021 and the gain in the other street railway operating revenue $1,242,803, principally from advertising, which shows an increase of $1,227,328 over the previous year.

Operating expenses with maintenance and depreciation included on the basis of contractual provisions were $33,540,813, compared with $33,088,385 last year, an increase of $452,428, or 1.37 per cent, the result of an increase of $656,713, or 3.04 per cent, on the subway division and a decrease of $204,285, or 1.77 per cent, on the Manhattan Railway division.

The net operating revenue was $28,168,002, compared with $25,330,606 last year, an increase of $2,837,396, or 11.20 per cent, the result of a gain on the subway division of $2,556,323, or 14.32 per cent, and a gain on the Manhattan Railway Division of $281,073, or 3.76 per cent.

The total amount of taxes was $3,350,783, compared with $3,299,590 last year, an increase of $51,193, or 1.55 per cent; the subway division shows an increase of $79,877, or 9.56 per cent, while the Manhattan Railway division shows a decrease of $28,684, or 1.16 per cent.

Income from operation was $24,817,219, compared with $22,031,016 last year, or an increase of $2,786,203, or 12.64 per cent, the result of a gain on the subway division of $2,476,446, or 14.55 per cent, and a gain on the Manhattan Railway division of $309,757, or 6.17 per cent.

Non-operating income was $276,979, as against $292,200 last year, a decrease of $15,221, or 5.21 per cent, the result of a decrease on the subway division of $21,573, or 10.10 per cent, and an increase on the Manhattan Railway division of $6,352, or 8.08 per cent.

Gross income was $25,094,198, compared with $22,323.216 last year, an increase of $2,770,982, or 12.41 per cent, the result of a gain on the subway division of $2,454,873, or 14.25 per cent, and a gain on the Manhattan Railway division of $316,109, or 6.20 per cent.

Income deductions were $21,669,158, compared with $21,176,429 last year, an increase of $492,729, or 2.32 per cent.

The net corporate income was $3,425,040, compared with $1,146,787 last year, an increase of $2,278,253.

Some $10,899,889 was spent during the year for maintaining the railroads, power plants and the rolling stock in good operating condition. This amount was $981,346 in excess of the contractual provisions and when deducted from the net corporate income leaves a balance for the year of $2,443,695, compared with a deficit the previous year of $345,508.

The number of passengers carried was 1,130,484,647, compared with 1,089,544,225 last year, an increase of 40,940,422, or 3.76 per cent, the result of a gain on the subway division of 47,459,401, or 6.44 per cent, and a loss on the Manhattan Railway division of 6,518,979, or 1.85 per cent.

A net expenditure of $3,087,693 was made during the year for additions, betterments and replacements. This amount includes the company's contribution toward construction and equipment under Contract No. 3 with the city and the related certificates, balance of cost of 150 additional subway motor cars and additional shop and power facilities to provide for operation of additional subway cars.

The comparative income account for the years ended June 30, 1926, and 1925, is contained in the accompanying table.

The system is made up of 378 miles, of which 237 is elevated lines and 141 subway.

COMPARATIVE INCOME ACCOUNT OF INTERBOROUGH RAPID TRANSIT COMPANY

Year Ended June 30	1926	1925	Increase
Gross operating revenue	$61,708,814	$58,418,990	$3,289,823
Operating expenses†	33,540,812	33,088,385	452,427
Net operating revenue	$28,168,001	$25,330,605	$2,837,396
Taxes	3,350,782	3,299,589	51,193
Income from operation	$24,817,218	$22,031,015	$2,786,203
Non-operating income	276,979	292,200	*15,220*
Gross income	$25,094,198	$22,323,216	$2,770,982
Income deductions	21,669,158	21,176,428	492,729
Net corporate income	$3,425,040	$1,146,787	$2,278,252
Add:			
Surplus at beginning of year	$1,529,863	$391,534	$1,138,329
Profit and loss account—Net changes during the year	13,865	*8,457*	22,322
Totals	$1,543,728	$383,076	$1,160,652
*Surplus at end of year†	$4,968,768	1,529,863	$3,438,905

*Stated exclusive of accruals under Contract No. 3 and related certificates payable from future earnings but with full deduction for sinking fund on first and refunding mortgage bonds, the payment of which is under the "Plan of Readjustment," postponed for five years from July 1, 1921, provided an amount equal to such postponed sinking fund be expended for additions or improvements to the property.

†Stated exclusive of expenditures for maintenance in excess of contractual provisions.

Michigan Road to Discontinue After Foreclosure

The Grand Rapids, Holland & Chicago Railway went under the hammer before Judge Clarence W. Sessions in United States District Court at Grand Rapids, Mich., on Oct. 20, with the Hyman-Michaels Company, Chicago, the successful bidder. Its offer of $227,500 for the entire road and equipment was accepted when no other bids were made.

The railway went into the hands of receivers in June, 1924, on petition of the Continental & Commercial Trust & Savings Bank, Chicago, the trustee under a deed securing $1,500,000 of Grand Rapids, Holland & Lake Michigan Railway first mortgage 7 per cent bonds (extended) on which interest was defaulted on Feb. 1, 1924. The Grand Rapids, Holland & Chicago Railway was incorporated on July 19, 1904, as successor to the Grand Rapids, Holland & Lake Michigan Railway. It owns 76 miles of track. In 1916 the road was leased to the Michigan Railroad for five years. This lease was renewed for another five years at its expiration, but on Jan. 1, 1924, the lease was canceled and the road returned to the owners.

The sale is, of course, subject to the approval of the court. Meanwhile service will be continued, but the prospect is that after the successful bidder is fully qualified and title passes the road will discontinue.

New Kansas City Mortgages Filed for Record

The Kansas City Public Service Company, new owner of the railway at Kansas City, Mo., has filed a mortgage under which bonds will be issued in an initial amount of $12,465,200. The mortgage is on the properties of the defunct Kansas City Railways, title to which has been transferred to the new company and is of the type that may be enlarged at intervals as the need may arise.

The new owners of the property will distribute a total of $11,150,755 of the bonds among themselves. The remaining bonds of the new issue, having a total face value of $1,314,444, will be remitted to the group of personal injury claimants, for whom Senator James A. Reed arranged a settlement with the federal court at the time of the receivership litigation.

The issue of bonds is being arranged on the basis of a 30-year maturity, but they will be recalled and exchanged for eighteen-year bonds in the event the franchise extension fails if a public referendum is held.

Also on Oct. 18 a similar mortgage on the Wyandotte Railways, a subsid-

Digitized by Google

iary operating in Kansas City, Kan., was filed there. The mortgage, which will be held by the Kansas City Public Service Company, provides for a bond issue of $1,750,000 face value on the Wyandotte County properties of the company. Thus the initial bond issue of the Kansas City Public Service Company represents a total face value of $14,215,200, secured by pledge of both the Kansas and Missouri properties.

Shall the Purchased Franchise Be Included in Property Value?

A hearing was held on Oct. 5 before the Court of Appeals of the District of Columbia in the case of the Public Utilities Commission against the Capital Traction Company, Washington, D. C. The case is on appeal from the decree of the Supreme Court of the District of Columbia fixing the fair value of the properties of the Capital Traction Company for rate determination purposes. F. H. Stephens appeared for the commission and George E. Hamliton and G. Thomas Dunlop for the railway.

An agreed statement of facts shows that the commission, after hearings made in 1919, found the value of the company's property as of 1914, and added thereto the cost of property acquired between that date and the date of valuation in 1919. This was conceded to be an error and the Supreme Court of the District of Columbia, having the entire record, revalued the property as of Jan. 1, 1925. On that date the court found the fair value to be $30,906,880, which included $5,150,000, the cost of franchise and other intangible elements.

The commission brought this appeal from the decree of the Supreme Court of District of Columbia, asking that the decree should be reversed and remanded with instructions to the court to eliminate the item of $5,150,000. The commission also sought consideration of historical cost or investment value and proper depreciation.

Counsel for the Capital Traction Company contended that the actual cost of the franchises and other intangible elements of value purchased from the Washington & Georgetown Railroad should be added to the reproduction cost new, as such actual expenditure was legal and necessary, and the stockholders had relied upon protection of such value. They contended, further, that there should be no allowance for depreciation as the sinking fund is adequate to care for it.

Year's Balance in Detroit Increases

The railway operating revenue of the city of Detroit Department of Street Railways, Detroit, Mich., for the year ended Sept. 30, 1926, was $23,064,009, against $21,736,795 for the year ended Sept. 30, 1925. The coach operating revenue for these two periods was $1,742,686 and $498,384 respectively. Railway operating expenses was $17,406,793, against $15,832,833 for the 1925 period. Coach operating expenses were $1,720,988 for this year, against $486,624 for 1925. The net revenue from all sources was $5,935,286 for the year ended Sept. 30, 1926, and $6,088,089 for the similar period in 1925.

After the consideration of deductions the net income was $3,249,252 for this year, against $3,462,897 last year. The balance for this year's period was $634,328 and for last year $531,285.

The total number of railway passengers for the year ended Sept. 30, 1926, was 495,946,976, against 465,694,211 passengers for the year ended Sept. 30, 1925. The total number of coach passengers was 22,569,423, against 6,811,112 in 1925. The report showed railway revenue car-miles to be 54,870,968, against 50,482,115 in 1925, and the coach revenue miles 7,503,988, against 2,056,587 in 1925.

Traffic on Decline in St. Louis

The United Railways, St. Louis, Mo., during the quarter ended Sept. 30 carried about 5,500 fewer passengers daily than in a similar period last year, according to a report filed with the City Register by Receiver Rolla Wells. It is revealed that during the quarter the company carried 61,989,925 cash passengers, compared with 62,097,861 for the similar month in 1925. In the quarter for which the report has just been filed the company operated on weekdays, except Saturdays, 1,308 cars, on Saturdays 1,104 cars and on Sundays 638. Last year 1,301 cars were used on weekdays, 1,091 cars on Saturdays and 612 cars on Sundays.

The reduction in traffic probably would have been much more pronounced but for the Greater St. Louis Exposition held in Forest Park during the last quarter and the little world's series baseball games between the St. Louis Cardinals and the Pittsburgh Pirates at Sportsman's Park late in August.

For the quarter ended June 30, 1926, the company reported 64,923,573 passengers, against 68,261,621 in a similar quarter of 1925.

Canadian Roads Doing Well

Canadian electric railways are showing an increase in business which is not only substantial but must be regarded as distinctly satisfactory by holders of their securities. For each of the seven months ended July, the increases in number of revenue passengers carried was from 2.46 per cent to 6.36 per cent higher than for the corresponding months of 1925. What is more, the improvement of the Canadian systems in 1926 followed a small improvement throughout the whole of 1925, shown at 0.19 per cent.

For the month of July the increase in revenue passengers carried by the seven Canadian systems reporting was 5.66 per cent. The improvement for July is regarded as very satisfactory, since there was a slight decrease for July, 1925.

Deficits on York Radials Paid

The radial question in Toronto, Ont., took a new turn on Oct. 19, when the City Council adopted unanimously the Board of Control's report recommending that payment be made to the Hydro-Electric Power Commission of Ontario for the accumulated deficits on hydro operation of the York radials up to July 31 of this year. The amount involved is $747,457, made up as deficits of $700,693 for 1923, 1924, 1925 and 1926 and $46,864 of accrued interest.

Conspectus of Indexes for October, 1926

Compiled for Publication in This Paper by
ALBERT S. RICHEY
Electric Railway Engineer, Worcester, Mass.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 137 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Digitized by Google

The action of the Council followed a conference between the Board of Control and C. A. Magrath, chairman of the Hydro-Electric Power Commission, at which Mr. Magrath insisted that these funds were needed at once by the commission to avoid financial embarrassment. Funds needed to cover the further deficit incurred between July 31 and Oct. 31 this year were not reported. In a letter to the Board of Control, recently made public, the Toronto Transportation Commission advised that the radials be abandoned because of their unprofitable return.

The poor showing of the radials and the subsequent hectic meetings on the disposition of these lines have been referred to previously in the ELECTRIC RAILWAY JOURNAL.

4,184,841 More Surface Line Riders in Chicago in Month

The monthly report of the Chicago Surface Lines for September points to an increase of 4,184,841 revenue rides over the number carried in the similar month last year. The total rides for the month were 127,149,619, of which 70,279,811 were revenue passengers, 52,926,708 transfer passengers and 3,943,100 free passengers. The average fare per ride was 3.82 cents.

During the first nine months of 1926 the Chicago Surface Lines has shown a consistent gain in traffic compared with the corresponding period of 1925. The addition of 100 new cars during September and October fortifies the company in its plans to care for the big increase in traffic expected during the Christmas shopping season.

EARNINGS OF CHICAGO SURFACE LINES

September	1926	1925
Gross earnings	$4,916,535	$4,721,820
Operating expenses, taxes, etc.	3,889,973	3,753,402
Joint expense account	34,525	10,000
5 per cent interest on purchase price	671,493	671,965
Divisible receipts	320,543	286,453
City's share	176,299	157,549
Company share	144,244	128,904

Divisible receipts for September were $320,543, after taxes, renewals, operating expenses and the 5 per cent interest on the purchase price, against $221,855 in August and $286,453 in September of last year.

Segregation of Delaware & Hudson Properties Authorized

The managers of the Delaware & Hudson Company were authorized by the stockholders at a special meeting on Oct. 26 "to transfer to a corporation or corporations (all the stock of which shall be owned by the Delaware & Hudson Company) all or any of the railroad properties, boat lines, traction lines, motor bus lines, hotels and other analogous interests belonging to it. . . ."

L. F. Loree, president of the road, explained that no plan had matured to date for the segregation of the D. & H. coal properties, since the stockholders granted the board authority to sell the holdings at a meeting in May, 1925.

Commission Hears Chicago Rapid Transit Security Petition

Evidence bearing on the petition of the Chicago Rapid Transit Company for permission to issue and sell $1,500,000 of 7.2 per cent prior preferred stock, series B, and on another, seeking authority to issue $1,795,000 of first and refunding mortgage gold bonds, series A, was heard in Chicago on Oct. 26 by the Illinois Commerce Commission. Orders on both petitions will probably be issued within the next ten days.

The preferred stock is to be sold to reimburse the company for improvements already made this year.

As mentioned in the ELECTRIC RAILWAY JOURNAL for Oct. 16, a special meeting of the stockholders of the company is to be held on Dec. 9 to vote an increase in the company's capital stock from $25,330,500 to $30,330,500, to be issued in the form of prior preferred stock to provide for future capital requirements.

Receiver Appointed for Geneva Road

The Geneva, Seneca Falls & Auburn Railroad, Waterloo, N. Y., went into the hands of Lansing S. Hoskins and James M. Ryan, as receivers, on Oct. 20. The road was forced into bankruptcy by the Chatham & Phoenix National Bank & Trust Company, New York, representing the holders of $504,000 of bonds on which the company was unable to pay interest due on Jan. 1, 1926. Operation will be maintained on the electric line and the Geneva Railway & Bus Line, a subsidiary.

The company operates about 14 miles of line. It was incorporated in 1913 as the successor to the Geneva & Auburn Railway, which had been sold under foreclosure.

Indianapolis & Cincinnati Reorganization Progress

Current newspaper accounts to the contrary notwithstanding, nothing definite has been done or even agreed upon regarding the proposed reorganization of the Indianapolis & Cincinnati Traction Company, Indianapolis, Ind. Nor will anything definite be done along these lines until a decree is entered in the pending foreclosure suit, intended to clear up all debatable questions regarding the property to the end that those interested may know exactly how the matter stands in every respect. It is not possible to tell how soon this will be done, but it will probably be in the near future.

Changes in Financial Set Up Approved in New Jersey

At a special meeting of the stockholders of Public Service Corporation of New Jersey held on Oct. 19 the certificate of incorporation was by a vote of more than two-thirds of all classes of stock outstanding amended in accordance with the recommendation of the board of directors so as to:

1. Increase the authorized preferred stock from 1,000,000 to 2,000,000 shares.
2. Increase the common stock from 2,000,000 to 10,000,000 shares.
3. Provide that of the 2,000,000 shares of preferred stock, 1,250,000 shall be 6 per cent cumulative preferred.
4. Provide for the payment of monthly instead of quarterly dividends on 6 per cent preferred stock.
5. Provide for an exchange of the common stock outstanding at the time the amendment takes effect on the basis of one share of present stock for three shares of the common stock authorized by the amendment.

To the stockholders present at the meeting President McCarter said:

> The corporation is having its best year. Its affairs were never in better condition than they are now nor have its prospects for the future ever been brighter. I have been in this work sufficiently long not to have any delusions about it, so I speak with some confidence when I say that the corporation's condition is very prosperous. We look forward to a continuance of this prosperity in the future, which, of course, will redound to the benefit of the stockholders.

Net Income Lower. — For the three months period ended Sept. 30, 1926, the passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., was $2,754,902, against $2,760,996 for the similar period last year. Operating expenses and taxes increased from $2,368,555 to $2,409,750 for the three months period ended Sept. 30, 1926. After consideration of income deductions there was a net corporate income for the period from July through September of this year of $268,009, against $321,473 for the similar 1925 period.

Net of Eastern Massachusetts for Nine Months Up.—The Eastern Massachusetts Street Railway, Boston, Mass., reports net income of $20,824 for September after charges, depreciation and taxes against $50,904 in September, 1925. Nine months net income was $550,892 after above charges against $543,318 in the similar period of 1925.

Charitable Disbursements Large in Louisville.—The balance in the fund of the co-operative association of the Louisville Railway, Louisville, Ky., on Aug. 1, 1926, was $4,366, and interest on deposits $4.60. The disbursements, including sick benefits, death benefits, salaries and recreation, totaled $1,822. The balance as of Aug. 31, 1926, therefore, was $2,549.

Net Income Increases.—For the nine months period ended September, 1926, the gross revenues of the Twin City Rapid Transit Company and subsidiaries, Minneapolis, Minn., were $9,479,051, against $9,231,793 in 1925. Operating expenses increased from $6,853,485 in 1925 to $6,913,957 in the 1926 period. Net income also advanced from $714,611 in 1925 to $901,085 for the nine months period ended September, 1926.

Nine Months Net Off in Boston.—The Boston Elevated Railway, Boston, Mass., reports to the Department of Public Utilities for the quarter ended Sept. 30, 1926, gross revenue of $7,836,886, compared with $7,686,541 in the third quarter of 1925, and deficit after cost of service and dividends of $1,081,119, against $793,836. Gross revenue for the first nine months of 1926 was $25,957,201, comparing with $25,267,219 in the first nine months of 1925, and deficit after above charges of $749,654, as contrasted with surplus of $49,877 in the similar period of the previous year.

Personal Items

Another Employee Director Elected

W. E. Murphy, Chief Dispatcher, Made Representative of Employees on International Board

William E. Murphy, chief dispatcher for the International Railway, Buffalo, N. Y., was elected a member of the board of directors on Oct. 25. He is the second employee to be made a director, the other representative of the workers being George Burgain, motorman at Cold Spring station. By this action the employees will have double representation in discussions of the affairs of the railway.

Mr. Murphy is vice-president of the I. R. C. Co-operative Association, of which Mr. Burgain is president. Members of this association, comprising the employees of the company, collectively hold $2,000,000, par value, of the company's bonds and stocks, have a saving fund of about $100,000, and each member is protected by a $1,000 life insurance policy. Under the Mitten cooperative plan the men have 50-50 jurisdiction with management in all discussions of wages, working conditions, discipline, etc.

W. E. Murphy

The new director has been employed by the railway continuously for 26 years. His first position, as clerk in the engineers' office, paid $35 a month. Shortly afterward he became timekeeper in the track department, from which position he went to the switchboard. In 1904 he was made a dispatcher, controlling the movement of cars, dispatching of the emergency wagons and attending to similar operating problems. In 1921 he was promoted to the position of chief dispatcher. His office is the nerve center of the entire system on the Niagara frontier, stretching from Buffalo to Niagara Falls, to Chippewa and Queenstown on the Canadian side, and through Lockport to Olcott Beach, which is on Lake Ontario.

Mr. Murphy is the third employee to be elected to the position of director of the company. In 1925 James E. Deaton, full-blooded Mohawk Indian, a pitman in the shops of the company at Niagara Falls, Ont., and then president of the I. R. C. Co-operative Association, was thus honored. He was succeeded by George E. Burgain when the latter became president of the association, and Mr. Burgain is now joined by his vice-president. Together they will represent the employees in the most intimate discussions of company policy and progress.

Personnel Changes in Fitchburg

Emerson W. Baker, district attorney, has been elected president of the reorganized Fitchburg & Leominster Street Railway, Fitchburg, Mass. In this capacity he succeeds Wesley W. Sargent, resigned.

George R. Wallace, Jr., was elected vice-president to fill the vacancy caused by the resignation of Herbert I. Wallace.

Louis H. Cushing is general manager.

Edwin G. Ordway is serving as superintendent of traffic. He has been adjuster of claims of the company for many years.

B. J. Wahle Shore Line Coach Official

Bernard J. Wahle, for the last year and a half assistant general manager and assistant secretary and treasurer of the Calumet Motor Coach Company, Hammond, Ind., has been appointed assistant treasurer and auditor of the Shore Line Motor Coach Company, Gary, Ind.

Since he was graduated from Crane Technical College in Chicago in 1912, Mr. Wahle has been connected with various banking and industrial concerns in the capacity of accountant. He was with the Continental & Commercial National Bank, Chicago, for five years prior to the war, during which he served as paymaster and financial representative of the U. S. Navy at Newport, R. I., and Baltimore, Md.

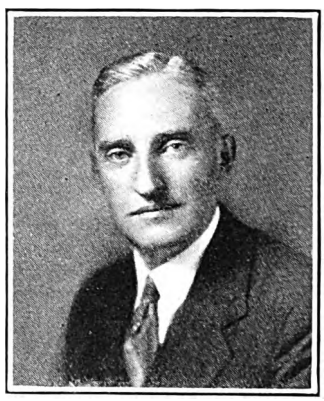
In 1919 he resigned from the Navy to become associated with a firm of public accountants in Chicago. Later, he went to work for the Industrial Appliance Company of that city as auditor.

As operating engineer for the Yellow Cab Company in Chicago, he was subsequently for four years engaged in assisting insolvent taxicab companies to reorganize. In 1925 he entered the employ of the Calumet Motor Coach Company, an independent bus line in Hammond, Ind., but became connected with the Shore Line Motor Coach Company when the Calumet company was brought under unified management last August.

The Shore Line Motor Coach Company is jointly controlled through stock ownership by the Chicago, South Shore & South Bend Railroad and the Gary Railways, members of the Midland group of Insull utility companies.

T. W. Noonan General Manager of Pittsburgh Bus Operation

T. W. Noonan has recently been appointed general manager of the Pittsburgh Motor Coach Company, a subsidiary of the Pittsburgh Railways, Pittsburgh, Pa. He became affiliated with railway work in 1907 when he entered the employ of the Pittsburgh Railways. He served successively as payroll clerk, in the traffic department, in the general manager's office, in the overhead lines department, as secretary to the president of the Duquesne Light Company, and the Pittsburgh Railways. In 1917 he joined the U. S. Army and went overseas. He was discharged from military service in 1919. He re-entered the employ of the Philadelphia Company and affiliated companies in June, 1919, as chief clerk to the operating assistant to the president. His connection with the Pittsburgh Motor Coach Company dates from Dec. 1, 1925, when he assumed the duties of service manager. It is of this company that he was appointed general manager some few weeks ago. The Pittsburgh Motor Coach Company operates 33 miles over territory in and surrounding Pittsburgh.



T. W. Noonan

Mr. Noonan was born in 1888 in Pittsburgh. He attended the grade and high schools there and was graduated from the Duquesne University.

Bill Boyce on Pittsburgh Conference Board

W. H. Boyce, commercial manager of the Pittsburgh Railways, Pittsburgh, Pa., has succeeded Frank R. Phillips as the railway company's representative on the Traction Conference Board. Pittsburgh is represented on the board by two members and the boroughs and townships by a fourth member. As noted previously in the ELECTRIC RAILWAY JOURNAL Mr. Phillips has been appointed to the Duquesne Light Company.

Changes in Westinghouse Engineering Department

R. E. Hellmund Is Made Chief Electrical Engineer and A. M. Dudley is Made Engineering Supervisor

R. E. Hellmund, formerly engineering supervisor of development for the Westinghouse Electric & Manufacturing Company, has been appointed to the newly created office of chief electrical engineer and A. M. Dudley, formerly manager automotive equipment engineering department, has been made engineering supervisor of development, the position left vacant by Mr. Hellmund's promotion.

Mr. Hellmund's activities in his new position will be principally in connection with electrical development work to assure the adequacy and progressiveness of designs and properly to co-ordinate this work throughout the engineering department. He will continue to serve as chairman of the engineering educational committee and will also retain his connection with the supervisory group on development and the patent board.

Mr. Hellmund entered the employ of the Westinghouse company in 1907 as a designer of induction motors. Later he was engaged in general engineering work and, in 1912, was placed in charge of the design of all direct-current and alternating-current railway motors. In 1917 he engaged in miscellaneous consulting work for the company. In this capacity he continued until 1921, when he was appointed engineering supervisor of development. He continued in this capacity until his recent promotion.

He was born in Gotha, Germany, on Feb. 2, 1879, and was graduated from the College of Illmenau in 1898 with the degree of electrical engineer.

Mr. Dudley entered the service of the Westinghouse company as an apprentice in 1904. Shortly afterward he was given a position in the company's engineering department, where he was engaged in the design of alternating-current motors and controllers. Early in 1906 he was made commercial and general engineer in the industrial and power sales department.

In 1907 he was placed in charge of the alternating current motor section and continued in this position until 1918, when he was placed in charge of the design of starting, lighting, and ignition equipment for automobiles. In 1920 he was made manager of the automotive equipment, engineering department. This position he held until 1924, when he was appointed to assist Mr. Hellmund in his work as engineering supervisor of development.

In the capacity of engineering supervisor of development Mr. Dudley will be responsible for all central activities of the engineering department in connection with the development budget and program of the electrical group. He will continue to act as secretary of the engineering educational committee and secretary of the supervisory group on development.

Mr. Dudley has taken out numerous patents on the details of construction of electric machinery. He was born in Cincinnati, Ohio, in 1877, and was graduated from the University of Michigan in 1902 with a degree of bachelor of science in electrical engineering.

Messrs. Egolf and Savage Advanced by North Shore

John F. Egolf, former general manager of the Aurora, Elgin & Fox River Electric Company and for the past few months assistant to the president of the Chicago, North Shore & Milwaukee, Chicago, Aurora & Elgin and Chicago, South Shore & South Bend Railroads, was appointed general manager of the Chicago, North Shore & Milwaukee Railroad on Oct. 26. He succeeds Jesse S. Hyatt, who was recently made engineering assistant to Bernard J. Fallon, vice-president of the North Shore, South Shore, Aurora & Elgin and Chicago Rapid Transit Lines.

Mr. Egolf began his railroad career as a conductor on the Columbus, Ohio, street railways in 1902 and from that position rose to assistant superintendent of the Ohio Electric Railway. Later he became general manager of the Springfield & Xenia Railway. He was president of the Illinois Electric Railway Association in 1925.

Simultaneous with Mr. Egolf's appointment, Howard P. Savage, newly elected commander of the American Legion and former superintendent of the maintenance of way division of the Chicago Rapid Transit Company, was named assistant general manager of the North Shore Line. Mr. Savage entered the service of the rapid transit company as track foreman in 1913. In his new position he succeeds Bert W. Arnold, who will continue as manager of the motor coach department of the company and will also assist B. J. Fallon, vice-president in charge of operation.

Harry B. Ivers Joins Parker Staff

Harry B. Ivers, widely known among electric railway executives of New England for his service on the former Old Colony Street Railway and on various Maine properties, has been appointed head of the newly created co-ordinating department of C. D. Parker & Company, Boston, Mass., investment bankers. He will report to Vice-President Bowen Tufts.

In 1893 Mr. Ivers entered the electric railway field on the Norfolk Suburban Street Railway and during nine years of service on that property and the Old Colony Street Railway rose to the post of assistant treasurer of the latter. For four years he was treasurer and manager of the railway, lighting and gas utilities at Westerly, R. I., and then went to the Milford Electric Light Company of New Hampshire, where he was occupied in hydro-electric development. He next became treasurer and assistant to the president of the Bangor Railway & Electric Company, Bangor, Me., and for eight years served as general manager of the Lewiston, Augusta & Waterville Street Railway. He was the first general manager of the Cumberland County Power & Light Company, Portland, Me., during this period. Since 1917 Mr. Ivers has been engaged in various activities, including a term of service in the banking business.

H. C. Couch Honored Again

President of New Arkansas Organization One of the South's Most Useful and Prominent Citizens

When the record of utility achievement in the South has been written, one of the most conspicuous names on the roster of useful citizens will be H. C. Couch, prosperity promoter of Mississippi and Arkansas. His dauntless pioneering and untiring energies in behalf of these two states have won public approval and recognition from time to time within the past four years. An added distinction has been conferred upon him in his recent election as president of the new utility group, the Arkansas Power & Light Company, formed by the Electric Bond & Share Company, New York, N. Y. This merger brings under one corporate head public utility properties in Arkansas and honors, because of his executive and financial ability, one who perhaps knows more about Arkansas and its possibilities than any other man.

As president of the new Arkansas Power & Light Company Mr. Couch also serves as president of the Pine Bluff Company, operating 10 miles of electric railway in Pine Bluff, Ark. Assisting Mr. Couch in his work will be two vice-presidents, namely, C. J. Griffith, vice-president and general manager of the Arkansas Central Power Company, and J. L. Longino, vice-president and general manager of the Arkansas Light & Power Company. Other officers will be former officials of the Arkansas Light & Power Company, the Arkansas Central Power Company and the Pine Bluff Company.

Harvey Couch is not so much interested in the recognition and subsequent honors as he is in having gratified, to some extent, his ambition to play a part in the great utility development of the South. His goal was rather to make his particular section a better place in which to live, and in this he has succeeded. Railway patrons, manufacturers and farmers, the latter especially, are unanimous in the belief that if a young mail clerk, a son of Georgia parents, had not turned his attention twenty years ago to utility enterprises the new South would still be a dream.

Born in Magnolia, Ark., 49 years ago, Mr. Couch worked in his early youth as a mail clerk running between Memphis and Texarkana. While at this job he determined to make the life of farmers an easier and better one by building more telephone lines. He paid another clerk $100 to swap runs and he took the run from McNeil, Ark., to Bienville, La. In partnership with the postmaster at Bienville he sold coupons for telephone service to the farmers, and with this money and their reputation obtained credit for wire and insulators and built a telephone line, using small trees for poles. His subsequent selling coup, by which the Southwestern Bell Telephone Company parted with $1,500,000 in favor of the Couch-Longino combination, is a thrilling chapter in the romance of the South.

Mr. Couch next turned his attention and energies to the electric light and power possibilities in Arkansas, acquir-

Digitized by Google

ing the systems of Arkadelphia and Malvern. As president of the Arkansas Light & Power Company and the Pine Bluff Company his outstanding services have been mentioned previously in these columns. The railway line he reconstructed until it was put on a paying basis. He saw the same opportunities for service in Mississippi that had stimulated him in Arkansas. He and his associates acquired public service properties in Jackson, Columbus, Greenville and Vicksburg. The Mississippi Power & Light Company was organized, with C. P. Couch, brother of H. C. Couch, as vice-president and general manager at Jackson.

True it is that many railway and power magnates made valuable contributions to utility progress, but it is to be remembered that Mr. Couch succeeded in the midst of war-time struggle and industrial stress. With him success was within—no chameleon judgment, but an adamant purpose to win for others and himself some of the amenities of life to be lived in Arkansas and vicinity. In the midst of sterner realities he remained visionary, an idealist, with performance always part of the dream.

The Pine Bluff Chamber of Commerce good citizenship award of 1925 was presented to him early this year. This trophy was voted to him by the unanimous opinion of a committee representing, in the words of the Pine Bluff *Commercial*, "every activity, every walk of life and every phase of community life in Pine Bluff." A few years ago the Mystic Shriners elected him a potentate. By that title he will always be known in the utility field.

A. W. Brownsworth has succeeded Fred Heckler as master mechanic of the Lake Shore Electric Railway with office at Sandusky, Ohio.

Thomas A. Wright, Jr., has resigned as purchasing agent of the Wilkes-Barre Railway, Wilkes-Barre, Pa. He has been connected with the company in many different capacities for the past thirteen years.

Obituary

Frederick M. Nellis, special representative at New York of the Westinghouse Air Brake Company and secretary since 1899 of the Air Brake Association, died on Oct. 16. He entered the service of the Westinghouse Air Brake Company in 1882 as a demonstrator on its instruction car. Later he went to Cornell University and took a special course in mechanical engineering, remaining at Cornell for three years and being graduated with the class of 1899. He then resumed his association with the Westinghouse Air Brake Company, serving in various responsible positions. For a number of years he was on the editorial staff of *Locomotive Engineering*. Mr. Nellis was born in 1862 at Tionesta, Pa. Early in his career he was a locomotive engineman on the Panhandle Division of the Pennsylvania Railroad. Throughout the remainder of his life he was a member of the Brotherhood of Locomotive Engineers.

Brill Will Build Philadelphia's 150 New Subway Cars

A contract for building 150 high-speed electric cars for Philadelphia's new Broad Street subway was awarded to the J. G. Brill Company on Oct. 26 by Henry E. Ehlers, Director of City Transit for the city of Philadelphia.

The Brill bid, which was the lowest of several received some weeks ago, was $4,039,434, and in awarding the contract Director Ehlers placed the limit at $4,500,000 to take care of unforeseen expenditures. Under the specifications delivery must begin in May of next year and continue until the full consignment has been delivered to the Fern Rock terminal yard.

The cars will be built at the Brill plant in Philadelphia. The Department of City Transit is to supply the motors, motor control equipment, air brake equipment, door-operating devices, couplers and draft gears and other appliances. Bids for this equipment will be advertised for shortly.

Under the Brill contract ten extra trucks are to be delivered. It is also planned to equip ten of the 150 cars with Hyatt roller bearings to determine the effectiveness of roller bearings in this type of equipment.

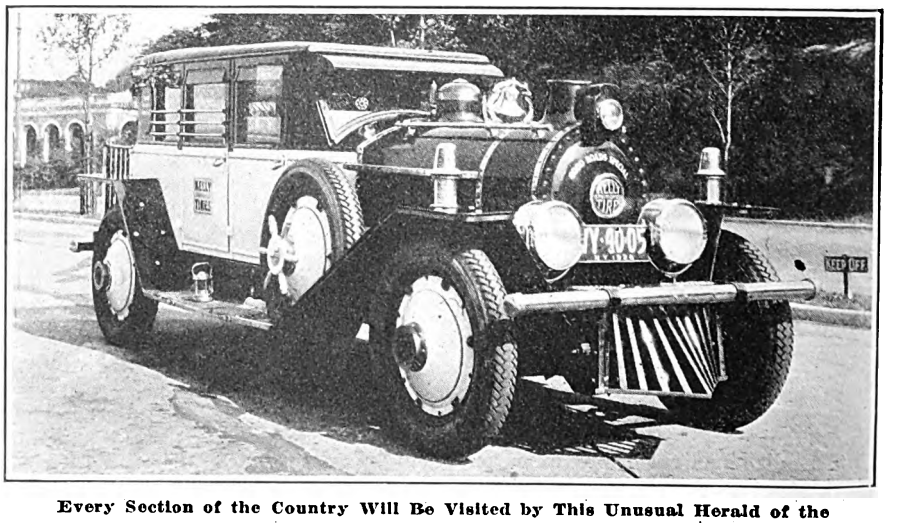
To Stimulate Interest in Good Roads

A desire to stimulate interest in the good roads movement has actuated the Kelly-Springfield Tire Company to send out a "Good Roads Special" on a tour of the United States. The car, from the front, has the appearance of a locomotive, and from the rear, of an observation car. It was first introduced at the convention of the American Electric Railway Association in Cleveland during the week of Oct. 4. The realism of the special is heightened by the fact that it has a smokestack which emits smoke, a real bell and whistle, a sandbox, and Westinghouse air brakes.

Training Apprentices for Industry

A thoroughgoing treatise on the subject of apprenticeship in industry has been issued by the department of manufacture of the Chamber of Commerce of the United States. Information and experiences in the development of industrial training are very completely reported in this booklet, and as a result of the investigation which has been made in preparing the report a number of deductions are made which will be of real interest to all executives charged with the supervision of mechanics and shop labor. Special emphasis is laid upon the value of co-operating with manufacturers and industrial organizations in the training of apprentices by city school systems. It was found as a result of a survey conducted on this point that a large majority of vocational education is carried on in direct conjunction with the industrial organizations of the communities involved, and that the courses described are laid out with a view to training young men for specific lines of employment.

While training of employees for railway shop practice is not specially considered, the subject of industrial apprenticeship has been treated in a sufficiently broad manner to make it well worthy of the attention of railway executives and of railway equipment manufacturers. Apprenticeship for both large and small companies is considered, and the experiences of a number of typical companies are considered in outlining the results of the survey. Opinions of representatives of employers, labor and the engineering profession on the subject of apprenticeship are included.



Every Section of the Country Will Be Visited by This Unusual Herald of the Good Roads Movement

Frank Fageol Resigns

Frank R. Fageol has just announced his resignation from the American Car & Foundry Motors Corporation, New York, N. Y. Mr. Fageol was formerly head of the Fageol Motors Corporation of Oakland, Cal., and the Fageol Company of Kent, Ohio. These two companies were consolidated with the American Car & Foundry Company some time ago and the American Car & Foundry Motors Corporation was founded.

Mr. Fageol has not announced any definite plans for the future, aside from the fact that he intends to take a much-needed vacation in the next few months. It is understood that he will retain no affiliation with the American Car & Foundry Motors Corporation or with the subsidiary Fageol companies. He is now in California and expects to remain on the coast for several weeks.

Rail Orders Are Not Fluctuating

Orders for steel rails thus far placed in the last third of the current year for delivery in 1927 total about 550,000 tons, it is reported. The total last year, September to December inclusive, reached approximately 1,500,000 tons, and it is estimated that the current year's buying will be about the same. No material extensions of existing rail lines are indicated in the purchases for 1926, the total tonnage being almost entirely for replacement use.

J. G. Brill Dividend Period Coincides with Calendar Year

A dividend of $2.91⅔ a share has been declared by the J. G. Brill Company, Philadelphia, Pa. This is at the rate of $5 per share per annum on outstanding common stock for the period from March 1, 1926, to Oct. 1, 1926, to adjust the dividend period to coincide with the calendar year. On March 1 a quarterly dividend of $1.25 a share was paid on the common stock, which was the rate paid quarterly during 1925. The regular quarterly dividend of 1¾ per cent was also declared on the preferred stock. Both of the above dividends are payable Nov. 1 to holders of record Oct. 29.

A Significant Demonstration of Electrical Transportation

On Oct. 29 the directors and officials of the General Electric Company participated in a unique demonstration of various types of electrical transportation mediums. Gathering at the Grand Central Station in New York City at 10 o'clock Friday morning, the General Electric representatives, officials of the New York, New Haven & Hartford Railroad, and various newspaper and technical journal representatives boarded a special two-car train which was pulled to New Rochelle by one of the New Haven standard electric locomotives.

At New Rochelle this locomotive was detached from the train and an oil-electric locomotive took its place. Again, at Stamford, the oil-electric locomotive was dropped off and one of the General Electric Company's a.c.-d.c. locomotives took up the load. When South Norwalk, Conn., was reached the party detrained and boarded a gas-electric rail car which was waiting for them at that point. Thence they proceeded to Bridgeport, Conn., where the party was picked up by gas-electric buses and taken to the General Electric plant located there. The officials and guests were thus enabled to compare the different types of electrical transportation equipment in regular railway service, as the various stops and changes of motive power were made, and it was possible to draw important conclusions as to the relative merits of each form of equipment for main and branch-line service.

Upon reaching Bridgeport the board of directors and other officials of the General Electric Company went directly to the company's plant which is located there. Newspaper representatives and technical journalists were taken to the University Club for lunch, while the General Electric board went into session for a short meeting. Later the directors were served with luncheon at the plant, where they were joined by a number of prominent local business men, Governor Trumbull of Connecticut, the Mayor of Bridgeport and others. Following the luncheons those who so desired were conducted through the General Electric plant, while the others returned by regular trains to New York or other points.

All save four of the members of the General Electric board of directors were present at the meeting in Bridgeport. In addition, F. C. Pratt, G. P. Baldwin, J. G. Barry, E. W. Allen, W. B. Potter and H. L. Andrews, the two latter executives of the railway department, were on hand. E. J. Pearson, president of the New Haven Railroad, and two directors of that road, J. H. Harding and W. B. Lashar, were in the party that went up from New York.

Westinghouse Billings Continue to Rise

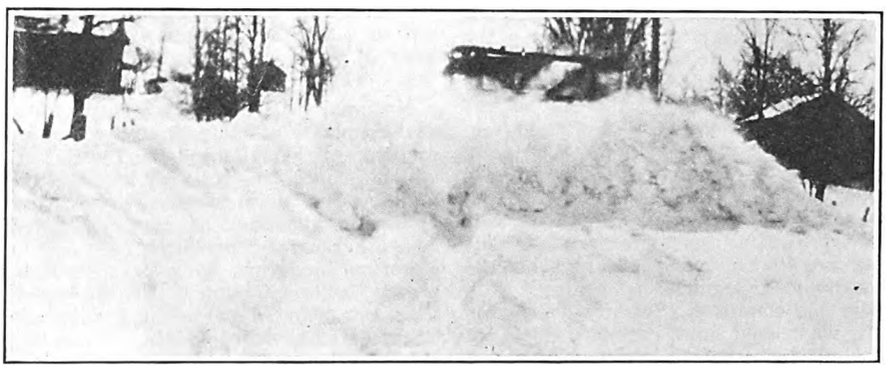
For the quarter ended Sept. 30, 1926, orders amounting to $41,008,310 were reported by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., as compared with $41,250,000 in the corresponding quarter a year ago. The sales billed showed an increase this year, totaling $49,313,230, as against $46,700,000 in the similar quarter last year. For the six months ended Sept. 30 orders amounted to $85,870,667, compared with $85,682,211 in the similar period during 1925, and sales billed $94,453,186, as against $85,424,000.

To Join the Yellow Truck & Coach Manufacturing Company

Raymond C. Snell, formerly in the electric and steam railroad division of the national sales department of the White Company, Cleveland, has joined the Yellow Manufacturing sales organization as assistant to H. E. Listman, vice-president. Mr. Snell has been with the White Company for three years. Prior to this time he was connected with the electric railway industry. Mr. Snell, as assistant to Mr. Listman, will act as special representative of the Yellow Truck & Coach Manufacturing Company. His headquarters will be in Chicago.

Gas-Electric Drive for Snowplows

Fifteen snowplows equipped with gas-electric drive are being obtained by the Philadelphia Rural Transit Company, bus operating subsidiary of the Philadelphia Rapid Transit Company, for use this winter in keeping the roads open for its large fleet of buses, which also have gas-electric drive. The plows were adopted after an experimental unit was tried by the company last winter.



Experimental Gas-Electric Snowplow in Use in Philadelphia Last Winter

Incorporation of gas-electric drive in this service marks the first use of such transmission for other than buses. The plows are mounted on the fronts of trucks and are being manufactured by the Walters Motor Truck Company of Long Island. The electrical equipment, similar to that in the hundreds of buses used by the railway, is being supplied by the General Electric Company. The snow fronts are demountable, so that the trucks will be of service during the summer.

The plows are furnished with two-motor equipment, thus eliminating the differential and reducing wheel slippage and skidding. Some of the inherent characteristics of gas-electric drive found advantageous in bus operation, such as higher schedule speeds and greater comfort for passengers, are not of so much importance in a consideration of plow equipment, but other advantages, such as the impossibility of racing under load or stalling the engine, are important.

Track and Line

Utah Light & Traction Company, Salt Lake City, Utah, has been granted permission by the county commission to provide a single-track turnout or Y track at the intersection of 33d Street South and Highland Drive running eastward.

New York, N. Y.—The Board of Transportation on Sept. 14 asked for bids, receivable Oct. 8, for the construction of the elevated portion of the Fourteenth Street-Eastern subway from Stewart Street, connecting with the Broadway elevated structure, Brooklyn, to East New York. This is the only remaining section of the Fourteenth Street-Eastern line not under construction.

Wisconsin Gas & Electric Company, Kenosha, Wis., has started the work of replacing the single track in Racine on its West Sixth Street line with double track from Lafayette Avenue west to the Kinzie Avenue bridge. Consideration is being given to the plan of extending the West Sixth Street line on Linderman Avenue over the North Shore tracks into West Racine, thence to the Manree Park addition.

Pacific Electric Railway, Los Angeles, Cal., started service recently over the 9,700-ft. extension to the Reliance Rock Company's plant near Azusa. The new line, which branches off the Covina line near Bassett, using an electrified section of the Southern Pacific Company tracks for a distance of 4,500 ft., extends in a northeasterly direction from Bassett. Construction work on the project, costing approximately $200,000, was begun on April 17, and but 3½ months was required to bring it into operating condition. Seventy-five-pound rail was used and catenary type of construction employed in the overhead. An interchange yard of six tracks, capable of storing 125 cars, was constructed. Storage yards adjacent to the rock company's plant also will care for the storage and handling of approximately 100 cars. At the present time the Reliance Rock Company is the only industry served by the new extension, this company's product being crushed rock, sand and gravel, used largely in highway construction in this section.

Power Houses, Shops and Buildings

Los Angeles Railway, Los Angeles, Cal., has given a contract to the Willard Brent Company for the erection of a modern brick, reinforced concrete and steel structure to be used for general bus, truck and auto inspection and as a repair shop. The building will be 310 ft. long and 100 ft. wide. It will provide pit accommodations for 30 buses. It will also contain store room, machine shop, battery room and offices for the superintendent of automotive equipment. The machine shop will be equipped with lathes, milling machines and cylinder grinders. Plans call for three traveling cranes to run the entire length of the building. All of the plans for the new structure were drawn by the engineering department of the railway.

Nashville Railway & Light Company, Nashville, Tenn., has been granted the permit for the construction of a $20,000 fireproof one-story garage. The building will be located on Fourth Avenue, North, adjoining the carpenter shop of the company's car shops, and will be used as a temporary storage garage for the company's motor vehicles, including the new buses which are reported soon to be put in operation.

Trade Notes

Silent Hoist Winch & Crane Company, Brooklyn, N. Y., announces the removal of its works and general offices into its new building at 762 to 772 Henry Street, Brooklyn. The company manufactures winches, cranes and derricks for motor trucks, and electric and gasoline car pullers, hoists and winches, as well as equipment to meet unusual requirements in hoisting work.

Sullivan Machinery Company, Chicago, Ill., announces the appointment of J. E. M. Schultz as manager of its office in Dallas, Tex., to take the place of D. H. Hunter, who has resigned.

G. C. Barry has been appointed assistant to E. G. Hines, general sales manager of American Brown Boveri Electric Corporation, New York, N. Y.

National Carbon Company, Inc., Cleveland, Ohio, has prepared a moving picture entitled "Behind the Pyramids," which shows in a very interesting manner the manufacture, application, operation and care of carbon brushes and other carbon products used in the electrical industry. This picture will be shown before technical society meetings, operating department groups and engineering college classes. There are three reels of film, requiring approximately 45 minutes for showing. Arrangements for showing this film may be made by writing to the carbon sales division, National Carbon Company, Inc., Cleveland, Ohio, or through its sales engineers.

A. D. McKerrow has been appointed sales representative in central New England for the Line Material Company, South Milwaukee, Wis. Mr. McKerrow's headquarters will be at 10 High Street, Boston, Mass. He was formerly manager of the paper and rubber mill department of the Westinghouse Electric & Manufacturing Company's New England office in Boston and prior to that was employed in the engineering and commercial departments of the New England Power Company, Worcester, Mass.

Indianapolis Street Railway, Indianapolis, Ind., has completed contracts for financing and building five electric substations mentioned in the ELECTRIC RAILWAY JOURNAL, issue of Sept. 18, 1926, page 482, and designed to replace completely the present methods of supplying power to the Indianapolis street car lines. Under the contracts more than $600,000 will be spent immediately, the end being more dependable and faster service. The improved plan of supplying current includes four substations of the automatic and one of the manually operated type. Construction on the new stations will begin immediately. The contract for the electrical equipment provides for shipments by units, covering a period of about four months, and the building program calls for completion of the buildings in time to house the equipment as it is received. The equipment will be provided by the Westinghouse Electric & Manufacturing Company and will consist of transformers and rotary converters.

New Advertising Literature

Electric Railway Improvement Company, Cleveland, Ohio, announces the publication of three new catalogs bearing on steel arc-weld rail bonds, portable arc welding and bonding equipment for voltages above 400 and copper arc weld rail bonds. Circular No. 15 outlines a new method of directly copper arc welding rail bonds to mine and railway rail and describes the effect of a new type of copper arc welding rod which carries a special coating. Circular No. 16 is a complete treatise on the various types and methods of arc weld bonding of railway and mine rail and contains a considerable amount of data of value to bonding crews, as well as to purchasing and engineering departments. The Erico type SR portable bonding and arc welding outfit is described in circular No. 17. This circular gives complete data on the use of this equipment for electric welding, brazed bonding and arc welding. In addition to the description of the welding, pictures and explanatory matter are given on a new type of trailer which has just been brought out by the company.

J. G. Brill Company, Philadelphia, Pa., has issued a leaflet giving information on savings in operating costs effected by new cars on four railway properties where modernized rolling stock has been placed in service.

Cornell Iron Works, Inc., Long Island City, N. Y., has issued a new 32-page catalog on steel rolling shutters and doors. The publication describes steel rolling doors and labeled Underwriters' rolling fire doors and includes details of construction with full dimensions and specifications. Fifty actual installations of these doors and shutters in factories, warehouses, shops, etc., are described and illustrated.

Metal, Coal and Material Prices

Metals-New York	Oct. 26, 1926
Copper, electrolytic, cents per lb.	13.80
Copper wire, cents per lb.	16.00
Lead, cents per lb.	8.25
Zinc, cents per lb.	7.56
Tin, Straits, cents per lb.	69.00
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$7.375
Somerset mine run, Boston, net tons	4.125
Pittsburgh mine run, Pittsburgh, net tons	2.675
Franklin, Ill., screenings, Chicago, net tons	1.525
Central, Ill., screenings, Chicago, net tons	1.45
Kansas screenings, Kansas City, net tons	2.35
Materials	
Rubber-covered wire, N. Y., No. 14, ptr 1,000 ft.	$5.75
Weatherproof wire base, N. Y., cents per lb	17.75
Cement, Chicago net prices, without bags	2.10
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.50
White lead in oil (100-lb. keg), N. Y., cents per lb.	15.25
Turpentine (bbl. lots), N. Y., per gal.	$0.89

Volume 68 New York, Saturday, November 6, 1926 *Number* 19

Baffling Problems Are Those Worth Solving

EVERY industry is confronted with problems that for a time baffle solution. They are discussed by the many, but tackled seriously only by the few. For a time they stay the wheels of progress. The industry as a whole pauses and shakes its head. The rank and file think more of the difficulties involved than of the solution—that's why they remain in the ranks. But each of these baffling problems presents an opportunity as well as a difficulty. They test the wisdom, initiative and energy of the men who encounter them.

The electric railway industry has more than its share of baffling problems. It is beset on every side by difficulties that to many have seemed to defy solution. Inadequate revenue, restrictive franchises, burdensome and unfair taxes, listless employees, unfair competition, obsolete equipment, traffic congestion—these have all seemed for a time to be insurmountable difficulties.

But the very number and difficulty of these problems in the electric railway industry measure its opportunities. To the very extent to which they baffle solution by the many do they offer opportunity to the few—to those who have the heart and the courage and the imagination needed. Among those who are today courageously grappling with the electric railways' baffling problems are the industry's leaders of tomorrow.

Jitney Controversy in Detroit Appears to Be in Final Stage

STILL another chapter has been written in the story of the attempt by the city of Detroit to bring the jitneys operated on its streets under regulation. The latest move is an order by the State Supreme Court which sustains a previous order made by Justice Bird last July enjoining the city from enforcing the jitney regulation ordinance pending a decision by the United States Supreme Court. The city wants the case advanced on the court calendar before further damage is done to the railway.

The jitney matter has been before the people of Detroit now for several years. The various moves made are all reviewed briefly elsewhere in this issue of the JOURNAL. It has been a long contest, far too long. The conclusion is inescapable that the management of the municipal railway has been embarrassed beyond measure by this unrestrained competition, which last year mulcted the revenues of the municipal system to the extent of more than $1,000,000.

Long before the recent referendum city officials felt sure of their ground in contending that the jitneys are a menace, and so they considered themselves justified in carrying on an intensive campaign against them. That public opinion had been appraised correctly was shown by the vote at the election on Sept. 14, at which an amendment was defeated which would have allowed 500 jitneys to operate under city license on Woodward, Jefferson and Grand River Avenues and on Fort Street.

At the inception of the controversy in Detroit there was no disposition to deal harshly with the jitney owners. Notice was served to them long in advance that on a specified date they would be expected to withdraw from the field. They were never disposed to comply with this order. Instead they elected to give battle, in behalf of what they considered their rights. In the meantime, however, they have been a source of constant annoyance to the management of the municipal railway. It is to be hoped that the United States Supreme Court will heed the plea for the advancement of the case on its calendar. The issues at stake justify it.

Closer Control Needed Over Operations that Obstruct Streets

IN THE streets of mid-town Manhattan the New York Police Department recently found more than 200 obstructions to traffic caused by building operations, repairs to water, gas and sewer pipes, subway construction, etc. Movement of all traffic was greatly hampered. Street railway service suffered seriously because the presence of these obstacles in the vehicular roadway forced an unwonted volume of traffic onto the car tracks.

The existence of obstructions of this kind in the streets is not a new evil, but the tremendous increase in the use of the automobile has brought it sharply to the fore in all large cities. Although a permit from the municipal authorities is ordinarily a prerequisite for work that will result in blocking a street, the officials responsible for the circulation of traffic seldom are consulted. Building permits generally are granted by the building department and permission to open the pavement by the street department. The traffic department is left to deal as best it can with the situation thus created. Before the advent of the automobile this policy probably served well enough, but nowadays, when every available inch of roadway is needed for traffic, closer control should be exercised over operations that obstruct the streets.

Some interference to traffic doubtless is unavoidable during the construction of any building of considerable size. Often, however, the builder avails himself far too liberally of the public street for the storage of his materials and the location of his machinery. A certain amount of ingenuity and possibly some slight additional expense might be required to reduce the amount of obstructions to a minimum, but, after all, the right of the public to the use of the streets is superior to the convenience of an individual. By firm exercise of the

Digitized by Google

municipal authority it would be possible to reduce greatly this kind of obstruction.

Similarly, obstructions resulting from repairs to water, gas and sewer pipes cannot be eliminated entirely, but they can be lessened materially. In new developments such pipes can be laid under the sidewalks or in parked strips along the curb where reconstruction will not disturb costly pavements nor interfere with vehicular traffic. In older districts, of course, these utilities have already been installed and cannot well be moved. Nevertheless, much can be done to co-ordinate repair work so that the street will not be opened today to fix one set of pipes, and again next week to fix another set. Many renewals can be made to advantage when the paving is open without waiting for breaks to make them necessary. When a section of Fifth Avenue, New York, was opened up some years ago seven gas mains were found where two would have sufficed. No authority existed, however, to order their reconstruction or repair, and new pavement was laid over the old mains. During the ensuing six months more than 50 openings had to be made in this new paving.

More attention is being given to this subject today from the standpoint of protecting the pavement. Its importance as a cause of traffic congestion, however, is often overlooked. In congested districts the latter feature of the situation is fully as serious as the former and deserves the careful consideration of municipal authorities.

A Governor Hell Bent for Heaven

GOVERNOR PINCHOT of Pennsylvania has appointed R. J. Beamish to the Public Service Commission to represent, as he said, the public as contrasted with the utilities of the state and has tagged Chris Golden, another of his recent appointees, a representative of labor on the commission. But that is not the end of this iniquity. The Governor says that he hopes "to be able in the near future to announce the appointment of another commissioner whose attitude toward the rights of the public will be the same." Probably not one bit of fault can be found with either Mr. Beamish or Mr. Golden, but how unfair it all is to them, to the public and to the state as a whole. No similar case is recalled in which a Governor so labeled men named by him for appointment to a regulatory body.

The Governor has been almost continually at war with the Public Service Commission ever since he has been in office. There is no mistaking his leaning. The conclusion is inescapable, however, that he is either unable clearly to conceive the character and purpose of the Public Service Commission as defined in the law or he chooses to disregard its specifications and spirit.

For his attitude he is rightly called to account by the Philadelphia *Public Ledger*. The whole idea of regulation is that it shall be conducted by a quasi-judicial body. It is not supposed to reflect the desires or views of a particular class or faction. Like the courts, the regulatory body sits in judgment on the facts and the evidence. As the *Ledger* says, it presupposes these new members will permit their judgment to be swayed in accordance with the humor of the forces they are supposed to represent. In designating his appointees as he did, the Governor takes from them the first requisite of efficient service—independence of judgment and decision. His attitude represents an assumption of power not conferred by any state law.

It will not do to dismiss the issue with the thought that the Governor will be out of office the first of the year. The matter is too far-reaching for that. The question that arises and is being asked is how the ends of impartial judgment can be attained when members are appointed specifically to represent the ideas of this and that shade of opinion. Such action is not at all in conformity with the intent of the law or with ordinary ethical conceptions. It can only be explained in terms of the acts of the zealot "hell bent for heaven," to whom every corporation, even at its best, is the embodiment of the world, the flesh and the devil.

Utilities Hit by Higher Learning Wave

WITH the serious season well under way systematic and clearly-defined educational plans have been evolved by many railways, with hundreds of employees and officials, too, enrolled for courses in instruction desired, needed or suggested. Among the prominent exponents of the educational theory is the Boston Elevated Railway. Here under a carefully selected staff of instructors an employee can indulge in electric railway law, public speaking, reading and current events. So interesting and profitable were last year's courses in Boston that many requests were made for similar topics during the 1926-1927 term. In Milwaukee, under the slogan "The Trained Man Wins," the Milwaukee Electric Railway & Light Company is offering to its employees not only necessary information for their advancement but is also giving advice to individuals on the best path to pursue. Subordinates of the Pacific Electric Railway, Los Angeles, who are quick to grasp the opportunity for a limited number, have the privilege of learning the elements in "Traffic Management," with a practical demonstration by men actually employed in such work. Nor has Mr. Mitten lagged behind in this march to higher learning—his men are attending classes for "broader understanding of the principles underlying the company's co-ordinated system, and its varied activities." In the utility classes in Pittsburgh a vice-president sits adjacent to a conductor, so avid are they both for enlightenment on the utility as a business. These above-mentioned properties are fairly well launched on the campaign for the better-informed employee, but there are many other properties in the inchoate stages of this development idea.

This "learning wave," so far as the railway employee is concerned, has followed naturally the universal interest in the subject of utilities and their management. Many university leaders have seen the need for including in their curriculums courses in public utility regulation and management, and certain undergraduate school authorities have arranged for public utility speakers to discuss such phases of the economic life. An instance of the latter is seen in Ohio, where the state superintendent of public instruction has arranged for speakers to address various student bodies.

This year such activity in the universities is being continued. Northwestern University of Evanston, Ill., is offering a course in public utilities, and Indiana University of Bloomington, Ind., is giving not a profes-

Digitized by Google

sional course for the training of future executives but a course in general information. Today, a properly qualified business man can learn at the Harvard Business School methods of public utility regulation through a study of utility decisions. Closely akin to the utility subject is accident prevention, which is this year being discussed at New York University. Again, these are only the "high spots" in this educational panorama, but they are evidences of the present-day demand for knowledge of utilities.

With a corps of better-trained employees and a well-informed management and public, might not the *ne plus ultra* in the railway business be realized? It is hoped and expected that the various studies now being undertaken will be reflected in a new service, sympathy and solidarity embracing the public, the management and the employees.

Nashua Pioneers for True Bus Flexibility

ON THURSDAY, Oct. 28, 1926, the Public Service Commission of New Hampshire issued an order that will make it possible for at least one electric railway operator to take full advantage of the flexibility of the motor bus. Under this order, the commission gives the Nashua Street Railway the broadest possible right "to decide for itself what streets may best be included in convenient and profitable routes."

Heretofore, only the lawless jitney has been able to choose its routes at will. When electric railways have entered the bus business, as at Nashua, they have found the flexibility of the bus greatly circumscribed by the condition that they were expected to run over the same route throughout all hours of the day and all days of operation. The operator has not been permitted to use his own judgment in combining maximum service to the public with best returns to himself.

Naturally, so broad a right is not lightly granted. In the case of the Nashua Street Railway, the commission recognized points of special merit. The company had earned the confidence of its local public in every possible way and was known to be doing all in its power to give service to all parts of the city. However, its bus operations were hampered by the customary terminal-to-terminal restrictions. It seemed to the management that if the bus routes could be shifted to meet varying requirements of service in different parts of the city, such routes would be much more useful to the community. This decision helps to establish a precedent in car and bus co-ordination that will surely aid the industry everywhere.

Advertising Plays Important Part in Everyday Existence

MANY statements of interest to manufacturers and electric railway men were made by President Coolidge in an address on Oct. 27 before the annual convention of the American Association of Advertising Agencies. The President, who is temporate of speech and self-effacing in action, praised advertising as having played a leading part in stimulating the growth of the United States and in making possible the maintenance of a high standard of living and a high scale of wages.

Advertising, a comparatively new but none the less potent force, is a factor that is shaping economic destiny. It is doing it in one field no less than another, but its effect is not evenly appreciated. In other words, the consciousness of it is deeper in some lines of endeavor than in others. Its value as a business builder has been slow to express itself in the electric railway field—far too slow. There is no need to reiterate the reasons why this is so. In the sale of transportation, as in the sale of any other commodity, it is essential that the merchant know the important part that advertising plays today—that he be fully cognizant of the fact that advertising is one of the most potent influences in adapting and changing the habits and modes of modern life, affecting what we eat, what we wear—the work and play of the whole nation.

Railway men everywhere should read the President's speech. And in reading it they should remember the truism on which his central theme revolves, namely, that mass demand has been created entirely through the development of advertising and that while advertising is the life of trade its successful use depends upon a representation of the exact truth.

No statement of these virtues made for advertising by anyone within the profession would have carried the weight that the President's remarks did.

Cost Accounts Should Do More than Record Expenditures

IGNORANCE of essential facts often leads to serious errors of omission or commission in management. It is to the accountant that the railway manager must look for his facts. But accountants as well as other department executives are seeking economies in the operation of their departments and in so doing the basic facts relative to the economies of old versus new equipment are often not revealed.

This was effectively shown in a recent examination of the monthly statements of a large interurban property. New light-weight cars replaced old ones on one division, yet the cost of equipment maintenance showed no change to the division affected, because the savings were spread over the whole property. This was the result of a practice existing on many properties of throwing the cost of maintaining all equipment into the prescribed classification of accounts and prorating to divisions on the basis of car mileage. There is consequently no basis for determining the relative cost of different groups of cars or of knowing when the costs on obsolete equipment have become excessive.

It seems even more important to classify accounts between groups of cars than between the different classes of work on all cars. The present classification, of course, has many obvious advantages and has become a standard with the I.C.C. and many state commissions. For bookkeeping purposes it has proved satisfactory and adequate.

Cost accounts should do more, however, than form a mere record of expenditure. They should serve as an active guide in the administration of operating and maintenance departments. In the equipment accounts, particularly, the present classification falls far short of this requirement.

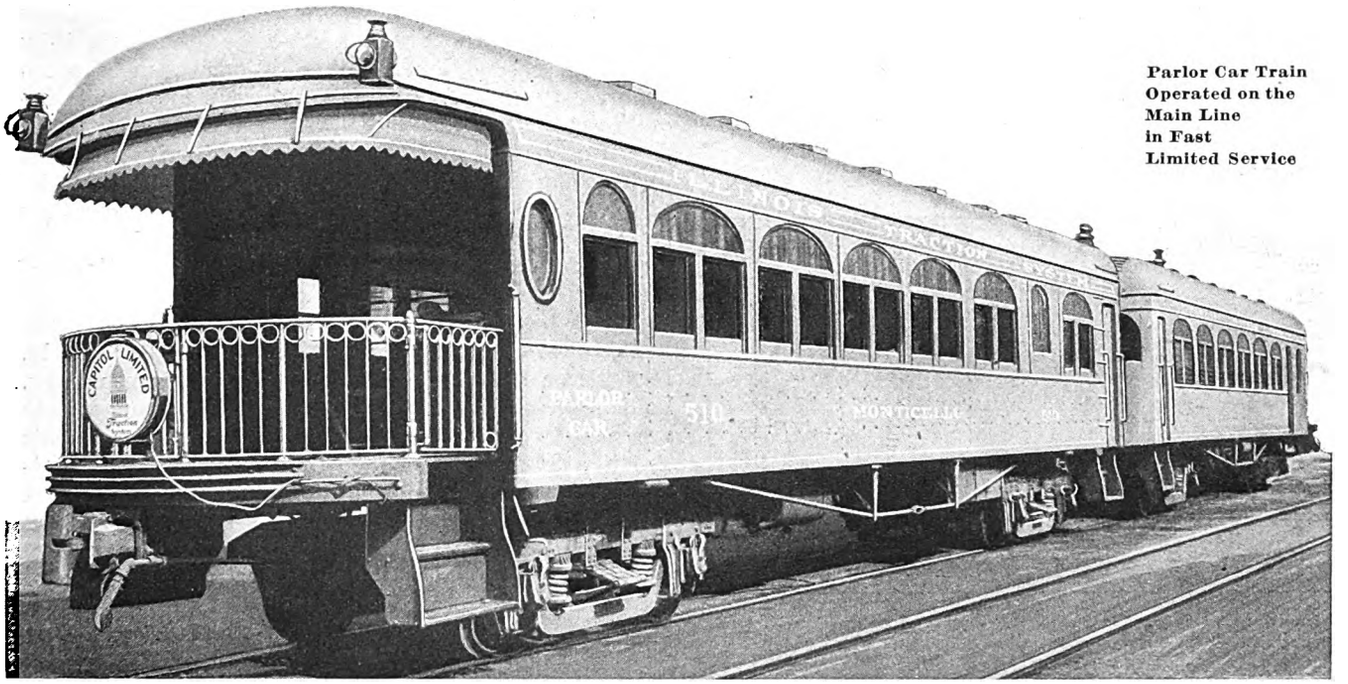
Illinois Traction

Checks Passenger Decline with Improved Equipment and Service

More Attractive Equipment, Faster Schedules, More Frequent Service and Intensive Merchandising Effort Cause Recovery of Passenger Receipts in the Face of Severe Automobile Competition



Parlor Car Train Operated on the Main Line in Fast Limited Service

IN COMMON with other electric railways throughout the United States, the Illinois Traction System has been confronted by a condition of dwindling passenger traffic due to the tremendous increase in the use of private automobiles in intercity transportation. Not only has the number of private automobiles greatly increased, but their use in intercity transportation has been fostered by the annually increasing mileage of paved highways.

An alarming decrease in passenger revenue made imperative extraordinary efforts to check the decline. The measure of success in these efforts is shown by the fact that the curve of passenger earnings again is turning upward. The number of registered automobiles in the state increased from approximately 950,000 in 1923 to more than 1,350,000 in 1925. The mileage of paved roads in the counties served by the Illinois Traction System increased from 890 in 1924 to 1,006 in 1925. More damaging, however, to the company's passenger earnings than the increase of 15 per cent in the hard road mileage was the closing during the year of many unpaved gaps in the existing hard road.

As a result of this paved road competition, passenger earnings, which amounted to approximately $1,100,000 during the six months period ended Oct. 30, 1923, failed to increase during the six months period ended April 30, 1924, and then began a rapid decline. Earnings for the six months period ended Oct. 30, 1924, amounted to only approximately $850,000, and a further decrease was noted for the six months period ended April 30, 1925, when passenger earnings were less than $800,000. At this point strenuous efforts on the part of the passenger traffic department resulted in slightly increased traffic and earnings held steady for the six months period ended Oct. 30, 1925, at slightly less than $800,000. Results of the intensive campaign to increase passenger revenues did not, however, become fully apparent until April 30, 1926, when the upward movement of passenger earnings began. A detailed story of the accomplishments along this line is told in the brief presented by the company in competition for the 1926 Coffin prize.

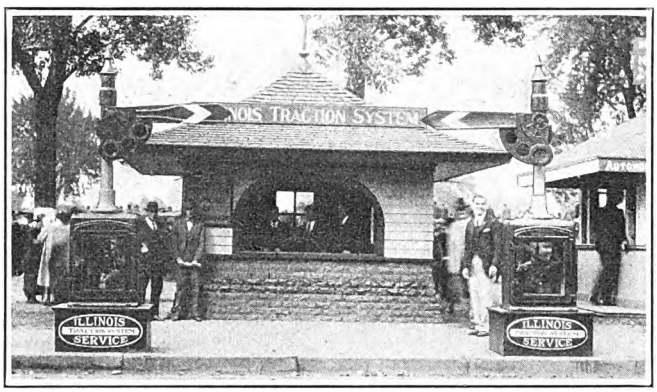
The first step taken to increase passenger traffic had for its object the development of through riding between the larger cities on the line. To accomplish this a revision of schedules was made. More trains, faster running time and better connections were provided at the larger cities all along the line. From Peoria to Springfield and St. Louis an additional "Tangerine Flier" was provided, bringing the number of these popular trains up to four daily, in addition to the "Capital Limited," parlor car train, and the "Owl," sleeping car train, between these points. This marked the adoption as permanent of the Tangerine Flier service inaugurated late in 1924 and described in the Nov. 29, 1924, issue of

Digitized by Google

ELECTRIC RAILWAY JOURNAL. The Tangerine Fliers operate on extremely fast schedule between Peoria and St. Louis. Special cars are used for this de luxe service. Seating arrangements provide for both the usual type of coach seats and also for parlor car chairs. No extra fare is charged on the Tangerines. The cars are painted a special color, developed by the Illinois Traction System, which for advertising purposes has been given the trade name of Tangerine. This has been effective in calling the public's attention to these trains.

SPEED AND FREQUENCY OF SERVICE INCREASED

From Peoria to Bloomington and Decatur an additional limited train was added, bringing the total number of limited trains in each direction up to four daily. Connecting Springfield, Decatur, Champaign, Urbana and Danville four fast trains each way daily were provided and schedules for both local and limited trains on all divisions were readjusted to improve service. An intensive campaign of advertising was then inaugurated. Newspaper display advertising was employed in announcing the changes, and in addition thousands of time-table circulars were sent out to chambers of commerce, fraternal and civic organizations, churches, societies and associations throughout the territory. In cities where chambers of commerce were in existence arrangements were made whereby copies of the circular were mailed to each member of the chamber. This advertising activity was supplemented by the usual circular and time-table matter distributed in stations, by time-table distributing companies, in railroad guides, railroad stations, on connecting lines, in hotels and by travel bureaus, etc. Arrangements were made even with a number of taxicab companies in the larger cities to distribute condensed time-table circulars in the "take-one" boxes in the cabs.



Information Booth at State Fair Helped to Advertise the Illinois Traction System Service and to Make Friends for the Company

Organization of a "Traction Go-Getters Club" also helped in building passenger revenue. Letters were sent to the employees of every department of the road urging them to be on the alert for passenger business and asking co-operation with the passenger traffic department by turning in tips on probable passenger movements, whether of a single individual or a considerable number. These bulletins, sent to each employee at monthly intervals, had the effect of keeping constantly in the minds of each his vital interest in the welfare and prosperity of the company. Each month many tips were sent to the traffic department covering prospective freight and passenger business. These tips are turned over to the traffic department representative in the district where they originate, and personal solicitation for the business is made.

The Illinois Traction System is in competition with twelve steam railroads. In an effort to make its service more attractive, the company instituted the sale of a $10 coupon fare book at a 10 per cent reduction. The book, which sells for $9, contains $10 worth of 1-cent coupons good for bearer and party for one year from the date of sale. The coupon books are advertised as a 10 per cent reduction under the regular interurban fare and a 25 per cent reduction under the steam road fare. Frequent riders are urged to purchase these books, with the object of establishing the habit of riding the electric line. The use of coupon fare books is just entering upon its second year, and its popularity is illustrated by the fact that sales now exceed those of a year ago by 83 per cent.

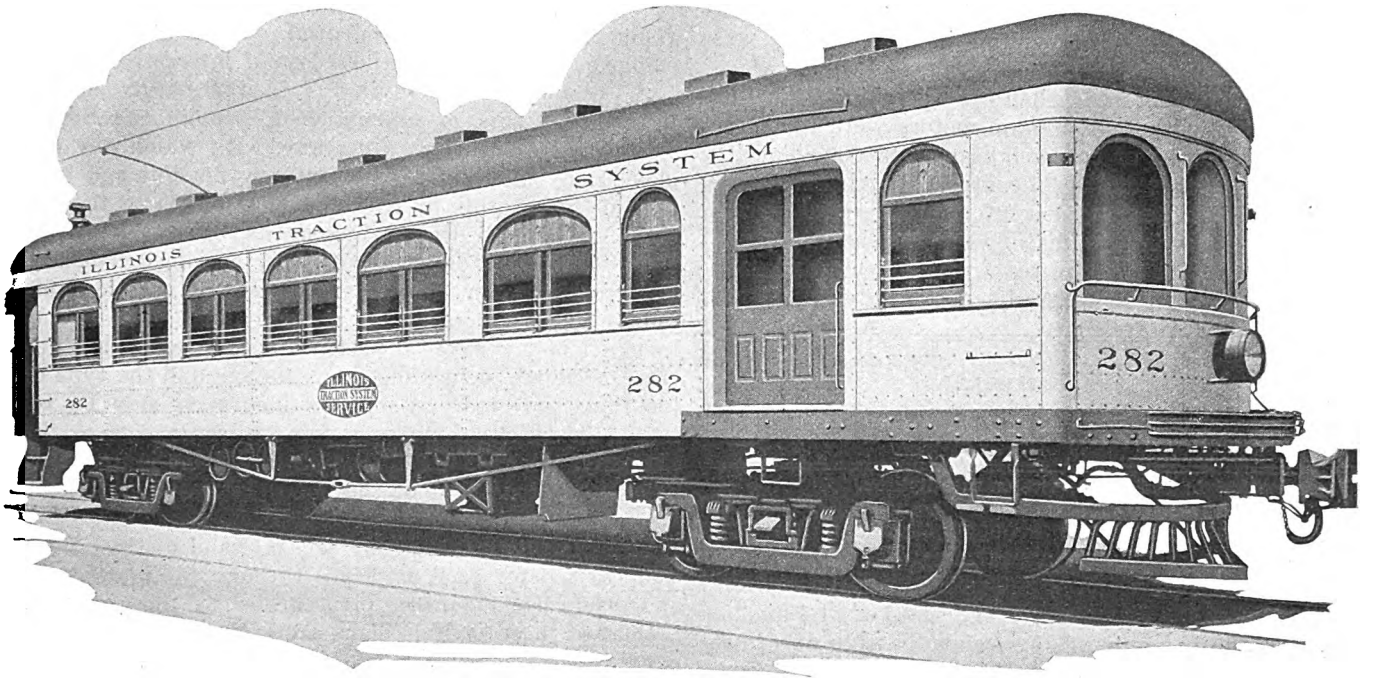
Recognizing the efficacy of building public good will as a promoter of business, the company has bent its efforts toward the creation of a good will asset by rendering special, out of the ordinary service when opportunity offers. Where large group movements require special trains these are provided, and traffic department representatives are trained to give attention to the comfort and needs of the party. These special parties not only add to the passenger revenue but they create good will and have the cumulative effect of promoting future business, as is evidenced by testimonial letters received from many sources. Special attention is paid to baseball enthusiasts who wish to attend Three I League games at Peoria, Bloomington, Springfield, Danville or Decatur, or the major league games at St. Louis. In all the cities named special arrangements are made to set aside certain blocks of seats for Illinois Traction System patrons, so that those desiring to attend games may purchase tickets at traction ticket windows.

REGULAR PARLOR CAR AND SLEEPER SERVICE OPERATED

The Illinois Traction System claims to be the first electric railway to adopt regular parlor car and sleeping car service. This has been successfully continued. The latest addition to its sleeper service is that started in 1925 between Champaign, Ill., and St. Louis, a distance of 198 miles. Because of the lateness of the hour at which sleeping car passengers arrive at Champaign, 8:30 a.m., a light breakfast is served, for which no charge is made. The porters hand each passenger a small card on which is printed "Good Morning—This light breakfast is served by courtesy of the Illinois Traction System to guests aboard our St. Louis-Champaign sleeping car." As a result of the establishment of this service the St. Louis to Champaign traffic has been increased 41.9 per cent and Champaign to St. Louis traffic increased 57.45 per cent over the previous year.

The value of paint and a general appearance of attractiveness, which has proved so effective on the Tangerine Fliers, is also being demonstrated on the company's suburban line connecting St. Louis, Venice, Madison and Granite City, Ill. Cars operated in this service are run in two-car trains. Recently a change in the color scheme and vestibule arrangement met with an immediate response from the riding public. It was noticeable that when the newly painted cars were placed in operation with the old cars during mass movements they were plainly preferred by the car riders. The program of reconstruction includes the removal of the front bulkhead and the addition of two seats in the front end of the car. A small cab was built around the motorman's position. The partition forming this cab

Digitized by Google



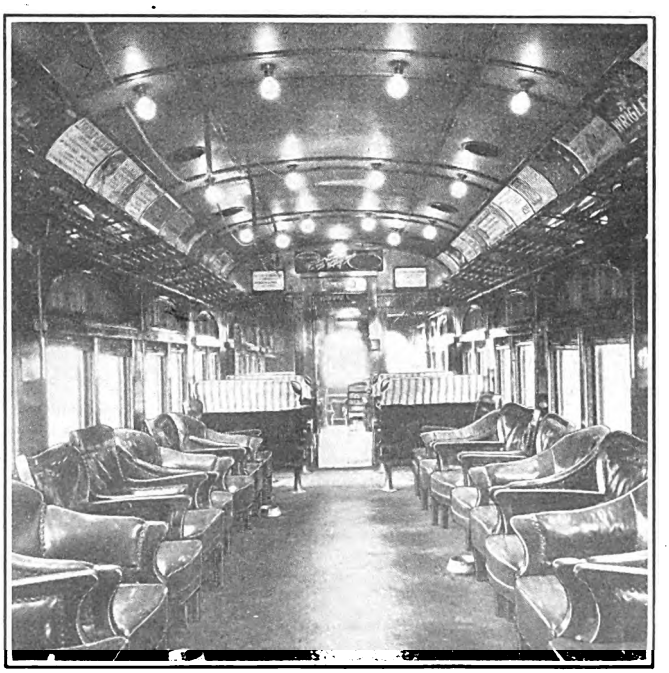
Exterior Views of New "Tangerine Fliers." Distinctive Color, High-Speed Operation and Semi-Parlor Car Facilities with no Extra Fare Have Helped to Build Up Riding

is equipped with glass above the watertable, thus allowing passengers a clear view ahead of the car. All light and heat switches, as well as all equipment pertaining to the operation of the car, formerly exposed on the front platform, are now hidden from view. Economy meters are placed inside the cab where the motorman may easily read the registration. This arrangement also eliminates the practice of smokers standing on the front platform. Those desiring to smoke are requested to ride in the trail car and consequently all passengers seem to be pleased.

Tightening of passenger train schedules on the main division has not only resulted in more economical but also more efficient operation. Revised passenger schedules with an average speed for all limited trains of 29.56 m.p.h., compared with 27.22 m.p.h., and an average speed for local trains of 24.34 m.p.h., compared with 22.45 m.p.h., resulted in having 93.5 per cent of the passenger trains on time daily, which is an improvement of 4.2 per cent over the previous year.

Passenger car miles for the year ended May 1, 1926, showed an increase of 13.3 per cent over the previous year, while passenger trainmen's hours for the same period showed an increase of but 7.77 per cent. This is evidence that the addition of trains and reduction of schedule time have proved to be an economy. Many ways have been found for speeding up passenger schedules. Delays in getting trains through congested sections of the cities have been eliminated by enlisting the co-operation of municipalities and other carriers and by routing freight trains either around the principal cities or over routes that do not interfere with the operation of passenger trains.

The installation of flashing light signals at street corners has eliminated previous positive safety stops in some of the smaller towns, the installation of crossing gates over railway crossing tracks, which are set normally for Illinois Traction trains, also help. Electric switches make it unnecessary for trains to come to a stop. Flagmen of street railways over which Illinois Traction trains operate, flag trains over railroad crossings and station agents in the small towns flag public street crossings adjacent to their stations. All these arrangements have helped to speed up service and have made it possible to operate limited, non-stop passenger trains while at the same time increasing safety. These improvements have likewise affected the freight service. They have made it possible to put through freight trains on working time-tables and have helped to increase the allowable tonnage per train.



Interior View of New "Tangerine Flier"

The use of one-man interurban equipment on the Illinois Valley Division has been given more than one year's test and has resulted in increased riding, reduced operating expense and increased earnings. Although the Illinois Valley Division operates 106 miles of track through sixteen stations and carries baggage and express on all trains, the management decided that one-man operation was entirely feasible. Consequently, seventeen new one-man, single-end, double-truck cars were purchased and substituted for the heavy equipment previously used. The former schedule was on a two-hour basis.

Digitized by Google

The present schedule, providing hourly service, was inaugurated on Aug. 1, 1924.

Where previously interurban cars weighing 94,000 lb. and equipped with four 100-hp. motors were used, the new one-man type of car weighs only 37,000 lb., with four 35-hp. motors and K-35 control. Particular attention was paid to passenger comfort and general attractiveness. Seats in the main compartment are plush covered, the floors are covered with linoleum and each seat has arm rests and an adjacent coat hook. Sand-

	1923	1925	Saving per Car-Mile	Per Cent Reduction
Equipment	3.60	0.95	2.65	73

Platform expense	5.17	3.75	1.42	27

*Includes freight and city service on this division.

blasted pebble glass upper windows of the Gothic type give the car a distinctive appearance. These cars are geared to about 40 m.p.h. at 600 volts and on an average line voltage of 520 make an average speed of 21.4 m.p.h., with one stop per mile of 35 seconds average duration. Passengers ordinarily enter and leave by the front door. However, at heavy loading points the rear door may be operated by an air valve outside the car and fares collected by street fare collectors. Passengers pay to their destination when entering the car and receive destination checks, which are surrendered to the operator upon leaving the car. A full description of these cars was given in the Jan. 10, 1925, issue of ELECTRIC RAILWAY JOURNAL, page 51.

With these one-man cars on hourly schedules reports show 97.2 per cent on time, as compared with 92 per cent for the same twelve months period under two-man operation of old cars on a two-hour schedule. The one-man cars have practically eliminated platform accidents. Only one such accident has been reported since the cars were put in operation. Reduction in operating cost per car-mile for those accounts affected by the new cars are shown in the accompanying table.

The results of the operation of these cars have been so satisfactory that the company has appropriated funds for the purchase of ten additional cars of the same design to be used on branch lines of the main division to replace heavy, two-man equipment. Other similar equipments include the remodeling and acquisition of light-weight, double-truck one-man cars for city service in La Salle and Peru and branch line service on the Vermilion Heights and Catlin branches out of Danville. All three of these situations have responded to the improved service and marked economies in operation have been effected.

Employee Savings Made Easy by Northern Texas Traction

TWO plans for employee saving have been perfected by the Northern Texas Traction Company of Fort Worth, Tex., as of June 1 this year. These plans are an outgrowth of successful Liberty Loan sales made during the war period and later sales of 7 per cent notes by the company.

Through arrangements with the Tarrant County Building and Loan Association any employee of the Northern Texas Traction Company may ask the company paymaster to deduct any amount the employee desires and apply it to building and loan shares. These deductions bear interest at the rate of 8 per cent. Provision is made for withdrawal on the part of the employee at any time without loss of interest.

A second plan of saving is in the nature of life insurance. This is accomplished through the Southwestern Life Insurance Company, with which any employee may take out a policy of any amount and have it paid for monthly by regular deductions from the pay check. Through the arrangements of the Northern Texas Traction Company with the insurance company, the premiums for this insurance are at a lower rate than would be charged for an individual policy. Any form of policy may be selected by the employee, the rate, of course, depending upon his age and the type of insurance selected. Also, this insurance may be retained in case the employee for any reason leaves the company. In case the age of the applicant is under 45 years, or the amount of the policy is less than $5,000, no physical examination is required.

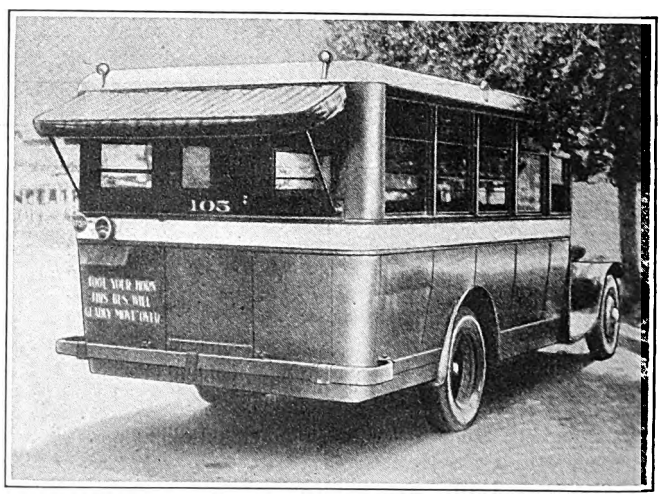
This insurance is entirely separate and distinct from that carried for each employee through the mutual aid and group life insurance plan carried by the company.

Both of these savings plans are explained in the company's 1926 Coffin prize brief.

Rear Awning Protects Bus Passengers

ALL buses of the El Paso Electric Company have been equipped with awnings which shade the rear seats and keep the inside of the buses cool. These awnings make riding more comfortable, especially during rush hours in the morning and evening when the buses are crowded. Many favorable comments have been received from passengers. Mention is made of this device in the brief presented by the company in competition for the 1926 Coffin Prize.

On the back of each bus has been painted a sign which reads "Toot your horn and this bus will gladly move over." This sign has done much to create good will. It shows the drivers of private automobiles, whom the company is endeavoring to secure as customers, that



Buses of the El Paso Electric Company Are Equipped with Awnings at the Rear to Protect Passengers from the Glaring Sun

it is trying to do its share toward keeping traffic moving smoothly. Keeping this sign constantly before them also tends to make them more considerate of the rights of other users of the street. This, in turn, reacts to the advantage of the company. Many people have expressed admiration for the spirit of fairness and co-operation which prompted the El Paso Electric Company to place this sign on its buses.

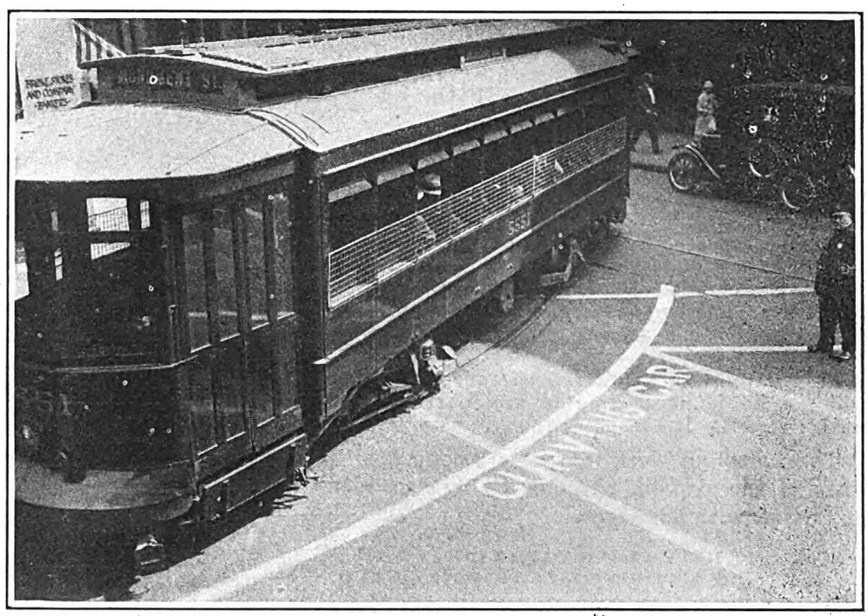
Elaborate Safety Precautions in Baltimore

Efforts Are Addressed to Public and Employees, and a Number of New Methods Have Been Put in Operation This Year—They Include Distinguishing Straps for Car Greasers, New Rule Book, Expansion of Safety Courses, Lighting of Waiting Areas on Streets, Etc.—Gratifying Gain from Safety Work Done Thus Far

FOR a number of years past the United Railways & Electric Company of Baltimore has paid a great deal of attention to means for reducing accidents. Its safety program has included teaching safety intensively and constantly to its employees; imparting safety information to children in the schools and at all public gatherings of children; impressing safety rules and practices upon the general public by widespread publicity, and eliminating hazards and adopting safeguards in operation and service whenever opportunities appear. The success of this effort is shown by the lower accident records of the company.

In 1925 there was but one boarding and alighting accident and but one person injured in street car collisions in Baltimore for each 106,210 passengers carried, while in 1919 there was one such accident and injury for each 63,817 passengers carried.



These Markings on the Pavement at a Curve Are a Warning to Pedestrians of the Overhang of a Car

In the three years ended December, 1925, the decrease in the number of pedestrians struck by cars was 11 per cent; in persons injured while boarding cars, 24 per cent; in persons injured while alighting from cars, 51 per cent; in passengers injured in collisions between cars, 12 per cent; in injuries to occupants of horse-drawn vehicles, 43 per cent; in accidents to employees, 4.9 per cent. Injuries to occupants of motor vehicles in collisions with street cars increased 2 per cent.

But the net decrease in personal injury cases from all causes during the three years ended December, 1925, as compared with the three years ended December, 1922, was 17 per cent. Compared with 1919, the decrease in 1925 was 34 per cent.

In the same comparative periods street car accidents resulting in fatalities decreased 20 per cent.

Comparing the same periods, accidents resulting in claims have decreased from 37 per cent of the total to 29 per cent, and the percentage of gross revenue expended for claims and suits decreased from 4.61 per cent in 1920 to 3.45 per cent in 1925. Evidence that the trend is still downward is found in still further decreases during the first six months of 1926, indicating 3.25 per cent of gross revenues.

The company's methods of impressing upon its men the necessity for thinking of safety always will be dealt with later on, but at the outset the story of its most recent efforts to reduce accidents will be told, as given in the company's presentation in the Coffin contest for 1926.

Early in May, 1926, the company launched a series of "Week-End Safety" campaigns. Each Monday morning the newspapers carried stories of the long lists of accidents that had occurred on Saturday and Sunday when thousands of families were taking summer holidays. Many tragedies were among them, by far most of which involved automobiles. The street car accident reported over the week-end was rare.

But the company used the newspaper publicity given to week-end accidents as a vehicle to carry its own safety messages to its men. Large posters were placed in all carhouses and substations and in the company's offices as follows:

Accidents Over the Week End
Mar Happiness in
Many Homes
Make Our Service
SAFE
Prevent
WEEK-END TRAGEDIES

At the same time cards were distributed addressed "To operating employees," and reading in part:

Digitized by Google

All of us know the week-end toll of accidents. Monday's newspapers carry columns about these mishaps. Lives are lost. Untold suffering and economic waste lie in the wake of weed-end holidays. . . .

In the interest of public safety this company is co-operating in efforts throughout the city to

PREVENT WEEK-END ACCIDENTS

We have the utmost confidence that every man in this company will lend his full assistance to this worthwhile effort.

The responsibility is placed squarely upon you and we know you will be equal to it. SAFETY DEPARTMENT,
United Railways.

No accidents involving street cars were reported in the newspapers on the first Monday morning following the launching of the campaign, and at once the safety department put out posters, reading:

Street Cars and Buses Were Absent
from Newspaper Accounts
of
SERIOUS WEEK-END ACCIDENTS
You Demonstrated Skill
and Carefulness!
BEAT LAST WEEK'S RECORD!

This time, too, cards were distributed to all operating men, reading:

Street cars and buses were conspicuously absent from Monday's newspaper accounts of serious accidents in this city last week end. Your special effort to bring about this result was another evidence of the fine team work and co-operation which always produces results in our organization. . . .

As we approach another week end, we are confident you will not be found lacking in any particular to beat last week's record. It can be done and you will do it.

The following week the posters contained lists of the lines of the system, without a single accident, serious or trivial, with the legend:

HELP PLACE YOUR LINE IN THE
NO-ACCIDENT LIST THIS WEEK END

The newspapers took up the campaign and printed articles about it, featuring the company's efforts with such headlines as:

WEEK-END TROLLEY SAFETY CAMPAIGN ON
Effort Started by United to
Cut Down Holiday
Mishaps

Another story was headed:

SEEKS TO REDUCE ACCIDENTS
United Railways Will Use Posters
as Part of Campaign

NEW IDEAS WERE PUT INTO EFFECT

Several new ideas intended to impress the value of safety personally upon the men in the track, shops and power departments were put into practice during the past year. One was the regular distribution to the men in these departments of monthly accident record cards, showing how many men in each department had clear accident records for the month, but bearing in a list the names of the men who were hurt. The effect of this publicity to the men who had been hurt was a decrease of 15.8 per cent in accidents in the first five months of 1926, while the decrease in May, over May, 1925, was 33 per cent. The deep impression made by printing names of injured men probably was responsible.

TRAFFIC COP BELTS FOR CURVE GREASERS

Another was the adoption of crossed white safety belts for curve greasers and men engaged in trackwork on the street—belts exactly like those worn by Baltimore's traffic policemen. The object, as in the case of the policemen, was to increase the visibility of the company's men. In sixteen months 31 of them had been hurt, some seriously, by reckless automobilsts. These belts have greatly reduced the hazards of street work for the curve greaser and track worker.

Still another was the regular issue of instruction leaflets to motormen and conductors, each leaflet covering a special subject directly affecting the safe operation of street cars. The list of subjects so far covered follows: (1) The pedestrian, (2) boarding and alighting accidents, (3) passengers injured on cars, (4) collisions between cars, (5) collisions between automobiles and street cars, (6) employee accidents, (7) "assured clear course."

The leaflets are printed on colored paper, a different color for each leaflet, and are as simply and as interestingly written as possible. After each "lesson" there is a list of questions relating to the subject of the "lesson."

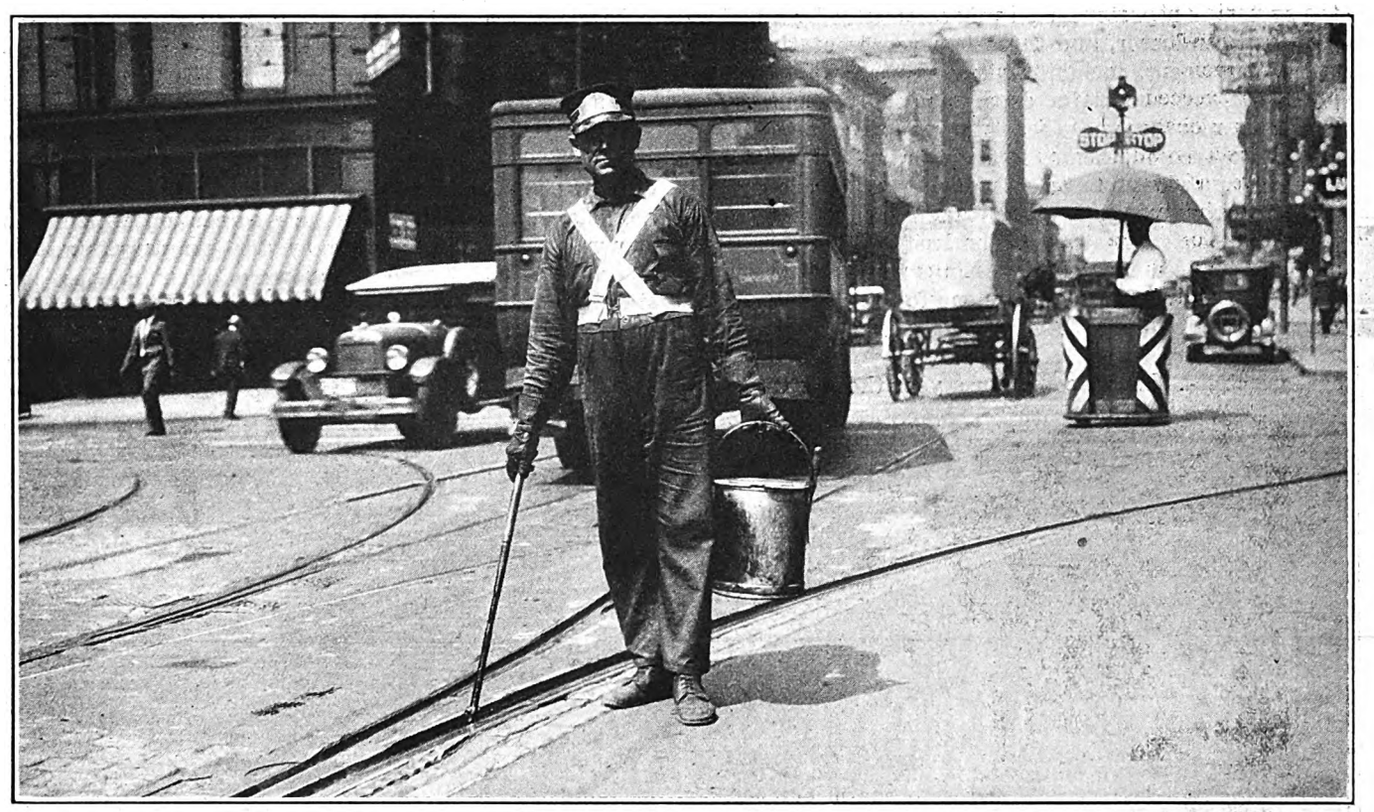
MOTORMEN'S SAFETY CONFERENCES

A fourth innovation during 1926 was a series of special safety conferences especially for motormen, added to the regular safety meetings of many sorts. In all the regular conferences motormen and conductors meet together, but the company believed special work should be done by and with the motormen. These special conferences began March 12, 1926, and so far about 700 motormen have attended them. They are addressed by the superintendent of transportation, the safety director and the claim agent of the company, and have brought good results not alone in improved accident records, but in more thorough participation by the motorman in the company's affairs, since the company's problems are discussed with the utmost frankness. The special safety conferences for motormen will be continued until every motorman on the system has attended them. Then a similar special series will be held for conductors.

In Baltimore regular courses in safety instruction start with a man's first days on the system and before he actually begins work. He must pass a rigid medical examination and exacting tests of eyesight and hearing. Then he must spend several days in school rooms for conductors and motormen. These school rooms are equipped to teach the men everything about a street car and its work. For motormen there is a series of lights showing the path of current from the trolley. By this means they are taught the principles of energy saving as well as the principles of safety. In January, 1926, a new rule book was issued. The safety department really inaugurated the revision and took the initiative in actually revising the rules, with the result that by far the most of the new rules relate to safety. Then, in order, if possible, to insure their being thoroughly read and understood, the safety department started its accident record card plan of keeping the recent accident records of their lines, or their friends, closely before them. One card would read, in part: "Have you read the new rule book? If there is any rule you do not understand, please indicate the number of it so it can be more fully explained."

There would also be a question concerning the rules on the card, which every man was supposed to answer in writing, turning the answer in to his superintendent. The cards for each department would contain the names of men who had had accidents during the month.

Digitized by Google



Curve Greasers Wear Crossed White Belts as a Protection in Heavy Traffic. Note Also the Stop-Go Station with Safety Striping

These cards were supplemented with such posters as this in all carhouses:

DO NOT FORGET!
This Month's Question on Your Accident Record Card
Have You Read
THE NEW RULE BOOK?
It Is Important
DO IT NOW
REMEMBER TO GIVE THE NUMBER
OF ANY RULE YOU DO NOT UNDERSTAND

About three-fourths of the men replied that they had read the rules and understood them. Those who did not reply, or who replied negatively, were checked up. Then, month after month, the card system was carried on, the questions asked on each card being answered on the card issued the following month, which also bore new questions.

The plan worked about like this: Many collisions between cars were occurring, due principally to motormen running their cars into open switches and colliding with cars on other tracks. So, on all cards issued to motormen one month, this question appeared: "What are the rules governing the operation of your car at a facing switch of any type?"

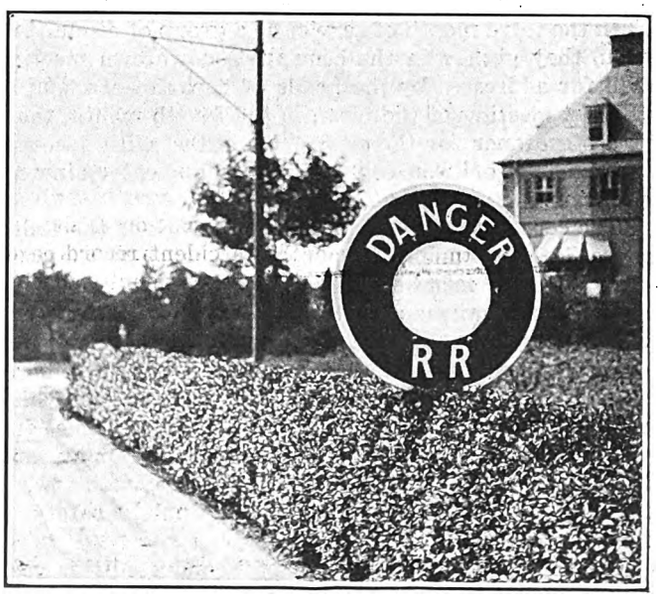
About half the motormen replied, "Slow down," or "See that switch is properly set," and so on. On the card issued the following month the correct answer was printed—the rule requiring them to come to a full stop was quoted. The result was a marked decrease in the number of collisions of this sort.

School Room and Platform Instruction

To go back a moment to the company's regular system of training men in safety practices: After their school room experience they are sent out on the cars to do practical work under instructors. If a man is quick and careful, the instructor may stay with him only a week. If he is slow, the instructor will spend more time with him. During this period of instruction and for some time afterward the men must attend weekly safety lectures, which include painstaking discussions of accident prevention, the need of knowing one's own line thoroughly; the company's plan of organization, and general outlines of the work of all the company's departments.

It is in these lecture periods that the company's service department is represented with talks on courtesy and the great influence of the car man's position upon the company's relations with the public.

Once accepted for service the new motorman and conductor are eligible to serve on the company's "safety committee," which is a sort of "safety congress," or "house of delegates" within the company. Each line on



Self-Illuminated Reflector Signs Warn Automobilists Day and Night of Dangerous Crossings with the Railway

Digitized by Google

the system is represented on this committee by a motorman and conductor, and there is a representative from each department, including the bus transportation department and the claim department. Members serve for four months and then other representatives are elected to succeed them. Every man on the system is thus given a chance to be a safety committeeman.

They meet frequently during their period of office to thresh out safety matters. The best results have been achieved by holding special meetings for each particular group—one for operating men, one for shops, power and track men, and so on. Each committeeman is virtually a "safety scout," with a watchful eye for clues to unsafe practices. In the course of a year these committeemen bring in more than 1,000 reports and suggestions and, on an average, about three-fourths of the suggestions are adopted.

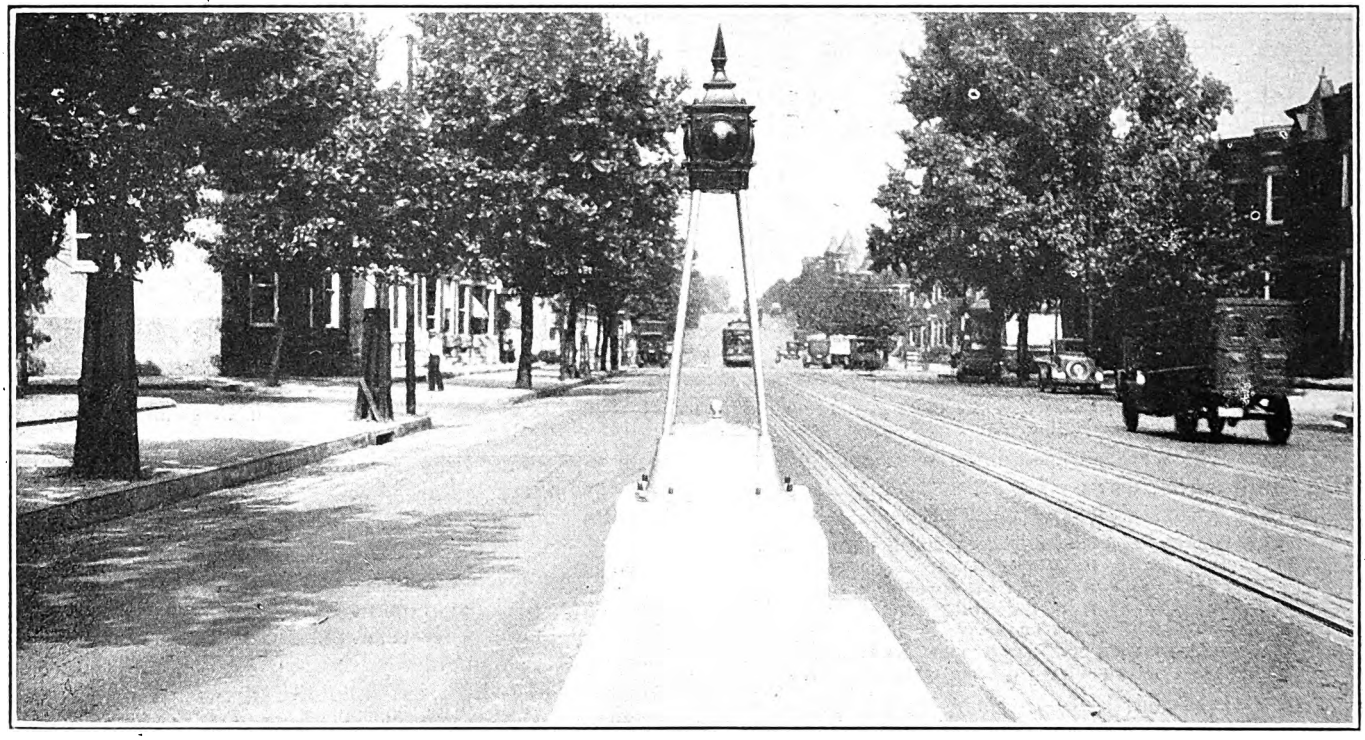
In the third month of service of a group of committeemen, they gather in the company's downtown meeting hall for addresses by the heads of departments, and at the last meeting of the term, in the fourth month, there is a big dinner for the entire committee, with speeches by officials of the company, and an entertainment program.

The company is quite active in the work of the Baltimore Safety Council, the general manager of the company being a member of the board of control of the council and chairman of the publicity committee, while the vice-president of the company is chairman of the council's executive committee. The council itself resulted from the "No-Accident Week" campaigns, which will be remembered in Baltimore for a long time, and were initiated by this company. The company contributes substantially each year to the council's work in schools, industries and wherever public safety is important.

In the "Drivers' safety contest," conducted this year by the Baltimore Safety Council for all commercial truck drivers, the railway's drivers finished first.

In the company's own safety work among children and the general public, many new things were accomplished last year. At the Better Homes Exposition in the Fifth Regiment Armory, where the company's bus and street car exhibit was one of the most popular, a "Kiddies' Theater" was a noteworthy feature, with rows of little benches decorated with friezes of birds and animals, and a moving picture screen on which was shown a safety film made by the company, entitled "Perilous Paths," and there were other movies and stereopticon pictures. The show was continuous and so was the audience.

At the end of each showing of the film an "essay contest" was announced, and paper and pencils were distributed throughout the "theater" so that the children could write briefly on the subject, "Why Should I Be Careful?" Six Eversharp pencils were offered as prizes, and during the week hundreds of essays were turned in.



Forty-eight Gas Beacon Lights and Eight Electric Beacons Have Been Installed at Car Stops, Including Raised

The company's "Safety Ladies," who also make frequent talks to classes of children at the public schools, moved through the crowds, pinning "safety buttons" on children, telling them always to "play safely." The whole exhibit with all its features besides the "safety" one was one of the most talked of things in the armory.

The "Safety Alphabet" originated several years ago by this company is apparently as popular now as it was in the beginning. It is a simple set of verses about safety, based on all the letters of the alphabet. Last year requests for copies of the "alphabet" ran into hundreds. School teachers seem to find it an easy way of teaching children simple safety rules, and requests for it have come from all over the country.

Before the company's two summer parks, Bay Shore and Gwynn Oak, open, the safety director makes a general safety inspection, and all the park employees are required to attend safety meetings and read accident prevention bulletins. Special features at each park are fully equipped playgrounds for children, each under the

Digitized by Google

supervision of an instructor or play leader. This has greatly reduced the accidents to children in the parks. Each park, too, has a completely fitted first-aid room, under the supervision of a physician, where minor cuts, bruises and bathing injuries are treated.

Forty-eight gas beacon lights and eight electric beacons have been installed at car stops all over the city, marking safety zones or loading platforms for the safety and convenience of car riders. In all, there are 76 safety zones for car riders, including eighteen concrete boarding and alighting platforms, five safety zones formed by electrically lighted street buttons, and 53 sets of chains and standards. The concrete platforms are built and installed by the company in co-operation with the Baltimore Police Department, which also contributes one-half the expense of the beacon lights.

The warning, "Danger—Curving Car," has been stenciled on street pavements where the overhang of a car making a turning movement might be a menace to pedestrians, and a broad white line marks the limits of safety while the car is turning. A number of reflector lights which catch the headlights of automobiles and warn motorists of car tracks ahead have been installed at dangerous crossings, where cars curve over busy suburban highways.

Fire drills for employees are frequent all over the system. All buildings are fully equipped with fire-fighting equipment. Block signal systems have been installed, and wherever even a possibility of danger exists at a curve or crossing, warning signals have been put up. At the drawbridges signals have been installed to stop cars when draws are open. These signals are interlocked with the drawbridge and cannot be operated until the signal has first been set to "stop" position. At one such drawbridge (Bear Creek), which is opened frequently to let boats pass, an automatic stopping device has been installed in connection with the signal, so that if the motorman should fail to observe or heed the signal, his car will be stopped automatically.

Wherever shrubbery or embankments in the suburbs have blocked the vision of motormen, the company has cut the obstruction away in the interest of safety.

Equally as important as the practical results of the company's safety program, in accident reductions and the like, is the sense of confidence in the company which its safety promotion activities give the public. Baltimore people know now not only that the street cars are the safest places on the streets, but that the first concern of the Baltimore street car men is the preservation of public safety.

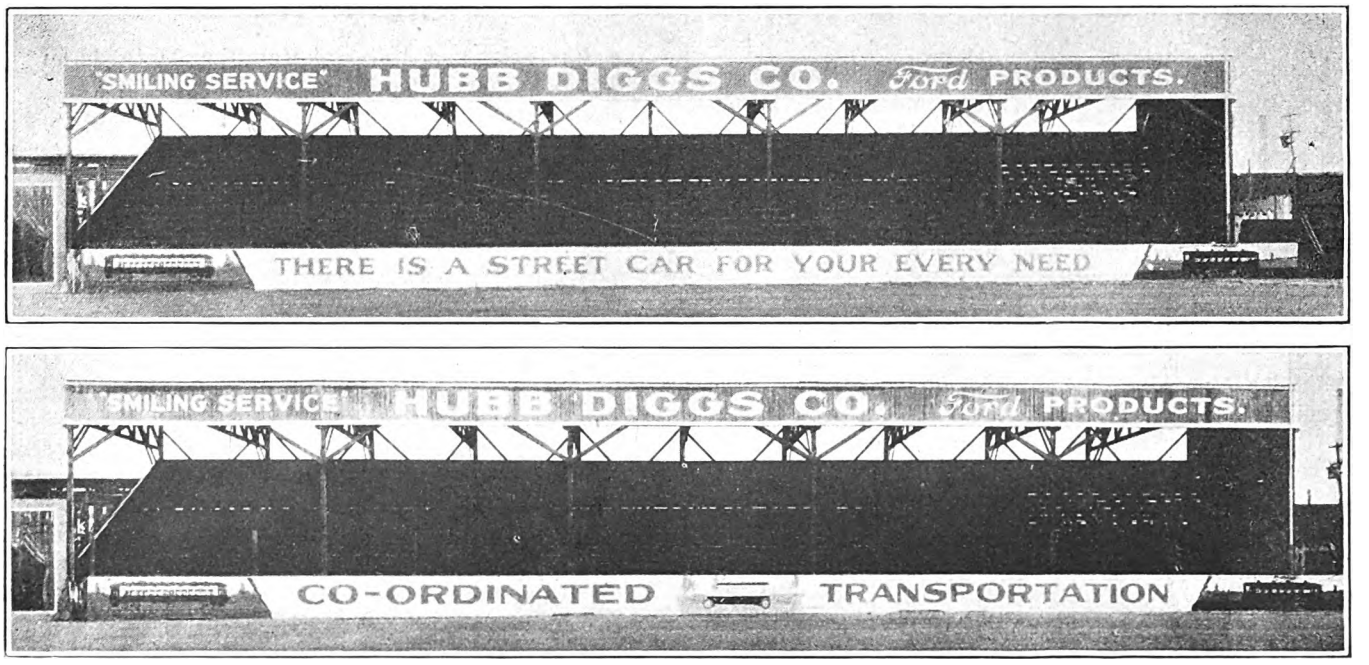
Ride Selling an Accomplishment of Long Standing on the Northern Texas Traction

MANY ride-selling ideas have been developed in the past year by the Northern Texas Traction Company of Fort Worth. One of these grew out of the co-operation of this company with the Junior Chamber of Commerce of Dallas in the promotion of a building opposite the Union Railroad station in that city. The interurban cars, known as the Crimson Limiteds, operate between Dallas and Fort Worth and pass this station en route. The thought behind the construction of this building facing the railway station was that it would be a permanent and continuous welcome to strangers arriving in the city via the Union Station.

The building was constructed through the co-operation of other railway companies in Dallas, as well as several business firms not engaged in transportation.

The problem of operating the station naturally came up, and it was felt desirable to have someone in attendance day and night who could give dependable information. The company, in co-operation with other railways in Dallas, took over the operation of this building, paying all expenses and erecting a large electric sign, as shown in the accompanying illustration in exchange for the privilege of selling tickets. The railway companies use their own men in dispensing information and for the sale of tickets. The plan was enthusiastically received, and after the building was completed it was officially opened, and for practically a year it has been operated under this plan. This has proved to be one of the principal revenue offices for the Northern Texas Traction Company.

At the town of Handley, 8 miles from Fort Worth and practically a suburb of that city, the company has

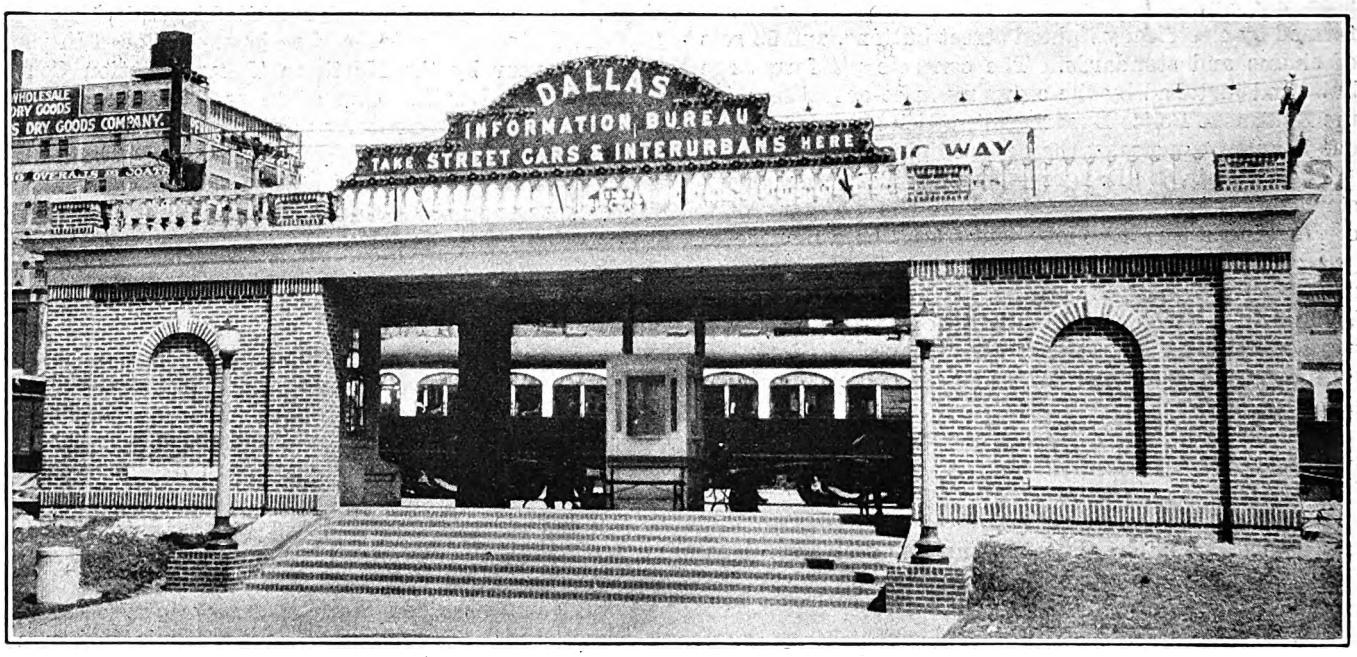


Prominent Advertisements Facing the Main Grandstand of the Fort Worth Ball Park. The Top Sign Appeared for Part of the Season and Was Repainted as Shown in the Bottom Picture After the Buses Were Started in Fort Worth

Digitized by Google

arranged a large, attractive parking station just opposite the Handley interurban station. This parking area has been fenced in and flowers and shrubbery planted to make it attractive. The proximity of the parking area to the station affords a measure of protection, and patrons have confidence in leaving their cars there while going into the city via the interurban. The number of autos taking advantage of this station's parking facilities is gradually increasing, there being from ten to twenty vehicles there at all times of the day.

The other parking space is within a loop of track on a main street car thoroughfare heavily traveled by automobiles from large suburban territories toward the west and northwest. Both of these parking spaces are being equipped with gasoline filling stations and will be manned by men capable of rendering any service to motorists. These men also handle the parking privilege and sell to each motorist a parking ticket and two street car tokens for 25 cents. As the price of the tokens is 15 cents, the parking privilege is sold for 10 cents. It permits the motorist to leave his car as long as he likes up to midnight of the day when parking begins.



Facing the Union Railroad Station in Dallas Is This Attractive Building Erected by the Junior Chamber of Commerce of Dallas, with the Help of the Local Railways and Other Business Interests. The Local Railways Operate the Building

Aside from the business-getting effect of this parking area, the improvement of the ground with shrubbery has added to the appearance of the city and the friendship between the company and the public it serves.

It is the claim of the company that merchandising transportation does not depend on one or two major things, but on a multitude of small items and small, relatively unimportant details that keep the service of the company constantly before the public mind.

That these methods have been successful is evidenced by the fact that in the four-month period from March to June of this year the company has shown an increase in gross revenue of $41,000. Specific examples are also given in the presentation for the Coffin prize for 1926 that shows that this increase in gross revenue has been experienced on all divisions and on practically all lines of each division.

Baltimore Provides Parking Space for Automobilists

PARKING spaces for the use of automobilists are being provided by the United Railways & Electric Company of Baltimore at two points on the company's system. They form one contribution by it to the solution of the parking problem, as well as a means of selling service, increasing patronage and improving good will, according to the 1926 Coffin prize brief.

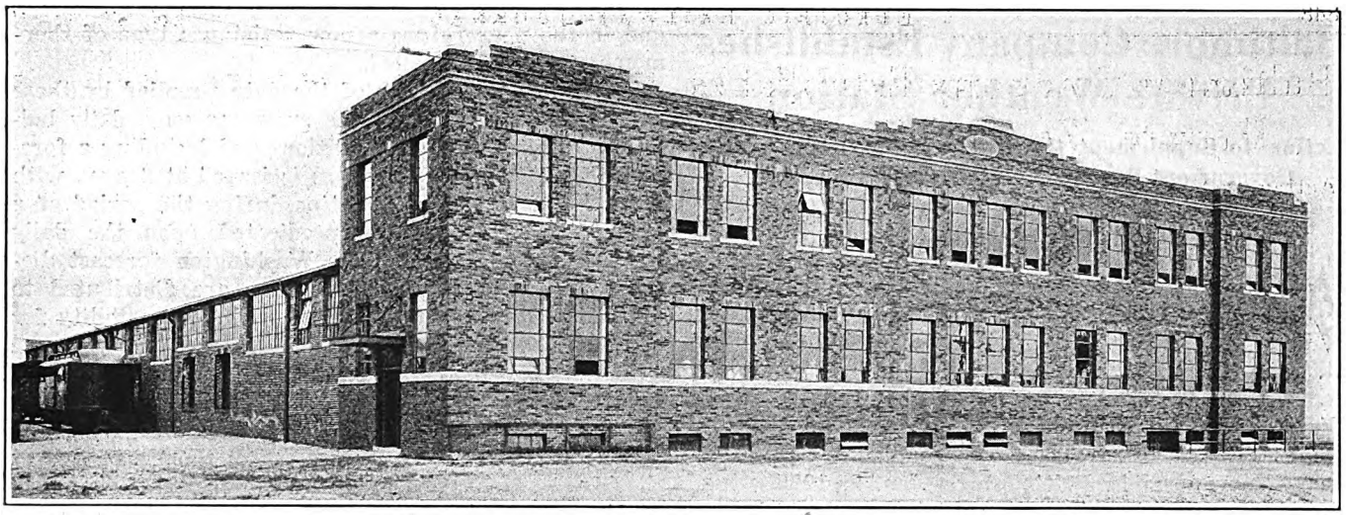
One large lot on Washington Boulevard adjoins the company's shop, outdoor storage house and concrete pole plant. Its present parking capacity is about 60 automobiles. It is directly on a main street car line and in the path of motorists from Washington as well as from small suburbs inside and outside the city limits.

Modern Storeroom Increases Efficiency

New Facilities and Material Handling Methods on Illinois Traction System Cut Waste—Printing and Reclamation Department Add to Saving

DURING the past year the Illinois Traction System has erected a modern stores building adjacent to its Decatur shops and has installed a system for handling stores that has saved time and reduced distribution cost on materials destined for various departments. The company's Coffin prize presentation gives the results obtained. The regular run of supplies has been standardized by a newly formed standardization committee within the company. Maximum and minimum quantities for various materials have been established and the supply department has thus been able to allot sufficient space in the bins and on the platform for these materials. When any supplies are requisitioned by the stores department from the purchasing department, the quantity that must be in each package is specified. For instance, all galvanized bolts must come in boxes of 50, 2,300-volt insulators in cartons of 50, cross-arm braces in bundles of twenty and high-tension insulators in crates of six. As much of this material as possible is kept in the

Digitized by Google



Exterior of New and Modern Storehouse at the Decatur Shops of the Illinois Traction System, Which Has Helped to Increase Efficiency by Providing Facilities for the Systematic Handling of Materials

original packages, so it is rarely that any such commodities appear in stock in broken packages.

As a result, the time required when preparing for reshipping to the various departments has been reduced 50 to 60 per cent. The time required in counting for inventory has also been considerably reduced and the material can be stored in much neater shape. For example, 10,000 ⅝ x 14-in. galvanized machine bolts—200 boxes—arrive at the storeroom. These boxes are stacked on platforms 8 in. high, 16 ft. long and 5 ft. wide, ten boxes (500 bolts) to the stack. One can easily appreciate the saving in time when counting these against the old method when such bolts were received in burlap sacks containing all the way from 400 to 450 in each sack, or when a carload of 50,000 porcelain insulators was received in barrels, each containing from 290 to 315. The new storeroom permits storage of 95 per cent of the items inside, while formerly about 40 per cent were stored outside the building.

The company also maintains a well-arranged stationery and printing department. During the past twelve months this department has printed, gathered and padded more than 4,000,000 forms running off quantities of 20,000 to an operation, instead of buying in quantities of from 100,000 to 200,000. The company maintains a reclamation department in which railroad lanterns, switch and marker lamps, track jacks, etc., which find their way to this department are dismembered, the parts inspected and usable parts prepared for reassembling. As an illustration of the saving made by this department, out of 30-odd switch lamps reaching the reclamation department 21 were turned back into service at a total outlay of less than the value of two new lamps.

Baltimore Company Establishes Private Weather Station

Acting to Supplement the Information Given by the Government Bureau, It Has Helped Greatly in Predicting Storms—It Issues Daily Bulletins to Department Heads

AMONG the most unique of the improvements introduced by the United Railways & Electric Company of Baltimore during the past year is a private weather station. Its purpose, of course, is not in any way to replace the excellent service of the United States Weather Bureau in Baltimore, but to supplement it. Its establishment grew out of trouble incident to a heavy snowstorm in Baltimore on Jan. 2, 1925, when the system was virtually paralyzed for nearly 24 hours. It was a "freak" storm in many respects, beginning about midnight with a heavy fall of sleet that froze to a depth and hardness impervious to the work of sweepers. On top of this sleet came a 13-in. precipitation of wet snow. Thousands of automobiles, coming downtown in the morning, traveled in or near the car tracks, which alone were clear to snow, threw it back on the rails and packed it tightly in the rail grooves. The effect of the almost complete 24-hour tie-up on the transportation system, which was the sole dependence of more than 700,000 daily riders, can be imagined.

To leave nothing undone to avert recurrence of such a disaster, the company sent a committee to a number of large cities in this country and Canada to study snow fighting and snow-fighting equipment. The committee found the Baltimore company as well prepared as any it visited, but recommended a plan of organization for better preparedness in such emergencies, and among other things, the establishment of a company weather station which would permit more frequent and perhaps more detailed reports to be made than could otherwise be had.

Station Has Complete Equipment

The weather station was, therefore, established. It was not a duplication of but an adjunct to the local government station, which, for lack of appropriation, was unable to maintain 24-hour service. If, before closing its offices, the government bureau predicted a snowstorm, the railway company was forced to choose between calling out its snow-fighting forces and perhaps keeping them idle, or assuming the responsibility for getting through the night without them.

The company's weather station, supervised by three members of its engineering staff, is located at emergency department headquarters, where a 24-hour service is maintained. The equipment consists of a barograph, a hygro-thermograph, a thermocouple temperature indicator and a remote indicating wind vane. The last-named instrument was built and designed by one of the company's electrical engineers and consists of a wind vane head located on top of an adjacent tall building, connected through a lead-covered cable to the indicating instrument in the dispatcher's office. Unlike the usual instruments for giving remote indications of wind direction by a system of lights denoting certain points of the compass, the pointer of the indicating dial on the company's instrument follows the slightest movement of the wind vane outside. The same engineer is at work upon a remote curve-drawing anemometer, and in the near future a new resistance type of thermometer will be installed.

An hourly log is kept of the data supplied by these instruments, and during the snow season a daily bulletin outlining weather conditions and including a forecast for the ensuing 24 hours is issued at 2 p.m., with more frequent special bulletins during the period of a storm. This bulletin is predicated upon the daily weather map issued for the Washington forecast district, and five copies of this map are distributed to officials of the company charged with responsibility for operation and snow removal.

These maps used to come by mail from Washington, but to reduce the delay in their arrival, the company arranged last winter with the Western Union Telegraph Company to have a messenger collect them each day at the Washington office of the Weather Bureau as soon as they came off the presses and deliver them to the noon train of the Washington, Baltimore & Annapolis Electric Railway Company. Through the courtesy of this company, these maps are delivered in Baltimore to a representative of the United Railways & Electric Company by 1:30 p.m. each day. They are thus in time to be included in the preparation of the daily bulletin. To illustrate the form in which the information from the company's weather bureau is given out, extracts will be given from one issued at 2 p.m. on Tuesday, Feb. 9, 1926.

After reporting a summary of the weather situation as shown in the official Weather Bureau map, the reading of the thermometer and the height of the barometer, the report continues:

> The outlook for Baltimore is most unfavorable, considerable precipitation being in prospect this afternoon and throughout the night. It is believed that the precipitation will be mostly in the form of snow; however, with temperatures just bordering on freezing there is possibility of sleet.
>
> The situation is to be regarded as serious and every precaution should be taken to cope with a moderately heavy snowfall. The center of the storm may not pass Baltimore until after midnight.
>
> The progress of the storm is being carefully watched, and a special bulletin will be issued at 11 o'clock tonight.

The bulletin continues with a record of the hourly data of the previous 24 hours.

As these bulletins contain forecasts made by the company's staff, they are considered confidential information, since public disclosures of them might be considered invasions of the government bureau's rights.

Supplemental Data by Radio

In addition to the data obtained from the company's own instruments, a radio set was installed and at 10:05 a.m. and at 3:45 p.m. weather broadcasts from station NAA, Arlington, Va., are taken by stenographers and copies forwarded to proper officials of the company.

As the result of all this, the company has a sense of preparedness in the snow seasons that never before was realized. A little more than a year after the storm that tied up the system, there was another snow and sleet storm, namely, on Feb. 4 and 5, 1926. This storm was accompanied by 12 in. of snow and much sleet, tying up telephone lines and interurban railways and working havoc with shipping in Chesapeake Bay, but through its weather station and the improvements that it made in its equipment, the company kept its cars on schedule. The daily newspapers in Baltimore learned the facts and were prompt to praise the company for its foresight.

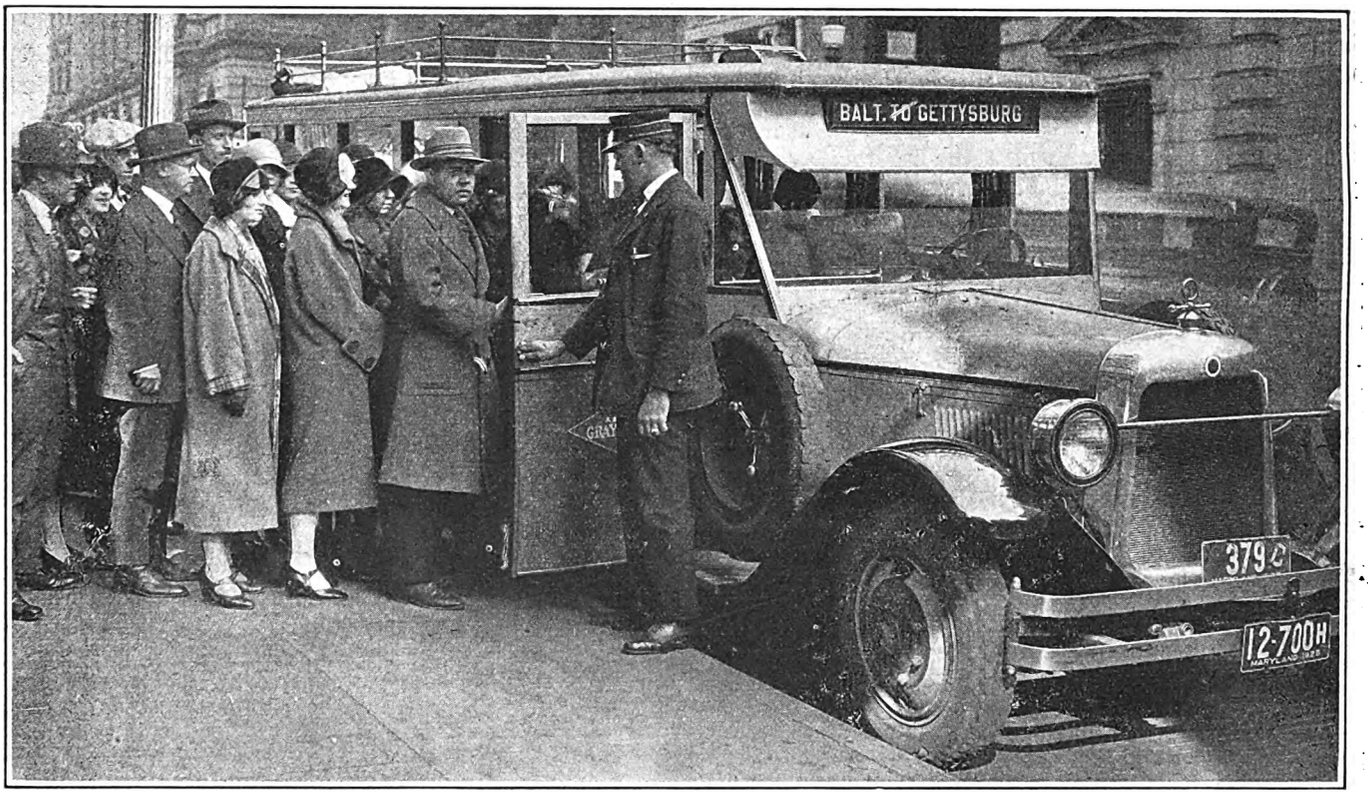
Co-ordinated Bus Service Makes Profit

Operations of the United Railways & Electric Company in Baltimore Include Both Lines Which Transfer with the Cars and Lines Which Do Not, Sightseeing Trips, Extended Tours and Chartered Buses—The Last Mentioned Business Is Considered the Most Profitable



A Touring Party Starting for Gettysburg on a Motor Coach of the United Railways & Electric Company

ON THE basis of present earnings, the United Railways & Electric Company of Baltimore estimates that its buses are earning annually a net profit of $20,622.16 in addition to providing a necessary service which if given by trolley cars would have cost $304,300. Hence it places its total profit and saving from the use of buses to the company at approximately $325,000 a year. The bus developments of this company are told in its 1926 Coffin prize brief.

The company's first bus line, established some ten years ago to operate between the center of the city and the northern residential section, was put in operation in the heyday of jitneys for the purpose of offsetting the effect of jitney competition and to pre-empt a desirable route. Since that time, but particularly during the past year and a half, the company's bus service has been greatly expanded. All this service is now in charge of the department of bus transportation, a newly organized branch of the company, which directs the activities of:

1. The Baltimore Transit Company, which operates the bus line already mentioned, as well as another serving the northwestern section of the city.

2. The newly acquired East Fayette Street Bus Company, which was bought from private owners and operates a fleet of some 30 single-deck buses from the shopping district to the eastern section of the city.

3. The Gray Line sightseeing and tour coaches, bought at the same time as the East Fayette Street Bus Company.

4. A trackless trolley line, operating from a junction with two car lines to a point 6 miles away in the northwestern suburbs.

5. Four bus feeder lines, which act as auxiliaries to the street railway service in various sections of the city, there being an interchange of transfers between buses and cars.

6. All motor vehicle equipment of the various departments of the United Railways & Electric Company.

The services operated by the Baltimore Transit Company and the East Fayette Street Bus Company and the trackless trolley line are independent fare collecting institutions, producing a direct revenue. Most of the "railway bus lines" are not in themselves producers of revenue, their principal rôle being to lessen the expense of passengers carried in the territory they serve by relieving the company of the necessity of building and equipping railway extensions.

The Gray Line cares for that portion of the public interested in sightseeing, operates motor trips to points of interest near and far and cares for parties desiring chartered service for special tours. In this latter service there are also employed buses of the transit company, and the development of this class of business helps to solve the problem of idle equipment

Digitized by Google

in non-peak hours and on Sundays and holidays. Thus, buses which otherwise would have stood idle in garages when off scheduled routes earned during the first five months of 1926 a gross revenue of $26,031 and a net income in the same period of $2,554.

A concrete example of the usefulness of the bus in lightening the expense burden of the railway is shown in the case of the Montgomery Ward Company, which established a branch with approximately 3,000 employees in a section without adequate trolley service. A bus line with a twelve-minute headway service was installed at a cost of about $30,000 a year less than would have been the cost of one-man Birney cars with double tracks.

Another instance of the same kind was in the case of a new real estate development about a mile from the terminus of a car line, where the realtors agreed to purchase a bus which would be operated at their expense by the Baltimore Transit Company. It was further provided that the transit company should credit the real estate operators with $52 a year for each house built and occupied on the property after the date of agreement and should take over the entire bus operation when 800 houses had been constructed.

There is also a copartnership arrangement between the company and residents along the route of the trackless trolley under which the burden of the annual deficit of that line is shared by those residents. A bus line, in addition to those which have been mentioned, was inaugurated under a similar arrangement with a real estate developing company.

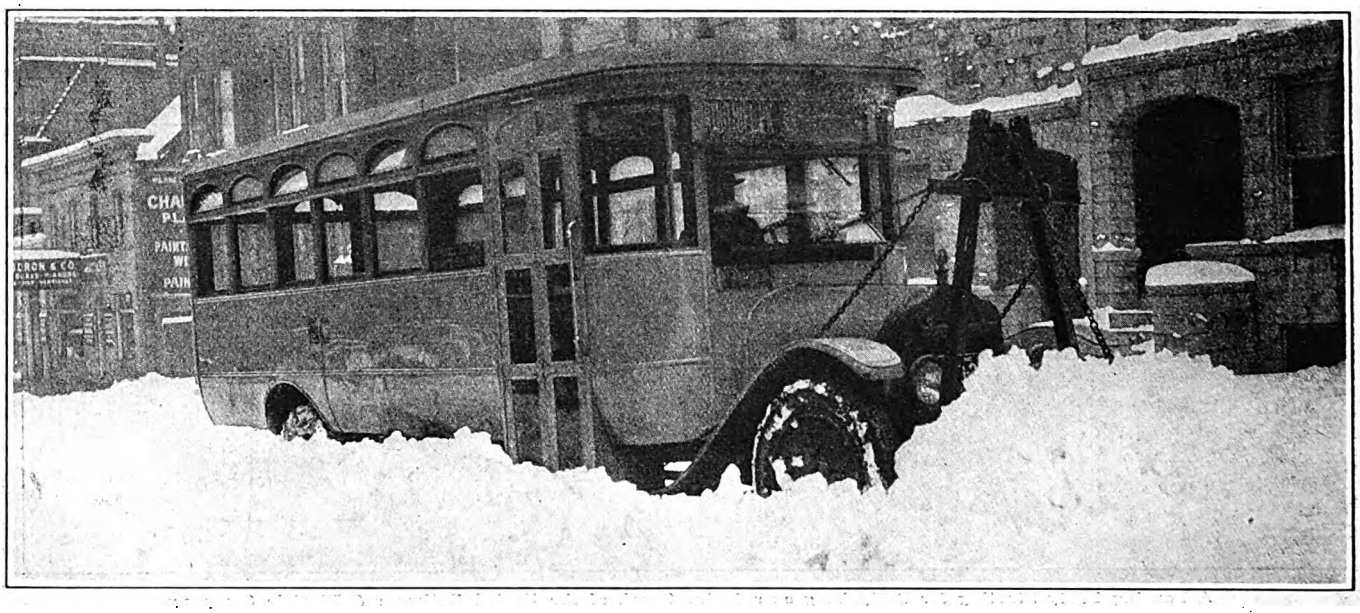
Outings and Tours Office for Giving Information

A feature of building up good will for the company, as well as business for buses, is the outings and tours office established by the company in the heart of the city. At this office tourists and others can obtain answers to all sorts of questions, of which about half are for information on subjects not directly relating to outings and tours, such as ferry schedules, railroad schedules, steamboat schedules, local street car schedules, hotels, theaters, restaurants, and so on. This service is given by the Gray Line, which also operates the sightseeing tours in Baltimore.

Baltimore has never been considered a sightseeing city, such as is Washington, New York, Philadelphia or Boston, yet more than 10,000 passengers were carried on the company's city sightseeing trips during the twelve months ended June 30, 1926. Indeed, so great has been the increase of passengers on sightseeing trips in Baltimore since the company took over the operation of the Gray Lines that the Mayor of Baltimore has appointed a committee of citizens to work up a program of advertising and entertainment for visitors and to establish a municipal "visitors' bureau." An official of the company has been appointed to this committee, as the sole representative of the city's public utilities.

Chartered Buses Profitable Service

The most profitable branch of the company's bus business is that of chartering buses. This business is done largely with single-deck buses, used also for regular



City Bus Used for Clearing Streets of Snow in Winter

line service. During the busy season, which is from April to October, an average of about fifteen of these buses are used for chartered business on weekdays and from 20 to 30 on holidays and Sundays. The maximum number of chartered buses on any one day has been 40, and sometimes the demand exceeds the available supply.

About 4,000 persons have taken the Gray Line tours from Baltimore to Washington and Mount Vernon, Gettysburg Battle Field, Atlantic City, Blue Ridge Mountains, Harrisburg and Susquehanna Valley, Philadelphia and Valley Forge, Annapolis and Naval Academy, etc. One form of this business is the handling of parties of tourists making combination railroad and boat trips and consists of the handling of a dozen to several hundred tourists with their baggage between railroad station and steamboat wharves, and vice versa. Usually a sightseeing trip through the city or to more distant points is included in these trips.

Advertising the Bus Business

In developing chartered bus business and business for bus or coach sightseeing tours some of the publicity has been of a unique and original character. One was a series of evening entertainments for civic and church organizations and community gatherings. The program on these occasions consisted of a "travelog," descriptive

Digitized by Google

of one of the regularly operated bus or coach tours. These travel talks, illustrated with stereopticon slides, were presented by one of the young ladies of the publicity department, who carried her auditors on interesting picture trips to Harper's Ferry, the Blue Ridge Mountains, Washington and Mount Vernon.

Talks of this kind have been presented, by request, before various religious, social and improvement organizations. Each of these talks meant a great deal of favorable publicity for the company's tourist business and also served to promote good will, as the remarks of the presiding officer in introducing the lady speaker invariably included an expression of appreciation of "the kindness of the United Railways, to which we are indebted for this evening's entertainment," or similar sentiment. Finally, the audience never failed heartily to voice its collective appreciation in the form of a resolution or vote of thanks, together with a request to "come again" at the conclusion of the talk.

Light Regulates Heating in Cars

WHILE El Paso usually has mild winters, the use of heaters in the street cars of the El Paso Electric Company is necessary during cold snaps. As these cold spells are intermittent and often of short duration, it is possible to make substantial savings in energy consumption by careful regulation of the heaters. To insure their most economical use, their operation is controlled by an inspector located at the dispatcher's room in the center of the city. Practically all cars pass this point. When heat is needed in the cars the inspector turns on a red light so placed that it can be seen easily from the platforms of passing cars. A thermometer on the outside of the booth is used to determine when the heaters should be used. Operators on the outlying lines and in shuttle service depend upon the chief dispatcher to keep them advised as to heating requirements. An account of this practice is given in the brief presented by the company in the 1926 Coffin prize competition.

Interstate Railway Adopts Symbol

TO DISTINGUISH its buses from those of its competitors the Interstate Street Railway, Attleboro, Mass., recently adopted a circular symbol bearing the letters ISR, as shown in an accompanying illustration. The use of such a symbol was considered particularly

Symbol Used by the Interstate Street Railway to Distinguish Its Rolling Stock from that of Its Competitors

desirable because of the existence of many interstate bus lines in the territory served by this company and the consequent lack of individuality in the name "Interstate." The same symbol is used also on the company's cars, on its letterheads and advertising copy. Mention of this is made in the company's Coffin prize competition.

Railway Employees Build Bus Garage

WITH the expansion of bus business during the past year it became necessary for the Interstate Street Railway, Attleboro, Mass., to provide better facilities for housing its vehicles. It was decided that the best location for a bus garage would be immediately

Garage of the Interstate Street Railway Is Conveniently Located Immediately Adjoining the Carhouse

Digitized by Google

adjacent to the existing carhouse. A structure 45 ft. x 60 ft. with concrete floor, cement block walls and a waterproof roof was designed. The railway company's own track, shop and line employees did all the actual construction work at odd times at an almost negligible cost for labor. The building was under the direction of a specially engaged boss carpenter who supervised the work of the railway men. The total cost of the garage, including labor and materials, according to the company's 1926 Coffin prize brief, was only $4,944.75.

Prompt Daily Reports Guide Operations

IN COMMON with many railroads doing an interline freight business the Illinois Traction System formerly had no method of knowing quickly its daily earnings. The results of a month's earnings and operating expenses were not known until the monthly report was issued. This was usually not available until about the 25th of the month following. It then did not always reflect true earnings or the trend of business because of the large percentage of interline and intermediate business, the earnings from which are frequently very irregular in clearing between the railroads.

As the freight business of this road grew the need for an earlier and more definite record impressed itself more and more forcibly upon the management. The need for control of expenses and the necessity of making expenditures bear a proper relation to income also pointed to the need of a budget system and an accurate daily earning statement with an earlier monthly report. With this object in view, the control of expenses was secured by a simple budget plan based on estimates made by department heads. These estimates were then carefully analyzed and suitable budgets were allotted by the management, due consideration being given to probable earnings, condition of property and equipment, trend of labor and material costs, and previous operating and maintenance records. The budget allotments are approved for monthly periods and are usually planned from three to six months in advance, depending upon the season of the year, the character of the program and the department involved. These budget allotments are subject to revision only by the chief executive and as changing conditions warrant.

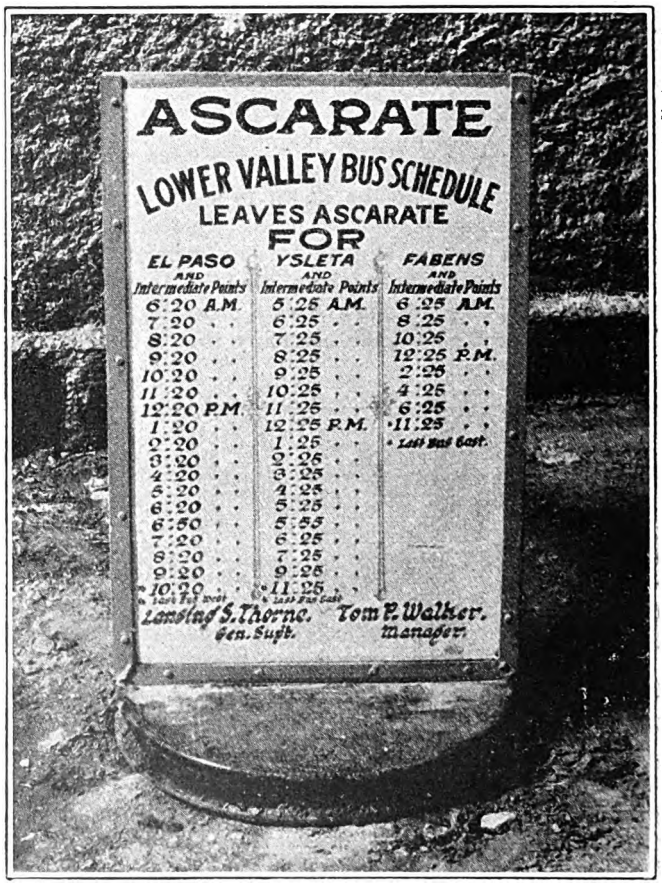
As a guide to the earnings of the system and as a means of controlling expenditures, a daily report has been formulated on the property. This is a summary of the daily records of approximately 100 station agents on the system and is quite accurate as far as the passenger and local freight earnings are concerned. The interline and intermediate earnings cannot be determined by the agents. To determine these last-named earnings daily in the office of the general auditor would require costly accounting and would delay the daily report. In 1925 the interline and intermediate tonnage on this road amounted to about 1,500,000 tons. It constituted more than one-half the system's freight business. An accurate method of forecasting these earnings was worked out by the freight auditing department by calculating division of earnings during certain test periods. Percentages were thus established which when applied to interline and intermediate total freight charges give an accurate estimate of the actual earnings. When very heavy special movements that may tend to disturb these percentages are handled such special movements are calculated separately.

Good results are mentioned in the brief presented by the company in the recent Coffin prize competition. By this system the management has a daily report three days after the day's business. This report records accurately the passenger and local freight business and estimates very closely all interline and intermediate business by dollars, by carloads and by tons. The comparisons are made day by day, are cumulative by the month and by the year. The report shows the freight business divided by carloads and less than carloads, by local, interline forwarded, interline received, intermediate and switching movements. Four divisions of freight as to class are made as follows: Coal, grain, sand, gravel, stone, shale and like products, and all other car movements. The passenger business is divided as to cars and buses, and also between station agent ticket sales and conductor cash collections.

This daily report provides an accurate guide to the company's business both as to total earnings and as to the volume and class of business handled.

Substantial Schedule Signs Used at El Paso

NOVEL and inexpensive time-tables have been designed by the El Paso Electric Company to inform passengers concerning the schedule of the Ascarate Valley buses. The complete schedule was neatly painted



Substantial but Inexpensive Schedule Signs Have Helped the El Paso Electric Company Popularize Its Intercity Bus Service

on a large piece of sheet metal. The lower edge of the metal was then imbedded in cement poured inside of an old tire rim and allowed to set. This forms a substantial base for the schedule, preventing it from being knocked over or blown over by a strong wind. A description is given in the company's Coffin prize brief.

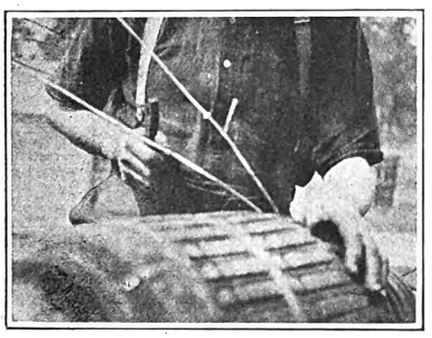
Maintenance Notes

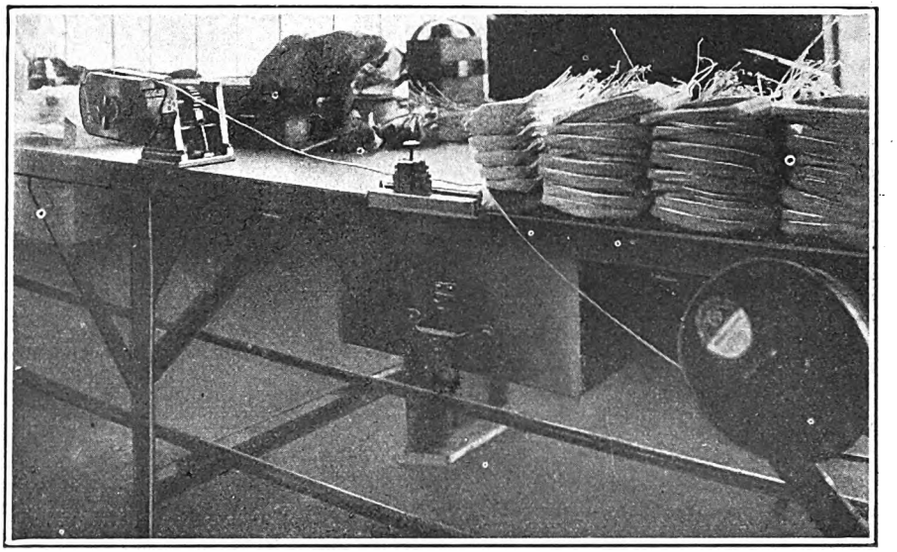
Safe Method of Splicing Armature Leads

SOMETIMES, in handling, the leads of an armature coil become broken and sometimes open circuits occur in the leads, while the coils remain in good condition. In such cases it is the practice of the Grand Rapids Railway, Grand Rapids, Mich., to splice out these leads. In doing this another piece of wire of the same size is lapped over the end of the lead and the two are wound carefully with fine copper wire. The entire joint is then brazed to form a tight connection. After the repair is made, the splice is taped carefully and an insulating sleeve is placed over the wire.

Previous to the use of this method it was the practice to use a small copper sleeve, which was placed over the ends of the two wires to make the joint. These were soldered in place. This method has been abandoned in favor of the wrapping with copper wire as this latter has proved much more satisfactory.



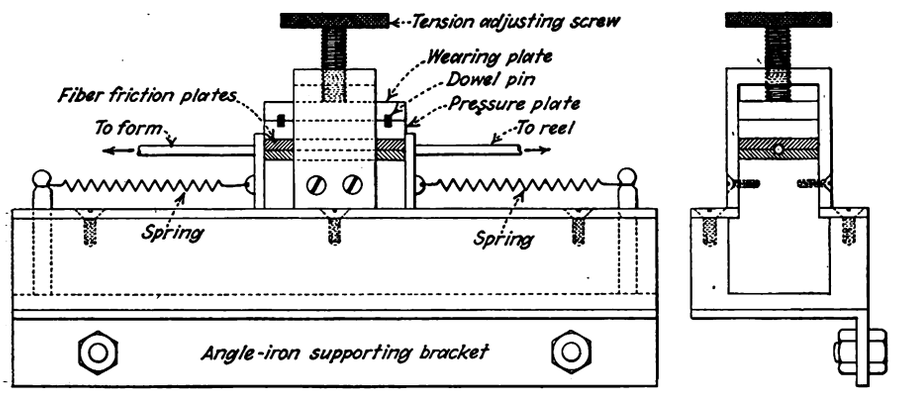
Splicing Leads of Armature Coils by Winding with Copper Wire and Brazing



In Winding Armatures the Wire Passes from the Reel at the Right Through the Special Tension Device to the Coil Form Shown on the Left

Tension Device for Winding Small Armature Coils

WHEN winding small armature coils such as those used for compressor motors, with the usual type of tension device, the tension on the wire will vary as the winding form is turned or stopped. This is not only annoying to the operator but serves to decrease the efficiency in winding. In order to provide for uniform tension, a special tension device is used in the department of electrical repairs of the Brooklyn-Manhattan Transit Corporation. This device consists of a carriage that slides back and forth on a guide against the restraining action of two springs located on either side. The accompanying line cut shows the details of construction. The wire is held between two plates, the pressure on which is adjusted by means of an adjusting screw. Fiber friction plates are used next to the wire. A reel of wire is attached to the bench at one end and after passing through the tension device goes to the coil form.



Details of Tension Device with Coil Springs on Either Side

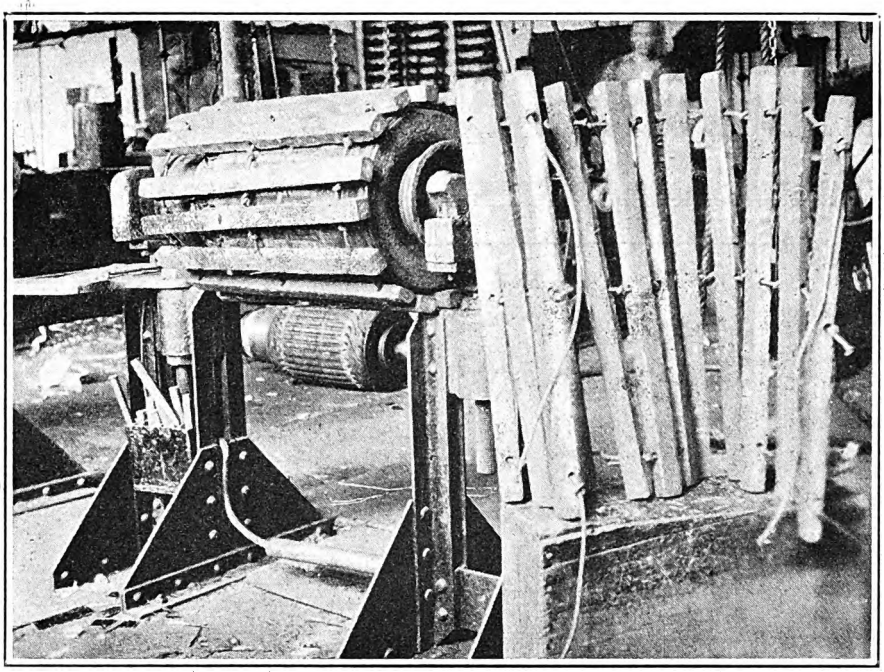
As necessity is the mother of invention, so's good lubrication your "old man" of prevention.

Wooden Protective Blanket for Armatures

SAFELY transporting armatures from point to point has always caused the armature department of the electric railways a considerable amount of worry due to the possibility of coil or commutator injury. To overcome this danger the New York Railways developed a wooden protective blanket, which since its adoption has decreased materially coil and commutator injuries during transportation and handling.

This blanket has strips of maple wood 1 in. x 2 in. with sufficient length to cover vital parts, laid equally spaced in parallel and securely roped together. Holes ½ in. in diameter are bored through the 2-in. dimension of each strip about

Digitized by Google



Wooden Protective Blankets as Installed on an Armature and Ready for Use

6 in. from either end and at the center.

A sufficient number of strips to encase entirely a desired armature and spaced about 1¼ in. are threaded on three ropes and the ends left long enough to permit making a secure knot when the completed blanket is installed on an armature. The 1¼-in. spacing of strips is accomplished by making a simple knot in each rope between strips so as to keep them apart.

This blanket has not only decreased the mechanical injuries to coils and commutators during transportation and handling but it has also practically eliminated the rolling about of the armature during transportation if not securely blocked.

Overhead Maintenance Kinks in Baltimore

Important Savings Made in Cost and Minutes Delay from Breaks—New Apparatus for Draining Manholes and Locating Cable Faults—Carhouse Conductor of Tire Steel

THE United Railways & Electric Company of Baltimore has reduced its trolley breaks per year continuously for the last six or eight years so that the number in 1918 of 1,321 was brought down in 1925 to 56. Concurrently, there has been a decrease in the delays to cars due to power trouble. Thus 1925, as compared with 1924, shows a reduction in number of delays due to this cause of 61.4 per cent and in number of minutes delay of 48.9 per cent. An organization of patrol inspection crews is responsible, the company believes, according to its 1926 Coffin prize presentation.

In the plan followed, the system is divided into four sections with an inspector assigned to each, and his entire time is spent in patrolling this section and reporting to the emergency dispatcher all necessary maintenance work. This work is assigned to the various overhead maintenance crews, who keep in frequent telephonic communication with the dispatcher so as to be available immediately for emergency work. Except during peak hours, when all crews are held at their various stations, one crew is held as standby at divison headquarters for answering fire, accident and other emergency calls. The remaining crews of both day and night shifts are kept on the street occupied in inspection and maintenance.

The present operating force of the emergency division consists of six truck crews on each of the day and night shifts and one line car crew on a suburban division. Each crew consists of a lineman, a chauffeur and a helper. As the overhead system has now been brought to an excellent operating condition, it is believed that a reduction in the maintenance forces can be made without detriment. The reorganization plan provides for the elimination of one of the day crews, two of the night crews and the line car crew. As most of these men, from previous experience, are capable as motormen or chauffeurs, they are to be transferred to other departments of the company where suitable vacancies exist, without personal loss to them by reason of the reorganization scheme. It is estimated that a net saving in labor and truck operation expense of about $28,000 yearly can be made by this change.

All of the overhead construction trucks are now motor-driven. The use of motor trucks instead of horse-drawn trucks permitted the company to reduce the personnel of the division from 43 to 26 men. Nevertheless, approximately 25 per cent more work was accomplished by the smaller number of men.

Detecting Cable Faults

The company is now using a capacitance bridge with microphone hummer to determine the location of the fault when a cable fails and the conductors are burned in two without grounding. It was virtually impossible to locate the fault either with the time-honored slide wire bridge or the exploring coil method. With the new instrument the fault is readily located by measuring the capacitance of the several conductors and computing the distance from office records, giving the per foot capacitance value of the cable. The old way of locating such a fault was by cutting the cable a number of times until the faulty section had been segregated, a method which was both costly and slow. The new instrument was purchased from a company which developed it for measuring the capacitance of telephone circuits, and it is said that this is the first time the instrument has been used by an electric railway or power company to adopt it for locating faults in power cables.

Pump for Draining Manholes

To expedite the work of maintaining the 1,500,000 ft. of underground cable in service, a 3-in. centrifugal pump was installed on the front end of a 2-ton truck during the month of March, 1926. The pump is driven by the truck motor through a power take-off connected to the crankshaft. An electric starter was installed on the motor to do the cranking, but if it is necessary to start the motor by hand, the front end of the pump shaft is adapted to take the hand crank.

An automatic primer connected to the intake manifold of the motor supplies a simple and quick method of priming the pump. Two sections of

Digitized by Google

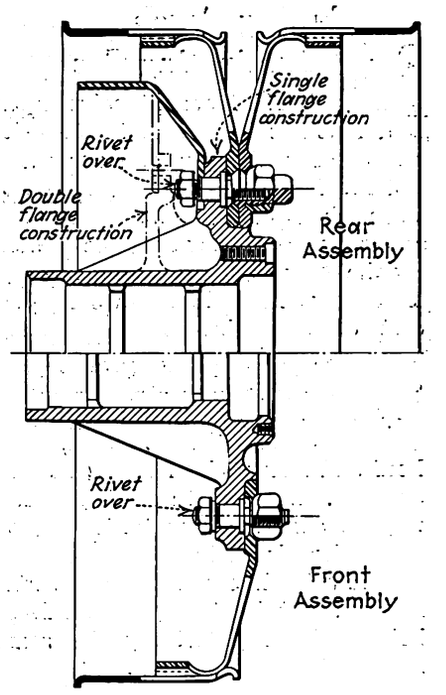
special smoothbore suction hose, each 15 ft. long, are carried on the truck and are used coupled together when the truck cannot be placed near the manhole. The capacity of the pump is 250 gal. per minute and it has proved to be very efficient in draining manholes, as well as in other maintenance and construction work.

New Carhouse Conductor

A new type of rigid contact overhead conductor has recently been installed in the carhouses of the company to overcome the problem presented by frequent crystallization of the wire at the ends of the ears and the burn-downs or pull-downs resulting from frequent shifting of cars by shop men.

The material used for the new type of conductor is ⅜-in. by 2-in. tire steel, which has one edge suitably rounded. It is supported by standard insulated clevis hangers, spaced 10 ft. apart in straight line work and 4 ft. apart in curves and special work. The tire steel, which is obtained in 30-ft. lengths, is mounted with adjacent sections held in alignment by two ¼-in. by ¼-in. by 10-in. straps, bolted and welded to the conductor. Frogs and crossings are bolted to the trolley trough, and the end of the tire steel conductor, where it enters these fittings, is so dressed as to provide a smooth under-run. Entrance under fire doors is effected by an insulated runner fastened to the bottom of the door, which provides a smooth under-run and permits ready lowering of the door.

A crew of three men with a line car will install an average of over 150 ft. of conductor a day, including mounting of supporting hangers. The conductor is neat in appearance, rugged in construction and easy to install and it will outwear the ordinary trolley wire many times.



Section Showing Double Cap-Nut Method of Mounting Dual Rear Wheels

New Equipment Available

Double Cap-Nut Method for Mounting Dual Wheels

DUAL rear wheels for buses can be mounted by an improved method announced by the Budd Wheel Company, Detroit, Mich. This is termed the double cap-nut method. With it each of the dual rear wheels is driven by an individual set of nuts. The original Budd dual wheel method of mounting was by means of a single nut through which both inner and outer wheels were driven. By this design the inner wheel of a dual assembly was in reality driven by the friction or clamp action between the outer wheel and the hub flange. With the advent of larger and heavier buses, improvements in the method of mounting became necessary as tires up to 7 in. and 8 in. are required to carry the load.

The principle of the Budd method of driving wheels remains unchanged from the original design. The wheel stud holes are larger than the studs themselves and are counterbored cup shape. The bored face of the cap nut fits into this counterbore. The design provides the nut with a great area of contact against the wheel. Right and left-hand studs, used on the respective sides of the vehicle, contribute to keeping the nuts tight after they are properly drawn up. It is stated that elimination of worn holes and sheared or broken studs is accomplished through this design.

Face Grinder for Frogs

WHERE flat surfaces are required in grinding track frogs and for similar purposes a large face grinder has recently been developed by the Diamond Machine Company of Providence, R. I. The machine is claimed to reduce greatly the time necessary to grind a frog satisfactorily. It is operated by a 75-hp. motor. Work up to 198 in. long and 48 in. high may be taken by this machine.

The table may be operated at a maximum speed of 30 ft. per minute. Machines are built in various sizes, 18, 30, 36, 54 and 66 in. diameter, and in various lengths.

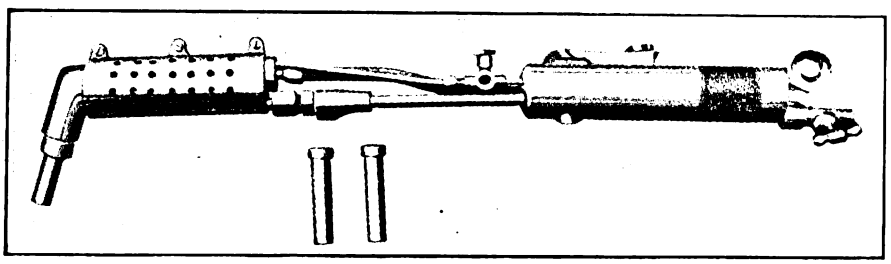
Cutting Torch Uses Illuminating Gas

RESULTING from extensive experiment and research in the utilization of a cheaper fuel for metal cutting is the gas cutting torch for use with illuminating and by-product gases, recently placed on the market by the Alexander Milburn Company, Baltimore, Md. Economies in fuel cost of themselves reduce cutting costs materially, and in addition the company claims that features of the new torch cause it to give better penetration into the metal, a narrow kerf and sharp, clean edges, as well as speedy and smooth cutting with a notable absence of metallic slag on the underside of the cut. Nor does the new torch case-harden the surfaces cut, it is stated, the surfaces being left in practically the same state as the original steel. With city gas costing approximately 1/30th that of other gases, the item of saving in this one direction is important. An outstanding feature of the



This Cutting Torch Uses Illuminating Gas

Milburn torch is the superheater which heats and expands the cutting oxygen, also the preheating of the gases, raising the temperature of the cutting oxygen to approximately 100 deg. C. prior to combustion. This increases the temperature of the gases at the torch tip, increases the rate of flame propagation in the burning mixture and reduces the oxygen consumption from 25 per cent upward.

The torch is ruggedly constructed of bronze forgings and specially drawn tubing. The high-pressure cutting oxygen is controlled by a thumb valve which remains fixed in either open or closed position. The arrangement of the gas tubes gives the torch great transverse strength. The torch is 21 in. long and is supplied with a complete range of tips for light, medium and heavy cutting. Heavy plate and slabs, risers of steel castings, structural shapes, gates, billets and other heavy cutting work may be handled with this gas torch, the Milburn company states.

Association News and Discussions

C.E.R.A. Winter Meeting Feb. 4-7

THE Central Electric Railway Association will hold its annual winter meeting at Toledo, Ohio, on Feb. 3 and 4, at the new Commodore Perry Hotel. Members are looking forward to this meeting as a banner gathering because, at the same time, the executive committee and also several of the American committees of the American Electric Railway Association will meet in Toledo.

Official announcements have not yet been made, but one of the preliminary entertainment features will be the banquet to be held on Thursday evening in the main assembly room of the hotel.

The date of the convention has been proposed for this time in order that the activities might be held at the Commodore Perry because of the excellent facilities. There are a number of large committee rooms; and the assembly room is provided with a stage, a moving picture booth, and also amplifiers.

This convention will immediately follow the Ohio Bankers Association and will be the second one on record at the new hotel. Delegates are urged to make their reservations early.

Regular Meeting Central Traffic Association on Nov. 17-18

CENTRAL Traffic Association will hold its next traffic meeting at Fort Wayne, Ind., on Nov. 17 and 18 at the Keenan Hotel. The opening session at 9 a.m. will be in the nature of a round-table discussion.

Hotel reservations should be made either through J. A. Greenland, superintendent of traffic and transportation Indiana Service Corporation, or through the Hotel Keenan direct.

Special Bulletins Available

FOLLOWING is a list of special reports which have been prepared by the Bureau of Information and Service of the American Electric Railway Association and which are available to member companies upon request:

Bulletin No. 111. Analysis of Electric Railway Franchises, Part I. This is an identical analysis of twelve franchises recently granted to electric railways under the following main subjects: General Terms; Public Control; Fares; Regulation of Service; Finances, Capitalization and Accounts; Regulations Governing Companies' Use of Streets. Part I covers the first three subjects mentioned, namely, General Terms, Public Control, and Fares.

Bulletin No. 112. Motor Bus Decisions. This is a collection of court and commission decisions regarding motor vehicle common carriers made since the issue of Bulletin No. 26—Motor Bus Decisions, June 1, 1925. It covers all decisions under existing motor bus laws handed down by the United States Supreme Court, the state supreme courts, and the various state public utility commissions. Included in the range of the decisions are such subjects as jurisdiction and powers of commissions, issuance of certificates of convenience and necessity, abandonment of service, extension or modification of routes, service requirements, rate structures, etc. The decisions are preceded by an analytical index, making possible ready access to decisions on all phases of motor vehicle operation.

Bulletin No. 113. Relative Seniority of Electric Railway Trainmen and Bus Operators. A collection of extracts from electric railway labor agreements covering the question of seniority of bus operators and trainmen, and the rating of trainmen who break in as bus operators.

In addition to the above the following supplements have been prepared, bringing the information they cover down to Nov. 1, 1926:

Supplement No. 14 to City and Interurban Fare Bulletins Nos. 41 and 42.
Supplement No. 1 to Bulletin No. 108, Wages of Trainmen.
Supplement No. 1 to Bulletin No. 109, Wages of Busmen.
Cost of Living Studies (Bulletin No. 114).

COMING MEETINGS OF *Electric Railway and Allied Associations*

Nov. 9-12 — **National Association of Railroad and Utilities Commissioners, annual convention, Battery Park Hotel, Asheville, N. C.**

Nov. 11-12 — **American Institute of Electrical Engineers, regional meeting, Engineering Societies Building, New York City.**

Nov. 16-18 — **Society of Automotive Engineers, National Transportation and Service Meeting, Boston, Mass.**

Nov. 17-18 — **Iowa Electric Railway Association, operating and maintenance section, annual convention, Fontanelle Hotel, Omaha, Neb.**

Nov. 17-18 — **Central Electric Traffic Association, regular meeting, Fort Wayne, Ind., Keenan Hotel, 9 a. m.**

Dec. 3 — **American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.**

Dec. 6-9 — **American Society of Mechanical Engineers, annual meeting, New York City, Engineering Societies Building.**

Feb. 3-4 — **Central Electric Railway Association, winter meeting, Toledo, O., Commodore Perry Hotel.**

The News of the Industry

Action Urged at Once

Mayor's Message to City Council Seen as Spur to Chicago Subway Construction

Breaking a silence on traction matters that has persisted since the defeat of his ordinance in April, 1925, Mayor William E. Dever of Chicago delivered a message to the City Council on Nov. 3, in which he strongly recommended that the city begin at once the construction of a system of downtown subways. It was, of course, known he had been following the negotiations for a new traction ordinance with great interest, but the Mayor's sudden action surprised the Council, by which the remarks are regarded as a final effort to put through a subway plan before his term of office expires next spring.

The message is obviously intended to separate the subway question from the complicated negotiations now in progress between the city and local traction interests for a unification, terminable permit ordinance and with the Harlan-Lisman interests, New York, for a twenty-year Surface Lines franchise. The Mayor made it clear, however, that he does not desire any interruption to this work. He declared:

> On the contrary, these negotiations should be prosecuted with the utmost diligence. These phases of the problem are equally important and must be solved before anything like adequate transportation can be given all portions of the city.

Mayor Dever assured the Aldermen that he fully appreciated the difficulties involved in the situation and did not purpose to criticise them for failure so far to obtain a solution.

The main features of the Mayor's plan, as outlined in his message, are as follows:

1. Selection at once of the type, location, and engineering plans for subways, using as a basis the recent report of the citizens' advisory committee.
2. Submission of the plan in a referendum, as required by Illinois statutes, at a general or special election, possibly the election in April, 1927.
3. Judicial confirmation of special assessment procedings, again using the citizens' advisory committee report as a basis for negotiations.
4. Operation of cars, either by the city through an arrangement with the surface and elevated lines, with a transfer arrangement; or direct rental of the tubes to the companies.

The plan of the citizens' advisory committee, which was referred to in the ELECTRIC RAILWAY JOURNAL for Aug. 28 last, calls for a low four-track tube for "L" cars in State Street from North Avenue south to Roosevelt Road, and a high level, two-track Loop subway for surface lines cars east of the Chicago River under Washington and Jackson boulevards, connecting at Michigan Avenue.

At $5,600,000 a mile, this system would cost approximately $32,500,000, about one-half of which would be raised by special assessments. These assessments might be voluntary, the committee suggested, thereby avoiding long litigation.

Mayor Dever stated concisely that the "city should own and control all subways." There is "no reasonable possibility," he asserted, "that either the surface or elevated lines could finance subways without increasing their fares."

He believes that the example of other cities where near-by property owners have borne a large portion of the cost should be followed in building subways for Chicago, in addition to utilizing the city's $45,000,000 traction fund. He said:

> The only subway construction possible under present financial limitations would be a subway of limited extent, so located as to render a maximum service to the greatest number of our citizens.
>
> Construction of subways in the central business district, by relieving traffic congestion, will inure to the benefit of all who use the transportation system, whether or not they actually travel through the subways.

In view of the Mayor's substantial following in the City Council and the urgency of his plea, it is believed that the message will go far toward clearing up the present maze of discussion centering about the transportation situation and tend to draw at least one phase of it—subways—out into the spotlight for early and specific disposition.

Traffic Regulatory Ordinance Passed in Baltimore

Mayor Jackson on Oct. 28 signed the most drastic ordinance on city-center parking which has ever been passed by the City Council of Baltimore. The new law becomes effective immediately. Under it, motorists must move their cars from congested downtown streets at 4:30 o'clock in the afternoon. From that time until 6 o'clock all parking in the city center is prohibited.

The measure was signed despite considerable protest, and the step is regarded by municipal authorities as the only solution available to the traffic problem.

Representatives of the Maryland Automobile Club, the Automobile Dealers' Association and many merchants' organizations opposed the plan, saying it would hurt business.

This newest ordinance is supplementary to the ordinance passed by the City Council on Sept. 27 after Baltimore motorists had enjoyed five days of unrestraint following the invalidation of the city's traffic laws by a court decision. In that case the court held that the Police Commissioner had no power to enforce the traffic rules he had promulgated by virtue of the powers vested in him by the State Legislature. As a result, Baltimore was left without traffic regulation from Sept. 24 to Sept. 26.

Votes Affect Utilities

Election Results Have Slight Bearing on Railway Industry—Commissions Target of Attacks

In at least eight states of the country the results of the elections on Nov. 2 had a more or less direct bearing on the light and power industry or the development of water power. However, these results had little bearing in the main on companies that are operating in the electric railway field.

In Colorado the proposed amendment to the public utilities commission law bringing under commission jurisdiction all public utilities except those municipally owned, thus abolishing the "home rule" feature of the present law, was defeated by a majority of two to one.

Governor A. V. Donahey of Ohio, Democrat, was re-elected for a third term by a small majority. He had been waging war with a Legislature of the opposite party over the personnel of the Public Utilities Commission. This war, which has culminated in a commission composed of two hold-over members and a third whose term will expire in February, will, the Legislature being once more Republican, presumably go on. One of the charges of the Governor is that the commissioners show undue favor to certain utility companies.

In Maryland Governor A. C. Ritchie has been re-elected. He was attacked for his support of the plan for the development of the hydro-electric plant at Conowingo as it was finally approved by the Public Service Commissions of Maryland and Pennsylvania and the Federal Power Commission.

COMMISSION ISSUE IN KANSAS

In Kansas a fight was waged around the Public Service Commission. The Democratic nominee for Governor, former Gov. Jonathan M. Davis, conducted his campaign on the issue of forcing public service companies to pay taxes on the same valuations used for rate-making purposes. During his term of office Mr. Davis helped to raise the valuations of utility companies $153,000,000 for taxation purposes. In most instances tax payments on such valuations were made under protest and the affected companies succeeded in having the courts enjoin the tax commission from further collection on the increased valuations. An attack on the commission and the utility companies failed to win the support of the voters, Governor Paulen, who had been renominated by the Republicans, winning readily.

The election for United States Senator in Illinois was of interest to the utility companies because of the attacks made on candidates who accepted contributions to their primary campaign

Digitized by Google

expenses from Samuel Insull, president of the Commonwealth Edison Company of Chicago. It was revealed by the Senatorial committee of investigation that the successful Republican candidate for the nomination, Frank L. Smith, then chairman of the Illinois Commerce Commission, accepted $125,000 from Mr. Insull and the Democratic nominee, George Brennan, $15,000.

This disclosure was largely responsible for the nomination of a third ticket by independent Republicans, who chose H. S. Magill as their candidate. The latter failed to poll a very large vote and Mr. Smith won over his opponent by a good plurality, but one much under the normal.

Fares on New Basis in Jamestown

The weekly pass entitling the holder to an unlimited number of rides on cars and buses of the Jamestown Street Railway, Jamestown, N. Y., and the Jamestown Motor Bus Transportation Company went into effect on Nov. 1. The pass sells for $1. On the same day, the new fare schedule on cars and buses in Jamestown went into effect. The new cash fare is 10 cents on buses or cars, but tickets may be purchased at the rate of three for 25 cents or ten for 75 cents. The new rate provides for interchangeable transfers from bus to car or from car to bus. The new fare from Jamestown to Celron or from Falconer to Ashville on the interurban division is 20 cents. Some changes in car routings also have been made on the local lines in Jamestown.

Claims Philadelphia Loss $4,000,000 in "L" Lease Terms

The Pennsylvania Public Service Commission considered a list of objections in City Hall, Philadelphia, on Nov. 4 to the proposed 30-year extention of the Frankford Elevated lease. Harold M. Evans, a former member of the Public Service Commission, acting as counsel for the City Club, pointed out that under the proposed amendment of the Frankford lease the city would receive in rentals from the Philadelphia Rapid Transit Company nearly $4,000,000 less than the total rentals payable under the original lease, if extended. There were many lively tilts at the hearing. Former Mayor Moore, who appeared as a witness, declared that the extension of the elevated lease to the Philadelphia Rapid Transit Company was a mere surrender by the city of its rights. City Solicitor Gaffney, President W. K. Myers and H. M. Evans argued over the difference between "equal to" and "equivalent to." At the close of the hearing Commissioner Beamish said he desired Mr. Myers to furnish at the next hearing, on Nov. 18, an explanation of what the Philadelphia Rapid Transit Company meant by "equal to" and "equivalent to" in reference to interest charges on city bonds.

The Mayor's recent approval of the "L" extension lease and the terms embodied in that agreement were referred to in the ELECTRIC RAILWAY JOURNAL previously.

Decision Reserved on Locomotive Inspection Order

As a result of an order of the Interstate Commerce Commission to appear and show cause why interurban electric railways should not be included among roads required to conform to the rules and instructions for the testing and inspection of locomotives other than steam, a meeting and hearing was held in Washington, D. C., Oct. 31 and Nov. 1. In order to arrange the information to be presented at the formal hearing a preliminary meeting of engineers and counsel was held at the A.E.R.A. headquarters in Washington, D. C., Sunday, Oct. 31. The rules and instructions of the Interstate Commerce Commission for the inspection and testing of locomotives other than steam were gone over very carefully and suggested changes in a large number of the rules were agreed upon. In the absence of Judge Ralph R. Bradley, chairman of counsel, C. D. Cass acted as chairman for the meeting. Harley A. Johnson was chairman of the engineering committee. Other members present were S. H. Anderson, J. M. Bosenbury, R. H. Dalgleish, H. J. Graham, V. R. Hasty, Guy C. Hecker, C. L. Henry, W. F. Howard, E. S. Johnson, Frank Karr, R. E. Quirk, C. W. Squier, D. F. Smith, Fred E. Stout, Charles E. Thompson and C. C. Whittaker.

The meeting held on Nov. 1 was before Examiner Rogers of the Interstate Commerce Commission. At this time argument was presented to show why, in the opinion of counsel for the electric railways, interurban roads should not be included in the order. Without in any manner waiving the rights of the electric railways, they were also requested to submit changes that they considered necessary in the present rules. To comply with this Harley A. Johnson took the stand and presented a list of the various changes in the present rules and instructions for inspection and testing of locomotives other than steam which had been agreed upon as requiring changes in order to conform with present electric railway practice. Decision in regard to the findings will be made later.

A New Idea in Regulation

In appointing C. J. Golden to the Public Service Commission of Pennsylvania Governor Pinchot said:

This appointment was offered to Mr. Golden not only because of his wide experience in the class of questions which come before a Public Service Commissioner, but more especially because he will represent the rights and interests of the plain people of this Commonwealth.

The working people of this State ride in the trolley cars and they are entitled to have a representative in the body that determines the amount of fare they must pay. Mr. Golden will give voice to the needs of the great mass of our workers who have hitherto been without representation on the commission.

The domination of the majority of the present commission by the public service corporations makes it especially important that every vacancy should be filled by a man who will be actively on the side of the people.

Only a few days before this the Governor named Richard J. Beamish for appointment to the commission to represent, as he said, exactly the opposite point of view to that of the utilities.

St. Louis Postpones Action on Fare Request

City Counselor Muench of St. Louis, Mo., on Oct. 26 filed with the Missouri Public Service Commission at Jefferson City, Mo., the city's answer to the petition of Rolla Wells, receiver for the United Railways, asking for an immediate temporary increase in fares. Counselor Muench asks that no increase be given the company until the city has been heard and until the issues raised in the company's original petition for an increase have been determined. While the city's answer does not specifically oppose the latest petition of the railway, it in effect asks for a postponement of action until the time the commission would have acted on the original petition for an increase from 7 cents to 8 cents or two tokens for 15 cents. The original application for a raise in fares was filed in June.

Changes Sought in Operation in Elizabeth

Proposed changes in the transportation service at Elizabeth, N. J., to provide for a single-fare ride between the eastern and western parts of the city were agreed upon recently at a conference between the Board of Works and the City Plan Commission.

The plans call for the following recommendations to the Public Service Railway:

Restoration of the former system of railway operation by rerouting the Roselle Park cars through Elizabeth Avenue to the Elizabethport section and the Morris Avenue cars to the terminal at Bayway.

Extension of the El Mora bus line down Elizabeth Avenue to Union Square.

Establishment of a new bus route to furnish transportation between downtown and Warinanco Park.

Extension of the Edgar Road and Irvington bus lines over loops east of Broad Street to relieve congestion now caused by their present terminals.

The City Plan Commission also advanced a suggestion that a crosstown bus line be established to furnish single-fare service between the El Mora and Kellogg Park sections.

Hearing Put Over on Buffalo Fares

The New York State Public Service Commission has adjourned from Nov. 8 to Nov. 22 the taking of testimony on the application of the International Railway, Buffalo, for permission to increase its fares from 8 to 10 cents in the city of Buffalo. Commissioner William R. Pooley explained the adjournment was made necessary because the accountants have not completed their work on the books of the railway. Dr. Milo R. Maltbie has been retained by the city of Buffalo to oppose the company's application for higher fares. It is said that the city hopes the figure of $22,000,000, fixed by the commission in a previous proceeding, will be used as the basis of the commission's computation of a reasonable rate in Buffalo. The city is not asking for a reduction of the present 8-cent fare.

De Luxe Cars Placed in Service in Chattanooga

The ten new railway coaches purchased by the Tennessee Electric Power Company, Chattanooga, Tenn., early in the year representing an investment of $150,000, were introduced to citizens of Chattanooga on Oct. 19.

The new coaches were assembled at Sixth and Broad Streets at 1:30. At 2 o'clock the coaches moved up in order and stopped in front of the Chamber of Commerce building. A fifteen-piece band was ready to lend a festive air to the occasion. E. D. Reed, manager of the Chattanooga district of the company, formally presented the new coaches to Commissioner Fred Frazier, representative of the city. After the preliminaries in the way of two or three short speeches the coaches were loaded to capacity for the maiden trip through the downtown sections.

City and county officials, directors and representatives of the chamber of commerce and the manufacturers' association, civic club delegates, press representatives and others were invited to be guests of the company on this occasion.

Led by the new coach "Chattanooga," which was on display at the recent American Electric Railway Association convention, the route of travel was south on Broad to Ninth, north on Market through the transfer station at Fifth Street, south on Market to Main to Central Avenue and return. Walter Cline took moving pictures of the parade. All ten coaches went into regular service on Wednesday morning.

The new coaches cost $14,600 each. They seat 45 passengers as compared with 36 to 40 on the present cars. They weigh 28,000 lb., or 14 tons, and are lighter than those now in use.

The following names have been given the coaches: "Chattanooga," "Chickamauga," "Missionary Ridge," "Sherman Heights," "Orchard Knob," "Fort Wood," "Cameron Hill," "Lookout Mountain," "Signal Point," "Cravens House."

A Lone Battler for the Right in St. Louis

R. B. Brooks, director of streets and sewers for St. Louis, Mo., debated single-handed against 50 men and women who appeared on Oct. 20 before the Aldermanic committee on streets, sewers and wharves to protest against the plan of the Board of Public Service to segregate street cars from other traffic when Olive Street is widened between Twelfth and Grand Boulevards. Mr. Brooks cooly marshaled facts and statistics, vouched for by experts from other cities, to uphold his contention in favor of the segregation plan.

The protestants, led by Lee Orcutt, secretary of the Greater Olive Street Association, based their opposition solely on their personal interests, disregarding the fact that 95 per cent of the users of Olive Street ride in the street cars and that a large portion of the cost of the improvement will be paid from bond issue funds voted by the city at large.

Director Brooks pointed out that if the present bill is killed by the Aldermen it will require at least another eleven months to bring a new measure up to the same legal status and in the meantime about 40 ft. on the south side of Olive Street for more than 2 miles would be filled with half-wrecked buildings, greatly depreciating values.

Real estate men who opposed the measure contended that the parkway would tend to decrease property values along the street.

Atlanta Cars in Merchandising Feat

Railway cars of Atlanta, Ga., played a big part in an advertising scheme introduced by the J. M. High Company at the recent 44th anniversary sale of that store. Thirteen cars of the Georgia Railway & Power Company were chartered and operated from the ends of thirteen main arteries of traffic between 8 o'clock and 10 o'clock on the morning of the opening day. Signs were hung on each of the cars inviting the shoppers and housewives to get aboard for free transportation. Wide publicity was given to the plan by the daily papers, which printed schedules for the bargain seekers.

Through a Motorman's Window

HOW simple are the duties of a motorman! All he has to do is to pilot his car through the mazes of down-town traffic and get back to the end of his run on time, with no passenger hurt or angered, no pedestrian scathed, no automobile jammed and his own ponderous vehicle unscratched.

Nobody has a kind word for the motorman. If a jaywalker gets in his way and is clanged at, the motorman is to blame. If a motorist gets in the way of a street car, the motorman is at fault. If a passenger arrives after the car starts or gets carried by a stop or is swayed against a neighbor by a quick application of the brakes, no one but the motorman is responsible.

The inflexibility of street cars in traffic is a factor too often overlooked in the consideration of congestion. A street car cannot dodge; cannot detour around an obstruction. The motorist who acts the grasshopper, gets out of line and into the car track may hold up 60 passengers merely to save a few seconds for himself. The driver who deliberately pulls in front of a car, knowing the motorman will not hit him if he can help it, does the whole brotherhood an injustice.

Blaming one's own faults on the motorman does not help solve the traffic problem. It is merely an index of one's own folly. The constant wonder is not that an occasional automobile is nipped by a street car but that such accidents occur so seldom. Behind a motorman's window is a good place to study highway foibles. The urban world passes in jumbled panorama outside.—*Cleveland Plain Dealer.*

Big Brother Club Hears Words of Wisdom

School boys and girls of Boston, Mass., have again been warned by Edward Dana, general manager of the Boston Elevated Railway, of the dangers incident to their going and returning from school. Over the radio on Oct. 22 he addressed the Big Brother Club and offered some statistics on the results of their co-operating with the conductors and motormen last year in avoiding accidents. He said that as far as the Boston Elevated was concerned only 59 instances were recorded during the past twelve months of children under 14 years of age injured while stealing rides on cars or being struck, compared with 85 for the previous year.

Memphis Railway Claims Right of Discipline

In a bill filed against the Amalgamated Association, the Memphis Street Railway, Memphis, Tenn., recently sought a judgment of the Chancery Court on the company's right under the existing contract to discipline its union carmen. A difference between the company and the men is that the latter claimed the matter should be submitted to arbitration, while the company claimed that the first clause in the contract, signed as of April 1, 1926, gives it this right. The union questioned the propriety and justice of this discipline and demanded arbitration. The company is asking the court to construe the terms of contract. If the court so rules the company will submit to arbitration. In this event, should the arbiters hold that the men suspended recently have been dealt with unjustly, the company has agreed to reinstate them with pay for time lost.

Pedestrians May Go and Stop on Signal

It is expected that stop and go signals for pedestrians will be adopted if the recently completed traffic survey of the Association of Commerce is approved by the City Council of Chicago. The preliminary statement said that the "hodge-podge intermingling of scampering pedestrians and slow-moving honking vehicles" caused a "chaotic condition" calling for "adequate treatment." Miller McClintock, director of the survey, said that thus far the pedestrian had been left to follow his own inclination, but that the time had come when all classes of street users had to be regulated if vehicles were to move faster and pedestrians be protected.

A count made by Mr. McClintock and his assistants on a typical Saturday last May showed 195,930 persons crossed State and Madison Street intersection between noon and 5 o'clock, 49,250 pedestrians an hour. It was his belief that this huge flow of traffic, not protected or regulated, resulted in a wild scramble of pedestrians and a retardation of vehicles. According to the survey in that fashion an average of 1,000 persons a block cross loop streets at the noon hour.

Ten-Mile Electrification Planned in Seattle

The Chicago, Milwaukee & St. Paul Railway plans to electrify 10 miles of its main line between Seattle and Black River Junction in Washington, over which steam trains are now being operated. The work will cost $250,000 and is expected to be completed within four months. The improvement will speed up service, as it will be possible after the change to run the electric locomotives into Seattle, eliminating delays incident to the change from steam to electric propulsion at the junction.

Commission Has Fresno Case

Mooted questions in Fresno, Cal., were aired before the Railroad Commission on Oct. 25, with the result that Commissioner T. H. Louttit took under advisement both the increased fare issue and the extension of the lines of the Fresno Traction Company to the Fink-Smith district. The Fresno Traction Company applied early in the present year to the Railroad Commission for an increase in its present 6-cent fare rate, alleging that it had operated at a loss of $4,056 during 1925. The commission first set the application for hearing on June 1 before Commissioner Brundige at Fresno, and intended to consider at the same time the complaint of the city of Fresno to require the utility to extend its tracks to the Fink-Smith district.

News Notes

One-Man Cars on Another Interurban.—In order to maintain the present high standard of service on its interurban line between Sheboygan and Elkhart Lake without increasing fares or curtailing service, the Wisconsin Power & Light Company has put new one-man cars into service.

Cash Fare Raised in Fort Dodge.—After operating its bus line for a year at an 8-cent cash fare, the Fort Dodge Transportation Company, Fort Dodge, Iowa, has found that a higher revenue is necessary in order to show a profit, and the City Council has authorized the company to increase the rate 2 cents. The new fare went into effect on Nov. 1. The company will not increase its ticket rate of sixteen for $1.

One-Man Cars in Operation. — The Springfield Street Railway, Springfield, Mass., has put one-man cars on its lines to Indian Orchard and Ludlow. The change became effective Oct. 18. The cars start from Victoria Square instead of from Main and Lyman Streets, as formerly.

Lives Insured. — Employees of the Northern States Power Company, Eau Claire, Wis., who have been with the organization six months or more are to receive the benefits of a group life insurance plan which the company has adopted. The policies will be carried by the Equitable Life Assurance Society, according to an announcement of Vice-President R. F. Pack.

Safety Records Discussed. — Motormen and conductors forming the Terre Haute, Indianapolis & Eastern Traction Company unit of the national safety organization of electric lines met recently in the carhouse of the company at Terre Haute, Ind., to honor the men who had made the best recent safety records. In speaking of the results on the Terre Haute lines J. I. Beals, superintendent, said that from June 1 until Aug. 31, this year, the mileage made by the city cars was 854,400, with an average mileage of 7,600 miles per accident. The total mileage on the interurban lines in the same time was 225,000, with an average of 16,000 miles an accident. In September the main line in Terre Haute won by having only five accidents to the 60,000 miles covered; the southeast bus had only one accident in covering 21,500 miles and the Sullivan interurban division had only two accidents in its 28,400 miles.

More About New Cars.—On blotters 6 x 2½ in. the Indiana Service Corporation, Fort Wayne, Ind., has told the story of its "Wabash Valley Flyers" and "Hoosierlands." A picture shows the luxurious cars which leave Fort Wayne daily and make connections at Peru and Lafayette. Patronage is sought on the de luxe cars which operate via Bluffton, Muncie and Anderson. This descriptive blotter is supplemented by an illustrated folder which gives in detail the schedule of these cars, including the parlor-buffet schedule. The new equipment includes five passenger motor cars and two parlor buffet cars built by the St. Louis Car Company at a cost of $35,000 each.

Changes Station Names as Co-operative Measure. — At the suggestion of residents of neighboring communities the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., has changed the names of two of its new stations on the Skokie Valley route. The stations affected and originally named in the $1,000 prize contest of the North Shore Line early this year are the Skokie Manor station, which is now known as Deerpath, and the Wau-bun station, which is changed to Northfield. Deerpath station is located on Deerpath Avenue, just west of Lake Forest, Ill. Northfield station is situated at Willow Road, adjoining the city of Winnetka, in Northfield township. The new names are considered better suited to the convenience of the traveling public.

More Light in Georgia "Snap Shots." —With the October issue, *Snap Shots*, the official paper of the Georgia Railway & Power Company, Atlanta, Ga., makes its début as a twelve-page edition. It is expanding from eight to twelve pages in order to publish news concerning the members of the many companies associated in the Georgia group of the Southeastern Power & Light Company. Heretofore *Snap Shots* has been devoted exclusively to the activities of the Georgia Railway & Power Company. Other properties included in this group are the Central Georgia Power Company, Athens Railway & Electric Company, Georgia Southern Power, Rome Railway & Light Company and the Mutual Light & Water Company. The co-operation of all employees is asked for the November issue of *Snap Shots*.

Foreign News

London Railway Men Return

During the last few weeks a delegation of four officers of the Underground Electric Railways, London, England, has been visiting this country to study the latest developments in electric railway and bus practice. In sending over a delegation this year the London company is repeating a practice which it has followed for several years past, though omitted last year. Each year a different group of officers takes the trip, timed so that they can attend the annual convention of the American Electric Railway Association, of which the London company is a member. Those in the party this year were A. V. Mason, deputy general manager; E. T. Brook, superintendent of rolling stock, and J. B. Mackinnon, superintendent of schedules, all of the London Underground, London, and G. Rushton, production engineer London General Omnibus Company, an allied company.

During the trip the party visited Buffalo, Cleveland, Toronto, Detroit, Chicago, Pittsburgh, Washington, Philadelphia, Newark, Boston and New York. The members returned to England on Oct. 30. While in this country they made their headquarters in the office of B. A. Hegeman, Jr., of the National Railway Appliance Company, New York. Mr. Hegeman is representative in this country of the interests of the Underground Electric Railways. On the eve of their departure Mr. Hegeman honored the visitors with a farewell dinner at the Lotos Club, at which a number of prominent electrical railway men in New York were present.

New Electric Line in Spain Completed

A new electric railroad 23 miles in length, known as the Urola, has recently been completed between Zumarraga and Zumaya. The necessary power is supplied in the form of 30,000-volt, three-phase alternating current from the power station of the Sociedad Hidro-electrica Iberica and is converted to 1,500 volts of continuous current at Azpeitia by means of two sets of transformers and mercury rectifiers. The rolling stock consists of seven motor freight cars. Each vehicle is provided with four 75-hp. motors at 1,500 volts for traction purposes. A converter is installed on each vehicle to enable the controller, the brakes and the lighting to be operated at 110 volts.

British Pre-War Halfpenny Fares Not to Be Reinstated—Restoration of the halfpenny fares in effect in London before the war on short routes of the tramway lines has been abandoned. It was estimated, after consideration by the highways committee of the London County Council, that their reinstatement at this time would result in a yearly loss of about £420,000, unless the passengers increased 10 per cent at the same time.

Recent Bus Developments

Another Jitney Respite

Local Court Acts in Operators' Behalf, but Ruling by Supreme Court Is Expected Soon

Operators who have been running their jitneys unmolested in the city of Detroit since an injunction ended the harassing steps taken by the Police Department and other city officials have received a further respite from the State Supreme Court. That body has upheld an order issued by Justice John E. Bird in July last enjoining the city from enforcing the jitney ordinance pending a decision by the United States Supreme Court on the merits of the case. The writ of error was obtained by the Red Star Motor Drivers' Association last summer while the majority of the members of the State Supreme Court bench were on vacation.

VACATION ORDER IN CASE OF DELAY

According to the decision, the right is reserved to the defendant in the case, the city of Detroit, to apply for the vacation of the order in question if there is unusual delay in presenting the case to the United States Supreme Court. It is expected that the case will be disposed of in a few months.

Offensives by the city will include filing a motion with the U. S. Supreme Court to advance on the calendar the hearing on the writ of error issued by Justice McReynolds and petitioning the State Supreme Court to fix a bond of from $250,000 to $500,000 on the jitney associations. It is claimed that the D.S.R. has estimated its losses at an amount such that if a decision by the U. S. Supreme Court is not returned until March, five months hence, the bond should be $500,000.

The corporation counsel's office cited that the State Supreme Court in upholding the injunction against the jitney ordinance quoted an opinion from Chief Justice Taft in which it was ruled that a stay of proceedings should be granted in such cases. It is contended that if court had gone still farther in the same decision it would have seen that Justice Taft stated that when such a stay was granted a bond should issue.

Certain points in the case are reviewed briefly in the court decision. On Dec. 29, 1923, a decree was entered in the Circuit Court retraining the city and certain of its officers from enforcing the so-called jitney ordinance. The defendants appealed to the State Supreme Court and the case was argued on Jan. 6, 1926. On April 14 following the Supreme Court reversed the decree and sustained the validity of the ordinance. This decision was not unanimous. On July 1 a motion for a rehearing was denied. On July 24 a writ was issued by the Supreme Court of the United States and the requisite bond was approved and filed, the writ having been allowed by Justice McReynolds. To this writ return was made Aug. 12.

On July 26 a petition for a stay of proceedings was filed in the Supreme Court of the state and this court, being on vacation, the chief justice granted the prayer of the petitioners. The city then asked the court to vacate such order.

It is further stated that it will not be necessary to pass on the contention that the order made by the chief justice alone is void, because if it is a nullity, as contended by the corporation counsel, the application of the plaintiffs for a stay of the court's decree is before the court now in session and should be disposed of.

The bill filed in this case is classed as an injunction bill pure and simple. The decision states that should the plaintiffs' contention be sustained in the United States Supreme Court, irreparable injury would be suffered by the failure to stay the decree of the State Supreme Court.

It is further cited that the allowance of the writ by Justice McReynolds is *prima facie* evidence that a meritorious federal question is involved. The State Supreme Court does not overlook the defendants' claim that the writ was allowed upon the injection of issues not urged in the trial court or the State Supreme Court. Whether such issues were injected and whether the Supreme Court of the United States will consider such issues are questions for that court to determine, not for the State Supreme Court.

New Waiting Station for Milwaukeeans Erected

A new type of waiting station which will afford greater convenience and comfort to street car and bus passengers of the Milwaukee Electric Railway & Light Company has been erected at the intersection of North and Lisbon Avenues at 47th Street, Milwaukee. This shelter, the first of its kind in Milwaukee, consists of a glass-enclosed structure, triangular in shape, placed on a raised concrete platform which forms a safety island in the center of the intersection. The roof is covered with red Spanish tile and has ornamental copper crusting. The interior is lighted at night.

Commission Permits Buses on Any Nashua Street

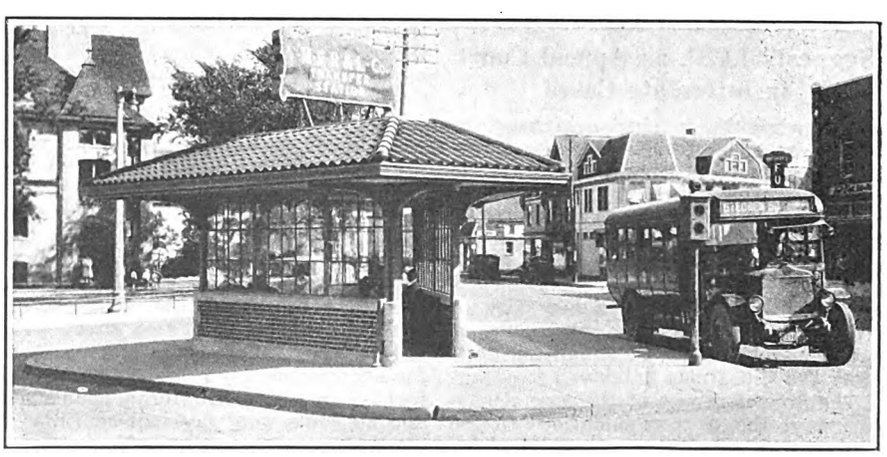
An order made by the Public Service Commission of New Hampshire on Oct. 28 on application of the Nashua Street Railway and the associated Nashua Transportation Company is probably the broadest and most liberal ever issued to an electric railway operating buses.

The commission specifies that service outside the city of Nashua is to be conducted over certain routes in the name of the Nashua Transportation Company, but the order grants to the Nashua Street Railway the right to run buses over any street within Nashua at its own discretion. The only stipulations are that schedules of routes must be filed with the Public Service Commission and that residents of Nashua shall have the right to appeal to the commission in cases where requests for service in certain sections are not granted by the company.

It is the opinion of the commissioners that, under ordinary circumstances, a company starting bus service in a city should be permitted to decide for itself what streets may best be included in convenient and profitable routes.

Municipal Buses in Buffalo Quit

Operation of the two municipal bus lines established last July by Mayor Frank X. Schwab of Buffalo, N. Y., was suspended on Oct. 30 owing to the serious illness of the Mayor. Orders to discontinue the lines were issued by John L. Kelly, the Mayor's secretary. The four other members of the City Council have no knowledge of the contracts between the Mayor and the companies which supplied the service. Recently when the Mayor refused to reveal details of the municipal bus service and its costs the Council rejected the Mayor's proposal to enter into agreements with several other companies to operate additional lines. It was said that it may be a month or more before the Mayor is able to return to his office. The South Buffalo-Main Street line used buses under an agreement with the manufacturer of the buses while the Delaware Avenue-Richmond-North Park route used buses under a lease arrangement with John C. Montana, who operated the Buffalo-Niagara Falls route last summer.



An Escape from the Elements Afforded Milwaukee Passengers

Massachusetts Commission Frowns on Double-Deck Vehicle

The Public Utilities Commission of Massachusetts, after carefully considering the operation of double-deck buses by the Boston Elevated Railway, has prohibited their use. The elevated has been operating a double-deck bus from the Fenway to Bowdoin Square on a temporary certificate. In its finding the commission states the bus is longer than the Legislature proposes to permit. Moreover, the commission found there was not suitable means of exit, but the elevated agreed to provide an emergency door. With this in use the commission found that passengers leaving the upper deck would be checked by the use of these emergency doors and voted them of little or no use as a means of safety.

The finding, in part, reads:

Buses do catch fire, and we know that buses do capsize. Instances have occurred in this state within a year where buses have caught fire, in one of which serious loss of life resulted.

Instances have also occurred where there have been accidents in which a bus has been overturned. We hestitate, therefore, notwithstanding the means adopted to insure the safety of the passengers, to approve the operation of such a vehicle unless there are reasons for its operation which outweigh possibilities of danger to the passengers.

It has been urged that this type of bus is in successful operation in New York, Philadelphia, Cleveland and other cities. Time may demonstrate that our apprehensions in relation to their safety are not justified. If such should be the case, and it becomes clear that it is not the intent of the Legislature that motor vehicles operating regularly upon the highways are to be limited to 28 ft. in length, application for authority to operate such vehicles may be renewed.

Reading Railroad Modifies Its Plan

After the Reading Company, Philadelphia, amended its application of Oct. 29 to operate buses between Doylestown and Norristown and asked permission to run the buses between Doylestown and Lansdale, a distance of 10 miles, the Philadelphia Rapid Transit Company and the Lehigh Valley Transit Company withdrew their opposition. Thereupon, the application was granted. E. D. Osterhout, passenger traffic manager, said that passenger trains were being operated on the Doylestown branch of the system at a loss. The company desired to economize by withdrawing some of the trains and substituting buses.

Suggests I.C.C. as Appeal Court in Interstate Cases

Following the conclusion of hearings held from coast to coast by the Interstate Commerce Commission since the June adjournment of Congress to consider the matter of bus and truck regulation, the commission has given parties at interest until Nov. 15 in which to file briefs. This means that conclusions of the commission as to the necessity of federal control and the character of such control will not be submitted until after the Christmas holidays.

The annual report of the commission carrying the recommendation to be made to Congress for railroad legislation has been prepared and will be sent to the printer before the briefs are filed in the bus case.

Efforts to vest complete jurisdiction over highway traffic in the commission have been practically abandoned. Considerable support has centered, however, around the proposal of the Bus Division of the American Automobile Association for an innovation in regulation of interstate commerce by the States through their regulatory commissions. Proponents of the plan claim that it is constitutional and will solve the difficulties arising from lack of any form of regulation of interstate traffic.

The Bus Division proposes that in application of the law the Interstate Commerce Commission would retain final authority and that it would constitute an appeal court in cases brought up from the state commissions.

Intervention of I.C.C. Sought in Pennsylvania Case

Counsel for the Schuylkill Railway and the Schuylkill Transportation Company, Girardville, Pa., has filed an appeal to the Interstate Commerce Commission at Washington, D. C., to prohibit the Reading Company, a steam carrier, from operating bus service in Pennsylvania, except under regulations by the commission.

The appeal is said to be based, among other things, upon a decision of the United States Supreme Court. As recently as last May Justice Brandeis is quoted as having stated:

A steam line operating in both interstate and intrastate commerce cannot engage in losing local (intrastate) business "not required for public necessity and convenience," and thus create "prejudice to interstate commerce" derived from profitable high rate interstate passenger and freight business.

Numerous applications for the right to operate buses have been filed by the Reading Company at Harrisburg for approval of the Public Service Commission. Governor Pinchot recently refused to grant a charter for the Reading subsidiary, under which the company proposed to establish bus service in 24 counties of the state, including territory served by the two Schuylkill companies with both railway and bus for a number of years.

South Shore Bus Establishes Commutation Rates

Further deployment of modern merchandising methods in the co-ordinated transportation business is instanced in the recent announcement by the management of the Shore Line Motor Coach Company, joint subsidiary of the Chicago, South Shore & South Bend Railroad and Gary Railways, that bus rates would be reduced nearly 40 per cent in favor of the frequent rider between Gary, Ind., and downtown Chicago.

A new ten-ride bearer commutation ticket rate of $5.50, and proportionately lower rates from intermediate points, was established by the company on Oct. 22 between these two cities. The tickets are transferable and are good for six months from date of sale. The former rate of $1.70 for a round trip and 90 cents one way will continue to apply, however, on all single and round trip tickets to the Chicago "Loop."

The commutation tickets are for use between Gary and Chicago on the Shore Line Motor Coach Company's fleet of new 29-passenger Fageol Safety coaches operating from Grand Rapids, Benton Harbor, Michigan City, and Gary to Chicago. The rates are almost identical with the commutation fares established on Sept. 16 by the Chicago, South Shore & South Bend Railroad, which closely parallels the coach route, between Chicago and Gary.

Bus Changes in Cincinnati.—The Oakley bus line of the Cincinnati Motor Bus Company has been taken over by the Cincinnati Street Railway, Cincinnati, Ohio, while the Norwood line of the same company will be operated by the City Transit Company. Approval of the recent application for the sale of these lines was announced recently by E. D. Gilman, Director of Public Utilities. The Cincinnati Street Railway has also taken over the operation of the Coney Island line of the Cincinnati Motor Bus Company, which will continue to operate only its Erie Avenue-Madisonville line.

End of Summer in Ottawa.—The Ottawa Electric Railway, Ottawa, Canada, recently discontinued its regular sightseeing motor coach trips. No further regular trips will be operated until next spring. The company will, however, supply chartered motor coach service.

Bus Line Extended.—A certificate has been granted by the California Railroad Commission to the Key System Transit Company to operate a California bus service between a point at the intersection of High Street and East Fourteenth Street in the city of Oakland, and a point at the intersection of Ygnacio Avenue and High Street, and intermediate points. This means virtually an extension of its Fernside bus line. The Key System has also been authorized by the Railroad Commission to operate a bus service as an extension of its Thousand Oaks Street car line in the city of Berkeley, Cal. This route will serve a section of the East Bay which is growing rapidly and has had inadequate transportation.

Bus as Transport Factor Grows in Significance.—The title of Electric Railway Section of the Wisconsin Utilities Association has been changed to Transportation Section as it carries a wider and fuller description of the functions of the section.

Company Operates on Temporary Permit.—The Scranton Railway, Scranton, Pa., has secured temporary permits from the Public Service Commission to discontinue operation of its railway from Wilson Creek to Forest City, and to operate buses between Forest City and Carbondale. There was a hearing on the permanent abandonment and application for the operation of buses in Scranton on Oct. 21. The commission has reserved decision.

Would Extend Bus Service.—The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has applied to the city for permission to install auxiliary bus service on the south side. This line would extend from National Avenue and Twenty-second Avenue south to Forest Home Avenue.

Financial and Corporate

Improvement on Third Avenue

$37,893 Net Income Compared with $102,138 Loss a Year Ago—Place of Bus Defined

For the fiscal year ended June 30, 1926, the operating revenue of the Third Avenue Railway System, New York, N. Y., was $14,666,998, an increase of $124,489 over the fiscal year ended June 30, 1925. The operating expense was $11,102,520, or a decrease of $64,332 over 1925. These facts were disclosed in the annual report to the stockholders of the company.

STATEMENT OF INCOME OF THE THIRD AVENUE RAILWAY SYSTEM FOR YEARS ENDED JUNE 30, 1926 AND 1925

	1926	1925
Operating Revenue:		
Transportation	$14,222,084	$14,111,026
Advertising	150,000	150,000
Rent of tracks and terminals	24,399	25,668
Rent of buildings and other property	208,102	189,147
Rent of equipment	50,152	50,980
Sale of power	12,259	15,686
Total operating revenue	$14,666,998	$14,542,509
Operating Expenses:		
Maintenance of way and structures	$2,256,726	$2,408,682
Maintenance of equipment	1,699,862	1,770,359
Depreciation accruals	*399,753*	*650,936*
Power supply	917,503	981,156
Operation of cars	4,872,190	4,985,676
Injuries to persons and property—expended	1,174,784	1,056,056
Injuries to persons and property—reserved	*31,903*	*2,096*
General and miscellaneous expenses	613,108	617,952
Total operating expenses	$11,102,519	$11,166,851
Net operating revenue	$3,564,478	$3,375,657
Taxes	1,036,624	1,044,377
Operating income	$2,527,854	$2,331,279
Interest revenue	197,434	252,532
Gross income	$2,725,288	$2,583,811
Deductions from gross income:		
Interest on first mortgage bonds	$513,080	$541,607
Interest on first refunding mortgage bonds	879,620	879,620
Interest on adjustment mortgage bonds	1,126,800	1,126,800
Track and terminal privileges	18,942	18,418
Miscellaneous rent deductions	8,499	8,293
Amortization of debt discount and expense	22,451	22,451
Amortization of limited franchises	7,469	8,581
Sinking fund accruals	33,480	33,480
Bus operation	16,783	.....
Miscellaneous	60,268	46,697
Total deductions	$2,687,395	$2,685,950
Net income	$37,893	*$102,138*

Italics denote deficit.

S. W. Huff, president of the company, called the attention of stockholders to the results of expenditures for equipment, which had been mentioned in the report of the year previous, as necessary for the company to make in order to stop the downward tendency in receipts. These expenditures had resulted in increased receipts and decreased operating expenses, with a substantial improvement in the financial condition of the company.

It was his belief that in view of the uncertainties that confront the local surface railways, it was important that the companies of the system be prepared, through a strong cash position, either to buy buses for the purpose of engaging in such transportation in a large way or to contend with a certain degree of bus competition. He said that where the company could consistently do so, it had applied for franchises for bus operation which would co-ordinate with trolley lines and serve as feeders rather than as competitors. By such co-ordination the public would receive the best possible service at the lowest cost, and the investment in existing facilities would be protected.

Review of Financial Affairs

President Huff went into detail on the financial status of the company for many years past. He said that there had been a large growth in revenue, but little territorial expansion of the system. This was remarkable when it was considered that a large part of the system served territory in Manhattan which for a generation had been fully developed by a type of building most desirable for supplying travel for surface transportation, and that so large a part of the operation in Manhattan had become congested with street traffic as to make it very difficult to operate cars in the streets with any degree of speed and regularity.

He said "the steady increase in revenue of the Third Avenue Railway System has been due to the vision of its early directors in determining not to confine its operations to Manhattan alone, but to extend the operations of the system into the then undeveloped territory north of the Harlem River." This seemed a perilous venture at that time, but the territory had grown rapidly until now it furnished more than half of the total revenue of the system, and all of its increase in revenue. During the past fiscal year there was a loss of $130,810 in operating revenue in the territory south of the Harlem River with an increase of $255,299 north of the Harlem River.

Westchester Situation Important

The situation in White Plains and Westchester vicinities was reviewed in the report. According to the report the Third Avenue Railway's position at the county seat of Westchester County is an important move for the system and only another step in the path of the policy of progressive but conservative development of adjacent territory. This extension, according to the report, into adjacent territory should protect not only the territory already served, but should mean much for the future prosperity of the company's system.

The system, in addition to all the trolley lines in the Bronx, includes all of the lines in the southern portion of Westchester.

Another Step in St. Louis Reorganization

The committee representing holders of bonds of the St. Louis & Suburban Railway, St. Louis, Mo., on Oct. 26 filed an amended bill of complaint in the United States District Court in St. Louis, Mo., preparatory to formal foreclosure of its mortgage on the properties now a part of the United Railways. The filing of this amended petition is another step toward the final reorganization of the United Railways.

The amended bill asks that the court direct the United Railways to pay all money due under the Suburban mortgages and in default of such payment to ascertain the exact properties covered by such mortgages, that the mortgages be declared a first lien and that the properties covered by them be sold for payment of the bondholders. It is anticipated that hearings will be held on the application before a special master to determine the extent and value of the Suburban properties.

Traffic, Wage and Fare Figures

Electric railway passenger traffic recovered from the slight slump reported for the month of August. During the month of September there was an increase in traffic, thus continuing the record of traffic increase which has been maintained throughout the whole of 1926, with the exception of the month of August.

The number of revenue passengers, including bus passengers, reported to the American Electric Railway Association by 207 companies for the month of September, 1926, compared with the similar month of last year, is as follows:

September, 1926	755,574,986
September, 1925	748,340,801
Increase, per cent	0.97

Average cash fares in cities of 25,000 population and over:

	Cents
Oct. 1, 1926	7.7056
Sept. 1, 1926	7.7056
Oct. 1, 1925	7.5996

Average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 miles or more of single track:

	Average Hourly Rate, Cents	Index Number 1913 = 100%
Oct. 1, 1926	56.88	208.73
Sept. 1, 1926	56.87	208.70
Oct. 1, 1925	56.25	206.42

Trustee Bids in Pennsylvania Line

Track, overhead and other similar property of the Philadelphia & Easton Transit Company, Easton, Pa., was recently sold at public auction for $51,000. The line, 32 miles long, was built at a cost of more than $1,000,000. It was considered the most picturesque road of its kind in eastern Pennsylvania. It has been in constant operation since Sept. 13, 1904. The purchaser was Augustus H. Sickler, Philadelphia, acting for the bondholders. The real estate and other property of the company will be disposed of at private sale. A bus line will be operated between Doylestown and Easton.

Digitized by Google

Public Service to Take North Jersey Rapid Transit

Application for the approval of the sale of the property of the North Jersey Rapid Transit Company has been made to the Public Utilities Commission by Henry H. Parmelee, receiver of the railway. The sale price of $200,000 has been approved by the Court of Chancery. The company operates cars between East Paterson and Suffern. It went into the hands of a receiver in 1912 on application by the Hamilton Trust Company, Paterson, trustee under a mortgage made in 1910 to secure an issue of $800,000 of bonds. The sale of the road to the Public Service Railway has been approved by the bondholders and by the trustee.

Refunding Operation Planned in Worcester

The Worcester Consolidated Street Railway, Worcester, Mass., has up for discussion several important problems in connection with the rehabilitation program. The directors have asked the stockholders for authority to abandon unprofitable lines, to sell any of the track, overhead work and other equipment of these lines.

The stockholders will also be asked for a decision regarding the creating of a single blanket mortgage under which bonds could be issued to take up securities now outstanding. The mortgages referred to are listed as follows: A $1,200,000 mortgage of the Worcester Consolidated Street Railway, dated Nov. 1, 1907; a $500,000 mortgage of the Worcester & Southbridge Street Railway, dated Sept. 1, 1902; a $40,000 mortgage of the Uxbridge & Blackstone Street Railway, dated Oct. 1, 1907.

It is unlikely that any definite move will be made now on the first of these proposals, but the directors, in seeking authority to act, merely wish to be vested with the authority to deal with any lines that continue unprofitable without calling a special meeting of the stockholders on each occasion.

Story of Their Company Told to New Jersey Stockholders

"Public Service Review—1926," a 72-page book in two colors, which explains by text and by pictures some of the many uses of the utility services furnished by the subsidiary companies of Public Service Corporation of New Jersey, is being sent to the corporation's stockholders.

This is the fourth in the series of "Reviews." The first, in 1923, outlined the historical development of Public Service, the book for 1924 told of the physical properties necessary to furnish gas, electric and transit service to most of the people of New Jersey and the book for 1925 was a record of construction and extension projects undertaken by Public Service.

The present volume tells of the manifold applications of electrical energy, the increasing use of gas as an industrial fuel and the basic service performed by local transportation in community development.

The book also presents the consolidated balance sheet of the corporation and its subsidiary companies and other statistical tables showing the operations of Public Service companies.

Issue of Notes Approved.—Issuance of $105,000 of equipment notes by the Central Transportation Company, Trenton, N. J., a subsidiary of the Trenton & Mercer County Traction Company, has been approved by the New Jersey Board of Public Utilities Commissioners. The proceeds are to be used in the purchase of buses.

Operation Statement Shows Improvement. — For the nine months period ended Sept. 30, 1926, the operating revenue of the International Railway, Buffalo, N. Y., was $8,095,985, against $7,980,166 in 1925. Operating expenses and taxes decreased from $6,950,729 to $6,843,938 for the nine months period of the current year. After the consideration of income deductions there remained a net income of $194,611 for the nine months of 1926, against a deficit of $92,271 a year ago.

Bond Issue Authorized.—The Indiana Public Service Commission has authorized the Evansville & Ohio Valley Railway, Evansville, Ind., to issue $56,500 in first refunding 5 per cent bonds to be sold at not less than 87½ per cent of par. Vice-President Millican said the money would be used for general improvements.

Surplus Lower.—For the period from Jan. 1 to Aug. 31, 1926, the gross earnings of the Lake Shore Electric Railway Company, Cleveland, Ohio, were $2,152,788, against $2,128,783 for the 1925 period. Operating expenses and taxes increased from $1,735,551 to $1,856,273. After the consideration of interest, there was a surplus in 1926 of $5,888, against a surplus for the period from Jan. 1 to Aug. 31, 1925, of $102,582.

Bond Payment Affects Terminal Ordinance.—Further delay in consideration of the application of the Pacific Northwest Traction Company for enactment of a franchise ordinance to permit construction of a new terminal on Stewart Street, Seattle, Wash., is the result of the refusal of A. W. Leonard, president of the Puget Sound Power & Light Company, to reduce payments on the railway purchase bonds or to accept bonds in payment of the city's share of the 1919 railway tax. The City Council utilities committee has asked these two concessions in return for enacting the franchise ordinance. Mr. Leonard offered to accept the amount in five equal payments.

Encouraging Report in Buffalo.—The International Railway, Buffalo, N. Y., in the nine months ended Sept. 30, 1926, earned a net income of $194,611 after all operating expenses, taxes and deductions, compared with a deficit of $92,271 in the corresponding period of last year. Operating income was $115,819 greater than in the nine months period last year and operating expenses were $106,791 lower than a year ago. Increased use of one-man cars and greater co-operation on the part of employees are said by the company to be largely responsible for this favorable showing.

Loss in Tacoma.—Figures showing that the Tacoma Railway & Power Company, Tacoma, Wash., has lost more than $500 a day on an average during the month of September are given in a recent combined statistical report to the City Council by the Tacoma Railway & Power Company and the Pacific Traction Company. The figures show that September's loss was $15,881 and that the loss has been $42,127 for the three months since cash fares have been 8 cents and tokens fifteen for $1.

Hears Abandonment Petition.—The Public Service Commission on Oct. 26 held a hearing on the petition of the Hudson Valley Railway, Glens Falls, N. Y., for approval of a declaration of abandonment of two portions of its line, Route 1, known as the Lake George-Warrensburg line, and Route 2, known as the Thomson-Greenwich line. Opposition was offered to the abandonment of the Thomson-Greenwich line, particularly by the Stevens & Thompson Paper Company and other paper manufacturing plants, on the ground that great inconvenience would be caused the residents of this territory if service were discontinued. There were no appearances noted from the village of Warrensburg. Testimony was offered by the railway to show that losses were increasing from year to year. The hearing was adjourned to Nov. 11, 1926, at the office of the commission in Albany.

Combined Revenues Show Gain. — While passenger revenues collected during September by the Madison Railways, Madison, Wis., showed a loss of $752 over the corresponding month in 1925, the combined railway and bus revenues, however, show a gain of $885 over September, 1925. Gross car and bus revenues for September were $31,011, compared with $30,125 for September of last year. Combined railway and bus revenues still continue, however, to fall below the four-year average of 1920-24. There were 452,670 railway and bus passengers in September, compared with 438,482 for the similar month last year, an increase of 14,188. Of this number, 410,792 were carried by the railway. This is 82,695 fewer passengers than the four-year average.

Deficit Increases. — For the two months ended Aug. 31, 1926, the total revenue from all sources of the Interborough Rapid Transit Company, New York, N. Y., was $8,534,419, a decrease of $1,112,695 over the corresponding period of last year. Expenditure for operating and maintaining the property increased $516,205. Taxes payable to the city, state and the United States increased $75,028. Rentals and other income deductions increased $27,788. The net result for the two months was a deficit of $2,095,845. This is $1,731,718 greater than the deficit for the corresponding period of last year. The comparison with last year is influenced by the strike during the month of July of this year, as well as the fact that in July of last year there was a lump sum payment of $770,000 on account of the new advertising contract, against which no similar payment was made to the company this year.

Legal Notes

FEDERAL DISTRICT COURT. — *Unauthorized Action by City Not Within Federal Jurisdiction.*

The city of East St. Louis adopted an ordinance requiring the removal of certain track from the street, and the railway company took the case to the federal courts under the fourteenth amendment. The district court decided that under the amendment mentioned, if the enactment of the ordinance was within the authority granted to the city by the state, it became a matter of federal jurisdiction, but if the ordinance was not authorized under power granted by the state, such an act is not the act of the state and cannot be enjoined by a federal court. The remedy is by action in a state court. [13 Federal (Second), Rep., 852.]

CALIFORNIA.—*Duties of Motorman and of Automobile Driver to Avoid Collision at Street Intersection.*

While the duties of a motorman and of an automobile driver approaching an intersection are reciprocal, yet from the fact that the street car is confined to its tracks, it is the duty of the automobile driver to give way to its clear passage. When there is failure by an automobile driver to observe the approach of a street car and use ordinary care to avoid a collision therewith, in order that recovery be had, it must be shown that the motorman actually observed the automobile in time to avoid the injury, before the doctrine of the last clear chance applies. [Haber et ux vs. Pacific Electric Railway, 248 Pacific Rep., 741.]

GEORGIA.—*Contributory Negligence in Jumping Toward Street Car to Avoid Injury by Automobile Held Question for Jury.*

Where one who is confronted by a sudden and dangerous situation, or emergency, while signaling a street car to stop at a street corner, a regular stopping place, on account of an automobile approaching directly toward him, or other circumstances likely to impair his judgment or discretion, such person cannot be held as matter of law to be lacking in ordinary care. Whether such person, who, in such emergency, and in order to avoid being struck by the automobile, jumps toward the street car, and is injured thereby, is guilty of contributory negligence so as to defeat an action for damages is a question of fact for the jury to determine. [Bryant vs. Georgia Ry. & Power Co., 134 Southeast. Rep., 319.]

MASSACHUSETTS — *Improperly Registered Automobile Held to Be a Nuisance, Precluding Recovery by Owner for Personal Injuries.*

A married woman kept her automobile registered under her maiden name, although married two years and living with her husband. It was held that the statute requires a motor vehicle to be registered in the name of its owner and if it is not so legally registered, it is a nuisance on the highway. Hence, its owner is precluded from recovery in case of accident. [Bacon vs. Boston E.R. Co., 152 Northeast. Rep., 35.]

NEW YORK—*On Condemnation of Spur, Elevated Railroad Held Entitled to Compensation for Right to Impair Abutting Owners' Easements of Light, Air and Access.*

The city of New York condemned a spur of the Manhattan Railway (elevated) on East 42d Street about two blocks long. In the valuation proceedings, various factors were considered, including the claim of the city that the expense of operation of this spur exceeded its receipts, and that little, if any, traffic was lost because passengers would use a neighboring station, claims of the company for franchise value, easement of light, air and access to abutting property, etc. The courts held that the determination of compensation in condemnation cases is a judicial function and specified $25,000 for the franchise, $120,438 for the physical property removed, $80,000 for additional sums expended to reconstruct a neighboring station because of the removal, and $750,000 for the easement rights. [In re 42d Street spur of M. R., 216 N. Y. Supp., 34.]

NEW YORK—*Permit to Operate Buses Without Reservation of Right of Revocation, Granted by an Ordinance, Is a Franchise*

An ordinance of Oswego, passed May 25, 1925, granted a bus company the right to use certain streets for ten years, but on Jan. 11, 1926, a resolution canceling the permission was passed. The court upheld the position of the bus company, since the grant was one of which it could not be deprived without due process of law and without compensation. [Colonial Motor Coach Corporation vs. City of Oswego, 215 N. Y. Supp., 159.]

NEW YORK—*Duty of Driver of Stalled Truck on High-Speed Railway.*

Where the driver of a truck stalled at a crossing on the track of a high-speed railway remains in the truck for the purpose of saving it from destruction, though he has an opportunity to save himself, he cannot recover damages, although the same degree of care is not required of a man in an emergency that is otherwise demanded. [Fowler vs. International R. Co., 216 New York Supp., 558.]

NEW YORK—*Duties of Pedestrian Crossing a Plaza.*

In a plaza, which was not a regular crossing, a street car has paramount right of way. At such a place, a pedestrian should not assume that a slowly moving car will not pick up speed, and he must exercise increased vigilance if his view of an approaching car is obscured by a taxicab. If he saw the car coming, it is immaterial whether the warning gong was rung [Hinz vs. Eighth Avenue Railroad, 213 N. Y. Supp., 362.]

OHIO—*Rulings of Public Utilities Commission on Bus Certificates Upheld.*

In one decision, the Supreme Court of Ohio passed upon seven different rulings on bus franchises of the Public Utilities Commission. They involved the legality of certain rules of the commission, regarding time for filing applications and protests, power to determine whether certain service is necessary, etc. In all these cases, the rulings of the commission were upheld. [Cincinnati Traction Co. vs. Public Utilities Commission of Ohio, et al. and six other cases, 150 Northeast. Rep., 81.]

OHIO—*Revocation of Bus Certificates by Commission Held Unauthorized.*

The Public Utilities Commission of Ohio revoked the certificate of a bus operator on the ground that he had failed to operate his route. Actually, he had leased his equipment and the operation of the line to another man, but would receive all receipts less operating expenses and a fixed amount to cover the services of his agent or lessee. This was held not to constitute abandonment. [Small vs. Public Utilities Commission of Ohio, 150 Northeast. Rep., 37.]

TEXAS.—*Company Not Responsible for Intending Passenger Struck by Automobile.*

A city ordinance requires street cars to stop at the near side of crossings to receive and discharge passengers when any wish to board or leave a car. The plaintiff stood at such a corner near the track and signaled to an approaching trolley car to stop, but it did not do so. The passage of the car raised considerable dust, and the intending passenger was struck and injured by an automobile following the trolley car, driven by a person unknown to him. He brought suit against the railway company, alleging the injury would not have occurred if the car had been stopped as required by law. The court held that the failure to stop the car was not the proximate cause of the injury and that while it was the duty of the motorman to stop his car to take on and discharge passengers, it cannot be supposed he would anticipate that should he not do so an automobile might run against and injure a person presenting himself for passage. The protection of persons on the street from passing automobiles was not the purpose of the passage of the ordinance. Hence the company was not responsible. [Franklin vs. Houston Electric Co., 286 Southwest. Rep., 578.]

VIRGINIA—*Authority to Abandon Line —Paving Obligations on Abandoned Line.*

The State Corporation Commission has power to permit a discontinuance of street railway operation on particular lines where continued operation would result in confiscation. It is not obliged to order a valuation on all the railway properties to determine whether these particular lines have been operated at a loss. The question of the company's paving obligations on lines so abandoned is a moot question. [City of Hampton vs. N. N. & H. R.G. & E. Co. (two cases), 131 Southeast. Rep., 328-330.]

Personal Items

C. J. Golden, Mine Union Official, on Pennsylvania Commission

The last vacancy in the Public Service Commission of Pennsylvania was filled on Oct. 29, with the appointment by Governor Pinchot of Chris J. Golden, Shamokin, president of District No. 9, United Mine Workers of America. Mr. Golden will fill the unexpired term of J. Henry Scattergood, which terminates July 1, 1929.

Mr. Golden has been a leading figure among the union miners of the anthracite regions for several years. He is also chairman of the Tri-District Board and the Anthracite Scale Committee. He played an important part in the conference between the operators and miners in the negotiations over wage and other disputes. Mr. Golden is also a member of the Anthracite Conciliation Board and of the International Scale Committee. His eight years membership on the Anthracite Negotiating Committee was cited by Governor Pinchot as evidence of Mr. Golden's fitness for the office.

The Governor has also recently named Richard J. Beamish for appointment to the commission. Mr. Beamish is a journalist now serving on the staff of the Philadelphia *Inquirer*.

Joseph G. Forsthove, district manager of the Illinois Power & Light Corporation at Quincy, Ill., has resigned to become manager of the Kewanee Public Service Company and the Kewanee & Galva Railway, Kewanee, Ill.

W. C. Bartels, recently made traffic engineer of the Wisconsin Power & Light Company, has been placed in charge of the newly created traffic department at Fond du Lac, Wis. The purpose of the new traffic department is to build up both bus and railway business, publish schedules and handle advertising.

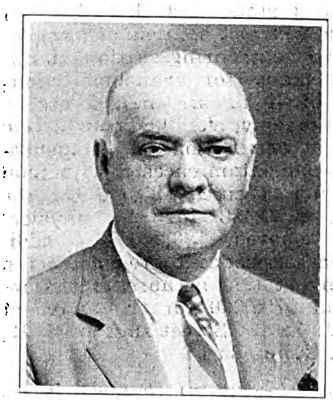
R. D. Morrison, formerly superintendent of the Wichita Railroad & Light Company, Wichita, Kan., has succeeded Joseph G. Forsthove as manager of the Quincy division of the Illinois Power & Light Corporation. For the past ten months Mr. Morrison has been in charge of the railway properties at Venice, Ill.

Harry P. Chandler has been appointed an executive assistant of the Public Service Corporation, Newark, N. J. He has been in the employ of the company and its predecessors for 36 years, and for the last seventeen years has been division agent of the central division for the electric and gas departments.

Charles A. Brann has been appointed superintendent of railways for the Eastern Texas Electric Company, Beaumont, Tex. In this capacity he succeeds Ralph A. Gill. Mr. Brann was formally superintendent of traffic for the Houston Electric Company and early this year was made superintendent and passenger agent of the Galveston-Houston Electric Company. He has also been identified with the El Paso Electric Company, El Paso, Tex.

New Duties Assumed by North Shore Officials

Appointment of John F. Egolf as general manager and Howard P. Savage as assistant general manager of the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., was made Oct. 25 in an official announcement by the North Shore Line. This follows the recent appointment of Jesse S. Hyatt, former general manager, as chief engineering assistant to Bernard J. Fallon, vice-president in charge of operation of the four electrically operated railroads in the Metropolitan area, and of Bert W. Arnold, former assistant general manager, to have supervision of motor coach operations of the railroads. These changes were referred to briefly in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 30, 1926, page 829. Mr. Egolf's career has been reviewed previously in these pages.



J. F. Egolf

H. P. Savage

The new assistant general manager is an internationally known figure, having only a few days ago been elected national commander of the American Legion at the national convention in Philadelphia. He has been serving the Chicago Rapid Transit Company as general superintendent of maintenance of way. Mr. Savage entered the electric railway industry in 1913 as a track foreman on the Metropolitan West Side Elevated Railroad. Later he was promoted to track engineer of the "L" lines and then to the position which he held at the time of his new appointment. During the World War he secured a leave of absence and obtained a commission in the 55th Engineers, serving in France from July, 1918, until July, 1919. On his return to civil life he resumed his position with the Rapid Transit Lines, in accordance with the policy of all utilities under the management of Samuel Insull and associates, that every one who was in government service should be restored to his former position or a better one.

Greater Individual Responsibility Under New Pittsburgh Plan

A new form of supervision, whereby the entire structure of the operating department of the Pittsburgh Railways, Pittsburgh, Pa., will be solidified and systematized, has been approved and will begin to function within a few days. The plan is based upon a policy of making each executive assume entire responsibility for his own departmental activities.

The scheme generally reaches to the fundamentals of railway operations. In the new plan J. M. Loftis, veteran superintendent of transportation, will delegate to three superintendents under him the three distinct functions of car operation.

A. J. Fink, formerly assistant to the general manager, has been made superintendent of traffic and schedules.

Frank W. McCarthy, formerly assistant superintendent of transportation, has been named superintendent of car operation.

Another man, so far unchosen, will be made superintendent of trainmen's instruction.

All of these functions, in the transportation scheme, have so far been handled by Superintendent Loftis. The duties will now be definitely divided, as they represent three distinct units of operation.

The trainmen's instruction department will prepare the men and school them before and after they go on the cars, so that they will be equipped to handle cars safely and adequately, and at the same time recognize the value of salesmanship and courtesy.

Mr. McCarthy's department includes the actual operation of the cars and the supervision of the men at the carhouses.

Mr. Fink's department will keep the cars moving and see that the service is carried through. He will have to assist him a traffic engineer; a chief inspector, R. C. Rearick, formerly load dispatcher, and four district inspectors,

Digitized by Google

F. A. McCarthy, William Fitzgibbons, Michael J. Carter and Earl Siggins, who were formerly inspectors but will henceforth be in charge of the inspectors of their respective districts.

Simultaneously with the reorganization of the transportation department, the mechanical departments of the company have been simplified and coordinated on a similar plan.

A. H. Leschke, formerly maintenance engineer, has been made operating engineer and will serve both transportation and maintenance departments.

Richard S. Bull, formerly shops superintendent, has been made superintendent of equipment, in charge of both the carhouse and shop departments.

Oscar Williams, formerly head of the way department, has been named superintendent of the way and structures, in charge of all track, rights-of-way, buildings and other structures.

M. W. Cooke, formerly chief of current control, is now also in charge of inclines, with the title of superintendent of power and inclines.

The plan will provide a closer supervision, with one man definitely at the head of each specialized branch of the railway's operation. Hitherto in the transportation department enlarged duties were handled through the appointment of an assistant. The new method groups all of the duties of the department and allocates them to one of the three new positions.

P. L. Smith is now treasurer of the North American Light & Power Company, Chicago, Ill. He has been affiliated with this company since 1916, when he assumed duties in the financial and accounting department. For three years he served as assistant secretary and assistant treasurer of all the companies in the North American Light & Power group.

Dr. Trumbower, chairman of the committee of highway finance of the highway research board, has resigned his position with the United States Bureau of Public Roads to become professor of transportation at the University of Wisconsin. One of his duties will be the development of a highway transport curriculum. He will continue his highway research activities.

Hal M. Lytle, vice-president of the Chicago, North Shore & Milwaukee Railroad, of the Chicago Rapid Transit Company and of the Chicago, Aurora & Elgin Railroad, was recently elected to a similar office by the directors of the Chicago, South Shore & South Bend Railroad and the Shore Line Motor Coach Company. The South Shore Line is a high-speed electrically operated railroad between Chicago and South Bend. The motor coach company is owned by the South Shore Line and the Gary Railways, in equal portions, and serves many of the cities served by the South Shore Line, as well as acting as a feeder for that railroad. The South Shore Line and Gary Railways are subsidiaries of the Midland Utilities Company.

W. D. Allen, general manager of the Hamburg Railway, Hamburg, N. Y., has assumed general managership of the company's new suburban bus line operating between Buffalo and Hamburg.

L. S. Ready Will Succeed C. O. G. Miller on Key System

C. O. G. Miller will resign as president of the Key System Transit Company, Oakland, Cal., on Jan. 1 and be succeeded by Lester S. Ready, chief engineer of the California Railroad Commission. The board of directors will meet on Nov. 12, at which time formal action will be taken on these changes.

It is announced that Mr. Miller is slated to stay as chairman of the board of directors.

Mr. Ready has been a railroad commission engineer for thirteen years, or since his graduation from the University of California. He has been chief engineer for 3½ years. He was an honor student at the university and is one of the most successful engineers on the Pacific Coast.

Mr. Miller has been president of the Key System since its organization. He issued a formal statement announcing his retirement from the presidency and asking the public to support and co-operate with his successor. Mr. Miller said that the new president will give his entire time to his office and will aid in helping to solve the East Bay transportation problem.

Paul S. Clapp Executive Head of N.E.L.A.

Paul S. Clapp, Washington, D. C., has been appointed executive head of the National Electric Light Association. This appointment follows the acceptance by the executive committee of the resignation of M. H. Aylesworth, managing director, who, as noted previously in the ELECTRIC RAILWAY JOURNAL, is to become president of the newly organized National Broadcasting Company, Inc.

Graduated from the Iowa State College at Ames in 1913 as a bachelor of science in electrical engineering, and ten years later attaining the professional degree of electrical engineer by award of his alma mater, Mr. Clapp has an excellent engineering groundwork for the post he is to assume. In September, 1913, he found his first employment in the Chicago factory of the Western Electric Company. In February, 1914, he advanced to the same company's engineering department in New York, remaining there until February, 1917.

In February, 1917, Mr. Clapp became assistant purchasing agent of the Allied Machinery Corporation, a subsidiary of the American International Corporation, remaining until September of the same year, when he was commissioned a first lieutenant in the Signal Corps of the United States Army and became division signal supply officer of the Thirty-third Division at Camp Logan, Tex. Later, while in charge of the field trial and responsible for the final engineering approval of all radio and telegraph apparatus for airplanes, tanks and field sets at the radio laboratories at Little Silver, N. J., he won promotion to a captaincy in the Signal Corps.

From December, 1918, to February, 1919, Mr. Clapp served on the peace commission in Paris as a member of the committee for the determination of damage in allied countries, and afterward he was affiliated with the American Relief Administration for Central and Southeastern Europe. After finishing that work Mr. Clapp for a year assisted in re-establishing cordial relations in the business interchange between American and western European industries and then sailed with Col. William Haskell and his original American Relief Administration party from New York to Russia.

Returning to this country, Mr. Clapp was appointed special assistant to the Secretary of Commerce in engineering, economic and commercial problems of the United States.

Jasper Johnson, general superintendent of transportation for the Aurora, Elgin & Fox River Electric Company, Aurora, Ill., was to leave on Nov. 1 to become manager of through lines and Michigan City, Wis., local lines of the Shore Line Motor Coach Company, operating between Chicago and Grand Rapids, Mich. Mr. Johnson has been with the Aurora, Elgin & Fox River property for sixteen years.

Obituary

F. M. Webster

Frank M. Webster, claim adjuster for the Grand Rapids Railway, Grand Rapids, Mich., for nearly 35 years, died suddenly on Oct. 30. Mr. Webster had not been in good health for some time, but he attended to his duties the day before he was stricken.

Mr. Webster entered the employ of the Valley City Street & Cable Railway, later consolidated with the Grand Rapids Railway, on July 17, 1891. After a year as conductor of a cable car he became claim adjuster, a position he had held since that time. In point of service he was one of the three oldest employees of the Grand Rapids Railway. In spite of the difficulties of his duties, Mr. Webster filled them with rare tact and diplomacy, always fostering the good will that existed between the public and his company.

Mr. Webster was born in Paris township, near Grand Rapids, in April, 1859. His parents were pioneers in western Michigan. He was a 32d degree Mason, being a member of York Lodge, F. & A. M., DeWitt Clinton Consistory, Scottish Rite, and Saladin Temple, Mystic Shrine.

John Larue Forkner, the first treasurer of the Union Traction Company of Indiana, Anderson, Ind., died recently. Mr. Forkner had lived in that city 60 years and had served respectively as sheriff, county auditor, councilman, city clerk and twice as Mayor of the city. He was 82 years old.

Edmond Alfred Hopkins, promoter of the Darby, Media & Chester Railway, now included in the system of the Philadelphia Rapid Transit Company, Philadelphia, Pa., died on Oct. 31 in that city. He was at one time connected in a managerial capacity with a railway property in London, England. He was 69 years old.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Akron Engineers Visit Timken Plant Via Northern Ohio Car

Forty-three members of the Akron Section, American Institute of Electrical Engineers, visited the plant of the Timken Roller Bearing Company in Canton, Ohio, on Oct. 16, to inspect the work of the various departments. Particular interest was manifested by the visitors in the steel mill, where five Heroult electric furnaces are in constant use to produce the highly refined alloy steel used in the manufacture of Timken bearings. The other departments of the steel mill and the bearing plant were also visited. Here more than 160,000,000 Timken bearings have been made. At the conclusion of the visit the experimental laboratories were shown.

In reaching the Timken plant the party used the new Northern Ohio Power & Light Company interurban parlor car. On this car the engineers were able to see Timken bearings in actual operation in the journal boxes.

Car Wheel Contract in Seattle Awarded

A contract for furnishing 200 33-in. and 100 26-in. car wheels for the Seattle Municipal Street Railway, Seattle, Wash., was awarded by the Board of Public Works on Oct. 15 to the Bethlehem Steel Company on that corporation's bid of $34 each for the 33-in. wheels and $24.50 for the 26-in. wheels. The contract involves an expenditure of $9,250. At this same session the Board of Public Works awarded a contract for furnishing 10 miles of No. 2/0 hard-drawn copper trolley wire for the railway department to the Pacific States Electric Company for $16.95 per hundredweight and 10,000 ft. of No. 8 arc duplex two-conductor cable to the North Coast Electric Company for $65 per thousand feet.

Ohio Brass to Have New Office Building

Much-needed larger working quarters will be provided for the general offices of the Ohio Brass Company when the new administration building at Mansfield, Ohio, is completed. Construction work started Oct. 1. The general offices at present are housed in the oldest building of the plant.

The new office building will cost approximately $500,000. It is to be a five-story steel and brick structure with stone trim, 255x52 ft., and having reinforced concrete floors. Construction will be fireproof throughout. The general layout and appointments will compare favorably with the finest factory office buildings erected in recent years.

Provision is made for a 25 per cent increase in office force over present requirements, so that the company is planning well for the future.

Ample space will be provided officers and general sales officials and the seven divisions handling the sales of Ohio Brass products in the five industries served by this company. In addition there will be a permanent display room on the top floor. A conference room, seating 350, will be provided on the fifth floor, to be used for sales meetings and the like.

Little Known Facts About Mica

Very comprehensive is the little book entitled "Mica and Mica Products" which has just been published for distribution by William Brand & Company, New York, N. Y. Little information, strictly technical or otherwise, has heretofore been available on the subject of mica, and this discussion of the subject by Richard Schroeder, a noted German authority on the subject of electrical insulating material, should do much to clear up any misapprehensions existing on the subject of the technical properties of mica. The material contained in the booklet is an excerpt from a series of lectures on electrical insulating materials delivered before various technical institutions and societies of Berlin by Prof. H. Schering. Copies of the booklet will be sent to any railway man interested by William Brand & Company.

Wide Range of Orders Reported by Yellow Manufacturing

Sales by the Yellow Manufacturing Sales Corporation, Chicago, Ill., to electric railways are holding up well. Between Sept. 1 and Sept. 30 the company reports a long list of sales made in this field. Units vary in size from a single vehicle to fleets of considerable size, and the sales cover a variety of types of bodies and chassis.

Sales included orders from the Los Angeles Railway, Los Angeles, Cal., for two 230-in. wheelbase double-deck and one Model X, 21-passenger pay-enter coaches; Virginia Electric & Power Company, Richmond, Va., two units, Model Z-230-in. chassis; Northern Ohio Power & Light Company, five units, Model Y chassis; Wisconsin Public Service Corporation, Green Bay, Wis., one unit, Model X, 21-passenger pay-enter coach; Southern Indiana Gas & Electric Company, Evansville, Ind., four units, Model Z, 29-passenger city service coach; Bamberger Electric Railroad, Salt Lake City, Utah, two units, Model Y parlor coach; Danbury Power & Transmission Company, eight units, Model X, 21-passenger pay-enter coach; Austin Street Railway, Austin, Tex., one unit, Model X, 21-passenger pay-enter coach, and the Evanston Bus Company, subsidiary of the Evanston Railway and the Chicago, North Shore & Milwaukee Railroad, two units, Model X, 21-passenger pay-enter coach.

No Lack of Activity in the Sisson Supply Company

"Pop" Sisson started something in February of this year. The "something" was the Sisson Supply Company, which consists of A. H. Sisson and his two sons, H. R. and Donald M. Sisson. "Pop" Sisson, as he is familiarly known throughout the railway industry, is one of the old-timers in the supply business. So this new venture of his is no wandering into foreign fields.

He started in the electric railway supply business in 1897 as one of the organizers of the Jewett Car Company, located at Jewett, Ill. In 1904 he went with the St. Louis Car Company, first as manager of the New York office and later as general manager of the company. In 1908 he became general manager of the Forsyth Brothers Company in Chicago, and in 1912 president of the Southern Car Company, High Point, N. C. Later he joined the National Pneumatic Company and still later the Columbia Machine Works, always centering his attention upon the various needs of the railway field.

This latest move of his, taken in conjunction with his two sons, is the culmination of a lifetime of training and preparation for just such work as this. The Sisson Supply Company will have for its territory the states of New York, Pennsylvania, New Jersey, Maryland, New England States and Washington, D. C. Among the manufacturers whom the Sisson Supply Company will represent are the following: Massachusetts Mohair Plush Company, Cleveland Tanning Company, Wheeling Corrugating Company, Chaton Fiber Company, Leon R. Wolf Weatherproof Fabric Company, Wright Rubber Products Company and the Industrial Products Corporation. The headquarters of the Sisson Company will be located at 1845 Grand Central Terminal Building, New York City.

Patent Suit Against Interborough Is Dropped

In a patent infringement suit brought by Samuel Thomas Walkup against the Interborough Rapid Transit Company, New York, N. Y., the United States District Court held that the railway had not infringed Walkup's patent on a car door control system for use in cars which are operated in trains. It was claimed by the plaintiff that the Interborough had adopted features of the patented control system which "has for an object to provide a control system whereby the platform men at the stations may operate the doors and whereby the number of cars controlled by a single platform man may be varied as desired . . . improved control system comprises a series of contact rails which are located at the stations above the tracks and at sufficient height to clear the cars, being secured to any suitable part, in this case the roof of the subway station."

The Interborough company was held

Digitized by Google

by the court not to have infringed the patents in its door-operating mechanism, since "the defendant did not use a contact rail or a series of contact rails adjacent to which a car or train is adapted to come to rest. The defendant uses motor armature resistance on some of its cars and light resistance on others to reduce the voltage of the third rail. Storage batteries are on all of its cars for the storage of energy to operate its doors." The bill was dismissed by the court on Oct. 18.

Westinghouse "At Home" All Year in Atlantic City

A year-round exhibit by the Westinghouse Electric & Manufacturing Company of Pittsburgh, Pa., has been opened in Atlantic City, N. J. The purpose of this exhibit is to display to the public electrical devices for transportation and marine business, industrial and home requirements. The exhibit is located on the ocean frontage of the Shelburne Hotel, almost opposite the Million Dollar Pier.

Prohibition Director Appeals for Manufacturer Co-operation

An appeal to big business heads throughout the country to assist in enforcing the prohibition law has just been made by Gen. Lincoln C. Andrews, Assistant Secretary of the Treasury in charge of prohibition enforcement, through the Citizens' Committee of One Thousand. This committee has sent copies of General Andrews' appeal to 14,000 business executives located in every part of the United States. The text of General Andrews' letter is as follows:

"Here is an idea which, if made effective, should be tremendously helpful to law enforcement; I believe that you and your organizations are the only agency to put this thing over.

"I know, from personal experience, that the big sales agencies for large manufacturers very often make it a practice to supply generous quantities of liquor by way of entertainment upon all manner of occasions, where their customers are meeting together for one purpose or another.

"For example, I was in the street railway business for some four years before taking this office. On every occasion, where the street railway men get together as in their annual state and national conventions, these agents of railroad supply houses were always present as delightful hosts dispensing unlimited quantities of liquor for the jollification of the occasion. What is true in this business is undoubtedly true in other big businesses.

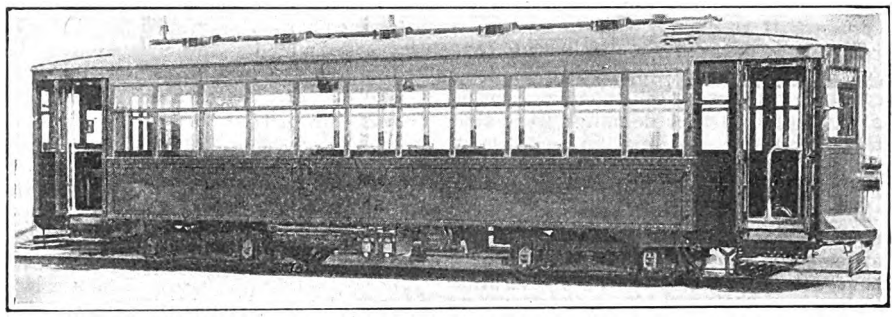
"It always struck me as unreasonable, even from the economic point of view, because in the end the purchaser pays for the costs of salesmanship. But let us look at it from the prohibition point of view. It is generally accepted that big business favors the prohibition law and its enforcement—so far as industrial labor is concerned. Certainly in the railroading world, and in many other businesses as well, management disapproves drinking on the part of employees.

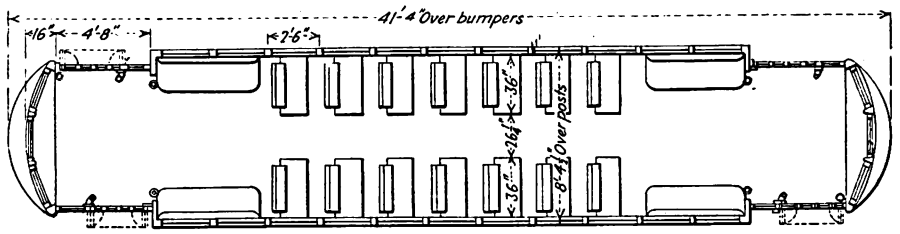
"Now, let us look at the picture. Big manufacturing business, through allowing or rather fostering these expense accounts for large quantities of entertainment liquor, is making a considerable part of the market for liquor, which in turn brings into existence and supports the organized liquor traffic which furnishes the liquor. How inconsistent on the part of these big businesses who claim they want the law enforced. Again, the employees of the railroads, etc., are pretty generally aware of these convivial practices at conventions, etc., and what an unfortunate example to these employees that their management personnel are thus taking these occasions for drinking parties!

"My sole interest in this is the elimination of just that much market for bootleg liquor—a market which is ready to pay any price and is thus sure to have its demand supplied. My thought is that if this picture can be properly presented to big businesses throughout the country they will readily enough agree to cut out this practice. They have only to take the stand that no 'expense money' used for the purchase of liquor will ever be authorized.

"If you can undertake to put this over, I will be much obliged and, of course, you may use this letter in any way you see fit."

Roanoke Cars Now in Operation





Delivery was made some time ago of six light-weight passenger motor cars to the Roanoke Railway & Electric Company, Roanoke, Va., by the J. G. Brill Company, Philadelphia, Pa. These units will be used in city and interurban service in Roanoke and the territory served by the railway. Seats for 44 passengers have been provided, these being of the Brill Winner type.

The principal specifications of the new cars are as follows:

Weights:	
Car body	1,700 lb.
Trucks	10,560 lb.
Equipment (electric and air)	8,570 lb.
Total	36,130 lb.
Bolster centers, length	18 ft. 10 in.
Length over all	41 ft. 4 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 6 in.
Height, rail to trolley base	11 ft. 0½ in.
Body	Semi-steel
Headlining	Agosote
Roof	Arch
Air brakes	Westinghouse Traction Brake Co. straight air
Bumpers	Channel
Car signal system	Consolidated
Car trimmings	Polished bronze
Center and side bearings	Brill
Control	Westinghouse K-35KK
Curtain fixtures	Curtain Supply Co.
Curtain material	Pantasote double faced
Destination signs	Electric Service Supplies Co.
Door-operating mechanism	National Pneumatic
Fenders	H-B lifeguards
Gears and pinions	Forged steel
Hand brakes	Peacock staffless
Heater equipment	Consolidated
Headlights	Golden Glow SE-95
Journal bearings	MCB
Journal boxes	3½ in. x 7 in.
Motors	Four Westinghouse 510-A, inside hung
Paint	Flood & Conklin
Sanders	Ohio Brass
Sash fixtures	Brill
Seats	Brill Winner
Seating material	Cherry wood slats
Slack adjuster	American type E
Springs	Brill
Step treads	Universal
Trolley catchers	Knutson No. 5
Trolley base	US-13
Trucks	Brill 77-E-1
Ventilators	Garland Type C-1
Wheels	A. C. & F., 33 in.

Another Chapter in Seattle Car Purchase Story

Plans for the purchase of 80 new cars for the Seattle Municipal Railway are apparently doomed. Corporation Counsel T. J. L. Kennedy has issued an opinion that the Board of Public Works has no power to amend the car purchase contract, as asked by attorneys of the St. Louis Car Company, to which the contract for the cars was awarded. The company submitted several proposed amendments a few weeks ago after a question had been raised as to validity of any bonds issued to pay for the cars. Mr. Kennedy points out that to amend the contract after it has already been awarded would set a dangerous precedent and violate the principle on which bidding and awards are based.

Digitized by Google

One of the provisions asked would permit the car builder to rescind its contract if it should fail to receive a railway warrant when due in payment for the cars or fail to obtain immediate cash for any warrant when presented at the bank. Other demands were that the company continue in possession until the cars are actually turned over to the city in the Seattle shops; that the $1,875,000 bond issue be segregated so that payment would be made from an issue designated for street cars only; that all warrants outstanding against the construction fund of the railway department be paid before any warrants in payment for the cars are due to the company; that the contract be automatically extended should there be any litigation concerning the deal or the bonds; that the furnishing of a surety bond by the company depend upon the approval by its attorneys of the marketability of the bonds.

Track and Line

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., plans to double track its Wells-Downer line on Downer Avenue from Edgewood Avenue north to Atwater Road in Shorewood. The total cost of this work will be $26,000. Reconstruction of the Kinnickinnic Avenue tracks between Oklahoma Avenue to the new city limits at Ludlow Avenue will soon be under way. This job will cost approximately $64,900. In Racine extensive railway improvements are under way at the Monument Square curve, where tracks are being torn out and replaced with heavier rails and steel ties.

Goose Creek, Tex.—Right-of-way for the Houston, Baytown & Goose Creek Interurban Railway has been secured and grading and track laying are making rapid progress, according to Harry K. Johnson, president. Track has been laid from Goose Creek to the San Jacinto River, and the contract for the construction of a bridge across the river has been awarded to the Austin Bridge Company. The total cost of the road's construction will be approximately $1,600,000, according to Mr. Johnson. The cars of the new line will enter Houston over the tracks of the Houston Electric Company.

Chicago Surface Lines, Chicago, Ill., has started work on the extension in West 79th Street from Ashland Avenue to Western Avenue, and according to the engineers in charge of the construction the line should be completed in about six weeks. The extension is 1 mile in length. The trolley wires have been strung over the new roadbed. Now the work of excavating in the open space left in the new concrete paving is being done and the laying of ties and rails will he under way within a few days.

Los Angeles Railway, Los Angeles, Cal., will complete the reconstruction of its car tracks in the downtown district by Nov. 1. All rail used was the heavy 116-lb. girder rail. The entire length of track reconstructed in this district will be, when complete, 3.625 miles.

Harrisburg Railways, Harrisburg, Pa., will extend its Market Street tracks to the new John Harris High School following the passing of the ordinance allowing franchise rights for the construction. Under the provision of the ordinance, the new stretch will extend 2,700 ft. east from 21st and Market Streets bringing the end of the track near the main entrance to the school building.

Trenton & Mercer County Traction Corporation, Trenton, N. J., has begun preliminary work in connection with the erection of a carehouse and a garage on East State Street. Nine switches will be placed in front of the proposed building and 750 ft. of new rails and roadbed will be laid on South Olden Avenue.

Trade Notes

Andrew J. Ryan has been added to the list of Kemi-Suede representatives. Mr. Ryan will take care of the Southern territory for the Leon L. Wolf Waterproof Fabric Company, Cincinnati, Ohio.

Evan J. Parker, formerly of the Morgan Engineering Works, Alliance, Ohio, has joined the forces of the Northern Engineering Works, Detroit, Mich., manufacturer of material-handling equipment such as electric and hand cranes, electric and air hoists, foundry equipment, etc. Mr. Parker will have charge of the sales promotion division.

C. W. Sproull of the firm of Allen, Sproull & Allen, Fort Worth, Tex., manufacturers' representatives, recently visited Bridgeport to complete arrangements to represent the Bridgeport Brass Company in the Southwest for the sale of the Bridgeport line of plumbing goods, Plumrite brass pipe and fittings and Bridgeport-Keating flush valves.

R. C. Brower has recently been appointed general manager of the Timken Roller Bearing Service & Sales Company, Canton, Ohio. The company maintains 25 direct factory branches and several hundred authorized distributors. Mr. Brower will make his headquarters in Canton, but will devote a considerable portion of his time in maintaining contact in the field. He is well known in the bearing industry, having been associated with it since 1913, and for the past four years with the Timken company.

Metal, Coal and Material Prices

Metals-New York	Nov. 3, 1926
Copper, electrolytic, cents per lb	13.725
Copper wire, cents per lb	16.00
Lead, cents per lb	8.00
Zinc, cents per lb	7.60
Tin, Straits, cents per lb	69.75
Bituminous Coal, f.o.b. Lines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$9.75
Somerset mine run, Boston, net tons	4.125
Pittsburgh mine run, Pittsburgh, net tons	4.00
Franklin, Ill., screenings, Chicago, net tons	1.725
Central, Ill., screenings, Chicago, net tons	1.45
Kansas screenings, Kansas City, net tons	2.35
Materials	
Rubber-covered wire, N. Y., No. 14, ptr 1,000 ft	$5.75
Weatherproof wire base, N. Y., cents per lb	17.75
Cement, Chicago net prices, without bags	2.10
Linseed oil (5-bbl. lots), N. Y., cents per lb	11.70
White lead in oil (100-lb. keg), N. Y., cents per lb	15.25
Turpentine (bbl. lots), N. Y., per gal	$0.88

New Advertising Literature

Westinghouse Traction Brake Company, Pittsburgh, Pa., has issued descriptive catalog T-2032, entitled "Motor-Driven Air Compressors." This catalog covers compressor types 3VS and 3VD and is dated September, 1926, superseding the issue of October, 1924.

Southern Manganese Steel Company, St. Louis, Mo., has published a booklet on "Fahralloy" castings, which is a trade name given to a series of alloys developed to meet varying heat-resisting and corrosion-resisting conditions. The pamphlet gives the general characteristics of "Fahralloy," together with illustrations of various forms of castings which are produced.

General Electric Company, Schenectady, N. Y., has issued an illustrated folder intended to show that in every phase of handling of materials G. E. motorized power has paid. Examples are offered of the G. E. locomotive in haulage jobs, the tractor in cutting handling costs, the trucks which save while they serve and the "world of cranes" actuated by G. E. alternating or direct-current motors.

Pyle-National Company, Chicago, Ill., has completed the third edition of its No. 101 general catalog of railway electrical equipment. This latest edition describes a number of recent developments in locomotive headlight case construction, as well as giving data on the Pyle-National Company's established line of turbo-generators and yard floodlights. A representative selection of the Oliver wiring appliances for locomotive, car and shop wiring is included, although the full line of Oliver material is presented in a separate catalog. New and complete information on locomotive headlight mountings and recommended wiring for locomotive lighting is presented, together with tables, diagrams and material lists. Copies may be obtained from the general offices of the Pyle-National Company, Chicago, or from the branch offices in St. Paul, Minn., St. Louis, Mo., and New York City.

R. D. Nuttall Company, Pittsburgh, Pa., has issued bulletin No. 52 entitled "Nuttall Products for Electric Railway Service." This bulletin succeeds bulletin No. 35 of the same title. The later publication, however, is not a reprint of the earlier catalog as it has been completely rewritten and a large amount of new material included. A complete discussion of helical gears for street railway service is included, covering such items as analysis of helical gear meshing, quietness of helical gears, preservation of tooth contour, allowable wear, etc. Further, the publication covers spur gears, super tooth pinions, spread centers, trolley poles, harps, trolley bases, pantagraph trolleys, and various similar items.

Harry M. Perry, Los Angeles, Cal., has issued a leaflet giving new pulley horsepower data. This should be of interest in railway machine shop practice. A description of the advantages and principle of operation of the belt-slacker drive is also included.

"Pack Up Your Troubles" if You Want to Win Public Favor

MR. AVERAGE CITIZEN is totally uninterested in the troubles of the electric railways. Granting that the industry has received a lot of unfair treatment, there's no good to be obtained by grumbling over it now. Face forward and set about improving the service. Forget excuses and tell the public the noteworthy things that are being accomplished. Such, in substance, was the advice given to members of the Metropolitan Section, A.E.R.A., at its meeting last week.

How this policy has worked to the advantage of the steam railroads was pointed out by C. S. Ching. Some time ago these carriers stopped looking for public sympathy and began to talk service. In public esteem they stand higher today than they have stood for a long while. Electric railways would do well to follow this example. Carrying the argument a step further, another speaker explained why interruptions to service, equipment failures, etc., constitute news for the press, while reliability of service and regularity of performance do not make news. To offset this the railway must definitely undertake to keep the public informed of its progress and accomplishments.

Those who were not fortunate enough to be at the meeting will find food for thought in the abstracts of these two talks, published elsewhere in this issue. Every railway man who attended this inspiring meeting left with a concrete idea that he could take home and use in his daily work.

New York Merchants Would Conserve Transportation Lines

RECOGNITION of the principle that existing transportation systems should be expanded to meet the increasing needs of the community is the feature of a report by the committee on city transit of the New York Merchants' Association, and which has been adopted by its board of directors. This action resulted from the recent recommendation of the city's Board of Transportation to grant new city-wide bus franchises. It is significant that this body of merchants, with neither political bias nor a brief for any particular transportation system, sees that the report "disregards the principle of unification and economic utilization of existing means of transportaton and fails to consider the property rights of companies now operating." True, motor bus franchises are deemed important, but the committee did not believe that the granting of new city-wide franchises was essential or desirable.

Unlike many other reports made by merchants' associations, in this one reference has been made to the best information available. "All disinterested studies which have been made," says the committee, "show that it is not practicable to replace surface lines in New York City by bus routes in any wholesale fashion. On the contrary, a sufficient number of buses to carry all existing traffic would generally lead to hopeless congestion of the streets."

Again, the committee holds that one of the present difficulties with transportation in New York City is adherence to the flat 5-cent fare. Competing bus lines would still further deplete the earnings of the surface lines and make the situation more difficult. Moreover, the move is of doubtful legality. But the existing systems should be encouraged to develop such motor bus lines within their territories as will extend and fill out their service. Any other method, it is held, will merely lead to increased cost and further complication, which would inevitably postpone the solution of New York's transit problem.

All of this is sound doctrine. It is applicable not only to New York but to every city where similar questions have arisen. When the business men and citizens generally appreciate their needs and foster the logical growth of the existing systems the problems of transportation will be much simplified. This is something for all railway men to ponder.

Trolley Bargain Day Again Comes to Town

WHEN good business and good will are tied together the result is a prize package. Residents of Toledo and Atlanta have recently been the recipients of these prize packages by virtue of a contract entered into by a merchandise house and the local railway company. Under the plan promulgated the store executives take a lease of the railway lines for certain hours on certain days; at the same time they extend an invitation to the public to ride free and purchase bargains in commemoration of anniversary sales. The crowds rush to the bargain counters via the railway cars, and speculation arises as to the benefits of the "trolley bargain day" revival in so far as the railway is concerned.

At the outset one is prone to see merely a day's increased receipts resulting from an increase in riding. True, the concomitant of business astuteness is financial gain, but that is only a small and relatively unimportant part of the picture. An intensive study, however, reveals a tendency of more far-reaching importance than the immediate acquisition of extra cash. The scheme binds the trolley still closer to the intimate affairs of every-day life—the trolley becomes the connecting link between man and the necessary habit of shopping.

And what pursuit transcends shopping in importance? To all women and to some men shopping is not a detestable duty, but rather a delectable diversion. Even the most unobservant salesgirl will testify to the meticulous concern and fastidious taste of the average buyer. Newspapers and magazines allot considerable space to giving advice to the prospective shopper and to enumerating the qualifications of the successful shopper.

Digitized by Google

In fact, the ideal shopper is in as enviable a position today as the perfect lover.

This important phase of every-day living presupposes transportation to the business districts and, as far as the great majority is concerned, by means of the electric railway cars. Thus, when a merchandising stunt includes trolley transport its promoters are proclaiming the trolley way as the ideal way. They are not only identifying the trolley car with every-day life but are also affirming its increasing usefulness in man's chase for the amenities of existence.

The railway bargain day idea will certainly grow. Perhaps in many localities some such campaign is awaited to awaken either a lethargic people to the serviceability of the railway utility or to win back a vacillating patronage that sees no progress unless in change, even applied to transportation. The prize packages may go to the bargain hunters, but somehow they redound to the glory of their promoters.

Transportation Is Very Closely Related to City Growth

PUBLIC opinion in this country does not usually recognize the close relation of local transportation to city development and growth. One reason may be that electric railways and other means of local transport suffer from the "triteness of long familiarity." Nevertheless, unless there is some method of conveying persons or merchandise to and from any given locality, real estate there would be almost valueless for community uses.

This is strikingly shown by the article by M. Jayot of Paris in this issue. It has a most unusual form of treatment, because of its wealth of data on transportation and its effect on city growth from various cities in Europe and South America. In it the author shows that until the beginning of local public carrier transportation, less than 100 years ago, the largest cities of the world were very different in social and community life from what they are today. So long as the cab and the private carriage were the only means of transportation, the great mass of city dwellers were forced to work, take their pleasures and do their purchasing within easy walking distances. There were no shopping or commercial districts, as these terms are now understood, in the cities of a century ago, and the largest of them contained but a few hundred thousand inhabitants.

Local transportation created not only the modern city; it created modern land values, because it enabled thousands of people to do business at a spot previously accessible only to scores.

M. Jayot's article would be of little value, except from a historical point of view, if it did not teach certain lessons and so help to solve some of the problems with which cities are now confronted. One of these, and probably the most important, is the need in any city-planning project of placing the question of public transportation at the head of the list of problems to be solved. This is true whether the portion of the city being considered is undeveloped territory or already solidly built up. Too often in the past transportation has been put far down on the list in connection with new developments and it has been disregarded almost entirely in the case of sections already developed.

A second question raised by the author relates to the economic side of public carrier development. If local transportation lines have such a vital influence on city development and land values, should not the public control and direct their expansion, even possibly subsidize their service where it would otherwise be unremunerative, because of the great public benefits they produce? An affirmative answer to the first of these questions and even to the second could be given without indorsing municipal operation. In fact, most American cities in a sense do follow the plan of the public direction of expansion when they require certificates of convenience and necessity before the construction of a railway or bus line, and the largest cities go even farther in this direction through their city planning commissions and boards of transportation.

As to the second question, American practice as yet hardly goes to the extent of subsidies, unless some of the special rapid transit contracts, like those in New York and Boston, can be placed in this category. In fact, we in this country have gone rather to the other extreme by placing heavy tax burdens, like the paving tax and park taxes, on street railway undertakings. A person can be opposed to government subsidies for private enterprise yet still believe that electric railway lines should be very lightly taxed instead of being one of the most heavily taxed among the various industries. In France, as in this country, private operation is favored, but the expansion of the local transportation system, at least in Paris, is much more closely directed by the authorities than here. The question of a direct subsidy is still a debated question in France.

Finally, the author suggests some standards by which speeds, capacities and types of local railway lines in cities of different sizes may be determined. Judged by his rules, most—if not all—American cities are far behind in the extent of local transportation facilities which they should have. Whether most French cities have transportation which meets the requirements given, his paper does not state.

Incidentally, the tables presented in the article mentioned should prove of great interest to all transportation men. By these tables American readers can compare their own operations with those of various cities abroad.

A Record of Progress Against Great Obstacles

FEW annual reports made during the last year have emphasized more clearly the appreciation on the part of the management of the changing aspects of surface transportation than does the report recently presented to his stockholders by President Slaughter W. Huff of the Third Avenue Railway, New York City, for the year ended June 30, 1926. Large expenditures for equipment were made by the company in the full belief that they would stop the downward tendency in receipts and the upward trend in the cost of operation. And they have. The results for the year prove it. Receipts have increased and expenses have decreased just as the management believed they would. In consequence the financial condition of the company has improved, and the management believes it will continue to improve. On its statistical side the report shows a change from a deficit of $102,138 for the year 1925 to a profit of $37,893 for the year 1926. That, of course, is heartening to the company's security holders, but the figures do not tell all the story.

Most important is the attitude of the management with respect to problems still before it. These it is look-

Grumbling Sells No Transportation*

Better Results Can Be Obtained by Telling the Public the Story of Electric Railway Accomplishments than by Talking About Operating Difficulties

By C. S. Ching
Supervisor of Industrial Relations United States Rubber Company

HAVING had about seventeen years experience in the street railway field, I feel that I can speak as one of the family. The concern with which I am now connected is in the manufacturing business—manufacturing products, selling to the public, in competition with other manufacturers. When the consumer gets our product we are many miles away. He buys our product through someone else and he consumes it over a period of months or years. In the street railway business, the railway is in touch with the consumer from the moment he starts to make the purchase until the product is entirely consumed.

> There isn't a poorer bunch of salesmen in the world than the transportation men. . . . Street railways have taken a whining attitude. . . . That has gone altogether too far.

In the year 1920 our advertising appropriation was more than $7,000,000 to get the public to buy our product. The street railway doesn't need advertising of that kind to tell the public about its product, because its salesmen are on the job all the time. Notwithstanding that fact there isn't a poorer bunch of salesmen in the world than the transportation men. I think that the transportation people are the poorest salesmen that God ever let live.

There are a lot of street railway men—and I was one of them—who say when talking about the business with a friend or neighbor, "Keep out of this business. It is a deuce of a job. It is nothing but a dog's life. You have to be on duty 24 hours a day and you get darn little thanks for it and not much salary."

Don't you find that attitude a whole lot in the street railway business? You don't find it in other concerns, yet they probably pay lower wages than street railways do.

We all know that our street railways have been unfairly treated, but Mr. Public is not interested. He says, "Go tell it to the cop." There is nobody interested in your troubles. It seems to me that the street railways have taken a whining attitude. It got into the street railway business about fifteen or twenty years ago at the time when it was discovered that it was not a bonanza. That has gone altogether too far. You have been telling the public a lot of your troubles, and the public doesn't give a darn about your troubles. It ought to. It is its responsibility. But the public is not interested in its responsibilities.

> The public doesn't give a darn about your troubles. They ought to. It is their responsibility. But the public is not interested in its responsibilities.

That attitude on the part of the street railway people as a whole of looking for public sympathy has had its reflection in your men who are out selling your product to your customers, with the result that the street railway man has looked on his job from an entirely wrong viewpoint. Of course, you need money to do things. You have got to have money in order to give the public the service it wants. You have got to get the money from the public in the first place. But the point is that the public will help you only when you tell the story of your accomplishments, and not the story of your troubles.

This matter of public opinion and how it is molded is one of the most intangible things that it is possible for us to consider. Theatrical men, too, have their troubles with public opinion, but if a new show lasts for a week and people begin talking about it, they go to the show and tell others about it. If conversation gets started, "Have you seen that show?" then the show is a success.

It is the contact that each man in the transportation industry has with the people he meets that influences public opinion. If we can get an attitude into the employees of transportation companies similar to that which the American Telephone Company has been able to get into its employees—the spirit of service, the spirit of pride in the job they are doing—then we will have infinitely better salesmen out on the road.

That attitude on the part of the employee is but the reflection of the attitude of the supervisor and the superintendent and the general manager and the president and the board of directors. In other words, you have got to have all up and down the line a group of men connected with the railway industry who feel that it is an important industry, a worthwhile industry, an industry to be proud of. Until that spirit gets across and you get the thought of an important service to the public on every occasion—not through newspaper advertising, but through contact of the people in that industry—the old idea will persist. When you do that, then you are going

*Abstract of a talk given at a meeting of the Metropolitan Section, A.E.R.A., New York, N. Y., Nov. 5.

Digitized by Google

to have public sympathy and public support in the things you are trying to do that you can never get by telling people a sad story.

Take the steam railroads throughout the country today. There has not been a time in the last 25 years when the steam railroads of this country were in such good standing with the public as they are today. You don't hear of attacks on steam railroads as you used to a few years ago. I am not speaking about what may happen in Washington before the Interstate Commerce Commission, but I am speaking of public opinion generally. That has come about because of an improvement in the service. They have done wonderful things in the way of efficient management in the last five or six years, and they stopped whining. They stopped looking for sympathy and went out and did a job.

> **Tell the story of what you are going to do for the public —not what the public must do for you.**

One of the characteristic things about the American people is the readiness with which they scrap machinery. The street car itself has been entirely revolutionized in the past twenty years except in the downtown sections of New York. Take the street cars, take the shops, take any of the manufacturing concerns, and you will find that they scrap machinery over night. Power station equipment is one of the best examples of that. Power station equipment is scrapped probably after five, six, or eight years of service for something that is more efficient.

We are the quickest people in the world to scrap old machinery for new. We are the quickest people in the world to adapt ourselves to new methods of transportation or communication. But there is one thing that we ought to keep in mind: we will scrap 50 old machines, but we won't scrap one old idea. That is true very many times. It is harder to scrap old ideas than it is to scrap a million dollars worth of machinery.

In the street railway and transportation business you are in the same position as we in the rubber business. If the leather shoe manufacturers of this country change styles over night, we have got to run to the last factories to have them make up lasts so we can make rubber shoes to fit the change in style, and that means we have to throw away all the old lasts.

> **It is harder to scrap old ideas than it is to scrap a million dollars worth of machinery.**

We are up against competition to meet the demands of the public. The public sets the pace. What the public wants the transportation company must furnish. There isn't the slightest use in raving about buses. All of you remember the agitation and almost the riots and the injunctions and all that sort of thing that went on when people started to transport the public for a nickel in a flivver. It started in California and wound up in Maine six months later. Everyone was excited about it. But no flivver can take the passengers away from you if you are giving equal service. If the people want to ride in flivvers, that is what you will have to give them. If they want to ride in luxurious buses, that is what you have got to give them.

The transportation company can't dictate how the public shall ride. But the transportation company must be on the alert to see what the public wants. There isn't very much use in trying to enjoin buses from operating. It may be effective for a time, but when you do it you are antagonizing a portion of the public that you want on your side of the fence.

It may be unfair competition—which it undoubtedly is—but if the street railway people are not alive to the situation of what the public wants and are not willing to show that they are in a position or anxious to give the type of service the people want, then you are going against public opinion, and you are causing resentment which will be turned against you at a time when you want public approval.

We all know that many of the troubles of the street railways come from the acts of salesmen out selling the service. I don't know how you are going to train employees to be courteous. I don't believe that the sign in the Boston subway, "Please do not expectorate here," has any more effect on the traveling public as far as courtesy is concerned than the "Don't spit" sign on the Interborough. I think they are equally effective. I don't believe that it will do much good to run a school to teach conductors to use the right voice inflection when announcing streets. In Boston at one time we had a school for voice training. That may help the man, but merely telling a man to be courteous is not going to make him so. If we can only instill into that man the pride of accomplishment, a pride in his job, courtesy will take care of itself. The public as a public is not looking for automatons or for artificial people, but it is looking for men who are men and who are themselves. It is all very well to say "please" and "thank you," but it must not be too mechanical. You have to have the real spirit of service behind it.

The public doesn't realize that some of the men are out all night operating a transportation system. They are on call 24 hours a day. They are there to serve no matter what time they go out. The public doesn't realize that. It is accepted as a matter of course.

Tell the story of what you are going to do for the public, not what the public must do for you. Give the story to it in an upstanding, two-fisted, man-to-man sort of way rather than to say, "Well, this street railway business is all shot to pieces, anyway. You wouldn't give us an increase in fare and now the tracks are worn out, there is no overhead construction, no allowance for depreciation. What kind of service do you expect? You are to blame for it, not me."

If we in the street railway industry are going to get public opinion on our side, and public opinion is not at present on the side of the transportation companies, we might as well begin now. Then we first have to make contacts at every possible point. We have got to tell the truth even if it hurts. We have got to have our salesmen on the job and have those salesmen represent us as we want them to, and also have them imbued with the spirit that will make them proud of their own jobs.

Tri-City Railway Car Remodeled to Meet Modern Needs

Dressing Up an Old Car

Softer Seats, Cabinets for Apparatus, Rubber Tiling on Floor and Better Lighting Have Improved Appearance and Increased Comfort

NEARLY all the cars now in use by the Tri-City Railway, Rock Island, Ill., were bought in 1913. Several years ago the bulkheads were removed and the cars arranged for double-end one-man operation. Believing that street cars should be not only safe but also comfortable to ride in, pleasing in appearance and as nearly noiseless as possible, the management recently undertook to remodel extensively one of these old cars.

The old rattan seat covering was removed, extra felt padding added and the seat and back covered with Kemi-suede of a light shade. This soft material gives the car rider a more comfortable seat and improves the appearance of the interior. The floor is covered with white and tan rubber tiling in checkerboard design, with edges bound in brass. This has a pleasing appearance compared with the old car slat floor of painted maple.

Further improvement has been made in the appearance of the car by inclosing all pipes, switches, brake staff and door engines in paneled wooden boxes. As the bulkheads had been removed several years ago, the most unsightly part of the car was previously much in evidence. A neat cabinet now incloses completely the controller and air pipes. Dirt and paper can no longer collect in the corners and crevices along the floor line. Cleaning the car is made easier and the sweepers can do a better job.

As the car is of the double-end one-man type it was thought desirable to provide a door in the rear whereby passengers can alight. Automatic step treadle doors furnished by the National Pneumatic Company were installed. Electric lighted signs with the words "Exit at Rear" have been placed inside the car, while on the front dash appears the sign "Entrance at Front." A large stop light is carried on the rear dash and when the brakes are applied its red glare gives a danger signal to the driver of any vehicles close behind.

Four ventilators have been placed in the windows of the monitor roof. Electric heaters with thermostat control provide additional comfort to the passengers.

Outside the car was given the usual coat of standard

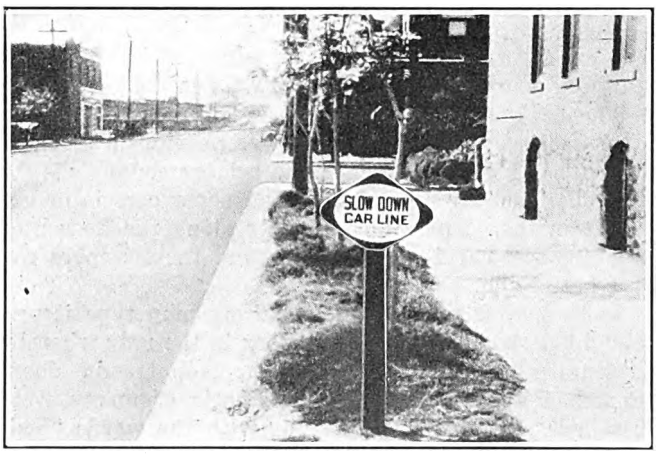
Digitized by Google

yellow paint, with moldings painted black. An orange band 3 in. wide runs from end to end, just below the windows, and gives a desirable streamline effect. Inside a white enameled roof reflects with good effect the light from eighteen 23-watt lights arranged directly over the seats, nine on each side.

Register rods were removed from the ceiling and foot-controlled pneumatic registers installed. The old roller curtain back of the operator has been replaced by one made of the same material as the seat covering and hung by rings from a rod attached to the vestibule hood. When not in use this curtain is drawn back and inclosed in a box to the left of the operator.

Motorists Warned of Near-by Car Line

PRECAUTIONS taken by the El Paso Electric Company to promote greater safety in the operation of its cars include the installation of warning signs on all streets at the approaches to car tracks. These signs are diamond shaped, supported by posts about 3 ft. high. They carry the warning "Slow Down—Car Line," as



Signs of This Kind in El Paso Warn Automobilists that They Are Approaching an Intersection with Street Car Tracks

shown in an accompanying illustration. The excellent results obtained by the safety work of this company are indicated by the fact that the proportion of gross earnings spent by the claim department for the first six months of the present year was less than 2 per cent. These accomplishments are told in the brief submitted by the company for the 1926 Coffin prize.

Encouraging Suggestions from Employees in Baltimore

WITHIN the last few months the United Railways & Electric Company of Baltimore has established a permanent plan of payment for suggestions from employees either to improve the company's service or to accomplish economies that will not harm the service. The plan is best explained by the following letter which was sent by the president to all employees:

To All Employees of the United Railways:

A permanent plan for payment for ideas which will, first, save money, and, second, improve service to the public, has been agreed upon.

For adopted suggestions from employees which are estimated to produce net operating savings or improve public relations, cash awards will be made ranging from $5 to $100, according to the value estimated for these by the efficiency committee.

The following simple rules have been adopted:

1. Suggestions should be sent directly to the Committee on Efficiency, Room 900, Continental Building.
2. Suggestions must be original, and the committee on efficiency awards reserves the right to reject any suggestions which have already been made and considered previous to the institution of the plan.
3. Employees need not confine their suggestions to the work of their own department.
4. Two or more employees may develop a suggestion together and submit it in the names of all, and the award will be divided equally among them.
5. If the suggestion is one which requires time to present in clear, understandable form, the employee may present to the committee a brief written statement of it as soon as he conceives it, thus entitling him to priority in case the idea should be duplicated by another employee before his own plan is ready for submission.
6. Suggestions should be presented in writing, as carefully and as intelligibly as possible, accompanied by any drawings or plans which in the belief of the employee will make the idea clearer.
7. Department heads are urged to offer employees all possible assistance or advice.
8. Department heads are not eligible for the award.

Suggestions may be sent in at any time—there are no contests, no time limits and no competition. *Trolley Topics*, the company's publication, will announce the making of payments from time to time.

When "suggestions" are received, they are sent to the heads of the departments most interested in them, the name of the person making the suggestion being withheld by the committee and a key letter substituted for it. The department head's opinion of the value of the suggestion is then considered by the committee, and it is possible to make the payment upon the pure merit of the suggestion, not complicated by any other matters. Although the plan was announced only this summer, nearly a score of suggestions were received during twelve days, and several of these are likely to receive merit payment.

The company expressly refrained from calling the payments "awards" or "rewards," preferring to have the employees consider the plan as a simple business arrangement involving fair recognition of good work and industrious thinking.

The Car-Riders' Conscience

COLLECTIONS found in the fare boxes of the Kansas City Railways, Kansas City, Mo., each day contain curios sufficient to start a museum. Anything from collar buttons and stickpin heads to welfare officer stars and jackstones are dropped in the boxes by people who are downright careless or by others so optimistic as to imagine the articles might be mistaken for a token. Sometimes the things deposited are mistaken for tokens, but more often the evasive ones are called back and obliged to pay.

Counterfeiting has become such a problem that the company has installed a machine to sort out the articles. One of the favorite fake fares is a token made from the wood of strawberry boxes. The fakes usually have flippant remarks or "wise cracks," as the user probably terms them, printed on both sides. The most common one is "Did you ever get fooled?"

About 60 tokens from other cities are found every day. All tokens are of uniform size and the foreign ones are harder to detect than any of the other counterfeits. Another trick to which the dishonest passenger resorts is that of trading 15 cents for two tokens and then, thinking the conductor is not looking, dropping a cent in the box.

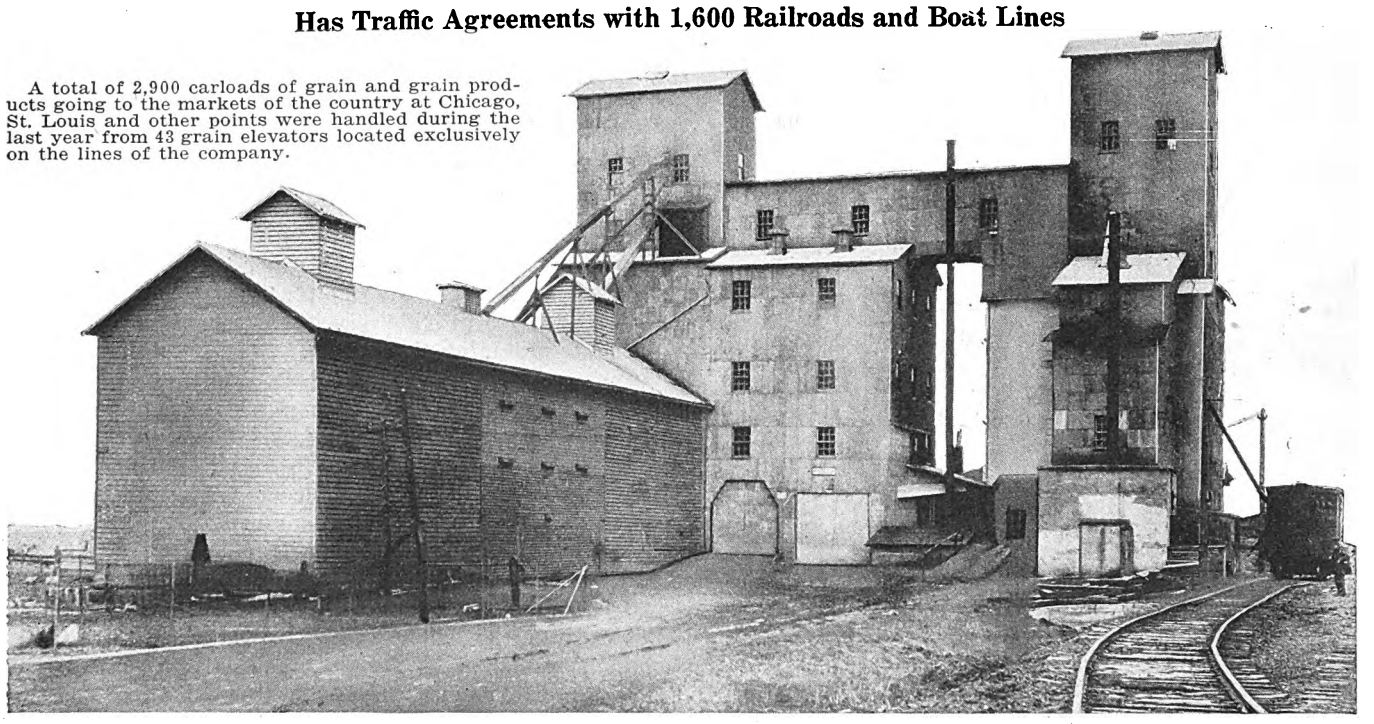
Improved Facilities and Intensive Merchandising

Build Profitable Freight Business

Illinois Traction System Increases Freight Earnings from $1,674,000 in 1924 to $2,209,000 in 1926—Road Handles Carload and Less than Carload Traffic from Coast to Coast—Has Traffic Agreements with 1,600 Railroads and Boat Lines



A total of 2,900 carloads of grain and grain products going to the markets of the country at Chicago, St. Louis and other points were handled during the last year from 43 grain elevators located exclusively on the lines of the company.

WITH 515.1 miles of its total main line mileage of 555 miles paralleled by new state hard roads, the Illinois Traction System saw much of its short-haul freight business taken by trucks. Whether or not such trucking could be done at a profit in competition with the railroad rates was an unsettled question, but that a considerable volume of short-haul business was going that way was an established fact. Furthermore, the hard road construction program and the subsequent truck competition had developed at a very rapid rate and the railway was therefore faced with a grave situation which required prompt and courageous action. The course taken was to improve railway freight-handling facilities on the one hand while engaging in a carefully worked out and vigorously applied business building campaign on the other.

The success of the methods followed is best illustrated by the following figures, given in the brief presented by the company in competition for the 1926 Coffin prize, showing the earnings from freight transportation:

For year ended April 30, 1924.....	$1,674,000
For year ended April 30, 1925.....	1,730,000
For year ended April 30, 1926.....	2,209,000

These figures do not include the freight earnings of the St. Louis Electric Terminal, the Illinois Valley division or switching revenues totaling $359,268.76 in 1925, an increase in these items over 1924 of $23,000.

Physical improvements necessary for properly handling interchange freight traffic have been made on a large scale. Interchange tracks, steam tracks, belt lines around important communities, industry tracks and connections, freight houses and unloading platforms now give access to industries in cities served by the company, facilitate the development of interchange business and place at the service of shippers and receivers of freight physical facilities of a character to insure prompt, reliable and economical service—essential to the building of freight business.

A program of enlarging freight house facilities and the construction of modern new passenger and freight stations in the smaller towns is being successfully carried out in co-operation with the passenger and freight traffic departments, with the purpose in view of continually improving facilities for the handling of all classes of traffic. In pursuance of this policy new passenger stations costing $10,000, exclusive of real estate, and $32,700, including real estate, respectively, were built at Mackinaw Junction and Litchfield, Ill. A combination passenger-express station and store building is being erected at Granite City at a cost of $42,000, including real estate. In Champaign a new freight depot and steam track layout is being constructed at an expenditure of $84,000 for real estate, building and yard trackage.

To provide better power facilities for the handling of

Through Traffic Agreements Have Been Made with 1,600 Railroads and Boat Lines. This Map Shows Through Freight Routings via Steam Railway and Illinois Traction System. Shipments from Coast to Coast Are Handled

heavy freight loads seven automatic substations were installed on a portion of the main division. With this installation, together with a desire to serve communities along the railway which are supplied with power, it was decided to change the frequency of transmission line circuits from 25 to 60 cycles over a considerable portion of the system. This change-over was made without junking the 25-cycle equipment, all of the old equipment being transferred to sections of the line still operating at 25 cycles and used to increase the capacity of existing stations at strategic points or to divide the territory between stations where the distance was uneconomically long. Substation capacity in the territory changed over was increased from an average of 37 kw. per mile of track to an average of 90 kw. per mile of track.

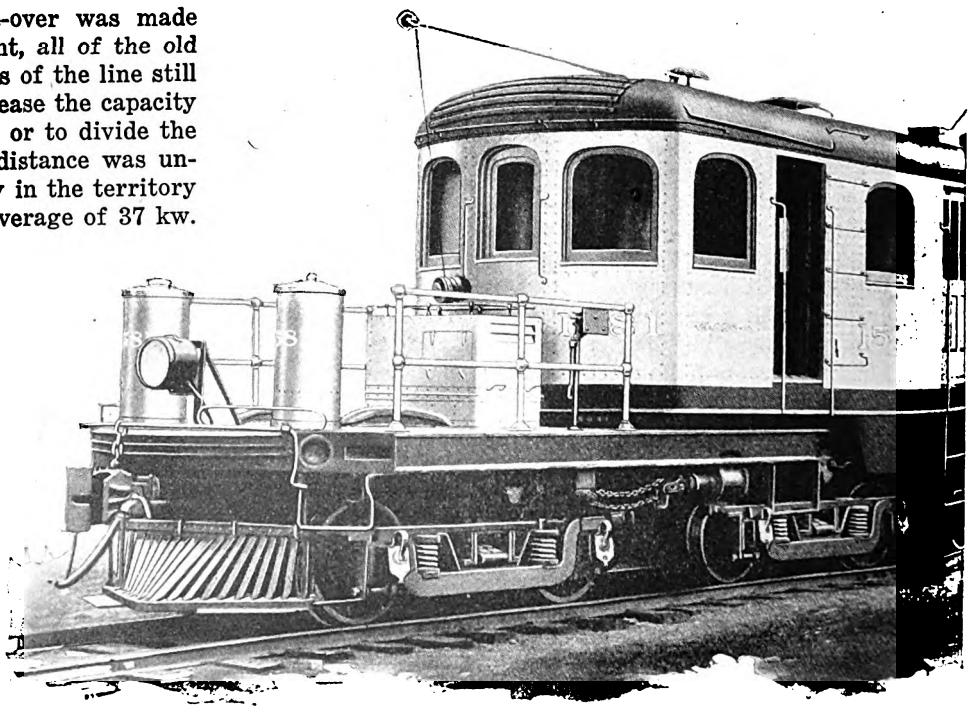
Development and design by the Illinois Traction System of its type C articulated electric locomotive, which was described in detail in the Jan. 31, 1925, issue of ELECTRIC RAILWAY JOURNAL, has been of inestimable value in opening a field of freight haulage hitherto closed by reason of physical obstacles which the new type of locomotive overcomes. The efficiency of this new type of pulling unit is indicated by the fact that the six now in service on the Illinois Traction System constitute only 11 per cent of the hauling units in service, but their use has enabled the road to handle 23 per cent more business during a year than was handled in any previous year in the history of the system.

By virtue of the increased freight train speed possible with these improved locomotives a large increase in freight car-miles has been made. In 1924 the figure for the year was 6,966,723. In 1925 freight car-miles amounted to 9,112,189, or an increase of 2,145,566 car-miles. Since this increase in speed affected many foreign cars, on which per diem charges applied, there was a marked decrease in the total per diem charges notwithstanding a high level for volume of business handled. With the aid of these new locomotives the year 1925 is the first year in the last five during which no embargo has been declared by the road, and this despite the fact that the car mileage throughout the entire year never totaled less than 1,000,000 per month.

All the Illinois Traction System freight cars are equipped with A.R.A. and United States safety appliance standards for interchange with steam roads and they are also arranged in a special manner to go around the company's short radius curves. To accomplish this standard A.R.A. couplers are provided with more side clearance than is the usual practice on steam roads. Brake foundation gear and truck levers are arranged in a manner to provide negotiating short radius curves without tightening the brakes. Cars are built with the bottom framing sufficiently above the wheels to prevent interference. The side bearings are extremly long and the limit of curvature is when the wheels stand at such an angle that they will come in contact with the center sills. This makes it possible to take standard cars around a 47-ft. center radius curve.

The interchangeable equipment operated by the company includes 310 box cars, 254 flat-bottom gondolas, 257 hopper bottom coal cars, nine refrigerator cars, 98 flat cars and 25 ballast cars. In addition to the interchange equipment for freight handling, the company has fourteen express motor cars, 94 express trailers and two special scenery cars arranged for operation on the company's lines, these being non-interchangeable on account of the radial coupler equipment.

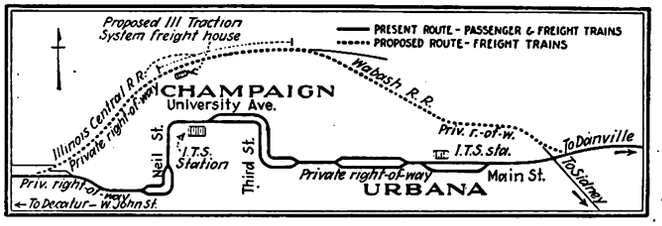
At the present time the company's freight haulage



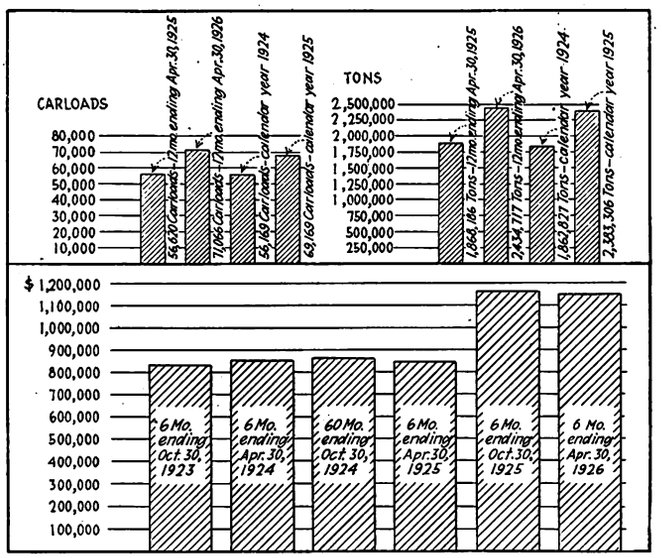
Digitized by Google

equipment is being supplemented by the addition of 100 steel underframe wood superstructure drop-bottom coal cars of 100,000 lb. capacity. These cars are used for the purpose of allowing handling of coal shipments in one direction and sand and gravel in another direction, thereby preventing one empty haul. They also can be utilized by local coal dealers who use portable elevators for loading coal in wagons from drop-bottom cars. Further, this type of car can be utilized where clamshells are used for unloading purposes, thus making the car a general utility car for coal, sand, gravel, crushed rock and other similar material. The particular feature in design is that although the car has a flat bottom, which makes possible top unloading, it also has a drop-door bottom corresponding to an ordinary hopper car.

By the successful negotiation of an agreement for the electrification by the Illinois Traction System of the main tracks of the Illinois Central and the Wabash Railroads at Champaign-Urbana, the electric railway will have, by the addition of a small amount of connecting track, a belt line for freight use in these twin cities where franchise and equipment limitations do not permit it to send freight trains through the streets. The electrification of the tracks of the Illinois Central Railroad extends from Staleys, Ill., to Champaign, Ill., a distance of a little less than 4 miles, and the electrification of the tracks of the Wabash Railroad from Champaign to Urbana, a distance of 2 miles. This, together with the small amount of connecting trackage required, gives a very important belt line at a relatively small cost and at a saving of duplication of investment in railroad trackage in those cities. The new route also eliminates a number of sharp curves and provides an additional interchange for the Illinois Central. Securing the consent of these two steam railroads for this electrification of their own main lines for this purpose is looked upon as something much out of the ordinary in the electric railway field. On this belt line and within three blocks of the business district of Champaign a large piece of property has been bought. Here the company expects to construct a modern freight house with steam track layout having a capacity of twenty cars. The new belt line will permit handling increased carload business through elimination of track obstructions and franchise limitations. It enables the length of trains to be increased and thereby



Duplication of Investment Was Saved in Acquiring a Belt Line Around the Cities of Champaign and Urbana by Electrification of Portions of the Illinois Central Railroad Main Line and a Section of the Wabash Railroad. Map Shows Old and New Routing

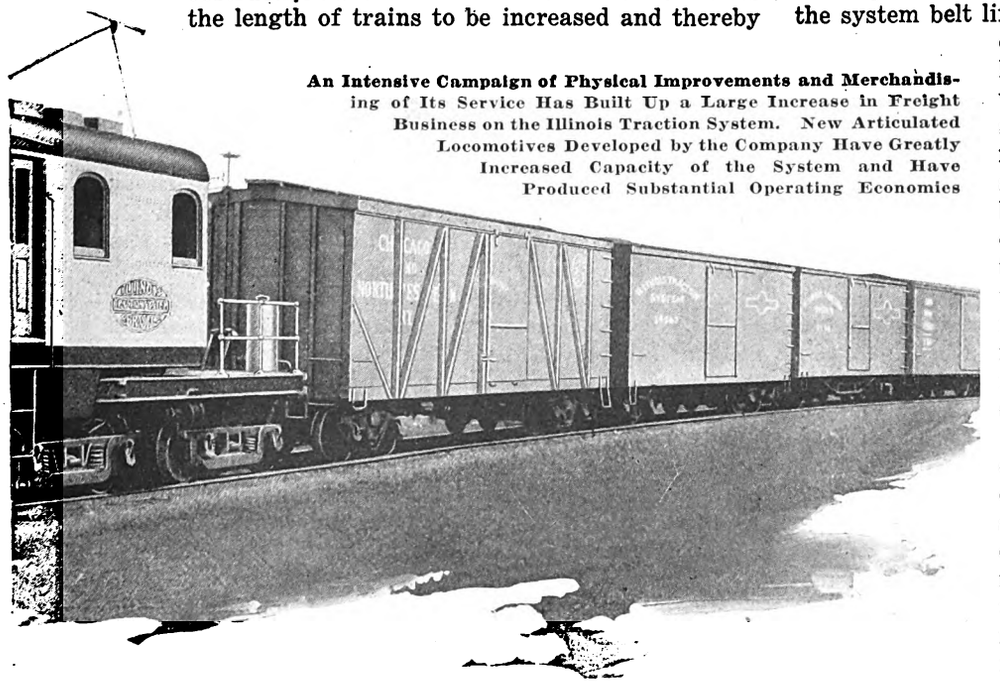


Increases in Carloads, Tonnage and Freight Earnings Were Made by the Development of Through Freight Business on the Illinois Traction System. Improved Facilities Made the Increase of This Business Possible

reduces operating cost. At the same time freight house and steam track facilities will be improved. The line haul will be decreased from 6.24 miles to 5.78 miles, the belt line being actually shorter than the main line. Elimination of freight operation from the streets of Champaign and Urbana will permit continuous haul for all classes of freight with no restrictions on equipment.

Completion of the belt line at Champaign will give the system belt line service around all of its principal cities. It already has in operation belt lines around Springfield, Decatur, Edwardsville and Granite City, thus speeding up and facilitating freight movement where it had once been slowed down or even made impossible by city track conditions or city franchise provisions. Steam track facilities have been greatly increased during the year in Peoria, Springfield, Bloomington and Edwardsville. Special platforms for the unloading of automobiles from freight cars have been built at several points.

When truck competition cut seriously into local business it was concluded by the management that the salvation of the property lay in the development of long-haul freight business, and it was therefore necessary to win an equal traffic basis for the arrangement of through rate tariffs and interchange with the steam railroads.



An Intensive Campaign of Physical Improvements and Merchandising of Its Service Has Built Up a Large Increase in Freight Business on the Illinois Traction System. New Articulated Locomotives Developed by the Company Have Greatly Increased Capacity of the System and Have Produced Substantial Operating Economies

Digitized by Google

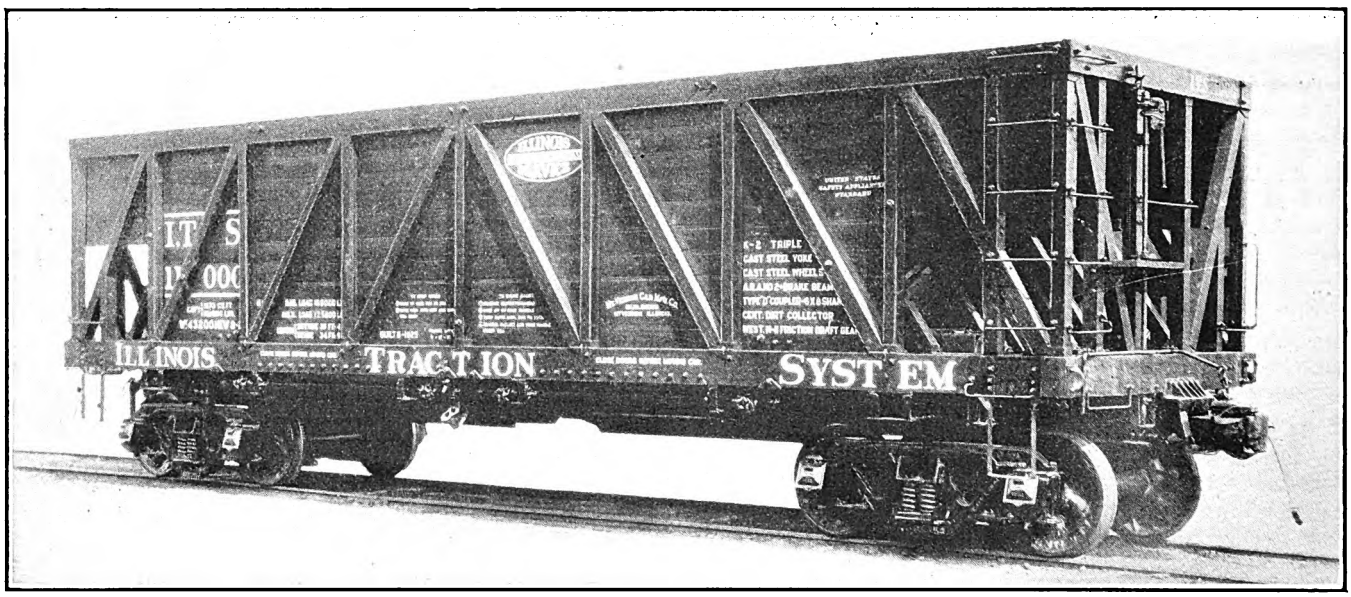
This campaign for recognition was carried on with such success that the road now has traffic agreements with approximately 1,600 existing common carriers, railroads and boat lines reporting to the Interstate Commerce Commission. The Illinois Traction System is now handling carload and less than carload freight traffic from coast to coast and from Canada to the Gulf of Mexico.

In order to stimulate the long-haul traffic the company has recently established off-line general agents in important freight originating distant points as follows: New York, Pittsburgh, Cleveland, Detroit, Chicago, Milwaukee, Minneapolis, Kansas City, and Tulsa, Okla. These agents are working on a per car commission basis on traffic originating in defined territories. Expenses of the agents are paid by themselves. This arrangement has given the Traction System wide advertising and has secured hundreds of cars of freight which would have otherwise been lost to competing roads.

Much freight as well as passenger business has been picked up through tips furnished by the "Go-Getters Club," employees who have sent in tips relating to future movements which might be secured by the company's agents. Names of those who give these tips are published in "Current Topics," the company's house organ, and much interest has been stirred up among the employees in this work. As an aid in the building of freight business, the traffic department issued an industrial and shippers' guide of 130 pages to encourage closer relations between the company and manufacturers, shippers, merchants and receivers of freight on the system. This guide, which was distributed among shippers, covers the towns and cities located on the Illinois Traction lines, giving a list of all stations, industries in each, their location as to railroad and facts about the cities themselves, their resources, populations and development.

In carload shipments the company made an interesting showing during 1925 with 28,635 cars of coal, 6,989 cars of sand and gravel, 3,908 cars of forest products, 2,900 cars of grain, 2,625 cars of petroleum and petroleum products, 165 cars of potatoes, 3,349 cars of iron and steel, 2,462 cars of brick, 1,413 cars of automobiles, 640 cars of cement, and other carload shipments of hay, butter, cheese, wool, hides, coke, ores, salt, asphalt, sugar, syrup, molasses, boats, lime, plaster, implements, household goods, furniture, beverages, textiles, canned goods and other articles of various kinds. Carload shipments during the year amounted to 62,417, an increase over the preceding year of 14,876. Less than carload shipments during the same year reached a total of 92,194 tons, showing a substantial increase over the year before.

As the company has its own bridge across the Mississippi River and terminals in the heart of St. Louis, merchandise is loaded daily there for the principal points along the lines of the system. Next morning delivery of such shipments is made at local destinations. Important traffic arrangements have been made with connecting lines for the handling of less than carload merchandise. This year an arrangement has been made whereby the merchandise loaded one day in Chicago on the Santa Fé Railroad is received at Morton, Ill., by the Illinois Traction System, transferred to Peoria, Ill., and the next morning put into the various set-out cars loaded from that point. The scheduled time on such shipments from Chicago to St. Louis, Springfield, Decatur, Bloomington and other points is second morning delivery from Chicago. This is practically as good freight service as that given by the direct steam roads operating between Chicago and St. Louis.



One Hundred New Steel Underframe, Drop-Bottom Coal Cars Recently Acquired by the Company May Be Unloaded with Clamshells or by Dumping the Contents. This Makes a General Utility Car for Unloading Coal, Sand, Gravel or Other Similar Material

Installation of charcoal heaters has enabled the company to secure a substantial share of the potato movement from the Minnesota district to its own territory during the winter. During the year ended April 30, 1926, 269,673 tons of coal were handled over the system from the coal mine at Gillespie, Ill., owned by the Virginia Coal Company. During the same period hundreds of tank cars of oil were handled from the Oklahoma fields and the Wood River-Roxanna district. A total of 2,900 carloads of grain and grain products going to the markets of the country at Chicago, St. Louis and other points were handled from 43 grain elevators located exclusively on the lines of the company. Close contact between the car distributing department and these elevators has resulted in eliminating the annoyance and difficulty from car shortage with which grain elevators have so frequently contended. Bread is shipped daily from St. Louis to points as far distant as Peoria, Decatur and Champaign, being delivered between 7 and 8 o'clock each morning.

Transportation a Vital Factor in City Growth*

By M. Jayo!
Inspector-General of Local Transportation in the Prefecture of the Seine, Paris

The vital relation of transportation to city growth is proved by the experience of different cities, especially Paris. The author also shows the effect of the construction of transportation systems on land values and points out the need for careful consideration of transportation questions and provision for adequate carrier service in city planning. A method is suggested for determining the necessary speeds and carrying capacities of local transportation lines in different circumstances. The article is accompanied by most interesting tables

THE topic of the relation between city planning and transportation will be discussed under the three heads which formed part of the recommendations of the speaker on this subject at the last meeting of the International Tramway, Interurban Railway and Bus Association.† This speaker, Georges Delavenne, member of the Municipal Council of Paris and president of the Paris Transportation Commission, offered for adoption three conclusions, which were as follows:

1. Local city transportation system assists in distributing the population of the city, in encouraging the movement out from the center and increasing to some extent the ability of the city to gain inhabitants.

2. Transportation lines are also necessary in building up undeveloped territory, but their routes in such districts should be laid out under the direction of an impartial and disinterested commission.

3. Transportation lines should seek to supply a service providing a maximum of speed, consistent with the physical and other limitations present, and capacity at all times, so far as it can be done with economy in operation and first cost.

Effect of Transportation on City Growth

This subject is not a new one to be considered by the international association. It was discussed at length by Mr. Dausset at the 1912 convention and by Mr. Delavenne at the 1924 convention. The latter was particularly happy in his outline of the genesis of modern cities when he said that in their first stage, without transportation, they begin by becoming congested at their centers, but with the expansion of local transportation a centrifugal movement develops and results in an increase in the demand for transportation much in excess of the increase in population. This is clearly shown in Table I, which is based on reports secured from questionnaires sent out by the international association.

This table, however, shows no constant relation between the second and the third vertical columns.

Mr. Brunhes says in his "Geography of Humanity," "A city is not an independent unity; it is affected by the soil on which it rests, the climate in which it exists and the means by which it lives." Transportation cannot be considered the only factor in the growth of cities, but it is doubtless an important, even indispensable, factor of such growth.

The first evidence of the need of local transportation in a growing city is from within. It comes when the demand for ground for new residences and new industries is so great that they can find it only in the suburbs. Without transportation these additions to the city's social and industrial life must either develop new social and business centers close to where the people live or else these enterprises cannot locate within the city at all. With the introduction of transportation the inhabitants can choose their homes on the basis of the time required to travel between the points where they live and their places of work, rather than upon the distance between the two. The city then enters a new phase of its evolution.

Points Illustrated by Paris

It is through this evolution that the city of Paris passed during the nineteenth century. In 1800 it had an area of a little more than 13 square miles. Its average density was 159 inhabitants to the hectaire (or about 64 to the acre), but commerce and manufacture were confined to very small establishments, the center of the city was closely congested and the suburbs were sparsely inhabited. Between 1800 and 1817 there was an increase of 165,000 inhabitants, but local transportation was almost entirely by cab. It was not until the period from 1836 to 1841, the epoch of the development of the steam railroad, that the city began its rapid growth, and in 1856 it had reached a population of

1,174,436. This period was accompanied by a great decrease in population density in the central sections.

The first common carrier enterprise in Paris was in 1828, when Mr. Baudry received authority to establish a system of buses and eleven lines were put in service. By 1836 the number of buses in operation in Paris reached 378, and in 1856 all of the bus companies were consolidated into one system. In general, the lines operated to the city limits, where they connected with suburban bus lines, and all, of course, were operated by horses. In 1856, also, the General Omnibus Company, the consolidated company, received a franchise to build two street railway lines, and in 1854 the first section of the steam Belt Railway was put in service. Tables II and III give statistics of the Paris local transportation system up to 1890.

TABLE II—STATISTICS OF LOCAL TRANSPORTATION IN PARIS, 1855 TO 1890

Miles of Route	1855	1865	1875	1885	1890
Omnibus	94	183	163	146	150
Tramways	..	18	37	175	183
Belt lines, steam	..	16	24	26	33
Total	94	217	224	347	366
Passengers Carried in Millions					
Omnibus	36	104.6	115.6	105.7	114.5
Tramways	..	2.8	15.2	136.1	135.6
Belt lines, steam	..	4.9	13.9	31.0	34.0
Total	36	112.3	144.7	272.8	284.1

TABLE III—RIDES AND TRANSPORTATION EXPENDITURE PER INHABITANT, PARIS

Year	Total Population	Average per Inhabitant Rides	Expenses in Dollars
1861	1,696,741	56	$3.53
1866	1,825,274	72	4.19
1876	1,988,806	99	5.18
1886	2,344,550	136	5.98
1891	2,424,705	155	6.56

The three decades from 1860 to 1890 were accompanied by an increase in population of about 50 per cent, with a rapid growth in all sections. The suburbs grew most rapidly, but in 1891 there were three sections in the center of the city with a population of nearly 400 to the acre.

We are now approaching the time of the construction of the Metropolitan subway, the electrification of the tramways and the use of automobile transport, which, beginning with 1900, had a decisive influence on the distribution of population, particularly the development of the suburbs. Recent statistics are shown in Table IV.

TABLE IV—PASSENGERS (IN MILLIONS) CARRIED IN LOCAL TRANSPORT, PARIS

Year	Bus	Tramways	Subway
1911	135.7	426.4	428.8
1913	246.2	477.4	467.5
1915	*	396.6	405.9
1917	19.9	508.5	588.3
1919	95.4	589.9	726.6
1921	245.9	626.3	637.5
1923	337.5	682.3	704 8
1925	344.5	720.0	793.8

*Service largely discontinued because of war conditions.

Figures from Buenos Aires

Somewhat similar results have followed the expansion of transportation systems in other cities. Thus, up to 1869, the city of Buenos Aires had no means of local public transport. It had a population of 177,787 with a density of population in four sections in the center of the city of about 173 inhabitants to the acre, while the density in the outer sections was less than one-tenth of this number.

The first street railway lines were put in operation in 1870, and in three years had developed a traffic of 12,000,000 passengers, corresponding to 56 rides per inhabitant per year. Seventeen years later, or in 1887, the system was carrying more than 36,000,000 passengers annually, or an average for rides per inhabitant of 96. There had been an increase in density of population in the center of the city in the four sections mentioned of from 10 to 34 per cent, but by far the larger part of the additions to the population was in the suburbs. The latest figures (1924) from Buenos Aires show a population of 1,838,561, with 807 km. (504 miles) of tramway track and the number of passengers per year about 650,000,000.

Relations Between the Increase in Land Values and Railways

Speakers at the 1910 convention in Brussels and at the 1912 convention at Christiania pointed out the close relation between railway development and land values, and especially the rapid increase with railroad extensions of values of land near the center of the city. Thus, a quarter of an acre at the corner of Madison and State Streets in Chicago, which sold in 1830 for $20, changed hands in 1836 for $25,000, in 1856 for $45,000 and in 1894 for $1,250,000. Somewhat similar figures could be cited from the experiences in many other large cities, made possible only because of transportation. As the creator of these values, the city should participate to some extent in this gain, as by the purchase of tracts in areas to be developed by new transportation lines, by assessments on real estate so improved or in some other way. Transportation extensions should also be made in a systematic way under government direction properly to develop the new territory.

In Paris these developments are under a city planning commission whose authority extends over all of the departments of the Seine, with powers to lay out streets, parks, sewer systems, water systems, extensions of existing transportation systems, etc., but the extent to which the transportation systems may be guaranteed against an operating deficit because of an unremunerative fare to develop these outside areas is still a debatable matter in France.

Questions of Speed and Capacity

The close relation indicated between transportation and city development emphasizes the need of both speed and capacity in the transportation system. The actual rate of speed required by the cars varies with the circumstances. In a town of small area a moderate speed is adequate, but in a large city, with distant suburbs, the matter of speed becomes of the greatest importance. Mr. Jayot, in his thesis on city planning, has endeavored to give the rate necessary under different conditions. "Let us assume," he says, "in a city practically in the form of a circle, that the time of travel from the circumference to the center should be twenty minutes, of which fifteen minutes is spent on the transportation line and five minutes walking and waiting for cars, and that the density of population should not exceed 200 per hectaire (about 73 per acre). Then, by a simple calculation, the following conclusions are reached:

"Walking (at a speed of 2½ m.p.h.) becomes too slow when the city reaches a radius of more than § of a mile. This radius corresponds to a population of 60,000 inhabitants and some transportation system, either tramway or bus, is necessary. Such systems (with speeds of 7½ m.p.h.) should answer for cities until the radius

Digitized by Google

reaches 2 miles, or corresponding to a population of not more than 600,000 inhabitants. Then faster transit is needed. Local subway lines (speed 15½ m.p.h.), with local stops, answer for cities up to a radius of 4¾ miles, or with from 600,000 to 2,400,000 inhabitants. Express rapid transit lines with schedule speeds of 25 m.p.h. or more become necessary where the radius is 6½ miles and the population reaches 6,000,000."

With the speed between termini determined, the next question is how it may be obtained by different means of transit. Within cities it appears difficult to increase the speed of vehicles on the public streets. Actually in Paris the tramway lines have an average schedule speed of about 7.2 m.p.h., with a maximum of 9.4 m.p.h. and a minimum of 5 m.p.h. Motor bus lines make an average schedule speed of 8.4 m.p.h., a maximum of 15.5 m.p.h. and a minimum of 6.4 m.p.h. The figures received by the international association from a questionnaire from various cities in Europe and the Argentine give about the same rates of speed, as shown in Table V. By the use of express buses, such as were put in service on a few lines in Paris in 1925, scheduled to make a minimum number of stops, a considerable gain over the figures mentioned above have been secured, but the amount of such service installed has been limited because the gain in time on most routes has not made the service worth while. In Paris the average distance between stopping points for passengers for both buses and tramways is 375 m. (1,230 ft.).

On the Paris subways the average schedule speed is 15½ m.p.h., although the stations are only about 1,640 ft. apart.

The Council of the Seine recently passed favorably on a proposed monorail system between Paris and St. Denis, a distance of about 2.1 miles, where it is expected that a speed of 50 m.p.h. can be made, or the run can be made in 3½ minutes, without any stops. The monorail will be about 50 ft. above ground, supported on columns 500 ft. apart. If constructed, it might throw some light on possible rapid transit lines of the future.

TABLE V—ELECTRIC RAILWAY DATA FROM DIFFERENT CITIES IN 1925

City	Population Served, in Thousands	Passengers Carried Annually, in Millions	Annual Rides per Inhabitant	Average Number of Cars in Service	Average Capacity per Car, in Passengers	Average Schedule Speed	
						In Kilometers	In Miles

(a) figures are for 1924.
(b) an interurban line.
(c) figures relate to tramways only.
(d) of which twelve are motor buses.
(e) of which 1,368 are motor buses.
(f) of which eleven are motor buses.
(g) of which nine are motor buses.

ADEQUATE CARRYING CAPACITY

The second condition mentioned was for the transport lines to be of a carrying capacity adequate to the needs, so far as can be done with economy in operation and first cost. Capacity, in turn, is dependent on both headway and capacity of the unit vehicle. Most of the companies replying to the questionnaire of the international association increase their capacity during rush hours by the use of trailers, although most of them admit that trailer operation reduces the speed. In Paris the carrying capacity of the motor car is 49 passengers and of the trail car 56. The motor buses in Paris have a capacity of 38 passengers if of the four-wheel type and 48 passengers if of the six-wheel type. A train of five cars on a Paris subway has a carrying capacity of more than 60 passengers per car.

The headway on individual street railway lines of heavy traffic in Paris is two minutes, reduced to one-half minute where several lines use a common trunk. On the bus lines the headway is one minute for lines separated and 25 seconds for lines using a common trunk. In consequence these lines have for tramways with trail cars an hourly capacity of about 3,600 people and the bus lines have about 2,500 people. The subway line has, during nineteen hours of the day, an average hourly capacity of 8,000 passengers, but during the rush hours this is considerably increased. The accompanying table gives some statistics on this speed and other data of a number of cities in western Europe.

Key System's Boat Launched

WITH appropriate ceremonies and in the presence of a notable throng, including city officials and men and women of prominence in the bay region, the new ferryboat *Peralta*, which is the first of two boats now being constructed by the Key System Transit Company, was formally launched at the Moore shipyards in Oakland, Cal., Oct. 14. The new craft will be ready for service about Jan. 1. The boats will be known as the *Peralta* and the *Yerba Buena*. Peralta is the name of an old Spanish family whose history is interwoven with that of the East Bay section. The family of Don Luis Maria Peralta was the first to settle in the East Bay. Yerba Buena was the name given by the Spanish to what is now the city of San Francisco.

There was another ferryboat known as the *Yerba Buena*, the first to be built for the Key System. This craft has now been sold, but its name will be given to the new boat, largely for sentimental reasons. The two new boats will be ready for launching in October and will be placed in service before the first of the year. Lines of a battleship have been followed in their construction, giving them a striking and solid appearance. Each will cost $849,565. They were designed by Hibbs, McCauley & Smith.

North Shore Uses New Equipment for Dispatch Freight

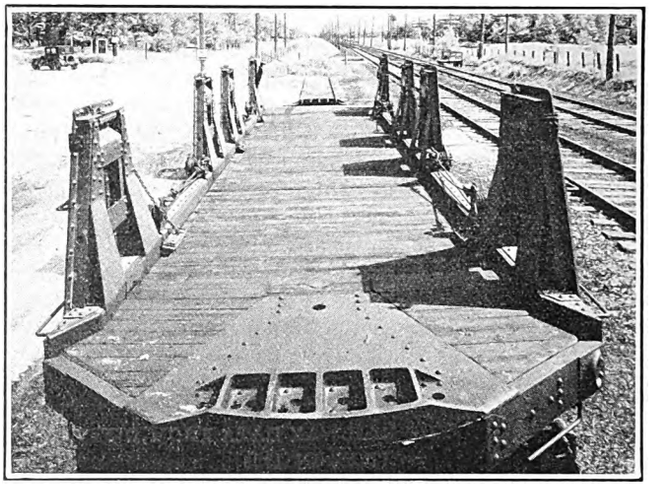
AN INNOVATION in the handling of less than carload lots of freight will feature this phase of service on the Chicago, North Shore & Milwaukee Railroad as flat-car and trailer equipment specially designed for the North Shore line is placed in regular operation between Chicago and Milwaukee.

This is the first equipment of its kind to be used on any railroad in the United States. It differs from equipment somewhat similar in nature in that the automotive trailers are mounted on the flat cars without the wheels being removed. Special runways are provided whereby two trailers are mounted on each flat car. Interlocking devices hold the trailers securely in place during rail transit.

The trailers eliminate all extra handling of shipments, since they are loaded at the point of departure and unloaded at their destination. After being loaded they will be hauled by motor truck to a central point where they will be mounted on flat cars. Deliveries of the trailers will be made in similar manner to all parts of the cities served by this new type of equipment.

Since the North Shore trains enter Chicago over the elevated tracks of the Chicago Rapid Transit it is not feasible to provide freight car facilities in downtown Chicago. This form of pick up and delivery is practically a necessity to successful operation. For some years it has been the custom to pick up and deliver freight in automotive equipment and transfer it to rail cars at the southern end of the surface section of the North Shore. This required double handling at these terminals and the consequent checking. This equipment will therefore avoid the extra handling of merchandise.

The first of the order of flat cars and trailers has already been delivered, and the balance of the order is scheduled for delivery by the middle of November.



One of the Rail Car Trailers Used on the North Shore for Holding Two Steel Box Automotive Trailers Used in Shipping Dispatch Freight between Chicago and Milwaukee

New chassis also have been ordered to convert trailers now in use to the interlocking type.

The trailers are of 8-ton capacity each, with 7x17-ft. metal container bodies manufactured by the Trailmobile Company of Cincinnati, Ohio.

Car Heater to Utilize Motor Rheostat Losses

AN ELECTRIC heater, designed to utilize the energy usually wasted in motor rheostats, has been installed on one of the cars of the United Railways & Electric Company of Baltimore. Patents to cover it have been applied for in the name of the company's engineers, who conceived the idea. The heaters are beneath the seats and can be grouped in any desired manner to possess approximately the same ohmic resist-

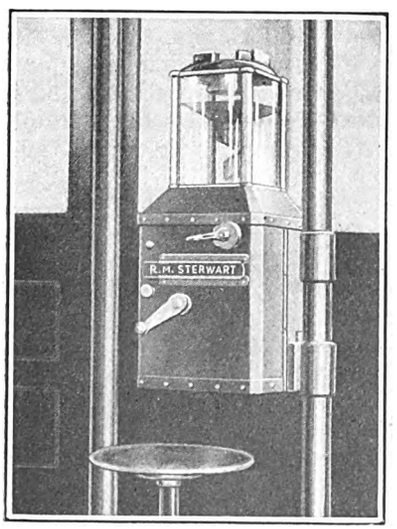
One Car in Baltimore Is Equipped with Heaters Which Utilize the Energy Usually Dissipated in Motor Rheostats. In Warm Weather They Can Be Put Out of the Circuit in Whole or in Part

ance as the exteriorly located rheostat. Means are also provided whereby the exterior rheostat or resistance may be used selectively, depending upon the season of the year or the temperature. This selection is made by a simple switch or control device, easily operated by the motorman or conductor and necessitates no change in the wiring of the controller or other parts of the car, aside from certain additions. The heaters can be grounded in the case of a short circuit.

As shown in the illustration, the heaters are arranged to replace the ordinary foot rest. Later designs are provided with guards so that passengers will not come into direct contact with the heater cases.

Operator's Name Carried on Fare Box

CAR operators of the El Paso Electric Company are known to the passengers by name. After experimenting with various methods of posting the operator's name for the benefit of the passengers, such as placing a nameplate in the vestibule or on the bulkhead, the company has selected the side of the fare box as the most satisfactory location. The operator's name is stamped on an aluminum nameplate which fits into a slot on the side of the fare box. The letters are raised while the background is painted blue. These plates are light and compact, being no larger than a pocket comb, and are easily carried in the trip-sheet holder. One operator's plate is removed and that of his relief inserted at the time register readings are taken, thereby making it unlikely to forget to make the change. Another advantage of this location is that in changing ends the name, being attached to the fare box, is always changed. Moreover, the visibility of this location is particularly good.



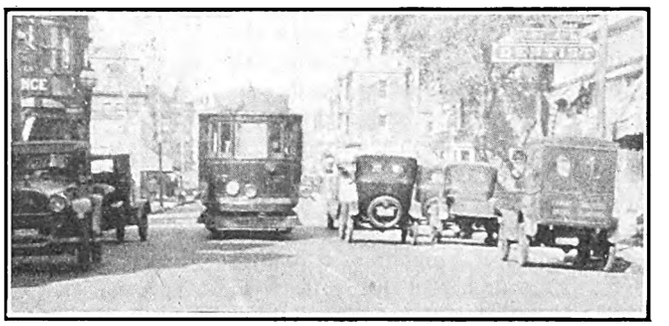
To Personalize Its Railway Service the El Paso Electric Company Places Each Operator's Name on the Fare Box of His Car

Track Shift Relieves Traffic Congestion

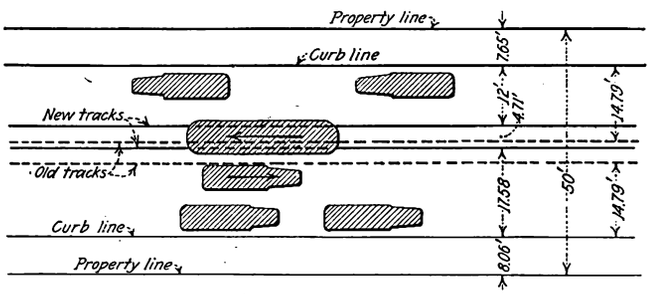
Location of Single Track Slightly Off Center on Narrow Street Gives Room for Double Line of Vehicles on Left and Single Line on Right

BY SHIFTING its track on Acushnet Avenue 2.79 ft. away from the center of the street the Union Street Railway, New Bedford, Mass., has made a substantial contribution to the relief of traffic congestion. Formerly with the car tracks in the center of the street it was impossible on account of vehicles parked along the curbs for a moving automobile to pass on either side of a street car. With the tracks offset it is now possible for an automobile to pass on the east side and many annoying delays have thereby been eliminated.

Acushnet Avenue is a north and south business street with stores on both sides. Its width from property line to property line is 50 ft. Approximately 8 ft. is taken on each side of the street for a sidewalk, leaving 34



Southbound Car on Offset Tracks Passing Northbound Automobile Without Interference



Track on Acushnet Avenue, New Bedford, Mass., Has Been Shifted 2.79 Ft. to One Side, Giving a Clear Roadway of More than 15 Ft. Between a Car and the Curb on the Left-Hand Side

ft. for vehicular roadway. With a 9-ft. car in the center of the street the clear roadway on each side was only approximately 12½ ft. This was insufficient for a moving automobile to pass between a parked machine and a car. When an automobile was moving in a direction opposite to that of a car, considerable maneuvering was necessary before the passage could be arranged.

On this street the cars operate in a southerly direction only and the tracks have now been moved 2.79 ft. off center toward the right, or west side. This gives a clear space on the left or east side of slightly more than 15 ft. between the car and the curb, sufficient for one line of parked automobiles and one moving line. Thus under the present arrangement northbound automobiles move freely on this side of the street. Southbound automobiles must travel behind southbound street cars. The offset continues for a distance of fourteen blocks or a total of 3,579 ft.

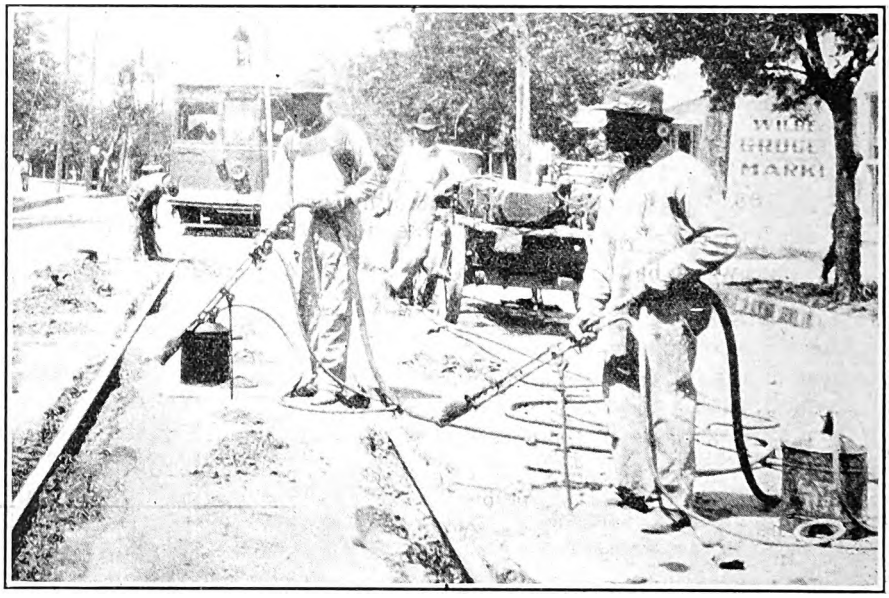
Maintenance Notes

Kerosene Preheaters Make Possible Asphalt Work in Cold Weather

KEROSENE - BURNING preheaters constructed in the local shops of the Northern Texas Traction Company, Fort Worth, Tex., have been used with success in emergency patch paving of asphalt. Necessity in this case was the mother of invention. A street was repaved by this company last winter and the asphalt torn out while the weather was fine, but when the new asphalt was to be replaced a day or so later the weather had turned cold and rainy. By the use of the preheaters the old asphalt was dried out and heated so that the new asphalt coated rock could be properly worked.

The preheater consists of a 2x6-in. burner tube and ⅜-in. air pipe with cutoff valve that connects the burner tube to the air compressor. A ⅜-in. fuel pipe and flexible hose extends to the kerosene supply. The heater is arranged with a staff so that it can be held in position and directed at one point.



Preheaters Made by Northern Texas Traction Shown in Use on a Street in Fort Worth. These Burners Make It Possible to Work with Asphalt Coated Rock During Wet and Cold Weather

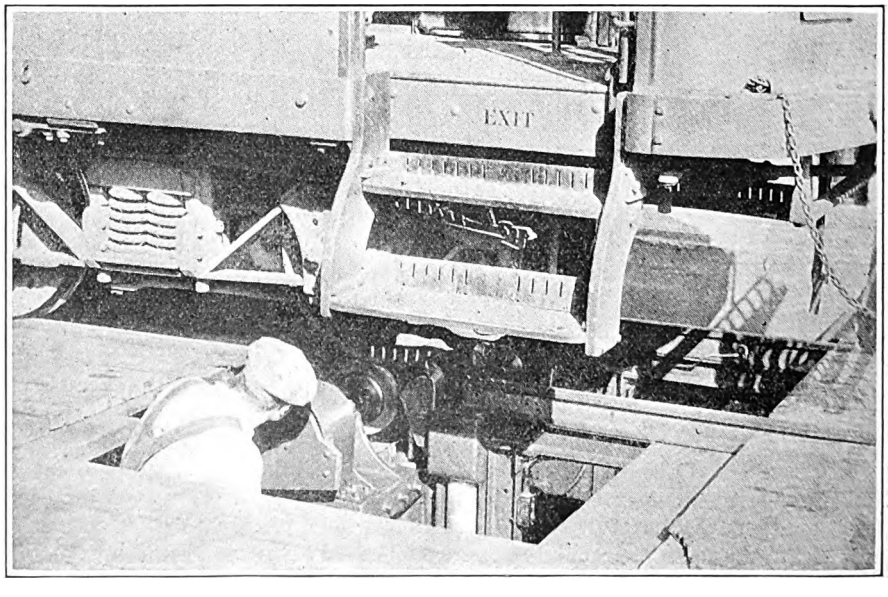
Los Angeles Railway Finds Pit Grinder Saves Time

IN A recent trial of a new pit grinder just installed in the shop of the Los Angeles Railway a pair of wheels were ground and put back into service in one hour and 35 minutes. The same operation would have required several hours with the former method of grinding wheels in vogue in this shop.

The grinder is installed in the pit below the tracks and is driven by a 20-hp. electric motor. When flat wheels are detected the car is pulled over the center of the grinding wheels and a pair of screw jacks with the bases resting on the platform are placed so as to lift the truck and car body so that the wheels will be normally about 1 in. above the rail. Gap rails in the track are then removed and the grinding wheel is brought into position by means of a screw. The car wheels are revolved by the motors geared to them.

The machine is double-ended so that two wheels can be ground at the same time. The rotating of the wheels is cut down to the desired speed by a special combination of resistor units. The grinder is equipped with a fan which exhausts, through a system of pipes, dust and particles of metal detached in the grinding process. These are forced into a receiving chamber. After the wheels are ground the gap rails are replaced and the jacks lowered until the wheels rest on the tracks so that the car can be rolled away.

Where it is necessary to grind the wheels on trailer axles which are not equipped with motors the axle is driven by a special arrangement of pulleys, gears and sprockets which have been designed by the staff of the mechanical engineer of the rail-



Grinding a Pair of Wheels with the New Pit Grinder in the Shop of the Los Angeles Railway

Digitized by Google

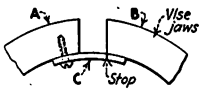
way. Previous to the installation of this grinder, wheels had to be removed from the truck and brought to a stationary grinder for truing up. This operation was slow, tedious and expensive. Increased traffic made it necessary to use some other means and the pit grinder is the result.

Your "Rough Riders" are dangerous, uncomfortable and unprofitable. Eliminate them by improved maintenance.

Stop on Coil-Straightening Vise Saves Workman's Time

IN REWINDING railway motor armatures which have strap wound coils it is the usual practice of electric railways to strip off the old insulation and reinsulate the coil. After the old insulation has been removed an important part of the preparation of the bare copper part is to straighten it in a vise before reinsulating. Owing to the shallowness of the vise jaws, the placing of a coil in the proper position for straightening may consume considerable time.

In order to provide an easy method of aligning the coil in the straightening vise, the Brooklyn-Manhattan Transit Corporation, in its department of electrical repairs, has its straightening vises provided with curved clips which extend underneath



Curved Clip Underneath Jaws of Straightening Vise Enables the Workman to Place Armature Coils in Position for Straightening Without Difficulty

the full width of the jaws when they are open. The accompanying illustration shows the construction. *A* and *B* are the two jaws of the vise and *C* is the curved clip which extends underneath. This clip does not interfere with the movement of the jaws, but acts as a stop so that the coil can be dropped into position quickly.

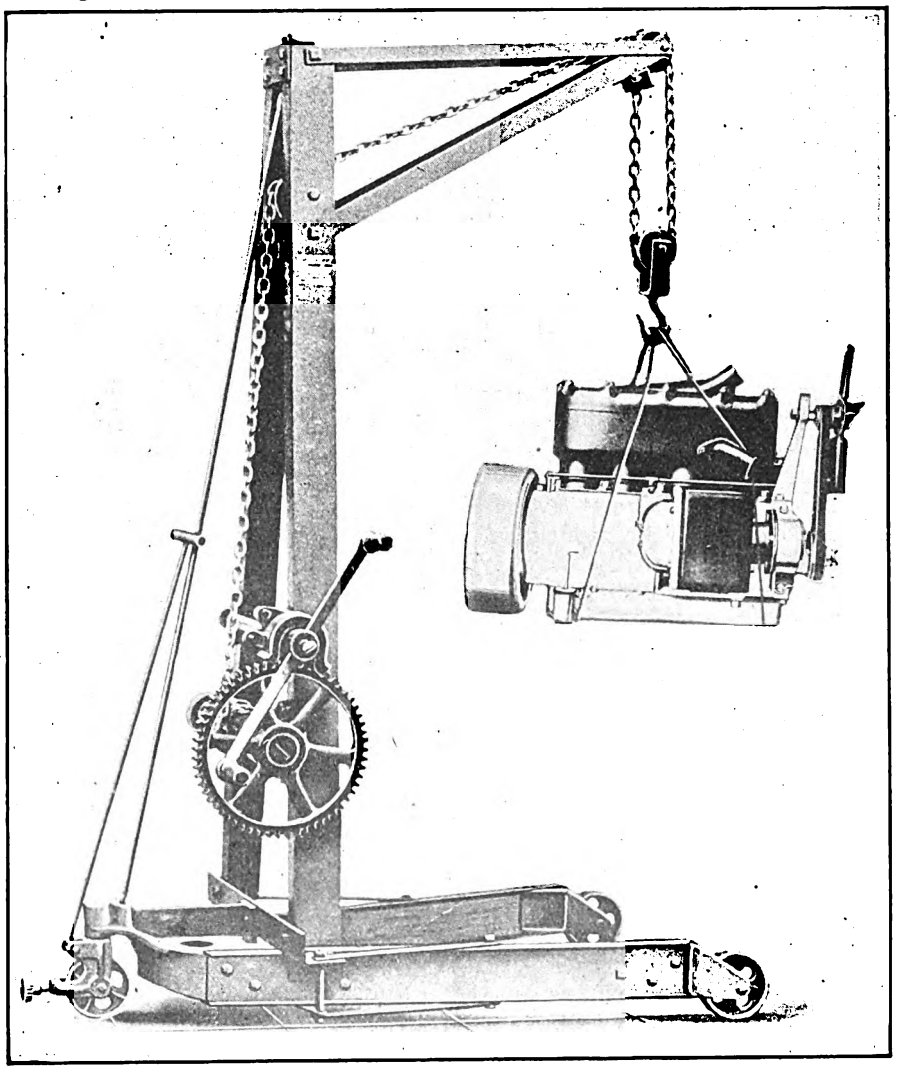
The usual operation is for the workman to open the jaws sufficiently so as to receive the coil and with one hand he drops the coil into position, while with the other he operates the vise handle to squeeze out any kinks from the coil leads. The curved clip eliminates trouble of alignment and a little experience enables the workman to straighten coils rapidly.

New Equipment Available

High-Lift, Deep-Overhang Floor Crane

WHERE shops are not provided with overhead cranes or some type of overhead traveling hoist, portable floor cranes are a convenient accessory. Heavy parts can be removed directly from cars and transported to workbenches for overhauling by one man without much exertion. In order to provide a floor crane which is light and which at the same time has high lift, deep overhang and a low base, the Manley Manufacturing Company, York, Pa., has brought out a new type. Different styles of this crane provide for a lift from the floor varying from 6 to 7½ ft. and with an overhang varying from 30 to 38 in. The weights of the cranes range from 300 to 770 lb. The base is constructed so that it may be run under a car body or motor car. The structure is on the cantilever bridge principle. The base is a combination of steel and heavy I-beams. With the heavy base and light superstructure the center of gravity is low. The light superstructure also makes it possible to have a deeper overhang with a higher lift and a lower base than would otherwise be possible unless danger of the cranes becoming topheavy resulted. The operating handle provides a leverage of 12 to 1 when in its center position and the handle may be pulled through a slot to its extreme length so as to double the leverage ratio, making it 24 to 1. A steel drum is provided for the chain so that it will not crowd or slip down from one convolution to another.

The wheels have wide faces and are fitted with roller bearings so that



Crane of One-Ton Capacity for Handling Equipment of Passenger Cars and Light Trucks. It Has a 7-Ft. Lift and 35-In. Overhang

Digitized by Google

transportation of heavy equipment can be carried out easily by one man. A small wheel is provided in the center at one end for steering. This can be locked to make the crane immovable while it is being loaded or unloaded. For bus overhauling the crane can be used instead of an incline for raising one end of the bus while working under the chassis. There are no thrust bearings, worm wheels or complicated parts to cause trouble.

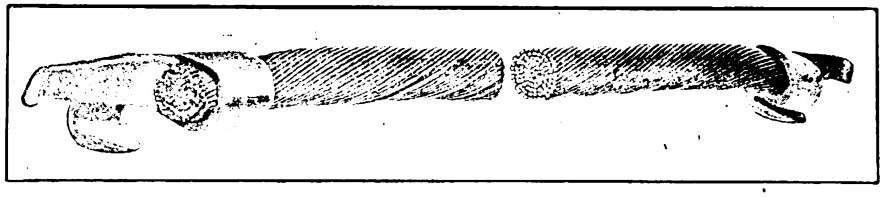
New Features in Line Switch Equipment

IMPROVEMENT in operation and decrease of need for maintenance are accomplishments claimed for new line switch equipment for type K control brought out by the Westinghouse Electric & Manufacturing Company. There are three new major pieces of equipment, a type UM-2-A magnetic line switch, a TC-2 control and reset switch and a TA handle switch, connected to a type K controller, all of which embody many features not included in older equipment.

The new equipment does not affect the present standard scheme of connections. It can be installed in place of the present line switch equipment without changing the cables on the car. The line switch is a lightweight unit especially designed to prevent freezing of contacts and false opening or closing. The blowout and arcing parts are designed to handle heavy overloads and short circuits quickly and effectively. An air trip cylinder is also provided for use with standard type of control safety devices.

The control and reset switch is much lighter and the mechanism is more accessible than the older type. It is equipped with a blow-out arrangement that eliminates the necessity of a blow-out coil, which in the older type switches was the source of annoyance because of the space it occupied and danger of open circuits. The switch is inclosed in a black molded Moldarta box with a hinged cover. All parts are easily accessible.

The handle switch takes the place of the ratchet switch, with more satisfactory results. It is mounted on the top plate of the controller instead of at the bottom as in the ratchet switch. By inclusion of a certain amount of lost motion between the main operating handle and the main drum shaft provision has been made for a set of make and break control contacts. This lost motion insures the breaking of the circuit to the operating coil of the line switch before the main drum starts to move to the "off" position. This eliminates arcing and burning of the controller. No change is involved if the safety control devices are applied on top of the handle. The over-all height of the controller with the TA handle switch is no greater than with the standard handle.



This Arcon "F" Bond May Be Applied to the Rail Base

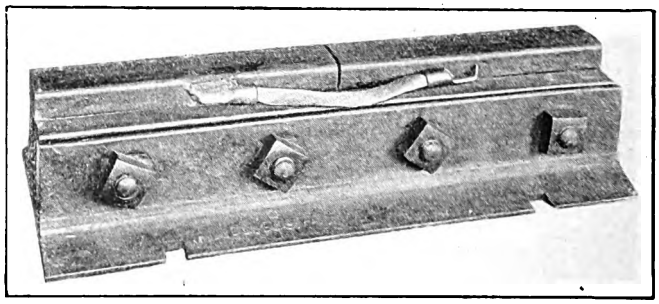
Three Types of Rail Bonds

COMPLETE absence of metallic pockets which interfere with the welding arc is claimed for three new types of rail bonds being manufactured by the American Steel & Wire Company of Chicago, Ill. These are known as Arcon bonds and are for application by the copper metallic arc welding process.

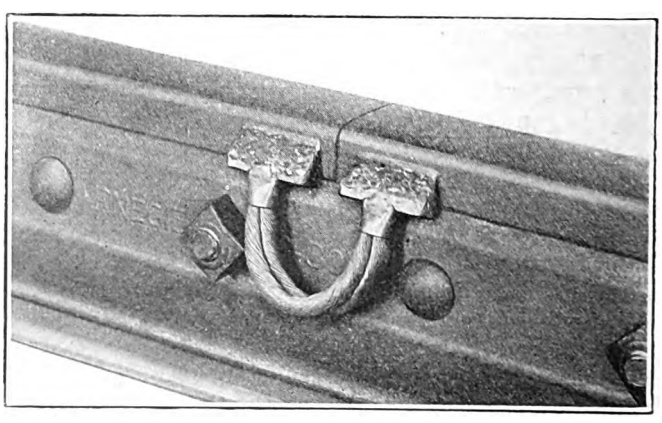
The first of these is the Arcon "A" bond, which is a U-shaped steel terminal bond for application to the rail head. Designed to provide a free and open welding space the steel terminals tilt the bond to clear the splice bars. The heavy steel lugs retain the welding metal and the metal can be built on a slope to the top of the rail to deflect wagon wheels and similar foreign objects. The strand is positioned in the terminals to insure a homogeneous weld between the strand ends and the head of the rail with easy arc manipulation. A seamless steel sleeve dampens and absorbs vibratory stresses in the strands and protects it from the heat of the arc.

A special design was worked out for the Arcon "C" rail bond with the idea in mind of its application to the rail head when a Weber joint is used. The steel terminal design is such that all parts of the terminal rail and conductor are accessible for welding. A low resistance all copper connection is easily and quickly accomplished. Accompanying illustrations show both "A" and "C" bonds actually applied to rail joints.

If it is desired to apply the bond to the rail base around the splice bar the Arcon "F" bond may be used. The steel terminal is designed to co-act with the angle of the rail flange to retain the welding metal. In this long flexible bond complete fusion between the strand ends and the rail base is accomplished with a minimum amount of welding electrode. All unnecessary retaining walls have been eliminated so as to permit easy penetration by the welding arc. A heavy hook is provided to hold the bond in place preparatory to welding. This hook is so designed that it will fit easily between rail and tie.



Arcon "C" Bond Is Designed for Use with Weber Joints



Arcon "A" Bond Applied to Rail Head

Motor Carrier Regulation Considered

Railroad and Utilities Commissioners Discuss Important Phases of Transportation at 38th Annual Convention in Asheville, N. C.—Factors in Bus and Truck Control for Interstate Service a Leading Topic

EDITOR'S NOTE—That the industry may be informed, in this issue is published a telegraphic report of the proceedings of the annual meeting of the National Association of Railway and Utilities Commissioners held in Asheville, N. C., Nov. 9-12.

This report contains a synopsis of committee reports of interest to the electric railway industry. Discussion of interstate bus regulation, uniform bus accounts, service and fares of electric railways are included. In next week's issue will be published extracts from these reports in more detail.

The trend of thought in the minds of state regulatory authorities is of vital interest to every utility. The JOURNAL has covered the meeting for the electric railway industry in order that this information may be available promptly.

REPRESENTATIVES from the Public Utilities Commissions or similar regulatory bodies of some 30 states met in Asheville, N. C., Nov. 9 to 12 for the 38th annual convention of the National Association of Railroad and Utilities Commissioners.

Several subjects of interest to electric railway men were included in the reports presented by standing committees and in addresses delivered during the meeting. Regulatory problems connected with the operation of motor vehicles were given an important place on the program and occupied a considerable part of an entire day's session. President A. G. Patterson, chairman of the Alabama Commission, in his opening address outlined a number of factors connected with the motor vehicle subject. His view was that existing state authorities should be employed as the agencies by which regulation, both intrastate and interstate, should be carried out. He also expressed the view that "in devising such legislation the rights and interests of existing carriers by rail or by boat should of course not be ignored." A more complete extract from Mr. Patterson's address relating to this subject will be printed next week.

In discussing common carrier rates the president made a strong plea in favor of checking the tendency since the war for the encroachment of federal upon state authority in regulation. A similar view with respect to the extension of federal authority was expressed by many speakers during the convention, including Commissioner J. J. Esch of the Interstate Commerce Commission. This latter view was contained in an address the subject of which was the commerce clause of the American Constitution.

Further reference to the matter of automotive regulation was made in the reports of the committees on state and federal regulation, motor vehicle transportation, express and other contract carriers, and by the special committee on motor vehicle legislation. C. C. McChord, counsel of the National Automobile Chamber of Commerce, discussed the interstate regulation of motor vehicles from the automotive viewpoint. A brief outline of the position taken by the Motor Bus Division of the American Automobile Association in preparing a bus regulatory bill for presentation to Congress was given by S. M. Markell, attorney for the automotive interests. Mr. Markell urged the expediency of concentrating effort on the passage of interstate bus regulatory legislation independent of truck regulation on the ground that such action involves no recession from the principle that both bus and truck transportation should be regulated. He pointed out that opposition to truck regulation is more determined than that to bus regulation, and that the problems presented by the truck are considerably more complicated than those involving the bus.

A decided difference of opinion arose in the discussion. Commissioner Ivan Bowen of Minnesota voiced strong opposition to any federal legislation on the subject on the ground that this would be another step toward extension of federal authority and also that it is highly desirable to insure the development of a competitive form of transportation, which he claimed would help hold freight rates to a minimum. Although Minnesota commissioners were alone in this extreme position there was considerable difference of opinion regarding the matter of advocating bus legislation separate from the control of trucks. The question was finally disposed of by a resolution leaving in the hands of the committees on motor vehicle transportation, motor vehicle legislation, and state and federal legislation the power to carry on the work of supporting legislation before Congress looking to the regulation of automotive vehicles in interstate commerce.

The committee on statistics and accounts of public utility companies indorsed the classifications for bus companies with annual operating revenues of more than $100,000 and those with operating revenues of less than $100,000 adopted by the American Electric Railway Association.

In the report of the committee on service of public utility companies of which J. F. Bell, lieutenant-colonel, Corps of Engineers, United States Army, was chairman, a strong statement was made in favor of giving more consideration to good service than to cheap fares in the regulation of electric railways. Extracts from this report will be published in next week's issue of the JOURNAL. Indorsement of the recommendation of the National Conference of Street and Highway Safety regarding the establishment of automobile stops at dangerous railroad crossings is contained in the report of the committee on safety of railroad operation. Experience in Minnesota, where such a law is in effect, is presented to show the reduction in accidents and fatalities that has resulted.

A strong indorsement of the indeterminate form of utility franchise was carried in a resolution presented by Commissioner Esch of Wisconsin.

Addresses were delivered during the convention by Joseph B. Eastman, chairman Interstate Commerce Commission; John H. Small, chairman Rivers and Harbors Congress; John J. Esch, Interstate Commerce Commission; M. H. Aylesworth, president National Broadcasting Company; Alexander Forward, secretary-manager American Gas Association; Carl D. Jackson, member American Bar Association committee on uniform regulatory law. Short discussions of relations with the regulatory commissions were made by representatives of

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Nov. 16-18*—Society of Automotive Engineers, National Transportation and Service Meeting, Boston, Mass.**

***Nov. 17-18*—Iowa Electric Railway Association, operating and maintenance section, annual convention, Fontanelle Hotel, Omaha, Neb.**

***Nov. 17-18*—Central Electric Traffic Association, regular meeting, Fort Wayne, Ind., Keenan Hotel, 9 a. m.**

***Nov. 19*—New York Railroad Club—annual meeting. Engineering Societies Building, New York City, 8 p.m.**

***Dec. 3*—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.**

***Dec. 6-9*—American Society of Mechanical Engineers, annual meeting, New York City, Engineering Societies Building.**

several public utility associations and companies.

John F. Shaughnessy, chairman Nevada Public Utilities Commission, was elected president for the ensuing year. Other officers elected were Henry G. Wells, Massachusetts, first vice-president; Lewis E. Gettle, Wisconsin, second vice-president, and James B. Walker, New York, secretary.

The next meeting of the association will be held during the third week in October, 1927, at Dallas, Tex.

American Association News

Public Not Interested in Railway Troubles

STRAIGHT from the shoulder talks by C. S. Ching, supervisor of industrial relations United States Rubber Company, and Walter Drey, vice-president and general manager *Forbes Magazine*, advising electric railway men to stop telling the public their troubles and to begin advertising their accomplishments, were the features of a meeting of the Metropolitan Section, A.E.R.A., held in the Engineering Societies Building, New York City, Nov. 5. Abstracts of the outspoken comments of these speakers appear elsewhere in this issue.

High spots of the recent Cleveland convention were outlined in a short talk by Guy C. Hecker. He quoted figures showing the amount of space used for the exhibits and spoke of the unusual interest displayed by the public. The proceedings of the various affiliated associations were briefly summarized for the benefit of those who had been unable to attend the convention.

A. L. Hodges presented the report of the secretary and stated that the membership of the Metropolitan Section is now 1,164. The report of the treasurer was also read by Mr. Hodges. Following the talks by Mr. Ching and Mr. Drey, officers were elected for the coming year. The program was concluded with several excellent entertainment features.

The new officers are: President, T. R. Langan; first vice-president, R. F. Carbutt; second vice-president, P. W. J. Smith; third vice-president, C. F. Scott; secretary, A. L. Hodges; treasurer, George H. Ord. Three new members were elected to the executive committee, one more than usual owing to the election of C. F. Scott to a vice-presidency. The new members are J. F. Lamb, W. G. Straight and W. J. Stanton.

Railway Outlook Has Changed*

To Furnish Local Transportation Regardless of the Type of Vehicle Is the Duty of the Industry—Public Favor Must Be Wooed, Not Taken for Granted

By WALTER DREY
Vice-President and General Manager *Forbes Magazine*

DESPITE the fact that a newspaper man if he were charged with the responsibility of running a railway couldn't meet the problems half as well as you meet them, yet he feels perfectly justified in criticising the work that you are doing. When you are in a public service business—and it isn't purely a burden that faces you as transportation men, because it faces every other public utility—it is not merely a problem of delivering 100 per cent service, whatever the conditions may be. After you have delivered such service you have got to be constantly telling that public such service as you have delivered to them is 100 per cent.

The reason why a transportation company must use advertising in order to maintain its public relations in the proper fashion is this: We people in the newspaper business are concerned with news, and you only reach or get into the news columns when something happens that is news. When a man does what he is expected to do, that is not news. In other words, if a man leads a decent, exemplary life and goes home to his family every night and raises his children as they should be raised, he can live that way from the cradle to the grave and he probably will never see the front page of a newspaper. But let that same man run off with another's man wife, or let that man do something outside of what he is expected to do, and he immediately becomes "news" and his activities have to be reported.

By the same token, when anything goes wrong on the railway, that is news and will find its way into the newspaper columns. When everything goes right on the railway that isn't news. That is just what you are expected to do, and you don't see the light of day as far as the news columns are concerned. It therefore becomes the job of the transportation company to tell the story of the operations in the form of advertising, to capitalize every possible resource that you have in telling your own story.

One of the chief problems today in public relations is to establish in the minds of the public the idea that you are at least trying to do the right thing, regardless of the lapses you have, because whatever you do will never be perfect. When you once do that, you will get an entirely different attitude with your public and with your community. When once I am fundamentally convinced that the man who is serving me is trying to do the right thing, I will excuse a lot of lack of service, whether it is my butcher, my baker, or my candlestick maker. When I get the idea that the man I am trading with is not trying to do the right thing, even though he gives me what appears to be 100 per cent service, I am still suspicious of him. He loses my trade regardless of the quality of the goods or the perfection of the service that he performs.

My mind goes back to the time of a meeting of the American Electric Railway Association three or four years ago at Washington. For the previous five years the electric railway industry as a whole hadn't been sure of its own future. Then a brand-new idea took hold of the men in this business, because suddenly the realization came that they weren't in the electric railway business at all, that they were in the transportation business, that the transportation business was essentially a controlled monopoly, that it didn't make a bit of difference whether the vehicle was propelled by gas, by gasoline engine, or by electric motor, or what-not, that the business of this industry was to haul the greatest number of people in the most comfortable way at a fair profit to themselves. The moment that thought took hold, it marked the rise of a new day, and it marked an epoch so that the people who were identified with the industry once more saw opportunity and a chance to be rewarded for the service that they performed.

That is where the electric railway industry stands today in the public mind. We don't think of you as operating any particular type of vehicle, but we do hold you responsible to give us the very best service that it is possible for you to give under any given conditions.

To my mind, the hardest pill that any group of men had to swallow was that which transportation men took when they accepted the bus. When a man has been trained for years to believe in the supremacy of electric power to meet any and all conditions under any and all circumstances, by the time he reaches middle age it is difficult suddenly to realize that mechanical development has created a situation where the thing which he thought was omnipotent has limitations. It is a tough pill to swallow. It was a very, very difficult thing for the traction men to take, but they took it like men.

Electric railway conventions today are no more like the conventions of three years ago in morale, in spirit, in attitude, than day is like night. That condition has been brought about within the last two or three years. One other thing remains to be done. You have got to tell the public your story.

It is like this: A fellow goes out to court a girl and he woos her. When he woos her he is constantly putting his best foot forward. Then he marries her. After that he may continue wooing her for a year or two, and then comes that stage of take-it-for-granted—you are here, and I am here, and everything is all right. The street railway industry was married to the public for 25 years, and after that they came mighty close to getting a divorce. Then came the realization that a new courtship had to be started, that the industry had to woo the public all over again. Now you have started wooing and you have won your public once more, don't take your public for granted. Continue to woo the public as long as you are on the job.

*Abstract of a talk given at a meeting of the Metropolitan Section, A.E.R.A., New York, N. Y., Nov. 5, 1926.

The News of the Industry

Hearings Begun in Kansas City

Start Is Made on the Discussion of Questions Involved in Settlement of Franchise Extension Matter

At last week's meeting of the special committee of the City Council of Kansas City, Mo., appointed to negotiate with the Kansas City Public Service Company in devising provisions for a new street railway franchise it was decided to hold two night meetings or hearings each week following the next scheduled meeting, set for Nov. 10.

Dean's Statement Interpreted

The statements made two weeks previously before the Council committee by Dean H. E. Riggs of the University of Michigan, in connection with valuation figures he had set upon the local properties for the federal court, were again discussed at the Council franchise hearing last Thursday afternoon. Both Mayor Beach and Councilman Henry L. McCune interpreted the statements to be that Professor Riggs meant that the valuation of the property in its present condition should be about $18,000,000, but after the projected rehabilitation program is completed the property should be evaluated at approximately $25,000,000.

The dean's statements were read before the meeting, and it was pointed out that he had said, "after the property has been put in good shape to operate, it ought to be allowed earnings on a capitalization of $25,000,000."

Judge McCune also referred to the valuation of $18,000,000 mentioned in Dean Riggs' report to the federal court, in which he also stated that about $7,000,000 would be required to rehabilitate the property; the Judge contended these references tended to bear out the fairness of the proposed valuation figure of $18,000,000.

President States His Case

William G. Woolfolk, president of the company, said he was of the opinion that his company could not accept a valuation as low as $18,000,000. In explanation, he cited the Interstate Commerce Commission's ruling that when a property is purchased at a low price all expenditures for rehabilitation must go into the capital account of the operators. Mr. Woolfolk also expressed the belief that Dean Riggs had said the property had a valuation of $25,000,000 on Jan. 1, 1925, which definite statement appeared at one point in the dean's recent testimony, in answer to a direct question.

In speaking of fares in connection with the probable earnings of the company, Mr. Woolfolk made the following statement before the committee:

Kansas City cannot expect for some time to get a lower rate of fare than that provided for in the extension franchise. We believe that in a new franchise valuation provision should be made for cost of materials and supplies getting lower; this would reduce expenses and could be used to lower fares.

For several years we do not expect to earn much above operating expenses. Provision should be made so we could earn $2,000,000 to $2,500,000. In five years the receivers averaged $1,934,108 a year. With conservative and economic operation we know we can do better than that. With necessary improvements and new equipment, we believe the road in a few years will be able to earn $2,500,000 a year.

We would be glad to see the present ordinance stand, if we could earn 6 per cent on the valuation it permits. Taking the original valuation of $25,000,000 and bringing it down to date by adding to it the cost of permanent improvements as soon as permitted by its provisions, we would be permitted to earn 6 per cent on a valuation of $43,000,000. But we know that could not be done.

We want a franchise which will permit the company to earn a fair return on the present rates of fare; also any new money which may be put into it, other than maintenance and repairs.

In his testimony last month Dean Riggs recommended 8 per cent as a fair return for a public utility, which he said would leave 2 per cent for depreciation, or for amortization at the end of a 50-year period.

The Council committee has asked Fred W. Fleming and Francis M. Wilson, until recently receivers of the property, and E. M. Stayton, city member of the board of control of the company, to testify at the next hearing.

Planning Board Agrees with Boston Elevated

In the pending discussion between the Boston Elevated Railway and the Mayor of Boston over the construction of a subway under Governor Square, so as to eliminate some of the traffic congestion on the surface, the Elevated scores through a new proposition which comes from the Metropolitan Planning Division. It would cost about $5,000,000 to build the subway, on which the Elevated company would have to pay the rental, but it would cost only about $1,400,000 to carry out the suggestions of the Planning Division. This plan would lift Beacon Street traffic over Commonwealth Avenue so as to eliminate both trolley and auto congestion in the street; there would be no crossings of lines. There would be a ramped viaduct, ornamental in design, a sort of two-level highway overpass from Commonwealth Avenue to Beacon Street.

While this is only a suggestion, it is important because it comes from a body which two years ago advocated a subway at this point. Today the Planning Division says that it is a serious matter to suggest that the car riders of Boston assume an added burden of several million dollars which they would have to pay for the cost of the subway. The proposed viaduct would not interfere with any future extension of the subway in Commonwealth Avenue, Beacon Street or Brookline Avenue.

Another Chicago Snare Ahead

Sectional Favoritism Basis for Opposition Which Blocks Appointment of Citizens' Traction Committee

The plan to appoint a citizens' advisory committee on Chicago traction matters, which was drafted and approved by the local transportation committee of the City Council, went awry on Nov. 4 when it was ensnared in a sectional battle in the Council.

Seven prominent Chicago business men were to have been appointed to the committee at that time by the City Council. The names proposed for the committee were James Simpson, Rufus L. Dawes, George Woodruff, Patrick Nash, Stuyvesant Peabody, John Hayes and George F. Nixon.

After several hours of debate, it developed that the principal objections to the plan was that Loop interests were being favored to the detriment of outlying wards. Mayor Dever's message to the City Council on the previous day, in which he urged that immediate steps be taken toward construction of a downtown subway system, paid for by special assessment and the city's traction fund, was also cited as further indication of this sectional favoritism. It is now considered unlikely that the proposal will again be brought up for discussion for another two or three weeks.

Assessment Plan Advocated

That there would be serious trouble ahead for any such plan as contained in the report of the citizens' subway commission, which was presented last August to the City Council (see ELECTRIC RAILWAY JOURNAL for Aug. 28) and which served as a basis for the recommendations in Mayor Dever's recent message to the Aldermen, was likewise made evident at the meeting of the local transportation committee.

One of its most bitter opponents was Alderman John Toman, who stated that he would fight the plan when it comes up for consideration on Nov. 16 because it permits only 35 per cent of the cost of subways to be assessed from property owners. He especially resented the suggestion to take moneys from the city's $45,000,000 traction fund for this purpose. He said:

The special assessment ought to be for at least 75 per cent of the cost of the subways. Daniel L. Turner, consulting engineer of the New York subway commission, said in a report three years ago that subways increased the value of property 75 per cent. It has been shown that the subways in Manhattan boosted values seven times and in the Bronx 5½ times. Take the Michigan Avenue link bridge right here in Chicago, costing $14,800,000. The plan commission showed two years ago that the bridge had increased property values $90,000,000. The figure is now probably more than $100,000,000. Property owners should certainly pay more than 35 per cent of the cost.

Denver Tramway Case in Supreme Court

City Attorney Henry E. May and Assistant City Attorney Thomas H. Gibson of Denver, Col., on Nov. 5 presented to the United States Supreme Court a petition in which they seek reversal of the decisions of Federal Judge Robert E. Lewis in favor of the Denver Tramway. Among other things they contend:

The trial court was without jurisdiction. The franchise is a contract between the people of Denver and the company. The franchise stipulates a 5-cent fare. The federal court cannot set aside the 5-cent fare provision of the franchise because the question of confiscation cannot enter into the enforcement of a contract. If you make a bad bargain, it is your own fault.

The brief is based upon a decision of the United States Supreme Court, to wit:

Provisions in ordinances granting franchises to railways that the rate of fare shall be not more than 5 cents or that the grantees shall not charge a higher fare are contractual.

Attention is directed to the decision of the Colorado Supreme Court, to wit: "No perpetual franchise can be granted in Colorado."

Judge Lewis' decision was to the effect that the franchise between the city of Denver and the Denver Tramway, which contained a 5-cent fare clause, was "perpetual." He did, however, authorize the company to charge an 8-cent fare.

Strike on Massachusetts Interurban Put Off

The strike planned by the workers of the transportation and freight departments of the Boston & Worcester Street Railway, South Framingham, Mass., to go into effect on Nov. 5 was deferred by the carmen until Judge Edward F. Pierce of the Massachusetts Supreme Court could confer with officials of the company and a committee of the employees. Conductors and motormen alleged that no attention has been paid to their demands for more wages and recognition of the union.

When the strike was voted, the following statement was given out:

Patrons of the Boston & Worcester Street Railway are notified that the motormen, conductors, one-man car operators, bus operators and others employed in the freight and transportation departments are going to suspend work on Nov. 5, at 12:06 a.m.

We regret the necessity of doing this, but for more than a year we have been trying to get the receiver of the property to deal with us. He declines to recognize our union, which has been organized on this property for thirteen years. We have been to the Supreme Court several times to get relief, but the receiver has blocked every attempt we have made to get it done.

We have been acting with him and the officers appointed by him since February, 1925, when he was appointed, and we believe were doing so under our contract. He treats this contract as just a mere scrap of paper. On Aug. 10, after eleven months of effort to accomplish something with the receiver, our meeting voted to suspend work and left the time of such suspension in the hands of the committee and international officers.

For nearly three months we have been endeavoring to arrive at some sort of an agreement with the receiver and have been blocked at every turn. We are giving the patrons of the road ample notice of this suspension.

A statement by the receiver discloses that the union had asked authority to negotiate a new contract through outside parties, not responsible to the court. The receiver in reply asked the union to take its petition to the court in August, with the offer to have his attorney go along. P. J. O'Brien, Springfield, Mass., for the union, urged a postponement until Judge Pierce could act on the petition.

Merchants Want Railways of New York to Operate Buses

The committee on city transit of the Merchants' Association proposed on Nov. 10 that the Board of Estimate should consider the rights of existing transit companies in the granting of new bus franchises and grant such franchises only to existing companies in Manhattan, the Bronx, Brooklyn and Queens for extension of present lines.

The proposal was incorporated in the committee's report of a consideration of the Board of Transportation's recommendation to grant new city-wide bus franchises, and the report opposed this recommendation in that it "disregards the principle of unification and economic utilization of existing means of transportation and fails to consider the property rights of companies now operating." Among other things the report said:

We believe that the existing surface, bus and subway lines should be encouraged to develop bus lines within their territories as auxiliaries and feeders whenever circumstances render such action desirable or practicable. Any other method of handling the question of surface transportation will merely lead to increased cost and further complications which would inevitably postpone a solution of the transit problems of New York City.

Provided equitable terms for any required new bus franchises can be agreed upon with the companies specified, we suggest the following as a basis for combining serviceable existing facilities with new and additional motor bus routes when shown to be necessary:

For Manhattan—The existing motor bus system of the Fifth Avenue Coach Company in combination with the lines of the New York Railways Company now controlled by it.

For the Bronx—The Third Avenue Railway system controlling the Union Railway Company, and other lines extending into Westchester County.

For Brooklyn—The combined trolley lines of the Brooklyn-Manhattan Transit Company and the Brooklyn City Railroad.

For Queens—Co-ordination under unified control of such existing surface lines as are serviceable, with such additional bus lines as may be desirable.

New Chattanooga Cars Praised

Public felicitations are due the Tennessee Electric Power Company for the public spirit recently exhibited in providing Chattanooga with the handsome new cars, as nearly noiseless as they can be made, and which are attractive and comfortable. Public utilities do not always show so marked a consideration for the comfort and the needs of their patrons, and when railways at last come to realize that in order to maintain competition with other modes of transportation they must provide equal accommodation with respect of comfort, ease of traction and promptness in reaching destination, it is for the public to show appreciation. There is every reason to believe that the public will show its appreciation of the company's enterprise by patronizing the cars liberally.—*Chattanooga Times.*

Gerard Swope Talks on Industry Responsibilities

At the annual dinner of the Associated Business Papers, Inc., and national conference of business paper editors held at the Hotel Astor, New York, on the evening of Nov. 10, with 300 in attendance, Gerard Swope, president both of the General Electric Company and the National Electrical Manufacturers' Association, spoke on "The Responsibilities of Modern Industries," dwelling on these as they concern, first, the industry itself; second, the public; third, the employee, and, last, the shareholder. Mr. Swope praised the business papers as interpreters and counselors in the formulation of high industrial standards.

Donald Kirk David, assistant dean Harvard School of Business Administration, spoke on "Aims and Responsibilities of Education in Merchandising," and there was a presentation to W. H. Ukers in recognition of his services in establishing the standards of practice of the Associated Business Papers. M. C. Robbins of the Robbins Publishing Company made the presentation. Malcolm Muir, vice-president of the McGraw-Hill Publishing Company, Inc., was toastmaster.

Court Upholds St. Louis Parking Provision

The St. Louis Court of Appeals has upheld a St. Louis city ordinance which prohibits parking of automobiles in the down-town shopping district. The measure went into effect on Jan. 26, 1926, and applies to the district bounded by Carr, Market, Fourth and Twelfth Streets. The decision is of interest to the local railway and bus companies, since it will enable them to avoid the delays incident to automobile owners trying to park in the downtown streets.

The ordinance was attacked by John E. Corvey, an attorney, who was fined $5 and costs by City Court Judge Rosecan on July 8, last, for parking his automobile on Market Street. Mr. Corvey had sought to set the ordinance aside on the grounds that it bore the date "Jan. 25, 1925," instead of "1926." He also attacked the constitutionality of the law. Concerning the mistake in the date showing the approval of the Mayor, Judge Daues held that the ordinance automatically took effect within twenty days, since Mayor Miller had not vetoed it, even if the error in date could invalidate the approval.

15 per Cent Rate Increase on Elgin Road Deferred

An increase of approximately 15 per cent in suburban passenger rates scheduled to become effective Nov. 12 by the Chicago, Aurora & Elgin Railroad, Aurora, Ill., has been postponed until next May. The petition was filed last June and a favorable decision was handed down by the Illinois Commerce Commission early this week. The proposed rates, made necessary by rapidly mounting labor and operating charges, were approximately equal to those charged by several competing steam railroads.

Steam Versus Electricity

Trained Observer's Inspection a Vivid Argument for Railroad Electrification —Merits of Both Roads Outlined

Pursuant to an order from the editor of the Chicago *Tribune*, James O'Donnell Bennett of the staff of that paper rode from Chicago to Milwaukee by the new electric line of the Chicago, North Shore & Milwaukee Railroad, 85½ miles, and returned by the old steam cars, 85 miles, making copious, prompt and careful notes on cost, speed, cleanliness, comfort and civility as offered by the respective roads. On the whole, the little trip seemed to him about the most vivid argument for electrification of railroads that there is—and for the new spirit that seems to go with electrification.

Both trains on which Mr. Bennett rode were on time, but the contrast in the appointments of the two was "striking," to use a much-maligned word. The porter on the electric train wore spotless white linen; the patient soul on the steam train, who dusted and dusted and dusted, wore hot blue cloth. The washroom facilities on both trains were practically identical, save that the electric equipment was more on a doll house scale. On the steam train the magazine vendor shouted his wares; on the electric train the porter brought you the latest magazines bound in neat black folders.

As the reporter ciphered it out the long and short of it is that the Chicago & North Western steam railway saved him eighteen minutes, which, as he is not an important person, did not matter much to him. It also saved him from eye strain because its roadbed is solid as the rock of ages and its rolling stock like steel safes; hence little jolting of the car and no swaying when he was reading.

The Chicago, North Shore & Milwaukee electric railroad saved him 74 cents, which is half the price of a good meal or of a tolerable reprint of some great book. It also pampered any self-esteem by treating him—in the matter of those fleeting courtesies which are so sweet a solace to a traveler—as if he were an important person. Above all it sent him from its train as he came to it—clean, good natured and rested. From the other line, owing to inevitable smoke and grit from the engine he departed with only one proper destination —and that a bathtub.

In the course of his account of the trip Mr. Bennett set down distinctly the relative merits of the two roads under the heads: Cost, speed, cleanliness, comfort and civility. According to him civility on the electric line was perfect. It was watchful and alert, and it was tireless without being oppressive. Upon leaving Chicago the porter brought each passenger an afternoon newspaper (free), and 35 minutes out he served iced water and peppermints from a tray. All questions were answered with precision and promptness. Deportment of the electric station personnel in both Chicago and Milwaukee was the same. Mr. Bennett never saw better treatment of passengers.

On the steam line civility was good to fair, shading off either to curtness or to slapdash. There was no offense intended or conveyed, but the employees certainly made you know your place as a passenger, "while the electric people treated you like company." Neither personnel knew Mr. Bennett was a reporter. The steam line civility was weakest in the stations—at the ticket windows—where the employees inclined to abruptness, sometimes answering questions scantily or with weary resignation. They displayed no interest in a passenger's bewilderments or anxieties. As Mr. Bennett stated it: "They were there to sell tickets, not to pamper you."

The sole annoyance on the electric was the swaying of the cars under high speed, making reading of small print difficult and legible writing impossible. In this connection Mr. Bennett said:

> In the diner luncheon became an adventure in dish balancing for me and a disaster for the tablecoth. Passing from car to car while train was moving was dangerous, and the conductor anxiously warned passengers not to do it, and gave them a helping hand when they insisted on making the move. Manifestly the roadbed needs heavier ballasting and perhaps heavier rolling stock. Ventilation of cars was admirable and temperature right.

Franchise Discussed at Jacksonville

Management Sets Forth Reasons Why a Thirty-Year Extension is Necessary—Operating Statement Offered as Testimony of Company's Position

PUBLIC hearings are being held at Jacksonville, Fla., on the proposed new 30-year franchise for the Jacksonville Traction Company. The existing grant has four years to run. Several of the city's clubs have indorsed the plan of a new franchise fair to both city and company. The franchise now pending before the Council was introduced in August by Councilman George J. Garcia. If the grant is passed by the Council it must be approved by the voters before it becomes valid.

At one of the recent hearings Mr. Garcia explained how it was that he came to act as sponsor for the new grant. He indicated that as a champion of better railway service he had conferred with John P. Ingle, manager of the company, but that Mr. Ingle had told him the banks would not loan the company money on a short franchise to make the extensions and improvements desired by the company and demanded by the public. Mr. Garcia then said:

> I verified his statement, from a number of bankers. Then I told Mr. Ingle to draw up some kind of a bill and I would introduce it to "start action." What I want is better service and I'm going to do everything in my power to get it. I believe if the city takes over the railway, it can be successfully operated, but if it does not, then let the company try to get a new franchise. Above all, we want better service.

Another recent speaker was Giles Patterson. His most important concern appeared to be about the question of safeguarding the city's interests. In making his recommendations, Mr. Patterson stressed the necessity of access by the city to the company's records and the need for careful examination of the situation before a franchise is granted. He suggested that a new franchise require the company to file with the city all data covering its financial operations.

Mr. Ingle feels that the officers of the company are entitled to ask the city to relieve the railway of the 3 per cent franchise tax and the expense of paving in order that earnings may be more nearly sufficient to attract the additional capital the company must secure from time to time to enable the system to keep pace with the growth of the city and yet at the same time keep the fare at as low a figure as possible for the benefit of the car rider.

Mr. Ingle was quoted as follows:

> I believe that as a matter of public policy the street car should be regarded as the poor man's means of transportation and everything should be done to make the cost of a ride as low as possible. All burdens levied on the company tend to increase the fare, for in the last analysis we all realize that they are reflected in the fare and are paid by the car rider.
>
> But there is another reason, and that is the financial ability of the company to continue to give adequate service with the additional investment of $750,000 we intend to make if a proper franchise is allowed and at the present fare.
>
> Our financial statement for the year ended Aug. 31, 1926, is as follows:

Gross earnings	$1,584,731
Operating expenses	858,058
Balance	726,673
Taxes	122,041
Balance	604,632
Depreciation	175,000
Balance	$429,632

> This balance of $429,632 represents 8 per cent on an investment of $5,360,000 and while this may not be all that the owners of the property are legally entitled to receive it might be regarded under the circumstances as fairly good.
>
> Let us see what will happen to our balance of $429,632 after we replace our 5 per cent bonds with 7 per cent bonds, make the added investment of $730,200 and give the increased service that we contemplate.
>
> First we will run 737,800 more car miles which at 20 cents per car-mile will add to our operating expenses $147,560.
>
> We will lose $30,600 on the operation of the buses,
>
> Depreciation on the added investment at 3½ per cent will be $23,950.
>
> The additional investment will increase our taxes, we must estimate, $10,000. Additional interest on the $1,245,000 bonds when we replace these 5 per cent bonds with 7 per cent will be $24,900. This gives a total increase in expense of $288,120.
>
> We estimate that with the added service our gross earnings will increase 5 per cent, or $79,240, which, deducted from the added expenses of $288,120, leaves a net increase in cost of $208,880.
>
> If this net additional expense is deducted from the present balance of $429,632 we have left only $220,752, which is only 8 per cent on an investment of $2,760,000, and no reasonable person can claim that this is a fair return on a fair value of the property being used in serving the public.

Advertisements Tell Railway Story. —The Duluth Street Railway is running in the newspapers a series of statements for the information of its patrons and public upon matters pertaining to street car service in the city of Duluth, Minn. The advertisements are signed Twin Ports Electric Lines. The first statement was called "Fare—7 Cents to Regular Patrons." The next statement dealt with the cost of the ride.

One-Man Cars on Nineteen Routes in Buffalo

With the extension of one-man car service to the Main Street and Kenmore lines, the two longest and most heavily patronized local lines in Buffalo, N. Y., the International Railway is operating one-man cars on nineteen routes in the city, leaving two-man crews on only four lines. One of these four routes the company is seeking to abandon entirely and on one of the others the company is unable to operate one-man cars because of the refusal of the city to grant permission to construct loops at the end of the route. It is the intention of the railway eventually to operate one-man cars on every local line in Buffalo.

Twice the City Council of Buffalo has made unsuccessful appeals to the Public Service Commission to prohibit one-man car operation. A renewed request was made in a general bill of complaint filed by the city against the company to the state utilities board two months ago.

Alton Deal Approved

The Illinois Commerce Commission on Nov. 5 issued a certificate of convenience and necessity to the St. Louis & Alton Railroad, which will operate the old Alton, Granite & St. Louis Traction Company's interurban line between St. Louis, Mo., and Alton, Ill. The Illinois commission also approved the purchase by the new company of the traction company's property from Louis Clements, special master, and E. M. Gregory, receiver for the Alton, Granite & St. Louis Traction Company, for $999,000.

Changes in Seattle Service

Operations of the Seattle Municipal Street Railway in Seattle, Wash., will be curtailed in one direction and expanded in another within a short time. The buses on Tenth Avenue Northeast, heretofore operated by private parties, began operation Nov. 1 under municipal ownership. Ten buses will travel the entire length of the avenue. Discontinuance of shuttle service on several lines is also announced, including the Youngstown and Ray Street shuttle lines, as well as curtailment of service on the Lake Burien, Mercer Street and Boston Street shuttles. It is estimated that these curtailments in service will reduce operating expenses approximately $100,000 a year.

Rapid Transit Proposal Advanced at St. Louis

Another step toward the rapid transit system proposed for St. Louis, Mo., was taken by the rapid transit committee of the Aldermen when it ordered Associate City Counselor Farris to prepare the drafts of legislative measures needed to pave the way for the system.

These bills will provide for the legal status of a proposed rapid transit commission, the extension of rapid transit bonds for fifty years and for the placing of special assessments against property benefited by the proposed system.

C. E. Smith, consulting engineer for the city, has estimated that it will take about fourteen years to complete the rapid transit program outlined in the recent report. About two years will be needed to pass the necessary legislation. The next two years would be devoted to building the down-town subways, and another fixe years for the second phase of construction, the extension of the tubes to Grand Boulevard. Finally five years would be devoted to the last stage of construction, the extension of the system to the city limits. Should St. Louis in the meantime decide to extend its city limits to the Franklin, Jefferson and St. Charles Counties lines it would take considerably longer to complete a rapid transit system to provide for the needs of the added territory.

The aldermanic committee has not decided whether to provide for a subway or elevated system.

Ten-Cent Fare Sought in Kingston

The Kingston Consolidated Railroad has applied to the Public Service Commission for authority to charge a 10-cent cash fare, three tickets for 25 cents, and transfer privileges with the Kingston City Transportation Corporation, operating buses in Kingston, N. Y. The present fare is 8 cents.

In its petition the company says the total revenue in 1924 was $200,610 and total expenses $178,782, leaving $21,828 available for return upon its property used in giving transportation service in Kingston, or 3.4 per cent. Total operating revenues from Nov. 1, 1925, to Oct. 1, 1926, were $123,237 and the expenses of operation $93,622. Taxes paid were $10,443. The amount available for return upon its property and contingent expenses was $19,533.

Total operating revenues on the bus line from March 10 to Sept. 30, 1926, were $31,888 and total operating expenses $25,484. Taxes paid were $240, leaving $6,163 available for return and contingencies.

The Mule Car Has a Day in Nashville

The Nashville Railway & Light Company put on a big parade on Oct. 29 in Nashville, Tenn., demonstrating the 60 years of progress from the mule car to the railway parlor coach. Public inspection of the first mule car, first electric car and ten new cars parked on Eighth Avenue North between Broadway and Church lasted from 2:30 p.m. until 5 p.m. The parade, which boasted of a gold sword presented to Gen. Andrew Jackson, was led by the "President Andrew Jackson," a model of the ten new cars, costing $150,000. Distinguished Tennesseeans live again in the coach names, namely, Andrew Jackson, James Robertson, founder of Nashville; John Sevier, first Governor of Tennessee; President James K. Polk, and others. Each new car seats 44. They are finished in red, olive and white, have automobile-type brakes, wide, convenient doors and steps, leather seats. Gone for 37 years, the old mule car returned for a day and the occasion was a festive one.

Relief for St. Paul Property Denied

The amendment to the charter of St. Paul, Minn., which would have enabled the City Council to relieve the St. Paul City Railway in whole or in part of certain charter and franchise requirements relating to street paving and maintenance was lost at the election on Nov. 2. Although the vote was about 60 per cent for the amendment, the law requires a 60 per cent majority of the votes cast at the election. A neglect to vote at all was against passage of the amendment. The proposed amendment in its purport did not relieve the company, but it enabled the Council to act in these matters in such measure as might be deemed best for the interests of the city. The relief would have totaled $117,000 a year.

Thus the Council may not act even though the present fare rate of 8 cents and six tokens for 40 cents was fixed by the Minnesota Railroad and Warehouse Commission on the theory and a strong suggestion that relief along the lines indicated would be given the company. Rate of fare is dependent upon cost of service, and it had been urged on voters that street paving and maintenance under the city charter and the franchise are part of the cost of service.

International Railway Against Higher Fare Opponents

The International Railway, Buffalo, N. Y., has brought an equity action in the United States District Court against members of the State Public Service Commission, the board itself, the cities of Buffalo, Niagara Falls, Lockport, Tonawanda and North Tonawanda and the villages of Lancaster and LaSalle. The action asks for temporary and permanent injunctions restraining the defendants from interfering with the collection of new fare charges set forth in the tariff filed by the company with the commission in September.

In its complaint the International Railway charges that the state is compelling the plaintiff to operate its lines at a rate of fare alleged to be confiscatory. The company asks United States District Judge John R. Hazel to designate two other judges to hear and determine with him the plaintiff's application for an interlocutory injunction and to hear evidence in the final determination of the equity suit. The company says its valuation should be fixed at $100,000,000 instead of the $22,000,000 fixed by the New York State Public Service Commission several years ago in a former rate proceeding similar to the present one.

The institution of the equity suit by the International Railway is the result of the refusal by the state commission to issue an order allowing the traction company to put into effect the tariff of increased fare charges which it filed on Sept. 16. The company seeks to increase its local fares in the city of Buffalo from 8 cents or two tokens for 15 cents to a 10-cent fare. Half fares in Buffalo would be increased from 3 to 5 cents. In the city of Niagara Falls it would increase local fares from 5 cents to 8 cents or two

Digitized by Google

tokens for 15 cents. It is proposed to charge half fare of 5 cents to children between the ages of five and twelve years. Local fares in Lockport, now 6 cents, would be increased to 8 cents or two tokens for 15 cents. LaSalle local fares, now 5 cents, would be jumped to 8 cents or two tokens for 15 cents. Interurban fares on the Buffalo-Niagara Falls and Buffalo, Lockport and Olcott divisions would be increased from the present charge of 2½ cents a mile to 3 cents a mile.

"L" Lease Argument Enrolls Services of Edward A. Roberts

Edward A. Roberts, transit expert and consulting engineer, of New York, has been engaged by the United Business Men's Association in connection with the discussion of the Frankford "L" lease, now under consideration by the Public Service Commission. Mr. Roberts attended the first hearing. He is preparing a list of questions concerning the earnings of the Philadelphia Rapid Transit Company. Harold M. Evans, representing the City Club, the Northeast Philadelphia Chamber of Commerce and the Civic Club, charged on Nov. 5 that complete facts with regard to the lease of the Frankford "L" to the Philadelphia Rapid Transit Company had not been brought out before the commission.

Chicago Surface Lines Loses to City in Paving Decision

A decision was handed down by the Illinois Supreme Court in Chicago recently declaring that the Chicago Surface Lines must pay for repaving when the city has torn up the street between its rails for installation or repair of sewers and water mains. This gives the city a potent weapon, it is believed, in its present negotiations with the Surface Lines for a new franchise. The decision ends a fight which has been in the courts for ten years and upholds a decision of the Appellate Court, which had reversed a Circuit Court ruling against the city.

Franchise Extension Defeated in Barberton

The franchise granted the Northern Ohio Power & Light Company by the city of Barberton last August was rejected by the voters at a referendum election on Nov. 2 by the narrow margin of 220 votes.

A study of the result shows that sections of the city where working people reside approved the franchise, while the so-called better residential sections voted against it. The company took the position that the issue was a civic one and that it was as much to the city's interest to approve the ordinance as it was to the company's.

Since the rejection of the franchise, the Council has offered to repass the ordinance under the pledge that no referendum will be called. The company has not decided to accept the proposal, feeling that it went too far in the defeated ordinance in agreeing to pay for paving between the rails.

The ordinance which was defeated provided for an increase in fare between Barberton and Akron from 10 cents to 12½ cents and for an increase in the city of Barberton from 5 cents to seventeen tickets for $1, four tickets for 25 cents, or a 7-cent cash fare.

The ordinance, a ten-year grant, provided for practically double-tracking the entire Barberton line at a cost of about $150,000. It granted the city the right at each four-year period to examine the company's books to determine the rate of fare for the following four-year period. Control of service reposed with the city.

In Appreciation of Roanoke's Electric Railway

In commenting on the general principle of the skip-stop system on electric railways, the Roanoke *Times* of Oct. 22 takes occasion to generalize on the system in that city. The comment runs as follows:

Railway service here is all that the public has a right to expect—indeed, it is far better than Roanoke deserves, everything taken into consideration. The railway has had anything but the best of it in its dealings with the city fathers. Nevertheless, it has gone right ahead making improvements to the service, making additions to the equipment, giving the city the very best available at all times. The railway has done its part toward solving the traffic problem in Roanoke. It cannot be accused of having laid down on the job ever.

The system in Roanoke is operated by the Roanoke Railway & Electric Company.

"Seeing Greater Chicago," a New Surface Lines Guide

A valuable sightseeing and route-guide by which residents and visitors to the big city can see Greater Chicago has been published by the Chicago Surface Lines. This is a 48-page illustrated pamphlet, including a map showing the system of the Surface Lines, the principal points of interest and direct lines of transportation. All directions given in the "Seeing Greater Chicago" presume starting from the "Loop." For additional information sightseers are asked to call the Chicago Surface Lines, at Dearborn 8800.

Piedmont & Northern Extension Plan Revived

Action was taken at a meeting of the directors of the Piedmont & Northern Railway, held in Greenville, S. C., on Nov. 3 looking to the completion of the system from Charlotte to Durham. This action was in the form of a resolution asking the stockholders to approve the expenditure necessary for the new trackage.

Two links of the line have been built, between Charlotte and Gastonia in North Carolina and between Spartanburg and Greenwood in South Carolina. The plan of the late James B. Duke, builder of the line, was thwarted by the World War, which halted all construction plans of this kind. Some months before Mr. Duke died, two years ago, discussion of the extension of the road was renewed and it was understood that plans for construction were being made. These plans were again halted by the death of the promotor.

The road is standard gage and is electrically operated. The operating company is affiliated with the Duke Power Company. The distance from Durham to Greenwood is 300 miles.

The stockholders will meet in Greenville on Dec. 8.

Hearing on St. Louis Fares Nov. 16

The Missouri Public Service Commission at Jefferson City, Mo., on Nov. 16 will hold a public hearing on the application of Receiver Rolla Wells of the United Railways, St. Louis, for an increase in fares from 7 cents to 8 cents or two tokens for 15 cents.

The original application was filed last June, but a few weeks ago Receiver Wells filed a request for an immediate increase in fares pending a final decision.

The city has opposed the increase unless a complete audit of the company's books reveals that more revenue is actually needed. The city officials also favor segregation of the revenues of the city and county lines, contending that city riders should not be compelled to carry the load for county riders who are transported at a loss.

Interstate Trainmen Receive Wage Boost

A voluntary increase of 2 cents an hour was made in the wages of the trainmen of the Interstate Public Service Company, Indianapolis, Ind., effective on Oct. 1. The new scale, in cents per hour, is as follows:

For first-year men, 41; second-year men 42; third-year men, 43; fourth-year men, 44; fifth-year men, 45, and for men employed longer than five years, 46.

Railway at Dover, N. J., Protests Against Bus

The Morris County Traction Company, Dover, N. J., is opposed to having Arthur J. Seldney operate a bus between Morristown and Wilsonville, N. J. Appearing before the Public Utilities Commission recently, C. W. Fields, superintendent of the railway, declared that the bus had caused a decrease of at least 16 per cent in the number of passengers carried on its line between Morristown and the State Hospital at Morris Plains. The Lackawanna Railroad, which had entered an appearance in the case, advised the commission it would not oppose. The commission reserved decision.

Fare Hearings Resumed.—Hearings on the petition of the United Traction Company, Albany, N. Y., for an increase in fare scheduled before the Public Service Commission on Nov. 15 has been postponed to Nov. 30. Testimony on the application will be taken on the basis of segregated revenues and expenses in accordance with the ruling of the commission that the company must show its profits and losses by cities lines.

Recent Bus Developments

Amended Petition in New York Case

An amended petition for a bus franchise in New York City has been submitted to the franchise bureau of the Board of Estimate by the Service Bus Corporation. The supplemental petition is designed to meet additional requirements laid down by John H. Delaney, chairman of the Board of Transportation, who has favored granting franchises for bus operation in Manhattan, the Bronx, Brooklyn and Queens to the Equitable Coach Company.

The new offer is in the form of a letter to the board signed by Ernest M. Howe, mananging director of the Service corporation. It petitions for a ten-year franchise, with a ten-year renewal privilege rather than a 25-year franchise, as in the original petition, and would give 3 rather than 2 per cent of the bus line's earnings to the city. Original offers to operate on a straight 5-cent fare basis with free transfers within a borough and half rate to school children stand.

The Service Bus Corporation also indicates that it will accept a franchise for the Borough of Manhattan only or a permit for any other boroughs except Staten Island added as the board may desire.

Bus Service to Argentine District at Kansas City Discontinued

The Kansas City Public Service Company, Kansas City, Mo., on Oct. 26 applied to the Kansas Public Service Commission for permission to discontinue its bus service to the Argentine district of Kansas City, Kan. The bus service was originally installed to replace railway service during the period in which the Twelfth Street Viaduct was closed to cars. The recent restoration of railway service to the Argentine district made the continuance of the bus service unnecessary.

Shore Line Coach Company Seeks to Abandon Eight Miles

Permission to discontinue its service between Schererville and Crown Point, Ind., a distance of 8 miles along its Hammond to Crown Point route, was asked in a petition filed on Nov. 3 with the Public Service Commission of Indiana by the Shore Line Motor Coach Company, a subsidiary of the Gary Railways and Chicago, South Shore & South Bend Railroad. The service from Hammond to Crown Point has been operated for the past five years and for more than two years the route has been operated at a substantial loss. The certificate was acquired by the Gary Railways in September, 1924, and later transferred to the Shore Line Motor Coach Company.

Charles W. Chase, president of the company, in referring to the poor earning situation, said that on May 1 of this year, feeling that the service rendered might not have been of a type to induce travel over the route, the street car type of motor coach was taken off and 24-passenger International parlor coaches were put on this run. This change, however, failed to stimulate riding, so that about a month ago the service was reduced from five to three round trips a day. This also failed to improve the earning situation, he explained. The deficit for the last two months was more than $2,000 a month.

Ordinance Would Regulate Bus Operation

Charging that the city and intercity buses now operating in and out of Manitowoc, Wis., are partly responsible for increased traffic congestion in the downtown section, an ordinance is to be presented to the Common Council for passage under which all buses using the city streets would be regulated as street cars. Under the proposed ordinance buses would hereafter load and unload passengers in the downtown section within the street car zone instead of at the sidewalk. Objection is also directed against intercity buses parking at the sidewalk because of the lack of station facilities. Consequently, recommendation has been made to compel these companies to establish their own bus stations.

Pennsylvania Case to I.C.C.

Electric Railway Contends Bus Service Conducted at Loss by Steam Line Is Inimical to Provisions of Commerce Act—Novel Points Raised Against Railroad Seeking to Compete in Electric Railway Territory

IN ITS appeal to the Interstate Commerce Commission against the Reading Company, to which reference was made in the ELECTRIC RAILWAY JOURNAL for Nov. 6, the Schuylkill Railway asks that the commission command the Reading Company, a steam carrier, to refrain from engaging directly or indirectly in the business of owning, leasing or operating buses in Schuylkill County, unless and until the terms and conditions of engaging in such service shall be approved by the commission's certificate of public convenience and necessity. It also asks the commission to make such further order or orders as that body may consider proper.

This is another move in the proceeding by the Schuylkill Railway, an electric line, to prevent the steam carrier from operating buses in territory now served by the electric railway by both bus and trolley. The electric railway and its bus operating subsidiary, the Schuylkill Transportation Company, charge:

1. That the practice of the defendant in operating local trains (specifically mentioned) at a loss is a practice directly in violation of the interstate commerce act of 1887 and its amendments and supplements, in this: that the said practice causes undue, unreasonable and unjust discrimination against interstate commerce by carrying on intrastate passenger transportation between the points hereinbefore mentioned at rates or fares on a substantially lower level than the rates or fares fixed and collected in interstate passenger traffic passing through the same points on the same rails. The losses incurred in and by the operation of the local trains aforesaid must be and in fact are met from the common fund produced by the defendant's interstate and intrastate business. The carrying of freight is the only service conducted at a profit by the defendant. The greater part of the freight traffic of the defendant consists in the transportation of anthracite and soft coals and most of the earnings from that source come from interstate business. The complainants therefore charge that the defendant is paying its intrastate traffic losses incurred in the operation of the trains aforesaid with and out of freight earnings principally derived from interstate traffic to the undue and unreasonable advantage and preference of intrastate commerce and to the prejudice of interstate commerce.

2. That the said unlawful practice and undue, unreasonable and unjust discrimination against interstate commerce may be removed by increasing the rates of fare on the said trains operated at a loss as aforesaid, or abandoning the trains.

3. That the proposed bus service if permitted would be only a continuation of the said unlawful practice in another form.

4. That the commission has power under the interstate commerce act of 1887, section 13, as amended by the transportation act of Feb. 28, 1920, section 416 (U. S. Statutes at Large 66 Congress, Sec. Session 1919-20, page 484), to cause the said unlawful practice as now carried on by the defendant to be removed as aforesaid, and to require that the defendant shall not undertake the proposed bus service without the commission's express approval of the terms and conditions of its financing and operation.

Wherefore, the complainants pray that the defendant may be required to answer the charges herein, and in particular to show in detail the earnings and entire cost of operation of all the trains hereinbefore mentioned, and that after due hearing and investigation an order be made commanding the defendant:

1. To remove the said unlawful practice.
2. To cease and desist from the aforesaid violations of the interstate commerce act.
3. To establish and put in force and apply in the future to the transportation of passengers between the points aforesaid in lieu of the fares hereinbefore named, such other fares as the commission may deem reasonable and just, but in no event less than the cost of operating the trains aforesaid or otherwise.
4. To cease to operate the said trains.

According to the complaint the steam railroad is substantially parallel with the electric railway between numerous points in Schuylkill County and between those points the two lines are competitive as regards strictly local and intrastate passenger business. There are no traffic agreements or understandings between the complainant and the defendant. The competition between them is unrestricted. The complainant, however, carries nothing but local passengers, while the defendant carries not only a great passenger traffic, which is mostly through traffic and interstate traffic, but also its immense anthracite coal freight traffic. Schuylkill County is the center of the anthracite mining industry served by the defendant and the larger part of the said coal carriage is interstate traffic. In comparison with the total amount of through and interstate passenger and freight traffic of the defend-

Digitized by Google

ant on and over the said competitive portion of its line in Schuylkill County, the amount of the defendant's local passenger traffic on that portion of its line is extremely small.

The electric railway charges the steam carrier with asserting, in proceeding before the Pennsylvania commission, its hope and expectation to overcome possible bus operating loss by increasing the number of bus passengers carried beyond the number now carried on its trains. The complainants seek to show that the defendant's hoped for and expected gain cannot be realized because there is no substantial amount of passenger traffic to be gained by the defendant for its buses except by diverting traffic from the competing lines of the Schuylkill Railway and other electric railway and bus companies now long and well established in the fields. It is charged that instead of the advantages now offered to the public by train service the defendant will by the proposed bus operation offer the public no transportation which is not already afforded by the complainants and other electric railway and bus companies. The electric railway avers that the proposed bus investment and operation by the steam carrier can only result in greater losses than the defendant now admits that it suffers in train operation and will suffer in bus operation.

Another Indiana Service

A coach line between Michigan City and South Bend, Ind., was established Oct. 23 by the Shore Line Motor Coach Company, a subsidiary of the Chicago, South Shore & South Bend Railroad, under an order of convenience and necessity recently granted by the Indiana Public Utilities Commission. The route is approximately 35 miles in length and parallels for most of the distance the tracks of the Chicago, South Shore & South Bend Railroad. The fare on the coach route will be the same as that charged on the electric trains. One morning and one afternoon coach in each direction between the two Indiana cities constitutes the initial schedule of the coach route. The Shore Line company operates 25 other routes in northern Indiana, southern Michigan and in Illinois.

Buses of Minneapolis Railway May Operate Over Parkways

A long-contested point has been settled by the park board regarding use of the parkways by the buses of the Minneapolis Street Railway, Minneapolis, Minn. The board by a vote of ten to four passed a regulation by which buses may operate over parkways upon payment of a license fee based on weight of vehicle, length of route and number of trips scheduled. The tax fee is put at 20 cents operation unit of "transportation of one ton over 100 miles of park highway." The application must be approved by ten members of the board and the fee paid upon receipt of permit. Applications must be filed with the board as well as the Minnesota Railroad and Warehouse Commission. Other lines utilizing parkways as a route between Minneapolis and St. Paul will be brought under the regulation, which was passed Nov. 4. They do not pick up passengers on the parkway.

Connecting Bus Line in Minneapolis Aids Transportation

The first trial of a connecting bus line instead of construction of a crosstown trolley line has been successful in Minneapolis, Minn., according to the findings of the Minneapolis Street Railway. The line has been installed on a newly paved crosstown street at Thirty-eighth. It connects the Bryant Avenue line on the west with the Minnehaha line on the east. The regular railway fare of 8 cents or a token sold at the rate of six for 40 cents is charged. Transfers are accepted and given to the electric lines crossed. This is eight blocks south toward the city limits from the Lake Street trolley crosstown line. The running time of the Thirty-eighth Street line is fifteen minutes. Eight to ten minutes headway is given in the day time and fifteen minutes after 8 p.m.

A second bus line has been installed on Lowry Avenue on the north side, which is equally important and is well patronized.

Railway Takes Over Neenah Line

The A. C. Homan Bus Line of Menasha, which has been supplying bus service in the vicinity of Neenah, Menasha and Appleton, Wis., in competition with the interurbans and buses of the Wisconsin Traction, Light, Heat & Power Company for the last five years, has been purchased by the traction company. The price involved in the transaction was not disclosed. The service provided by the Homan lines will be continued without interruption. The last obstacle to the sale of the line was the lack of assurance from the city of Neenah that other bus competition would not be permitted. That barrier was finally hurdled when the city agreed in the future to frown upon any attempt by a competing company to enter this field. On its part the company promised that no increase in fares would be asked and that the present standard of service would be maintained.

In outlining other bus activities of the company, A. K. Ellis vice-president of the traction company, stated that his company intended to start a bus line between Milwaukee and Green Bay and another between Fond du Lac and Madison.

The Purple Swan Versus the Blue Goose

A bus controversy between St. Louis, Mo., and Belleville, Ill., started on Nov. 2 when the Purple Swan bus line opened service from St. Louis to the Belleville, Ill., court house square via the St. Louis Municipal Bridge for a 30-cent fare. Promptly the Blue Goose line, owned and operated by the East St. Louis & Suburban Railway, East St. Louis, Ill., met the price cut and rearranged its schedules to meet the Purple Swan competition. The Blue Goose line had been charging 45 cents.

The Blue Goose line was started by the same management that now controls the Purple Swan company. It formerly charged 35 cents for the trip. The East St. Louis & Suburban Railway charges 39 cents by electric railway for the trip from St. Louis, Mo., to the Belleville square. The Blue Goose line operates on a certificate of convenience and necessity issued by the Illinois Commerce Commission. It does both an intrastate and interstate business. The Purple Swan line handles only interstate passengers and has no Illinois bus permit.

Further Bus Inroads Likely in Westfield

The Springfield Street Railway, Springfield, Mass., which a few months ago substituted buses on all lines in Westfield except a crosstown line, is now considering the use of buses to replace this trolley crostown service. Roy Chambers, manager of the Westfield lines, has already aproached the City Council concerning this proposed change. At the conference it was brought out that the line had operated at a loss. The railway in presenting its tentative plants for the new bus lines proposes to ask for a trial license through the winter months with the understanding that should buses prove inadequate trolley service would be continued. Two trolley cars are operated on the line.

The question will be taken up at the next meeting of the City Council. Opposition is likely to develop before the matter is settled, since other licenses to operate buses instead of trolley cars were granted by the City Council only with the understanding that this one crosstown line would continue to serve the city.

Would Substitute Buses.—The Westchester Street Transportation Company, Inc., subsidiary of the Third Avenue Railway, has applied to the Public Service Commission for authority to substitute buses in place of trolley cars on tracks in White Plains, N. Y., starting from the New York Central station and running through Main and Grove Streets to the Post Road and south on the Post Road to the White Plains-Scarsdale line. The company has a five-year grant in White Plains.

Adequate Bus Service to Be Substituted.—The City Council recently approved the Northern Ohio Power & Light Company's proposal to abandon operation of cars on the North Howard Street line between Federal Street and the intersection of Cuyahoga Falls Avenue and Main Street, Akron. Adequate bus service will be furnished to supplant the cars, the application stated. The company was also granted permission to remove street car tracks in North Howard Street, between the Little Cuyahoga River bridge and York Street. The installation of permanent bus lines will extend to all the points affected except between Glenwood Avenue and Olive Street. A tentative agreement is being considered by the city and the company officials to abandon the Grant and Bowery Street car lines. The distance included in all changes is about 2½ miles.

Financial and Corporate

Hemphill & Wells to Manage Poughkeepsie Property

Hemphill & Wells, New York, have assumed the management of the Poughkeepsie & Wappingers Falls Railway, Poughkeepsie, N. Y., following the withdrawal of the J. G. White Company as operating managers. Directors who have retired are Joseph K. Choate, vice-president of the White Corporation; J. I. Mange, president of the Associated Gas & Electric Corporation, which at one time held an option on the road, and Frank B. Lown. Their successors are Albert W. Hemphill, B. A. Tompkins, vice-president of the Bankers' Trust Company, New York City, and William Schickle, cashier of the Fallkill National Bank.

Mr. Hemphill has indicated that he and his partner, Gardner F. Wells, with other members of their staff, would be in Poughkeepsie for some time to study local conditions and transportation requirements, before deciding upon any changes in policy. He also indicated that George Wells, a brother of Gardener F. Wells, would be appointed resident manager of the road.

Hemphill & Wells own and operate the Interstate Street Railway, Attleboro, Mass., which provides Attleboro, North Attleboro and Plainfield with railway service and runs buses through Pawtucket to Providence. They have had a great deal of experience with combined trolley and bus service, and it is said that it was largely on the basis of their experience along these lines that they were retained in connection with the Poughkeepsie property.

The change in management just made marked the retirement of George W. Comfort, who has had charge of the road for the White Corporation since the resignation of Charles A. Brooks. Mr. Comfort will be assigned to one of the White properties elsewhere.

Sale of Interurban Advertised for Dec. 1

Property of the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad, which recently suspended operation, will be sold at public auction at the courthouses in Hamilton County, Ohio, and Dearborn County, Indiana, on Dec. 1. The sale will be conducted under the supervision of William A. Stark, special master commissioner appointed by the Common Pleas Court of Hamilton and Dearborn Counties. In view of the fact that the property to be sold as a whole is situated in two states, prospective purchasers are privileged to bid at both sales.

The property includes all real estate owned by the company in addition to carhouses, depots, shops and rights-of-way, also all tangible assets. In this category are listed rails, buses, wires, poles, machinery, tools, equipment and all franchises. Terms of the sale are cash on the day of the sale, except that bonds of the interurban may be used as part payment in lieu of cash as provided in the orders of the courts.

The railway extends from Anderson's Ferry in Cincinnati to Aurora, Ind., a distance of 57 miles. Part of the line is doubled tracked.

Additional Compensation for Kansas City Receivers

Fred W. Fleming and Francis M. Wilson, who recently relinquished their posts as receivers for the old Kansas City Railways, Kansas City, Mo., when that property was turned over to the Kansas City Public Service Company last month, each received additional salary allowances on Oct. 29 of $3,875. At the same time James E. Goodrich, attorney for the receivers, received $3,145. The special allowances were approved recently by the court for salary accruing between Sept. 1, the date originally set by the court as the end of the receivership, and the actual date of transfer of the properties. They were listed in Mr. Harding's report of expenditures filed in the federal court on Oct. 29.

$1,000,000 of Bonds Offered to Milwaukee Customers

The securities department serving the Milwaukee Electric Railway & Light Company and affiliated Wisconsin utilities has been authorized to sell direct to home investors $1,000,000 of the company's refunding and first mortgage 5 per cent gold bonds, series B, dated June 1, 1921, due June 1, 1961. These bonds are a portion of an issue of $9,800,000 authorized by the Railroad Commission of Wisconsin to refund an equal amount of 6 per cent bonds of the company called for payment on Sept. 1, 1926.

The bonds are offered in $500 and $1,000 sizes, at 98 per cent of par; the $500 bond sells for $490, the $1,000 bond for $980, plus accrued interest. Home investors can pay all cash or 10 per cent down and 10 per cent monthly for nine months. Buyers on the payment plan are allowed 5 per cent interest on their monthly payments, credited on the final payment. If unable to complete payments, they get back what they have paid in, but without interest.

The company reserves the right to call the bonds for payment on any interest date, giving four weeks notice by publication, at 104½ per cent of par, 6½ per cent above the price at which the bonds are now being sold.

The company directs attention to the fact that during its 30 years in business it has paid every obligation, principal and interest, on the due date in full and in cash. It has paid preferred share dividends in full and in cash every three months for the last 26 years. It has paid common share dividends in cash, at a yearly average rate of 8 per cent, every year for the last 24 years.

Another Hearing on Kite Route Affairs

At the hearing between officers of the Denver & Interurban Railway, Denver, Col., William H. Edmunds, receiver; John H. Gabriel, special master, and attorneys for the Guaranty Trust Company, New York, attorneys for the cities through which cars run, it was brought out that the Denver & Interurban Motorbus Company was organized in self-defense. The bus company and the railway are competitive, do not share profits, but are owned by the same interests. Judge J. Foster Symes will go over the evidence presented on Nov. 5, and then set a date for hearing. The Colorado & Southern Railroad, owner of the Kite and the bus company, desires to discard the railway, but the citizens oppose this plan.

Merger Talk Revived in Washington

The perennial question of a merger in Washington, D. C., of the Capital Traction Company and the Washington Railway & Electric Company is now being discussed. While Commissioner J. Franklin Bell, chairman of the Public Utility Commission, announces that preparation of proposed legislation to force the railways to enter into a voluntary merger will be started shortly, William F. Ham, president of the Washington Railway & Electric Company, at a recent informal public hearing, said that any plan for a merger of the Washington traction companies which failed to guarantee the full valuation of physical property and a fair return on the capital investment would be opposed by his company.

Later John Foster Dulles, of counsel for the North American Company, is said to have assured commission officials that his company would undertake immediately negotiations with the Capital Traction and the Washington Railway & Electric Company to bring about a merger of operation, sanguine that some step toward its accomplishment would be taken before Congress reconvenes next month.

Just prior to Mr. Dulles' appearance at the office of Commissioner Bell the commission made public a letter it received from Frank L. Dame, president of the North American Company, showing the corporation's present holdings in the utility corporations of the district. The communication was in reply to information asked by the commission when it started an investigation of the company's interests in the local corporations.

Mr. Dame revealed that the company and its agents now hold 48,500 shares of common and 6,300 shares of preferred stock of the Washington Railway & Electric Company, 3,012 shares of the Capital Traction Company and 21,207 shares of the Washington Rapid Transit Company. Compared with its holdings last January, the present ownership represents an increase of

Digitized by Google

3,300 shares of the Washington Railway & Electric Company's preferred stock, an increase of 81 shares of the bus company's stock and a loss of 990 shares of the Capital Traction Company's stock.

Utilities officials point out that the North American Company has full control of the Washington Rapid Transit Company, but it owns only about 36 per cent of the voting shares of the Washington Railway & Electric Company, and therefore cannot alone control its management. Its ownership in the Capital Traction Company is about 40 per cent of the total stock issued.

Authority for Worcester Refunding Not Conferred

Directors of the Springfield Street Railway and the Worcester Consolidated Street Railway, Springfield and Worcester, Mass., have re-elected their officers. Financial matters of importance were taken up at the business meeting. Bonds of the Springfield company, with the single exception of a $330,000 issue, which will be refunded in January, are all taken care of up to 1940. Stockholders of the Worcester Consolidated deferred action on its refinancing plans to take care of a large amount of bonds due soon but authorized the directors at their discretion to discontinue any unprofitable lines and to sell the trackage and equipment of abandoned lines.

Liquidation of Painesville Road Proceeding

Further facts are available about the discontinuance and liquidation of the Cleveland, Painesville & Eastern Railroad, Willoughby, Ohio. The Cleveland Electric Illuminating Company paid the Cleveland, Painesville & Eastern $1,400,000 for its light and power business, which included all wires and poles used for electric distribution. Out of this $1,400,000 the Cleveland, Painesville & Eastern paid off its $500,000 of first mortgage bonds and used the balance—$900,000—to pay off a part of its $1,131,000 consolidated 6 per cent bonds. The rest of these bonds are now being paid off out of money received by the Cleveland, Painesville & Eastern in the distribution of its railway property. To date, 95 per cent of the bonds have been paid off and the balance will be paid in the near future.

The common stock holders will receive nothing in the final adjudication of the company's business, but the preferred stock holders will receive approximately 45 per cent of their holdings. In fact, payments to them may go as high as 50 per cent, but will not reach the 60 per cent figure originally anticipated.

Vice-President Douglas, in disposing of the property of the Cleveland, Painesville & Eastern after the sale of the light and power business, has been selling the rest of the property piecemeal to various interests instead of selling all of the balance to a junk dealer. Practically only the rails and overhead have gone to the junk dealers. Cars and machinery, all still usable, have been sold at good prices.

In addition the company still owns a large amount of valuable realty in Painesville, Nottingham and Willoughby, and controls Willough Beach Park, which it is holding at a price of $500,000.

Purchase of Line by City Proposed

Purchase by the city of Seattle, Wash., from the Pacific Northwest Traction Company of the Greenwood car line on North and West Eighty-fifth Street, along the northern city limits, for $1,001 is proposed in an ordinance recently introduced in the City Council. The consideration includes $1 for the line and $1,000 for the paving between the tracks, which is being done jointly by the city and county on Eighty-fifth Street. The city has been operating a shuttle car over the line for years. The traction company would be permitted to haul freight over the line until Dec. 31, 1934.

Rhode Island Merger Offer Modified

The Rhode Island Public Service Company, Providence, R. I., has made an alternative offer to the stockholders of the United Electric Railways whereby two shares of the Service Company's preferred stock will be exchanged for one share of the railway stock. In addition, those who dispose of their stock under the offer will receive $1 per share in cash if 80 per cent of the stock outstanding is deposited on or before Nov. 15.

The new offer was obtained by the directors of the United Electric Railways and all of the directors who own stock have decided to deposit their shares. A statement says:

> Your board has carefully considered the plan and agreement and the additional arrangements above stated. They contain the best proposition for stockholders of your company which your board has received. Such of your directors as own stock of your company have decided to deposit their shares under the plan and agreement.

The original offer for the traction company stock, made by the service company under its plan for merging the United Electric and the Narragansett Company, provided for the exchange of one share of class A of the Service Company for one share of the U.E.R. stock. The new offer is optional with the depositor. He may receive either two shares of the preferred or one share of the class A, as he elects.

Ohio Interurban Suspends Service

Operation of interurban cars between Dayton and Piqua, Ohio, by the Dayton, Covington & Piqua Traction Company ceased on Nov. 6. Discontinuance of the service leaves a half dozen towns in the central part of Ohio without interurban service. Officials of the interurban said that the line, which had been a losing proposition for the past three years, would be junked. It is expected that the State Public Utilities Commission, acting at the request of residents of several towns affected by the discontinuance of the service, will award a bus certificate to one of several individuals who have expressed their intention of seeking operating rights.

Indiana Commission Seeks More Money for Experts

Recommendations for salary increases in the staff of the Indiana Public Service Commission in order to retain expert engineers and accountants are contained in a budget for the next two years filed by Howell Ellis, secretary of the commission. The engineers aid the commission in arriving at valuations for public utilities when new rates are in question. Mr. Ellis pointed out that with the loss to the department in the last few months of two expert engineers and three accountants, all trained in the work, the commission feels it should have sufficient money and authority to increase the salaries of such experts in order to prevent their leaving the commission for more remunerative positions. He explained that the recent annual report of the commission showed that body actually to be making money for the state by collecting more than enough in fees to pay the expense of the department for the year.

Traffic on the Increase.—For the nine months period ended Sept. 30, 1926, the United Railways & Electric Company, Baltimore, Md., carried 166,838,335, against 166,179,587 for a similar period of 1925. For the first six months these figures were 113,715,254 and 112,761,063 respectively.

Railway Service Suspends. — The street railway system in McKinney, Tex., operated by the Texas Electric Railway, suspended operation on Nov. 1, after nearly twenty years of service. Failure to pay actual maintenance and operating expenses was given as the cause by Jack Beall of Dallas, president of the Texas Electric Railway. This reason was contained in a letter to Thomas W. Perkins and the City Commissioner. It is said that J. H. Young, former street railway conductor, will operate a bus over the same route in that city.

Wants Tax Reduced.—The Western Ohio Railway, Lima, Ohio, in a bill of complaint in the federal court is seeking relief from what it contends to be excessive taxes levied on its property in six Ohio counties. The company charges that its property is valued at $1,300,000, but that it is on the tax duplicate for $1,600,000, against its protests. An interlocutory injunction is asked to prevent the treasurer from collecting the taxes assessed on the property of the company for 1925. One-half of the amount has been paid.

Reports on September Earnings.—Gross earnings of the Indianapolis Street Railway, Indianapolis, Ind., for September were $1,660 less than the gross earnings for September a year ago, the figures being $440,060 and $441,721 respectively. Operating expenses for last September were $20,654 greater than a year ago. This was attributed to the greater number of buses the company has in operation this year. Total operating expense for last month was $334,057. The company is now operating 32 buses, compared with seven in service at this time a year ago.

Book Reviews

Business Ethics—A Manual of Modern Morals

By James Melvin Lee. The Ronald Press. 312 pages. $3.25.

Ancient and modern methods of business are contrasted in this "Bible of Business," by James Melvin Lee, Litt. D. Creeds of the various industries showing the work-a-day practices from the Laundry Owners National Association to the American Electric Railway Association are set forth in codes supplementary to and amplifying the principles "preached" in the text. But since "the wages of sin is publicity," says Dr. Lee, and publicity, whether required by law or otherwise, promotes honesty in business, laws are helpful which require corporations to publish statements of their financial condition. Especially essential is it for public service corporations. "Fairness can only be expected when the people know the facts." He seems to be in sympathy, too, with Ivy L. Lee (though no relation, both are the sons of Methodist preachers), whom he quotes from an address Mr. Lee delivered at the annual convention of the American Electric Railway Association in October, 1916, in which he said: "No one must attempt to adopt publicity or make use of it for his benefit unless he is prepared to take all the consequences. A company cannot sing of its prosperity to security holders and at the same time cry over its poverty to tax appraisers and its workingmen."

The number of practical illustrations presented in the treatise shows that the author has spent years in collecting his data. And no better tribute could be paid him than the homage of his secretary, who worked with him for two years, used by Christopher Morley in the Bowling Green in the New York *Evening Post* for Nov. 10, 1922. She goes on to say: "James Melvin Lee is author, editor, teacher and friend. At one time he was the editor of *Administration*, the *Atlantic Monthly* of business. He has written 'History of American Journalism,' 'Newspaper Practice,' etc., and is director of the department of journalism of New York University, teacher of business ethics at the same institution, and is well known as benefactor to the student."

Dr. Lee does not set himself up as a reformer, nor does he stick to the academic track in his discussion. Instead, he talks in a chatty vein, and has adopted the policy of O. Henry, who used to go through his book when completed and stick in the raisins; so has he, and with them he has scattered currents which will enliven the thought of the man in industry and help him to follow the trolley through. He does not always see it as others see it, "Swat the Lie." He goes further, and asks the question, "Does he have the moral right to know the truth?" Often he believes temptations are put in the way. A certain railway has removed a cause of friction by fixing the classification of fares for children by a different standard than that used commonly. Children under a certain mark on the street car door are carried on the car free, but those taller than the mark pay full fare. No opportunity, therefore, is presented to patrons of the line to deceive as to the age of their children. But the key that unlocks the main thought of the book is to know all the facts of the case before one attempts to pass judgment. The problem for the reader to solve when he has finished the book is whether the business man is growing better or worse.

Motor Bus Accounting Practice

By Irville Augustus May, C.P.A. The Ronald Press, New York. 200 pages. $6.

Until quite recently bus accounting was like Topsy; it just grew. Some there are who might question the propriety of even attributing this virtue to it, but it does seem reasonable to say that much for it. The industry was new, many of those engaged in it had little or no previous exacting business experience and even those who did lay claim to business knowledge admitted themselves to be stumped when it came to the problem of attempting to systematize the accounts.

Independent operators, the first in the new field, were not slow to recognize the accounting needs, but it was not so easy for them to act. A basis was missing upon which to build. The electric railways operating buses were somewhat better off than were the independents. Through their committee on bus accounting, composed of members of the American Electric Railway Accountants' Association, they evolved a classification of accounts for bus operating companies which Mr. May includes as an appendix to his book.

Mr. May says of his book that it has been compiled to present in convenient form the best features of the accounting systems used by some of the well-known individual automobile and bus organizations and of companies operating in the field with the idea of welding them into a simple and practicable system. In doing this he has had in mind the needs of electric railways operating buses, joint railway and motor bus companies and so-called independents.

The author recognizes the need for simplicity of accounts and has been mindful of this need in arranging his suggestions. Every one will agree with him in his statement that "whatever system is adopted, it should be not only adequate but simple and easy to operate. The individual operator may disagree with Mr. May on some of the points he mentions and may find it expedient to modify some of his suggestions, but there can be no escape from the conclusion that the author has accomplished all he set out to do.

The book is divided into eleven chapters, headed in this order: "Importance of Operating Cost Information," "Installing and Operating an Automobile and Bus Accounting System," "Accounting Records in the Operating Department," "Tires and Other Supplies," "Handling Tires on Contract Basis," "Garage and Shop Costs," "Depreciation and Disposition of Worn-Out Cars," "Statistical Information," "Financial Statements," "Uniform Systems of Accounts for Automobile and Bus Accounting Practices," "Miscellaneous Accounting Forms and Methods." More than 50 forms are included in the volume. The contents of the book are, of course, especially applicable to electric railways reporting to the Interstate Commerce Commission.

Responsible operating officials everywhere may well take to heart the author's warning that poor office methods, unreliable statements and insufficient cost figures are responsible for many business failures. This warning is particularly pertinent in the bus field, where many elements, such as probable life of equipment, depreciation, obsolescence and liability features, are largely unknown quantities.

Mr. May, the author, is of course well known in the railway field as the comptroller of the Connecticut Company, as past-president of the American Electric Railway Accountants' Association and as past-president of the Connecticut State Board of Accountancy. He is the author of a volume on street railway accounting.

The Railroad Freight Service

By Grover G. Huebner and Emory R. Johnson. D. Appleton & Company, New York. 589 pages. $5.

Here is a book of particular interest to interurban officials engaged either in interstate or intrastate operation.

It has been written primarily to be of assistance to officials and others in the railroad service, and to those in charge of the traffic and transportation activities of industries. It describes in detail the railroad freight services, freight traffic rules and practices and the organization of the several departments by which the services are performed. It also contains an account of the organization and activities of the traffic departments connected with industries and with commercial bodies.

The presentation of each subject is detailed and comprehensive, the purpose being to present in one volume a full account of the railroad freight service. To do this it has been necessary to set forth in each chapter a large number of facts. The style is condensed, but the wealth of material to be covered has made the book a rather large volume. One impression that the book will quite certainly make upon those who read it is that the railroad freight service as a whole is a large and complicated business including a wide range of activities.

The book is essentially an account of freight services. It does not discuss the classification of freight and the making of rates. It is the hope of the authors that the book may ultimately have a companion volume dealing, in equal detail, with freight classification, rate making and rate structures.

Both of the authors are well known in the steam railroad field.

Personal Items

Key System's New President

Career of New Head of Oakland Road Reviewed—Engineer of Wide Experience

Lester Seward Ready will assume his new duties as president of the Key System Transit Company, Oakland, Cal., shortly after the first of the year, succeeding C. O. G. Miller, who becomes chairman of the board.

Mr. Ready, a resident of Berkeley, is 38 years old. He is the son of W. E. Ready, a bean and walnut rancher of Ventura County, California. He was graduated with honors from the University of California in 1912, being gold medalist of his class and having been elected to Phi Beta Kappa.

His first position after he was graduated was in the engineering department of the Pacific Gas & Electric Company. In 1913 he accepted a position as an assistant engineer in the California Railroad Commission. During the past thirteen years he has held successively the positions of assistant engineer, gas and electrical engineer, assistant chief engineer and chief engineer. He has been chief engineer for the last 3½ years.

L. S. Ready

His work has included participation by him in all important gas, electric, telephone, water and street railway valuations and rate and service matters. During his incumbency as chief engineer he has supervised valuation work in connection with pending condemnation proceedings involving the electric properties of the Pacific Gas & Electric Company and the Great Western Power Company in San Francisco.

In 1918, during the war, when there was a threatened shortage of electric power in California, Mr. Ready's services were sought as state power director. At that time, however, he could not be spared from his duties with the Railroad Commission and so the job went to another, who, however, received valuable assistance from Mr. Ready. Recently he rendered special service to the East Bay communities in reporting upon the Mokelumne River controversy. It was contended by certain critics that the engineers of the East Bay utility district erred in their selection of a site for the proposed Lancha Plana dam. They contended that the dam should have been placed farther up the river than the spot designated by the district engineers. At the solicitation of the Oakland Chamber of Commerce, Mr. Ready made a study of the project and reported in favor of the district engineers. A year ago he completed a valuation report of the Los Angeles Railway system.

In announcing the change in the presidency Mr. Miller, the retiring president, explained that the transportation problem of the East Bay cities is so important and is so bound up with the life of the communities that it has been considered advisable to place in charge of the company an East Bay man who would give his entire time to the problem. In its effort to supply the East Bay cities with a service that will meet their demands the Key System is spending millions of dollars in reconstruction and the purchase of new equipment. To this end Mr. Ready will work. Mr. Miller bespoke for him the cordial support of the people who are interested in the growth of their district.

In accepting his new position Mr. Ready pledged himself to an intensive study of the problems at hand and to co-operate with the public.

W. Gerald Holmes Becomes Industrial Agent at Indianapolis

W. Gerald Holmes has resigned as director of the manufactures and new industries bureau of the Indianapolis Chamber of Commerce to become industrial agent for the Interstate Public Service Company, Indianapolis, Ind. In his new position Mr. Holmes fills the vacancy caused by the death some weeks ago of Anderson G. Moore, New Albany, Ind., industrial agent of the company for fifteen years.

The new industrial agent became a member of the Chamber of Commerce staff on March 1, after having been connected with the bureau of business research, school of commerce, Indiana University. While with the university he conducted a number of important studies on natural resources of the state and the railway traffic rate structure. Since having charge of the Chamber of Commerce bureau he has represented the organization in the bringing of a number of new industries to Indianapolis and has made an industrial survey and a study of the industrial history of the city. His most recent work was the compilation of a booklet presenting the economic advantages of the city, with charts and pictures, which the Chamber of Commerce officials will publish and distribute in the program of developing Indianapolis industrially.

J. B. Smith Manager of Insull Properties in New Hampshire

J. Brodie Smith has been appointed vice-president and general manager of the Public Service Company of New Hampshire. He is one of the best known public utility executives in New England. He was born at Richville, N. Y., in 1861 and when only seventeen years of age built a telegraph line between two New York villages. His early manhood was spent in the drug business at Manchester, N. H., but in 1885 he was able to gratify a desire of many years to enter the electrical field, being appointed superintendent of the municipal fire-alarm telegraph system at Manchester. In 1886 he was appointed superintendent of the newly organized Ben Franklin Electric Company of Manchester, and upon its consolidation with the Manchester Electric Light Company Mr. Smith was named superintendent and director of the expanded organization. In 1896 he resigned and spent several months in Europe on business and pleasure, and upon his return was appointed general manager of the company.

J. B. Smith

In 1900 Mr. Smith became general manager of the Manchester Traction, Light & Power Company, and five years later he received also the title of vice-president. This company, with four others, was taken over Nov. 1 by the newly formed Insull property (the Public Service Company of New Hampshire), and the merged utilities will be managed by Mr. Smith under the new title. Mr. Smith is actively identified with many civic and fraternal organizations. He is as highly regarded in the electric railway field as in central-station circles.

Four New Illinois Division Managers Appointed

Looking toward a closer relation between the Illinois Power & Light Company and the public and improved efficiency of operation, B. H. Peck, general manager of the Southern Illinois group, recently announced the appointment of four new division managers in that group formerly known as the Southern Illinois Division. This group

Digitized by Google

has been divided into four divisions, designated as A, B, C and D.

Division A, which will be in charge of George Steinwedell with office at Granite City, comprises the former East St. Louis and Granite City districts; division B, which will be in charge of A. T. Early at Belleville, comprises the former Belleville, Collinsville and Edwardsville districts; division C, in charge of A. L. Hooper at Hillsboro, comprises the former Hillsboro, Litchfield, Gillespie and Greenville districts; Division D, in charge of Carl Steinhauser at Mount Vernon, comprises the former Mount Vernon, Centralia, Cairo, Eldorado, DuQuoin and Sparta districts.

English Honors for American Consultant

Walter Jackson, consultant on electric railway fares and service and on buses, has just received from England the gold medal awarded to him for his paper "Electric and Petrol Transport of Passengers in America," adjudged by the Council of the Institute of Transport, London, the most valuable paper of the year presented before the Institute in the Road Transport (Passenger) Department. It was donated by the London General Omnibus Company, of which Lord Ashfield, first president of the institute, is managing director. The medal is somewhat larger than a silver dollar and, of course, is much heavier. It is ornamented with a Pegasus, symbolic of the art of transportation, which was discussed in the paper. The latter was read at both a London and a provincial meeting of the institute. In it electric railway and bus practices of the United States and Great Britain were contrasted with a view of explaining the reasons for differences in method of operation and the opportunities of one country to learn from the other.

A. C. Homan of the Homan Bus Line, recently taken over by the Wisconsin Traction, Light, Heat & Power Company, Appleton, Wis., has been retained by the railway company. He will have charge of the company's bus interests at the Neenah-Menasha end of the line.

C. A. Walker, for twenty years chief electrician of the railway department of the Knoxville Power & Light Company, Knoxville, Tenn., resigned recently to accept a position with the National Pneumatic Company, New York, at its plant in Rahway, N. J. Before his affiliation with the Knoxville property he was connected with the shop forces of the Boston Elevated Railway.

S. C. Schmulbach, formerly sales manager for the Illinois Power & Light Corporation in the East St. Louis, Ill., territory, has been appointed district manager in Cairo, Mounds and Mound City. Mr. Schmulbach became connected with the company in May, 1913, as office clerk. During the past two years he has been in charge of the sales promotion and advertising departments. In his new position as district manager he will have complete charge of the street railway, gas, electric and water systems with principal offices in Cairo.

T. R. Langan Heads Metropolitan Section

Well Known Official of Westinghouse Company First Manufacturer Representative to Hold Post

Once more T. R. Langan steps up to the railway proscenium. This time it is on the occasion of the seventeenth regular meeting of the Metropolitan Section of the American Electric Railway Association, where he is elected president. Mr. Langan is known in the manufacturing as well as the operating end of the railroad business.

Tommy Langan was elected to the office of president in accordance with the avowed intention of the Metropolitan Section to accord the manufacturers full participation in the affairs of the section. He has been vice-president during the past year, and besides acting as a member of the subjects committee has fostered the affairs of the section ever since its organization. Even as a junior in the Westinghouse organization Tommy earned for himself a reputation as a diplomat. Withal he is an industrious worker. As will be made plain later in this account of his activities, he has had just the kind of training in actual transportation service that makes him keenly appreciative of the problems of the operating officials, and so invaluable to the organization with which he is connected for his ability to interpret the point of view of the "men who run the cars."

T. R. Langan

Less than two years ago Mr. Langan was appointed manager of the transportation division of the New York office of the Westinghouse Electric & Manufacturing Company. Prior to that he had been manager of the transportation section in the Buffalo district with headquarters in Syracuse. In his New York promotion he succeeded E. J. Manson, who had been promoted to the position of manager of the heavy traction division of the railway sales department at Pittsburgh.

Mr. Langan entered the employ of the Westinghouse company in 1904 as an armature winder's helper and wireman's helper in the service department. His work from 1904 to 1906 was concentrated on the earlier installation of multiple-unit control equipments on the Brooklyn elevated and New York subways. Then he began a special apprenticeship course at the East Pittsburgh works. A few years later Mr. Langan took up construction work in the service department and later he was made assistant general foreman of maintenance on the electric division of the New York, New Haven & Hartford Railroad, with headquarters at Stamford, Conn. In 1910 he was back again in East Pittsburgh on special service and engineering work in connection with the development of the present line of Westinghouse HL control and railway apparatus. His selling career was a reality before he went to New York in 1924, as he had met with notable success in Baltimore, Philadelphia, Buffalo and Syracuse.

The new president of the Metropolitan Section was educated at Pratt Institute, department of science and technology, Brooklyn. His studies there were correlated with his night courses at Carnegie Institute of Technology, Pittsburgh.

A. V. Guillou, who has been gas and electrical engineer of the California Railroad Commission for more than three years, has been appointed assistant chief engineer of the commission.

A. G. Mott, who has acted as transportation engineer of the California Railroad Commission for the past three years, has been appointed chief engineer of the commission to succeed Lester S. Ready.

Obituary

Virgil R. Powell, vice-president and general manager of the Peoples Railway, Dayton, Ohio, died on Nov. 9 of pneumonia. He was sick only three days. Mr. Powell had been a resident of Dayton for the past 27 years. He entered the employ of the Peoples Railway as a conductor 27 years ago. He was born at Mechanicsburg, Ohio, on Aug. 31, 1879.

Ellis R. Swan, formerly superintendent of the Olneyville Division of the United Electric Railways, Providence, R. I., died recently in South Milford, Mass. Mr. Swan went to work for the United Railways in 1866 and continued in its employ for 44 years, when he was retired on pension, at the age of 70. A glowing tribute was paid to this veteran railway man by the Providence *Journal* on Dec. 24, 1902, in connection with a presentation of a gold watch and chain by his fellow employees.

Anderson G. Moore, for several years industrial agent of the Interstate Public Service Company, Indianapolis, Ind., died on Sept. 28. Mr. Moore began his career as an industrial agent in New Albany, Ind., several years ago. He succeeded in locating many important industries not only in New Albany and Jeffersonville but for other cities served by the Interstate Public Service Company. Shortly after he took up his residence in New Albany, 25 years ago, Mr. Moore became associated with the old Louisville & Southern Indiana Traction Company and the Louisville & Northern Railway & Lighting Company, which was absorbed by the Interstate.

World Trade Discussed by Owen D. Young

Urges Americans to Attend International Congress at Stockholm Next June

Owen D. Young, chairman of the American committee of the International Chamber of Commerce, is urging affiliated organizations in this country to send a large and representative delegation to the general meeting of the chamber to be held at Stockholm, Sweden, next June. A report making definite recommendations for the elimination of trade barriers will be the main topic for consideration at this world-wide gathering of business men.

Mr. Young says that "the business men of the world must understand one another. They must learn to co-operate with one another. They must learn to have confidence in one another. Somewhere there must be a meeting place common to business men everywhere, whatever language they speak, under whatever laws they operate—a place where they can meet and discuss their problems.

The Stockholm meeting "will bring together business men of the 40 countries represented in its membership." Moreover, it will address itself to important economic problems of world-wide interest, in the correct solution of which no one has a greater concern than the business men of the United States.

In view of the recent discussion of the trade barrier problem, it is anticipated that this subject will attract a great deal of interest at Stockholm. This whole question will come before the Stockholm meeting in the form of a report drafted by a central trade barriers committee of the international chamber. This report will offer definite conclusions and recommendations for the removal or modification of trade barriers which hinder the free flow of commerce among the nations.

The American committee on this subject points to a number of trade barriers to which in its opinion attention should be given. Among these are double taxation, lack of international protection of patents, trademarks and designs, lack of centralized credit information, lack of uniformity in commercial letters of credit, inadequacy of the international parcel post, antiquated customs classifications and cumbersome and complicated customs formalities. Julius H. Barnes, chairman of the American committee, said that "it is certain the American delegation will allow there no move to bring about any action looking to a lowering of America's tariff such as would destroy the protection which American workers now enjoy." He explained that the United States is in a position different from Europe with respect to tariffs in that we have here a great buying territory which is able to purchase the output of our great factories without the bar of tariff walls.

First Cincinnati Car Dividend—Officers Announced

A dividend of 35 cents a share on the no-par common shares of the Cincinnati Car Company, Cincinnati, Ohio, was announced following the initial meeting on Nov. 5 of the directors since the reorganization of the company, which acquired all of the assets of the Ohio Traction Company. The dividend will be paid on Jan. 1 to stockholders of record Dec. 20. A resolution also was passed to list the stock on the Cincinnati Stock Exchange. W. Kesley Schoepf, former president of the Ohio Traction Company, was elected president. Other officers chosen were: H. L. Sanders, vice-president and treasurer; A. L. Kassmeyer, vice-president in charge of sales, and E. C. Bernhold, secretary and assistant treasurer. Directors elected are as follows: Mr. Schoepf, Louis J. Hauck, H. M. Levy, Charles J. Livingood, H. A. Worcester, Casper H. Rowe, Joseph B. Verkamp, H. B. Vorhees, H. L. Sanders, Edward C. Wettengel, T. H. Schoepf, Gustav A. Weil, Thomas Elliott, W. F. Wiley and Frederick H. Hertenstein.

Storage-Battery Locomotive Has Gas-Electric Auxiliary

Weighing 110 tons and capable of hauling a 1,500-ton train, equivalent to 70 empty or 30 loaded freight cars, at a speed of from 8 to 10 m.p.h., the largest storage-battery locomotive in the world is now in service in Chicago. It will be used for some time in the freight yards of the Chicago & Northwestern Railway to demonstrate its possibilities in solving some of the problems of railroad terminal electrification in that city. It made the 450-mile trip from the Erie, Pa., works of the General Electric Company under its own power, with a stop at Cleveland for exhibition at the American Electric Railway Association convention. The locomotive incorporates both the storage-battery and gas-electric drive, and has a number of novel features which make it particularly adaptable to switching service. An Exide Ironclad battery of 120 cells is used.

The control is so arranged that power can be taken entirely from the storage battery, or the gas-electric drive can be used. If more power is needed than is being supplied by the gas-electric unit, the storage battery supplies energy in parallel with the engine-driven set; if the gas-electric unit is supplying more power than is required by the motor the excess automatically charges the storage battery. In switching service the battery can thus be used to supply power, with the gas-electric unit used during slack periods to keep the battery charged. The storage battery can also be recharged by outside power.

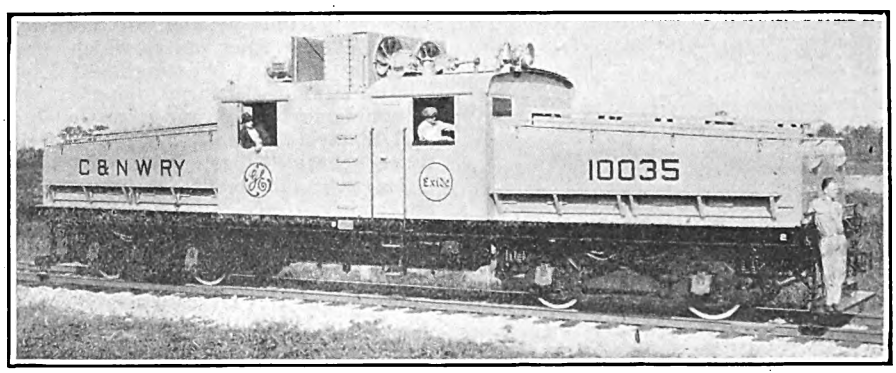
The problem of electrifying the railroads in Chicago has been studied by most of the prominent electrical and railroad engineers of the country during the past decade. Several of these engineers expressed their belief that locomotives of the storage battery type may be used to advantage for switching service in various sections of Chicago.

It is planned to subject this rather hybrid unit to a series of exhaustive tests and thus to develop experimentally its most effective field of service.

The following table gives the principal weights, dimensions and other data for this locomotive:

Weights	
Locomotive, complete	237,000 lb.
Mechanical equipment	100,700 lb.
Battery	78,960 lb.
Motor	29,800 lb.
Engine and generator	7,850 lb.
Radiator and fan	3,500 lb.
Control	9,150 lb.
Brakes	5,640 lb.
Heater	1,400 lb.

Dimensions	
Length over all	52 ft. 0 in.
Wheelbase	39 ft. 0 in.
Rigid wheelbase	8 ft. 0 in.
Height	14 ft. 8 in.
Width	10 ft. 0 in.
Tractive effort, one-hour capacity	17,200 lb.
Speed at one hour rating	9½ m.p.h.
Tractive effort, 30 per cent coefficient of adhesion	66,000 lb.
Maximum speed	30 m.p.h.
Time motors will carry maximum tractive effort	9 minutes



This Storage-Battery Locomotive Was Exhibited at the Cleveland Convention on Its Way to Chicago

New York "Post" Is Unconvinced

It Doesn't Believe Electric Railway Manufacturers Use Liquor Extensively to Stimulate Sales at Conventions

From various sources editorial comment has been elicited in response to Gen. Lincoln C. Andrews' recent open letter appealing for manufacturer co-operation in stemming the alleged use of liquor at conventions to stimulate sales. The text of General Andrews' communication was published in the issue of ELECTRIC RAILWAY JOURNAL for Nov. 6, page 869. Particular exception to the remarks which the prohibition director made with respect to the electric railway industry is taken by the New York *Post*, on the editorial page of which for Nov. 3 appears the following:

It will be interesting to learn what the manufacturers of the country think of General Andrews' discovery that their agents spend large sums of money for liquors with which to entertain their prospective customers. There has been a widespread impression that competition had become so keen that the man who was formerly known as "the cocktail member of the firm" had been eliminated. To prove his case General Andrews says that when he was in the street railway business the agents of street railway supply houses dispensed unlimited quantities of liquor in furthering the interests of their concerns. That must have been some time ago. Dealers in street railway supplies in recent years have had to change their ways. Buses and automobiles have curtailed the revenues of street railways and forced the traction managers to limit their purchases to their actual necessities and to buy closely. As a rule, the business is now done by bid and contract, which prevents the supply houses from adding liquor charges to the cost of their goods. The statement that the representatives of manufacturing concerns at their annual conventions are prone to entertain each other with liquor will hardly be disputed. But that is true of all sorts of conventions and is more of a social than a business matter. At such assemblages, as elsewhere, those who want to drink can usually find some one to drink with them.

Recent Orders for Supervisory Control Equipment

For installation in a new switching station at Hempstead Crossing, Long Island, the Long Island Railroad has ordered its third set of Westinghouse audible-type supervisory control equipment. The equipment will be the first audible-type supervisory control equipment to have the substation equipment panel mounted. It will form one section of the switchboard, and is to be used for the control of circuit breakers feeding the third-rail system. The substation will be situated at the intersection of two of the many lines of this company covering the lower part of the island. This substation is being installed to take the place of a smaller company's lines, which will insure fewer and less extensive interruptions to the power supply for the third rail.

In an order received from the Connecticut Light & Power Company a large number of standard Westinghouse supervisory control protective units are called for to be connected to the supervisory control wires. This will protect the supervisory relays from excessive voltage induced by surges on the transmission line which parallels the supervisory line.

The Penn Public Service Company of Johnstown, Pa., intends to control its Reeder Street substation by means of Westinghouse synchronous visual supervisory control equipment. The equipment will be arranged to control fourteen circuit-breakers at the present time, but provisions will be made for controlling four additional breakers at some future date.

Metal, Coal and Material Prices

Metals—New York	Nov. 9, 1926
Copper, electrolytic, cents per lb	13.60
Copper wire, cents per lb	16.00
Lead, cents per lb	8.00
Zinc, cents per lb	7.55
Tin, Straits, cents per lb	70.75
Bituminous coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$10.00
Somerset mine run, Boston, net tons	4.00
Pittsburgh mine run, Pittsburgh, net tons	3.50
Franklin, Ill., screenings, Chicago, net tons	1.875
Central, Ill., screenings, Chicago, net tons	1.725
Kansas screenings, Kansas City, net tons	2.35
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$6.00
Weatherproof wire base, N.Y., cents per lb.	17.50
Cement, Chicago net prices, without bags	2.17
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.5)
White lead in oil (100-lb. keg), N. Y., cents per lb	15.25
Turpentine (bbl. lots), N. Y., per gal	$0.90

Details of Pennsylvania's Order of Electrical Equipment

In addition to the electrical equipment for 93 cars which was recently ordered by the Pennsylvania Railroad from the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., as specified in the issue of ELECTRIC RAILWAY JOURNAL for Oct. 9, 1926, apparatus for 30 cars has been ordered from the General Electric Company, Schenectady, N. Y., and apparatus for five cars from the American Brown Boveri Electric Corporation, New York, N. Y. This makes a total of 128 electric passenger cars which are being secured for operation over the Southern Division main line between Philadelphia and Wilmington, Del., and the Octoraro branch between Philadelphia and West Chester, Pa. Extensive progress is being made on the work of electrifying these lines and the new equipment for them is expected to be delivered by November, 1927.

It was also reported in ELECTRIC RAILWAY JOURNAL on Oct. 9 that the Pennsylvania Railroad had contracted for the electrical equipment to be used in the construction of four new locomotives to be operated in passenger service between Pennsylvania Station, New York City, and Manhattan Transfer, N. J. These four units, which were ordered from the Westinghouse Electric & Manufacturing Company, will be supplemented by four from the General Electric Company, all to be of the same general type. Delivery of this locomotive equipment is expected by September, 1927.

The electrification work between Philadelphia and Wilmington and Philadelphia and West Chester constitutes one of the most important projects of its kind undertaken in recent years. It involves approximately 52 miles of line and 150 miles of track. Its consummation will give the Pennsylvania Railroad a total of 90 miles of line and 264 miles of track electrified for suburban service directly in and out of Philadelphia. In addition, the Camden-Atlantic City electric line provides Philadelphia with an extensive suburban service via the Delaware River ferries.

The electrification projects to Wilmington and West Chester are an integral part of the Pennsylvania Railroad's plan for its new main Philadelphia passenger station on the west bank of the Schuylkill River and the extension of electric suburban service into a centrally located underground terminal near the site of the present Broad Street Station in Philadelphia.

Rolling Stock

Northern Ohio Power & Light Company, Akron, Ohio, has purchased five of the new model six-cylinder, 29-passenger parlor car buses from the International Motor Company, New York, N. Y. This is the first company in this district to order the newest model Mack bus. The units will operate on the Akron-Cleveland-Canton route, a distance of 68 miles. The bodies on these five buses were built by the Lang Body Company. Special leather upholstery and seats have been installed and the further item of special shatter-proof glass has been used throughout.

New Orleans Public Service, Inc., New Orleans, La., recently received two six-cylinder gas-electric chassis from the Fageol Company of Kent, Ohio.

Track and Line

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has completed the construction of the Center Street extension from 51st Street to 60th Street.

Seattle, Wash.—The Municipal Railway Department will receive bids until Nov. 26 for 4½ miles of 50 to 70-lb. rail, also for 12,000 cross-ties, hewn or sawed.

Madison Railways, Madison, Wis., will improve its track zones on Winnebago Street from the Yahara River to the Northwestern road tracks and at two points on its Atwood Avenue line from Winnebago Street to Division Street and from Ohio to Fair Avenue.

New Advertising Literature

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued leaflet No. 20133-A, describing the type SK steel-clad distribution transformers. Detailed information is given on the outstanding features of the application and construction of this type of transformers, bringing out the new type of bushing that is being used in the construction.

Ohmer Fare Register Company, Dayton, Ohio, has issued a circular which describes the Ohmer odometer, a mileage counter which is particularly designed for use on buses and trucks.

Cause of Death—Malnutrition

PROPER maintenance of equipment is one of the best selling forces an electric railway may employ. In the past ten years the transportation industry has witnessed the abandonment of many properties. Of these it is probable that a large number would still be in operation if proper attention had been given to their physical upkeep.

Take as evidence one representative property in New England. This small company last spring discontinued its operations when scarcely a vestige of public patronage remained. Evidence of erratic maintenance was on every hand, and it seemed that this one item alone was sufficient to explain the steady decline in the company's fortunes.

The initial negligence lay in the condition of the track. More than one-fifth of the total mileage was laid in permanent pavement with 9-in. girder rail and steel ties set in concrete. The remaining roadbed was exposed 70-lb. rail on private right-of-way. The girder rail was eight years old, the tee rail was twenty. No money had been expended in maintaining the pavement and rail. Joints that could have been kept smooth were pounded down and the pavement had broken away beneath, allowing water to do its usual damage. Several hotel proprietors complained because guests were wakened early by the pounding of car wheels over these neglected joints. Finally the local hotel association appealed to the state utility board and the cost of relaying with new girder rail was the strongest point in the argument presented by the company attorneys when abandonment was sought.

Grading on the private right-of-way was apparently a lost art. Alignment of particularly bad sections of track and the occasional replacement of a rotting tie had been the extent of the company's efforts in this direction. The track paralleled a state highway for 18 miles and the sunken rails, in some places more than a foot below the grade of the boulevard, made winter service anything but reliable—an urgent invitation to competition by bus and private automobile.

The overhead line contributed to the ensemble of despair. Every windstorm, every cold snap, every extremely hot day evidenced the weakness of the structure. Interrupted service due to line failures made a dissatisfied public and invited the attention of every jokesmith in the various communities served.

No exception to the rule was found in the shops. There was no provision for armature baking, no field testing equipment was in sight, nothing modern—only tools and machines dating back to the '90s were in evidence. The cars were old-fashioned, heavy units, the motors obsolete, the controllers and other mechanical equipment poorly kept up and the condition of the woodwork was ample evidence that paint or varnish had been unknown for many years.

Struggling along with inadequate forces and with little or no money, the local management had been unable to make both ends meet—its hands had literally been tied, so far as any effort toward modernization was concerned. This case is but another proof that the longer one remains in a bed of quicksand the deeper and faster one would sink. Were this little property to have been saved, strenuous efforts should have been instituted many years ago. It is harder to win back patronage than to hold it.

CORNELL UNIVERSITY LIBRARY NOV 24 1926 ITHACA, N. Y.

Attractive Working Conditions Result in Better Maintenance

INCREASED attention is being given to providing greater convenience and comfort for shop forces of electric railways. Many shops now have sections set aside as lunch rooms and recreation quarters. Individual steel lockers, drinking fountains, and in some cases shower baths have been installed. In new shop construction better heating and lighting, provisions for effective cleaning and many added comforts are being incorporated. All these raise the standard of the workmen, prevent waste of good material and accumulation of refuse, save time in making repairs by enabling workmen to see clearly the equipment they are working on and to feel comfortable while they perform their duties.

Poor working conditions are responsible for much bad maintenance. In a recent visit to a railway property it was noticed that the cars were poorly maintained. On reaching the shop, this was found to be little more than a roof with some holes in the ground for pits. The pit walls were of rotted boards and the bottoms were dirt with only loose boards laid over them. In rainy weather the pits were wet and muddy; in cold weather the temperature of the shops was almost the same as that out of doors. An atmosphere of darkness and dampness pervaded the place. It was little wonder that the work was poorly done.

Electric railway shop men are human. Where physical discomfort is a daily experience a poor grade of work is sure to result. While sometimes mechanical repairs can be carried on successfully out of doors, it is much cheaper if this work can be done inside and better results will always be obtained. Time lost when men have to leave their work for short periods due to their physical discomfort amounts to a considerable total during a year. The time thus lost is added to by slowing down of work caused by poor lighting, use of old and inefficient machine tools, slow methods of

This is the issue in November that is devoted essentially to maintenance and construction subjects

Digitized by Google

handling parts, and waiting for cars to be placed in position due to a poorly-planned track layout.

The grade of men which a railway is able to secure for work in its shops is also influenced largely by working conditions.

Any plan that will provide better working conditions in electric railway shops is to be commended. It will certainly result in better-maintained equipment, which is now so essential in order to increase car riding. High-grade mechanics will not stay in a place where the surroundings are unsatisfactory.

Importance of Maintenance Is Not Measured by Interference to Service

DURING the past few years the spirit in which the average electric railway management approaches the public has undergone a noteworthy change. Many irritating practices once thought to be inevitable concomitants of operation have been eliminated. Good will has rightly been judged more valuable than certain of the economies practiced in the name of efficiency.

An earnest attempt has been made in most cases to inculcate in all employees this spirit of thoughtfulness of the public. Generally speaking, the men of the transportation departments have grasped the idea well. Maintenance men, on the other hand, sometimes appear to overlook the need for close attention on their part to avoid anything that annoys passengers unnecessarily.

Seldom does the maintenance man come in direct contact with this public. Hence his importance is not generally realized within the industry itself. When he does meet the public directly, during repairs to track under traffic, or when fixing minor defects of a car on the road, he has a natural desire to show how important he really is. The track man may do this by holding one or more passenger cars while a material car is unloaded, or while a piece of rail is cut out with an acetylene torch. The mechanical man may do it by fussing overmuch with lights, buzzers, or a fare register while a carload of passengers is kept waiting.

Probably the maintenance men who sometimes allow their work to interfere with passenger traffic honestly believe that they are doing it for the good of the service —saving the company money, or assuring the adequacy of repairs. By explaining to these men the importance of giving constant attention to the convenience and comfort of the passenger, the management can give them the merchandising viewpoint which lately has made many friends for the electric railways.

Waste Elimination Work Still Presents Great Possibilities

PROBABLY the most outstanding industrial accomplishment since the war has been the reorganization of the American railways, according to Secretary Herbert Hoover of the Department of Commerce in his annual report. While this compliment is directed mainly to the steam railroads, the electric lines have likewise contributed their share to the general improvement. Not only have they bettered their service in the great majority of cases, but the great savings in operating costs have made possible rates that are much lower than would otherwise have been necessary.

Prominent among the savings enumerated by Mr. Hoover is the elimination of waste. He places this in the lead as the essential problem for solution if the standards of American living are to advance. "One of the major attacks upon industrial and commercial waste lies in standardization and simplification," he said. "By standardization we secure a positive approach through the establishment of definite notation in dimensions, quality and performance of materials and machines which must be accompanied by a development of tests to be applied in the determination of the fulfillment of these standards. By simplification we secure a negative approach through elimination of the necessary varieties, dimensions or grades of material and products."

In both standardization and simplification the electric railway industry has taken a prominent part. It is necessary, however, that the work be continued, since elimination of one form of waste frequently leads to the uncovering of another that had been effectively masked. Mr. Hoover's proposal is no visionary or bureaucratic appeal, but one that is intensely practical and already has brought most valuable results. In furthering the work every railway can do its share. The success of the campaign will redound to the credit of all who get behind it.

Many Factors Affect Convention Location

LOCATION of the annual convention of the American Electric Railway Association for 1927 is being considered earlier than usual this year, in order that the time and place may be settled so as to permit the industry to proceed with plans to exceed again the records for attendance and exhibits established this last year at Cleveland and to outdo the enthusiasm shown there.

There is no question but that the location of a convention has considerable to do with its success. Closely associated with this factor is the co-operation offered by the local people who are interested in getting a convention in any given city. Natural attractions, hotel facilities, exhibit facilities and accessibility are all important factors in locating a convention. Cost to members, to the exhibitors and to the association are also important elements to be considered.

Last year, the matter of providing proper facilities for staging a representative electric railway car exhibit received careful consideration in selecting the place for the convention. The effect of such an exhibit on the industry itself and on the general public was considered to be of paramount importance. The result at Cleveland testified eloquently to the wisdom of that selection. The co-operation given to the association by the late Mr. Stanley, by J. H. Alexander and by the entire Cleveland Railway organization exceeded the limits of reasonable expectancy. The expense incurred by the local company in making the Cleveland convention the outstanding success that it was reflected the sincerity with which the Cleveland people carried out the promises made to last year's committee. This co-operation, combined with the ideal facilities provided for car exhibits, resulted in bringing about the largest exhibit of electric railway cars ever held in the history of the industry.

Hotel accommodations at Cleveland were far behind those available at Atlantic City. Although Cleveland has the advantage of a more central location, its natural attractions do not equal those of the seaside resort. Weather conditions were also unfortunate, particularly during the early part of the week.

Digitized by Google

Both Atlantic City and Cleveland are again actively seeking the next convention. The former seems to have the advantage from the standpoint of attractiveness and housing, the latter from that of exhibit facilities and central location. Although there will be available by next fall at least three new centrally located hotel buildings in Cleveland, Atlantic City would probably continue to have a decided advantage on this score.

All of these factors must be weighed carefully by the committee on location of the convention, and by the executive committee. The effect made on the industry and the public by a properly staged exhibit of progress in electric railway cars must receive primary consideration by these committees in the interest of maintaining and accelerating the definite forward movement which has set in during the past year. Many of the factors which must be carefully weighed by a location committee may not be apparent to one who gives the place of the convention only casual consideration, or who forms an opinion based on personal preference. This year's committee is starting its work early in the interest of the industry. The committee is a large one, and represents fairly the views of both operators and manufacturers from various sections of the country. The industry may await its decision with the assurance that the many diverse factors involved have received careful consideration, and that its selection will be dictated by the primary motive of promoting the interest of the entire industry.

Utility Commissioners Take Constructive View of Railway Situation

STATEMENTS made in the report of the committee on service of public utilities before the annual meeting of the National Association of Railroad and Utilities Commissioners in Asheville, N. C., Nov. 9-12, published elsewhere in this issue, warrant the careful consideration of every electric railway executive.

"The biggest service problem before the industry at the present time," says the report, "is that of modernizing its equipment. Cars which are more comfortable, more speedy and less noisy than ever before are being built, and with light weight and one-man operation they are frequently more economical to operate than the older types. The commissions can and should co-operate with the street car companies in this movement, because it is generally agreed that *today good service is more important in street car regulation than cheap fares.*"

The movement for the improvement of electric railway cars and the elimination of obsolete equipment, which is costly to operate, which drives away riders and which gives the industry the appearance of being down at the heels, is just getting under way. It has barely started. But the possibilities of this new thinking are clearly and emphatically brought out by this statement on the part of those charged with the regulation of railway fares.

Some railway executives have questioned the advisability of fare increases. In many instances an increase in fare has brought little if any increase in revenue. The drop in riding that followed higher fares on some properties raised a grave question as to the advisability of such increases. For a time it seemed that the only solution was to hold down fares and then to squeeze a narrow operating margin out of the situation by affecting still further reductions in operating costs.

Now all this appears to be another illustration of the lack of merchandising acumen in the electric railway industry. Had we been better merchants we would have realized that an increase in price is bound to cut down the volume of business unless there is at the same time a decided improvement in the character and attractiveness of the product.

It has been repeatedly pointed out in the JOURNAL and has been demonstrated by actual experience on those properties which have given the subject serious attention that improved cars have not only a direct effect on volume of riding and on operating costs but that they also help to create that favorable public opinion regarding railways which is absolutely essential to success. Public officials are helpless in the face of an unfavorable public opinion, regardless of how thorough an understanding they may have of the railway situation or how much they may be in sympathy with its difficulties.

Those railway men who still question the advisability of adopting heroic measures, if necessary, to substitute modern cars for obsolete equipment, and who still cling with an inexplicable attachment to heavy, cumbersome cars—even to the extent of spending several thousands of dollars apiece on them for remodeling—will do well to consider carefully the significance of this report by the utility commissioners. When representatives of the public are ready to say frankly that good service is more important than cheap fares, one is led to wonder whether they have not progressed further in their thinking on electric railways than have some of those who have the direct responsibility for making a favorable financial showing.

Coffin Award Contest Will Bring Out Best of Railway Accomplishments

DURING its recent meeting at association headquarters the Coffin Award Committee decided to issue at an early date invitations and announcements of the conditions of the 1927 award. Experience with the contest during past years has more than demonstrated its value to the industry, and particularly to the various participants, regardless of whether or not they win the award. For that reason the action of the committee in making possible early preparation of briefs is a wise one.

Each year the committee has experienced increasing difficulty in making a decision. This is largely attributable to the varying size and character of the briefs presented by the participants. In its report last year the committee made it clear that the award was made on the basis of the value of the accomplishments to the industry as a whole. This is unquestionably a constructive viewpoint. But the committee has repeatedly pointed out the difficulty of making a single selection under present conditions. The purpose of the award would probably be even better carried out than at present by its extension to permit fuller recognition of outstanding accomplishments by more than one company. Regardless of the extent to which this objective may be carried out during the current year, however, the conditions of participation are such that the benefit derived by a given company, even though the award is not won, is more than enough to justify the preparation of briefs by every railway which has made substantial progress during the year.

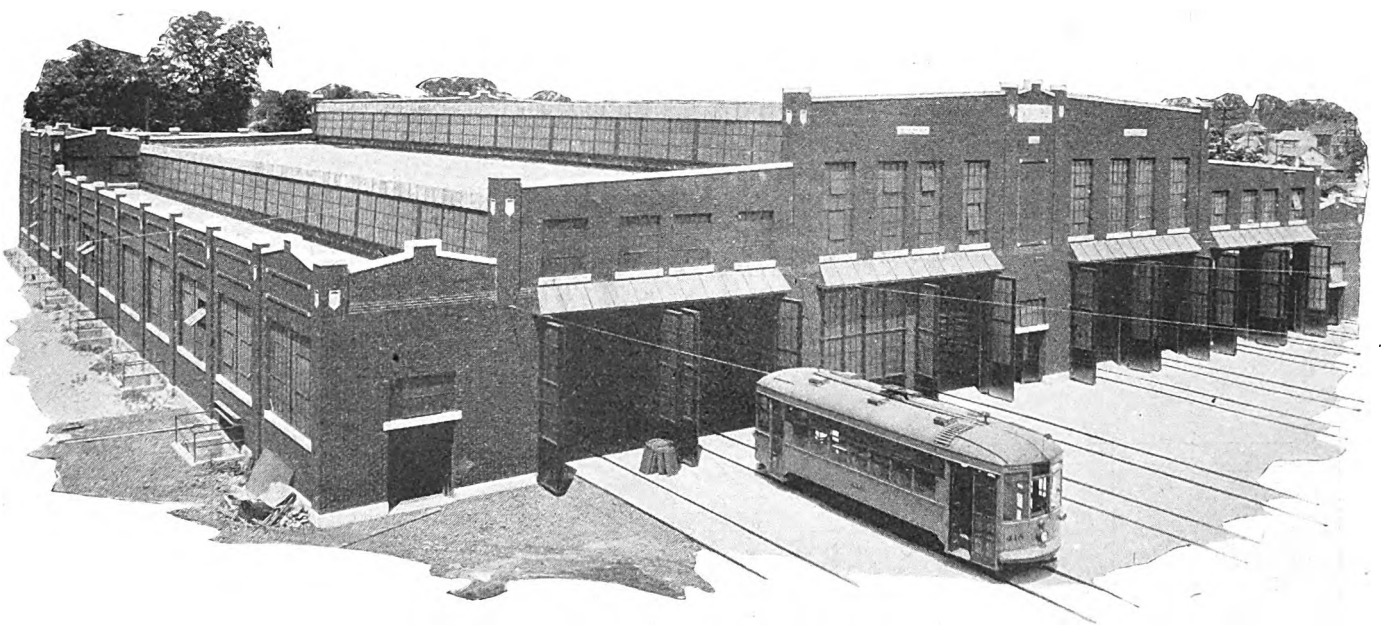
Attractive Overhauling Shop Completed in Fort Wayne

Large Building of Red Brick Added to Group Comprising Spy Run Shops of Indiana Service Corporation—Novel Pit Construction Used—Overhead Crane and I-Beam Traveling Hoist System Provide for Efficient Handling of Equipment — Machine Tools Provided with Individual Motor Drive



By Use of Three Roof Levels, Abundant Light Is Provided in the New Shops of the Indiana Service Corporation

LABOR-SAVING conveniences for handling car equipment during overhaul and an arrangement of departments that will fit into a carefully laid-out system for routing work are features of the new general overhauling shop of the Indiana Service Corporation at Fort Wayne, Ind. This is the eighth building of a group that constitutes the Spy Run Shops. Others include an inspection carhouse, building for general overhauling of buses, another for bus washing and storage, a fare box house, store house and oil house. The various buildings are surrounded and separated by attractive grounds so that the visitor is at once impressed with the orderly appearance that prevails in all departments. Well-kept lawns, crushed-stone walks, track with crushed-stone ballast and attractive buildings of red brick, all contribute to the pleasing appearance that is produced. The entire group of buildings and yard is surrounded by a Cyclone wire fence 6 ft. high.

High-grade fireproof construction of the steel skeleton type has been used for the new overhauling shop. The exterior walls are of high quality red brick laid up in red mortar with raked joints. Limestone trim, together with attractive pilasters, forms the ornamentation. The stone trim includes a water table, sills, coping, nameplate and pilaster. All windows have factory-type ventilated sash and the doors are all tubular steel hung on channel iron frames. The doors and the window frames are painted dark green of such a shade as to harmonize well with the brick work and the limestone trim. Large swinging doors are provided at track openings. These are of the double section swinging jacknife type and swing outwardly, thus conserving space inside. They are hand operated and glazed to within 4 ft. of the bottom with semi-obscure glass.

All foundations for both the outside and interior walls to the ground floor level are of plain concrete. Floors

No. 2 Kearney & Trecker milling machine.

WHEEL SHOP

48-in. Niles car wheel lathe.
400-ton Niles hydraulic wheel press.
42-in. Niles boring and turning mill.
42-in. engine lathe.
12-in. x 2-in. Ransom emery grinder.

BLACKSMITH SHOP

Two down-draft forges.
No. 2 Long & Allstatter punch and shear.
Air-operated bulldozer.
500-lb. trip hammer.

ELECTRICAL REPAIR SHOP

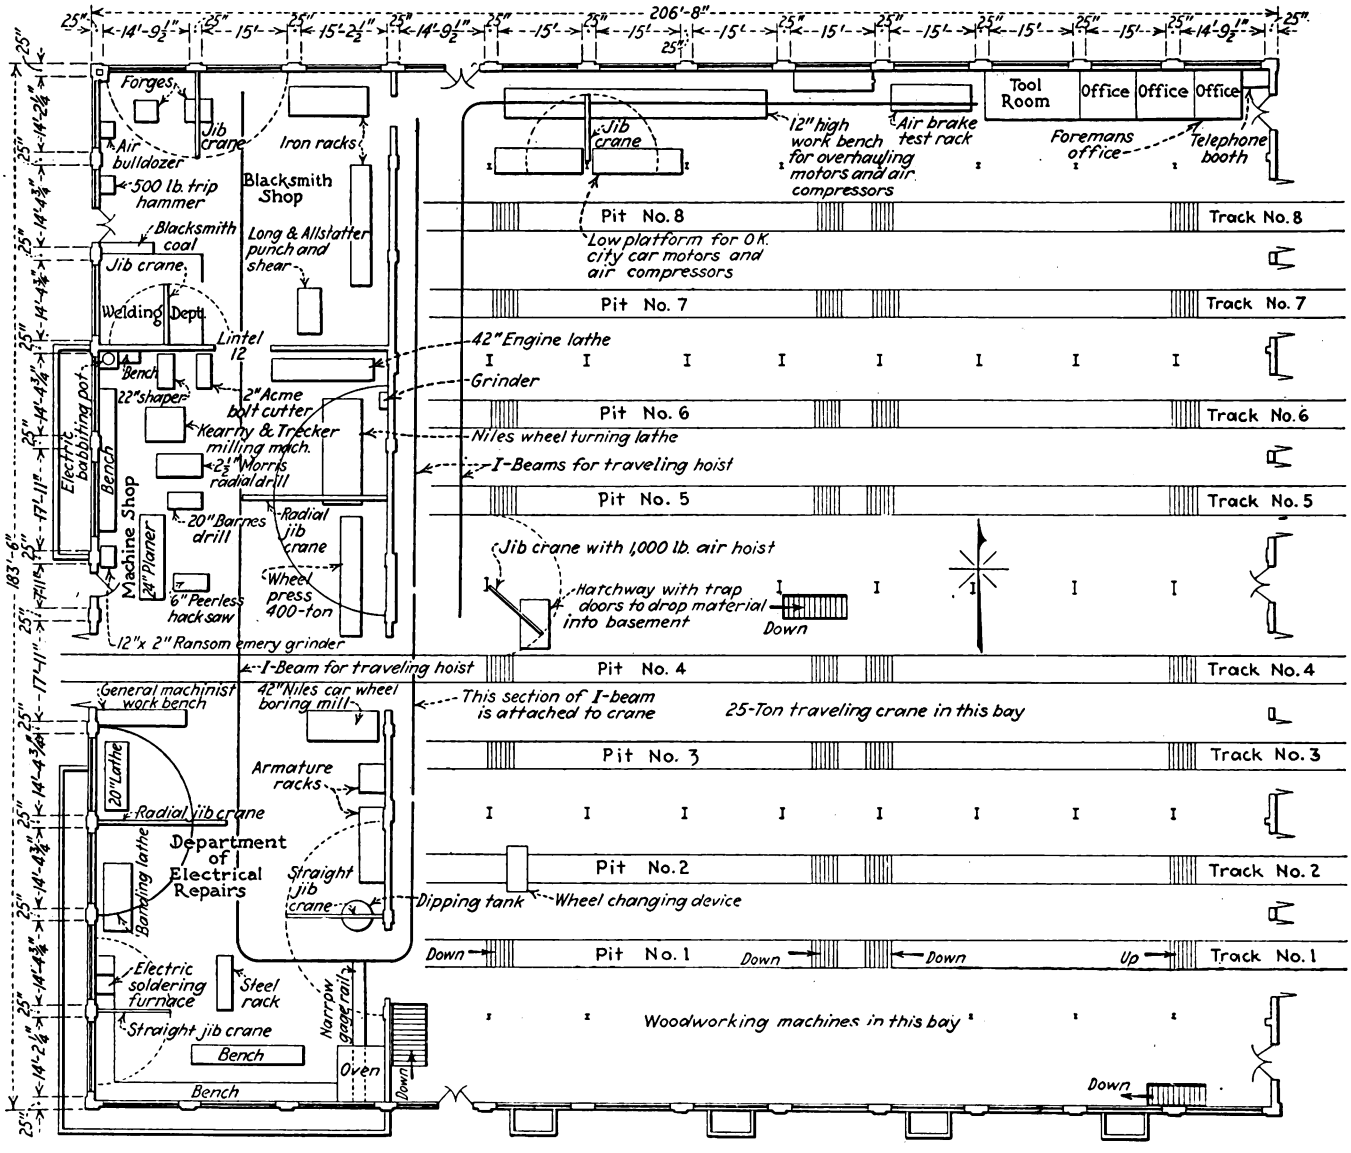
20-in. engine lathe. Banding lathe.
Westinghouse electric soldering furnace.
Baking oven. Dipping tank.
Armature racks.

WOOD MILL

24-in. surfacer. 12-in. jointer.
Double-spindle shaper.
36-in. bandsaw. Turning lathes.
Hollow chisel mortiser.
Wallace circular bench saw.

Digitized by Google

of the machine shop and the two outside bays running the length of the shop are of creosoted wood block flooring. The floor of the blacksmith shop is of crushed cinders with a topping of screened crushed limestone. All other floors are constructed of reinforced concrete with tion is 4 ft. 6 in. below the bottom of the pit. The pit floors thus appear like elevated platforms in the basement. They are of reinforced concrete and are supported at 8 ft. 6 in. intervals by upright 6-in. H sections which extend from the basement floor to the shop floor.



Floor Plan of the New Overhauling Shop of the Indiana Service Corporation

a one-to-one monolithic mortar top treated with metallic hardener.

The roof construction is of a precast concrete flat tile supported by steel purlins. It is treated with a five-ply pitch felt and gravel waterproofing. All flashing is 16-oz. copper. The front portion of the shop is designed with six bays, so that there are three roof levels. The two central bays are highest. The roof for the next bay on either side of the center drops down about 6 ft. and the roofs for the two outside bays drop down a further distance of 6 ft. This construction was adopted particularly in order to give effective illumination inside the shop without the necessity of employing saw-toothed roof construction.

The building is 185 ft. wide and 207 ft. long. The four central bays have two tracks each spaced on 15-ft. centers. This makes a total of eight tracks entering the building. All have pits. The pit construction for the four tracks in the south half of the shop is of unusual type, in that the basement floor under this section is 4 ft. 6 in. below the bottom of the pit. The pit floors thus appear like elevated platforms in the basement. They are of reinforced concrete and are supported at 8 ft. 6 in. intervals by upright 6-in. H sections which extend from the basement floor to the shop floor. The pits are thus entirely open both above and below their floor levels. They are 4 ft. 6 in. deep. Stairways are provided at each end of the pits and also in the center. These latter stairways lead down to the lower level so as to serve the dual purpose of reaching the basement and for intercommunication between pits. The construction of the four pits in the north half of the shop is quite similar except that there is no basement extending underneath the pit flooring. At present the lower level is used for storing materials, but as it is provided with ceiling lights and also with daylight from the open pit construction and light wells along the exterior walls, it is contemplated using certain portions for bench repair work.

Illumination of the pits themselves comes from the ceiling lights of the basement. The basement is illuminated by 23-watt lamps and 300-watt lamps are used for artificial light throughout the main shop, machine shop, armature room, etc.

This unusual type of construction was adopted partly

Digitized by Google

because there already was an excavation at this site before the building was constructed. At one time this was the forebay of an old-time water plant. With the use of modern improvements in power, the water-power plant was discontinued and a dried-up pit remained where the forebay stood. As the filling in of this pit would be rather expensive, it was decided to make use of it as a basement and to elevate the floors of the car pits. This type of construction is proving of particular advantage in connection with lighting, heating, and ventilation, and the additional expense that was necessary for steel reinforcement and concrete was very slight.

The Machine Shop Has Many Jib Cranes and an Overhead I-Beam Hoist System for Handling Material

Machine Tool Sections Located at Rear

A space 53 ft. 4 in. wide at the rear of the shop is divided from the front portion by a brick wall. This section is used for the department of electrical repairs. the machine shop, the wheel shop, blacksmith and welding shop. In the front portion the two outside bays provide space for miscellaneous bench repair work. The bay having pit tracks Nos. 1 and 2 is used for repairs to city cars. Track No. 2 is equipped with a wheel-changing device for changing wheels in single-truck cars. The equipment was furnished by the Columbia Machine Works and is driven by a 5-hp. motor. The bay with pit tracks Nos. 3 and 4 is used for heavy interurban repairs and for truck repairs to both city and interurban cars. The two bays with pit tracks Nos. 5, 6, 7 and 8 are used for heavy inspection and for light repairs. At the present time the bay along the south wall is equipped with woodworking machines and serves as a carpenter mill. It is planned, however, to construct an additional building to the north of the present overhauling shop some time in the future. This new building will be used as a carpenter and paint shop. The basement directly underneath the woodworking department is used for lumber storage. The present woodworking machines installed in the south bay are listed in an accompanying table.

The bay along the north side of the shop is used for motor overhauling, for testing of air-brake parts and equipment, and also includes a tool room and offices for the shop foremen. There are three partitioned rooms arranged so that two are occupied by the foremen, with the additional office for clerical help and records. The tool room is inclosed so that it can be locked. These offices command a view of the entire front portion of the shop. The offices of the superintendent of motive power, Arthur Reddersen, are located on the second floor of the adjacent storeroom building. This leaves the superintendent free from shop interference so that he can give his whole attention to administrative duties.

The materials handling equipment includes an overhead traveling crane, overhead I-beam traveling hoists,

Digitized by Google

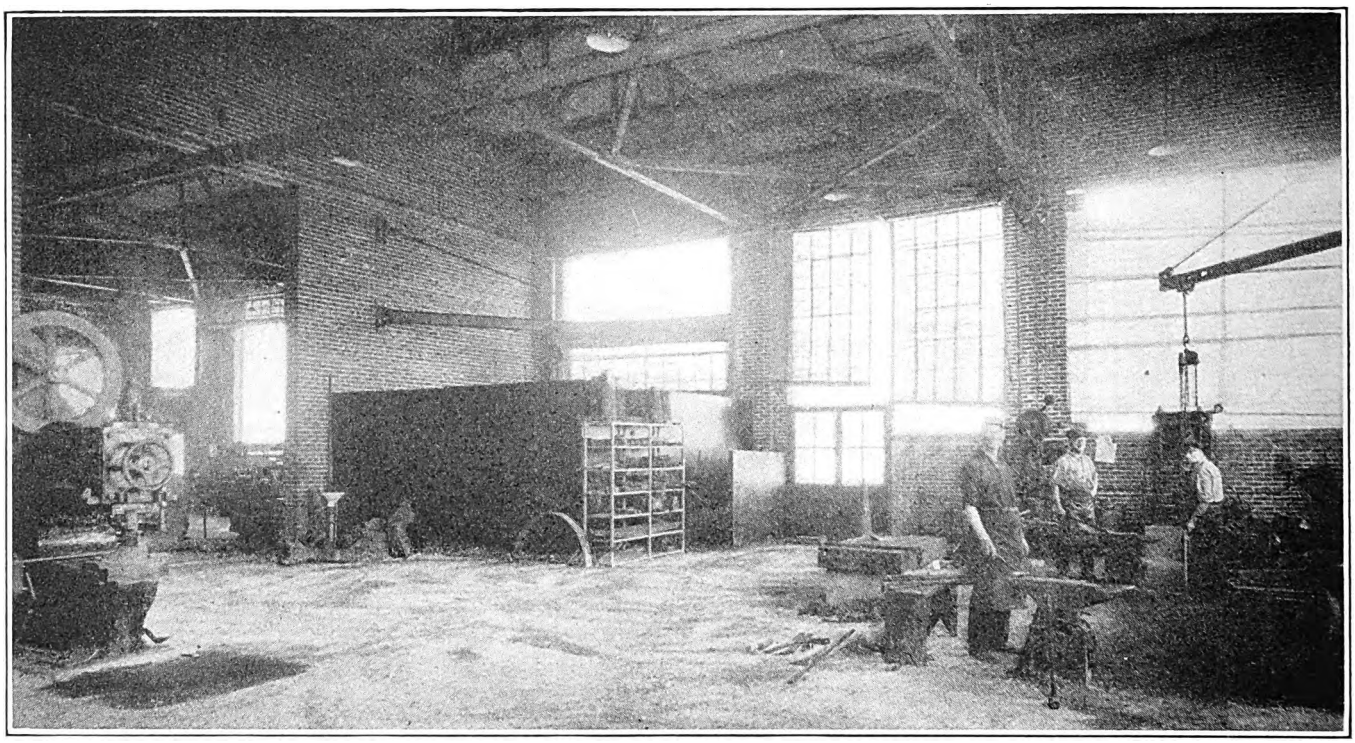
radial cranes, and jib cranes. The bay of the shop that contains pits Nos. 3 and 4 has a 25-ton traveling crane operated from the floor. The bay that contains pits Nos. 5 and 6 is of the same construction and can be equipped with an overhead crane whenever car repair work makes this necessary.

There are two overhead I-beam traveling hoist systems. One has an I-beam at the rear of the overhauling section, starting from pit track No. 4 and continuing along the rear to the bay at the north side of the shop and then through the length of this bay. The other I-beam traveling hoist starts from the north wall at the rear of the overhauling section, runs across the shop and through the opening into the department of electrical repairs. The I-beam then turns so as to run through the central portion of the department of electrical repairs, the car wheel turning and boring section, the machine shop and the blacksmith shop. The overhead traveling crane is also equipped with an I-beam so that it can be lined up with the various overhead traveling systems. This enables the I-beam which runs across the rear of the overhauling section to be placed out a considerable distance from the wall, otherwise the travel of the overhead crane would be limited so that it could not go entirely to the rear wall.

A jib crane with a 1,000-lb. air hoist is mounted on one of the upright I-beams in the central section of the shop at the rear. This swings over a hatchway and is used for raising and dropping material into the basement. The motor overhauling section in the north bay is also equipped with a jib crane for handling motors. In the department of electrical repairs and to serve the wheel turning and boring sections there ar two radial jib cranes and the machine shop is also provided with several jib cranes. The construction of the radial cranes provides a circular I-beam with a carriage to support the end of the boom so that these can be of sufficient length to reach to the center of the shop and thus serve a greater area than would otherwise be possible. In addition to these three radial jib cranes the department of electrical repairs has a straight jib crane and there are two additional straight jib cranes in the blacksmith shop, one of these being located so as to serve the welding room. An accompanying table gives the various machine tools provided for the different departments.

Overhauling Work Well Systematized

When motors or trucks are to be overhauled, the car is brought into the shop on track No. 4, which runs entirely through. The overhead traveling crane lifts the car body while the trucks are run out from underneath. The body is then set on horses during the overhauling. Truck overhauling work is done at the end of tracks 3 and 4. Where motors are to be overhauled they are lifted out of the trucks by the crane and are then picked up by the I-beam traveling trolley and taken to the motor overhauling station in the first bay along the north wall. Work of overhauling small motors and compressors is done on a bench with the top portion 12 in. above the floor. Handling of heavy parts is taken care of by the jib crane which serves this section, and after the motors are overhauled they are deposited by this crane on other low platforms which are used for O. K. motors.



The Blacksmith Shop Is Well Equipped with Tools to Handle the Forging Work for the Railway

Where armatures require repairing or rewinding they are taken by the overhead traveling hoist to the department of electrical repairs. Here they are placed on armature stands, where dismantling and rewinding are done. Two lathes in this department are used for turning commutators, slotting, truing up armature shafts, and other work on electrical equipment. A banding lathe takes care of armature banding work.

Oven Provided with Both Steam and Electric Heat

All armatures and field coils are dipped and baked. This work is done in the corner nearest the overhauling shop. A jib crane serves the dipping tank, oven and armature racks which are installed along the wall. The

Digitized by Google

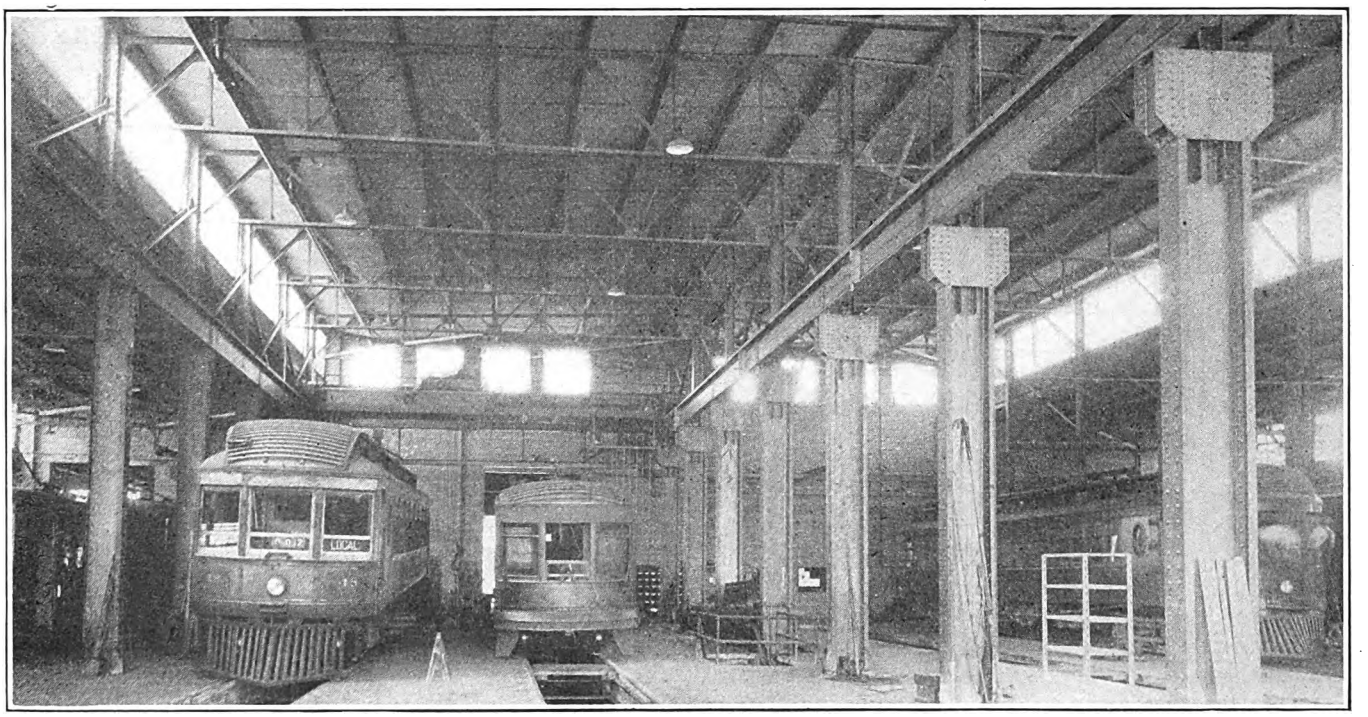
baking oven is located in the southeast corner of the electrical department. Both steam and electric heating are used in the oven. Steam is used to bring the temperature up to the proper baking point, after which the temperature is held there automatically by the electric heaters under thermostatic control. As live steam is available from the adjacent power house a considerable saving in electrical energy is obtained by this method. The oven is also equipped with a Bristol recording thermometer and a Westinghouse insulation tester. This latter equipment is essentially a voltmeter in series with the armatures being baked. One side of the voltmeter is connected to the trolley circuit and the other terminal with the commutator of the armature, while the shaft is grounded to the truck on which it rests. When the voltage reading drops to 10 the armature has been baked sufficiently. Provision is made so that the tester may be connected to six different armatures and separate tests can be made by merely operating a switch without opening the door of the oven.

At the present time the armature dipping tank is placed near the oven and is stationary, but it is planned to mount it on a truck so as to make it portable. A narrow-gage track runs from the doorway into the oven, and a truck with a capacity for eight of the largest types of armatures on end is used for rolling into the oven.

This electrical repair department also takes care of maintenance work on controllers, resistors, circuit breakers, unit switch groups, relays, brush holders, etc., and for doing this the shop is well equipped with modern work benches, which are mounted on steel legs and equipped with steel drawers. Steel skeleton shelves are also distributed throughout the department for racking various materials.

All wheel work is done by machines which are grouped about the through track No. 4. The machine tool equipment includes a wheel lathe, press, boring mill and axle lathe. Car wheel storage is underneath this section in the basement and wheels are rolled through a door from the outside directly into this section. New wheels are lifted through the hatchway in the overhauling shop by the jib crane and are rolled to the boring mill and wheel press. Wheels removed from cars are rolled to the wheel press, or to the wheel turning lathe, and after the work is completed they are returned to the trucks or else are lowered through the hatchway. Any surplus wheels and axles are returned to the basement storage. If required for immediate use they are returned to tracks 3 and 4 for mounting in trucks. The radial jib crane of the machine shop serves the wheel lathe and press and also the engine lathe in the corner which is used for axle work. The car wheel boring mill has its own hoist as a permanent fixture of the machine.

Machine tools in the machine shop are grouped along the opposite wall from the wheel section. The arrangement of machinery is shown in the accompanying floor plan and the table gives a detailed list of the machine tool equipment. Work necessary for babbitting bearings is done in one corner of the machine shop and an electric babbitt pot is provided for this work.

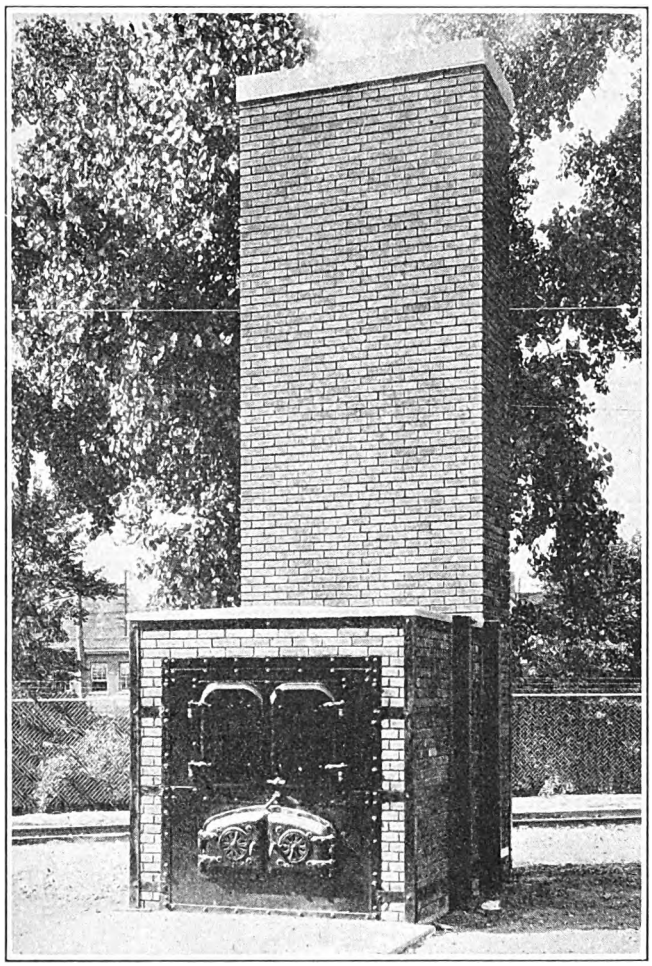


The Central Bay, Used for Overhauling Heavy Equipment, Is Provided with a 25-Ton Traveling Crane

The blacksmith shop is well equipped with tools to handle the necessary forging work of the electric railway system. One corner of the blacksmith department is partitioned off as a welding room. This is equipped with a Westinghouse motor-generator set for electric welding. Acetylene gas is also used for some welding operations, but is used principally for cutting purposes. About 90 per cent of the welding is done electrically. The electric welding machine is portable and also is provided with long leads so that welding work can be done in the overhauling section of the shop if necessary. Heavy work is handled by the I-beam hoist and jib crane. All windows along the west side of the shop are equipped with Venetian type window shades with blinds.

There is a large open space back of the overhauling shop which can be used for outside storage, but as the basement portion is quite large, it is considered that this will be ample to take care of the needs for some time. Access to the basement is by a rear door which

Digitized by Google



The Incinerator Assists Materially in Keeping All Departments Free from Refuse. It Is 7 Ft. 2 In. x 10 Ft. 6 In. x 7 Ft. High and Has a 22-Ft. Stack

opens directly into an areaway and, in addition, as already described, material is also handled through the hatchway in the shop by means of the jib crane. In the space back of the shop is an incinerator plant where all refuse material is burned and where insulation is removed from copper parts for sale as scrap, as are also salvaged iron parts. One corner of the basement is fitted as a wash room with shower baths, locker room, lunch and rest room for shop forces. All plumbing fixtures are porcelain, except the wash fountains, which are pearl marmorite. These wash fountains are of circular concrete type and are provided with foot rings for control of the water so that it is turned on only while being used for washing purposes.

The building is heated by direct radiation. The machine and blacksmith shops have unit heaters in addition with a low pressure vacuum system. Steam suitably reduced for heating is furnished from a power house near by. All electric lighting fixtures, placed in a manner to produce the best lighting effects, are in accordance with the latest practices and codes. A complete fireproof transformer distribution vault in the basement provides all power and lighting requirements.

The shop air system is supplied by a National Brake & Electric Company's 225-ft. compressor located in the basement underneath the machine shop. The shop air pressure is 110 lb. From the compressor a main line runs to the central part of the shop and then a cross line runs through the high part of the basement to the walls. This line has taps at each pit and provision is made for three outlets along the sides of the pits. The air line runs along the north wall of the shop to the air-brake test rack, and piping is arranged from the test rack so that various parts of air-brake equipment can be tested not only on the rack, but also on the cars themselves. This piping runs from the test rack across the passageway to the various pits. Outlets are provided so that air hose can be attached to reach to any piece of apparatus on the car itself and such parts as governors, feed valves, triple valves, etc., are thus tested in place. The test rack is also provided with storage reservoirs and compressors are given a running test against pressure after they are overhauled.

Signal Bells Ring Again in Los Angeles

SIGNAL bells are to be put back on the cars of the Los Angeles Railway, Los Angeles, Cal. The work of replacing them on cars, which are now equipped with metal-strip signals, will be done as rapidly as possible. The bells were removed many years ago because they were found to be a source of irritation to the motormen. A thin strip of metal was used to replace the bell. However, with the progress of time, the traffic noises increased so greatly that it is now difficult for a great many of the motormen to determine whether the conductor has given the signal to proceed.

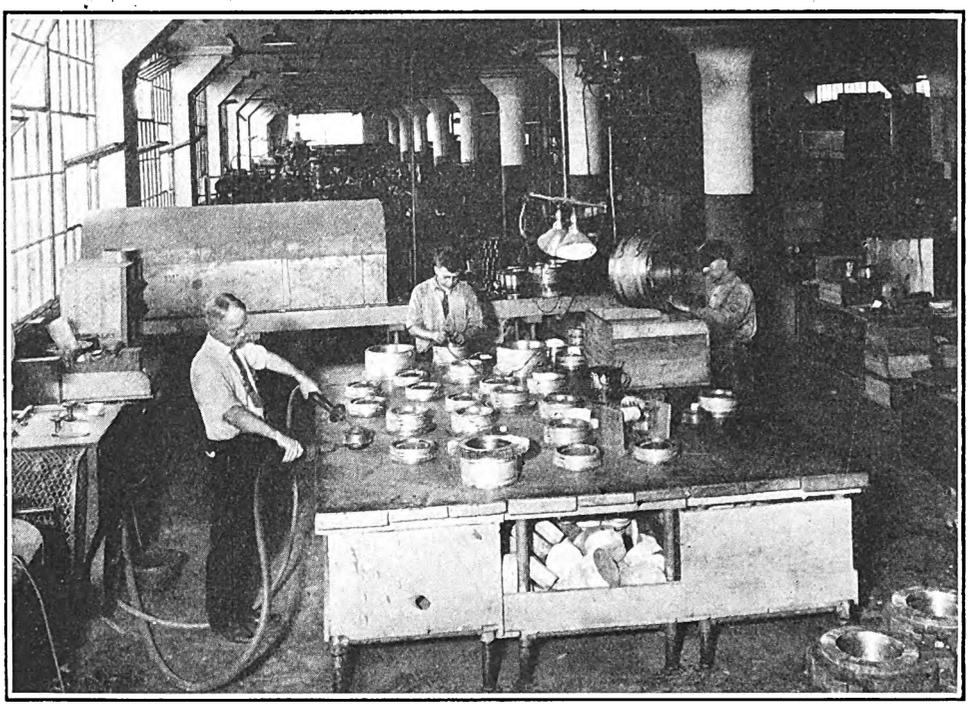
Accurate Machining of the Vs of Assembled Commutators Is Essential*

By Jesse M. Zimmerman
Renewal Parts Engineering Westinghouse Electric & Manufacturing Company

By Machining the Vs of Assembled Commutator Segments to a Smaller Gage Diameter, High Bars Experienced with Arch-Bound Commutators Are Eliminated—Careful Gaging and Testing Insure Accurate Workmanship

IN THE early days commutators were of the arch-bound type. It was necessary to tighten the commutator and "re-turn" the surface at the slightest indication of high bars. High bars were due to the whole structure loosening during the so-called process of seasoning, when the excess bond in the mica strips and V rings squeezed out. This led to the development of three things: (1) A mica plate for mica strips with a properly seasoned bond; (2) V rings which have a minimum amount of bond, along with proper flexibility of the mica; and (3) the "V-bound" or "opened-up" commutator.



Final Test of Assembling Segments and Commutators. This Includes the 500-Volt Bar-to-Bar Test for Assembled Segments and Commutators and a 4,000-Volt Ground Test for Complete Commutator

It will be well to explain the meaning of "gage diameter" of a commutator. It is the distance from the point where the extended sides of the 30-deg. and 3-deg. angles of the copper V or steel V intersect to the same point diametrically opposite. It can be measured accurately only with a male bridge gage.

After extensive tests, it was found that by machining the gage diameter of the Vs of assembled segments a definite predetermined amount, which is dependent upon the size of the commutator, different than the gage diameter of the steel V ring, it was possible to eliminate the difficulty encountered with high bars on the arch-bound commutators. When the commutator is assembled, the pressure of the mica V ring will be first exerted on the 3-deg. angle of the copper V. When the banding wire is cut the bars will all push outward, thus relieving the arch-bound pressure between the copper bars and mica strips sufficiently so that each bar will be held firm by the V ring. "Opened-up" places will appear after the banding wire is cut when the assembly is cold. This is how the name "opened-up" commutator was obtained.

After the assembled commutator has been heated and a pressure applied to the steel V ring, the pressure will also be applied to the 30-deg. angle of the copper V, drawing the bars in. When the assembly is cold, an equal pressure will be applied on the 30-deg. as well as the 3-deg. angle, thus holding each individual bar firmly so that it cannot raise or lower, should the bond squeeze out or the mica strips shrink.

Bars with Vs and Neck Punched to an Unfinished Size

Tapered bars for building commutators come either rectangular or with the Vs and neck punched to an unfinished size. The procedure for preparing these bars for machining is slightly different after alternate strips of mica and copper bars are built on a building plate, and will be dealt with separately as far as the work differs. The milled slots in the building plate permit the mica strips to extend beyond the copper bars, so as to produce the rear mica extension.

After the mica strips and copper bars are built on a building plate they are assembled on a dummy bushing. The assembled segments are then placed in an oven and heated to 150 deg. C. A split ring, which has a tapered face on the outside, is placed around the assembled seg-

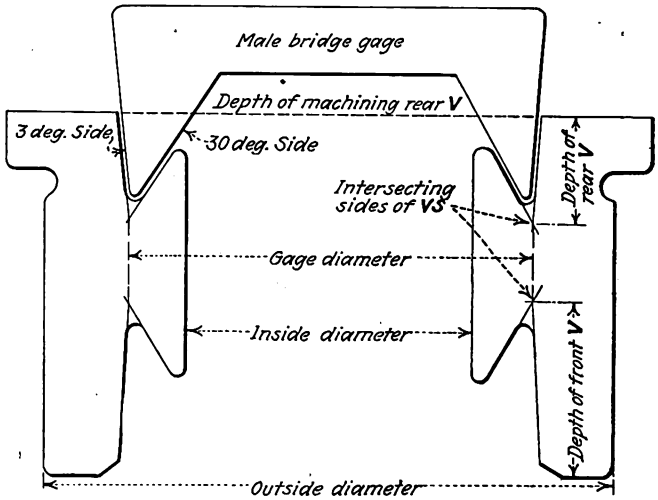
*This is the third article in this series on commutators. Others were "Choosing Materials for Railway Motor Commutators," published Aug. 21, and "Important Considerations in Replacing Commutator Bars," published Oct. 23.

Digitized by Google

ments while they are hot. A strip of fishpaper is placed between the ring and the assembled segments. A solid ring, which has a reversed tapered face on the inside, is placed over the split ring and pressed on at a pressure of 20 to 30 tons. This produces an arch-bound assembly. The dummy bushing is removed and the commutator is allowed to cool before the Vs are machined.

After the rectangular copper bar and mica strips are built up, a three-piece clamp ring is placed around them and the bolts are drawn tight. A strip of fishpaper is placed between the ring and the assembled segments. It is important that the assembled segments form as true a circle as possible. After the clamping ring is tightened around the assembled segments, they are placed in an oven and heated to 150 deg. C. The bolts on the clamping ring are then pulled tight, forming an arch-bound assembly.

It is difficult, if not almost impossible, to measure the Vs accurately by a scale, calipers, etc. A special tool is made for this purpose, which is called the "male bridge gage." It is used to measure the diameter of the intersecting sides of the copper Vs and to check the accuracy of the angles of the Vs. It has two projec-



A Graphical Illustration of the Male Bridge Gage

tions which are the exact size of the Vs in the assembled segments. The extended sides of each of the 30-deg. and 3-deg. angles of the projections intersect at two imaginary points that are the same distance apart as the gage diameter to which the copper Vs are machined. Since the Vs of the assembled segments are machined to a gage diameter, which is different than the gage diameter of the machined steel Vs by a definite predetermined figure, the male bridge gage is made different by the same predetermined amount.

The depth to which the Vs are to be machined is marked on the projecting Vs by a special tool. This tool is made so that it will fit over the end of the projecting V. It has a clamp which holds the steel scale. The extended 30-deg. and 3-deg. sides of the V of this tool have an intersecting point, which corresponds to the intersecting point of the sides of the copper V. Assume that the V is to be machined 2 in. deep. Then the 2-in. point of the steel scale is matched with the intersecting point of the V on the tool. The tool fits over the projecting V of each end of the male bridge gage. The end of the steel scale is the depth to which the V is to be machined. This point is marked on the side of each projecting V of the male bridge gage. When

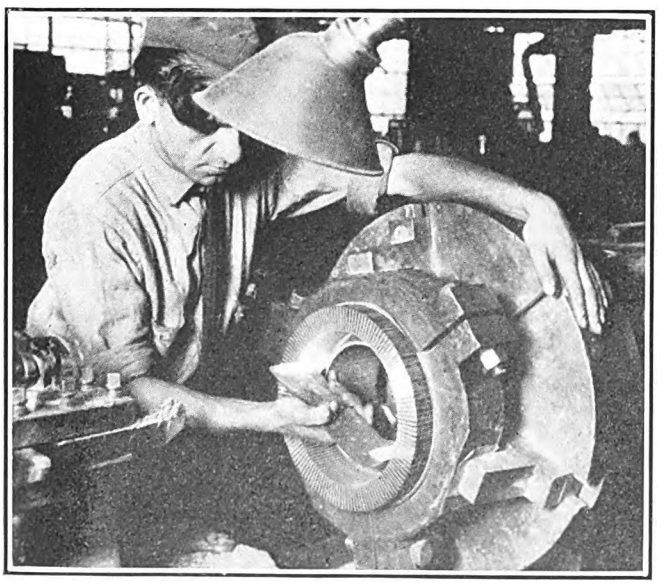
the two marks are in alignment with the end of the bar, it shows the correct machined depth of the Vs.

In the manufacture of a set of assembled segments, there are certain refinements that are essential if the life and service are expected to equal that of the original commutator. The lack of these refinements often causes premature commutator failures. Since every commutator failure invariably means damaged armature coils and various other motor troubles that will cause delays in service, one must take into consideration the cost of the delays caused by premature commutator failures when determining whether a set of assembled commutator segments without these scientific refinements should be used.

Some of the refinements necessary in the manufacture of assembled commutator segments are as follows:

A rear mica extension of $\frac{1}{16}$ in. should be allowed on all railway commutators. It serves as a barrier between the bars, thus eliminating the possibility of short circuits caused by solder while soldering the armature leads. It also increases the creepage distance between bars.

A mica extension of $\frac{3}{32}$ in. is desirable in the bore



Gaging Inside Commutator Segments During Machining Operation

of the assembled commutator segments. This mica extension, along with a drawn radius at the bottom chord of the bar, provides ample creepage distance between bars. Sometimes the distance between the commutator spider and the bore of the assembled segments is so small that it is necessary to machine the bore in order to provide sufficient clearance to assemble the mica V ring and mica bushing. When the bore is machined the burr, which is dragged to one side of the bar by the boring tool, should be removed by a special engraving tool being drawn over the mica strip. This tool gives the bar a small radius as well as removing all copper "drag overs," thus increasing the creepage distance between bars.

The commutator bars should not be out of axial alignment more than the width of a mica strip. It is essential that the bars be parallel with the carbon so that the brush will short circuit the same bars at the front of the commutator as at the rear.

The distance from any bar to the corresponding bar under the next pole should not vary more than plus or minus $\frac{1}{32}$ in. This variation is controlled by keeping the variation of the copper bars and mica strips within the specified variation of plus or minus 0.001 in. If this variation is larger or smaller, sparking will be prevalent at these spots. This is equivalent to increasing or decreasing the width of the commutating zone while the brush setting remains constant. Consequently when a wider or narrower commutating zone passes under the brushes, they must short circuit bars connected to coils whose potential is not zero. Therefore, sparking will be prevalent at these points.

Assembled segments should be heated in an automatic temperature controlled oven at a temperature of from 125 deg. to 150 deg. C., before the Vs are machined.

The process of heating the assembled commutator segments before the Vs are machined is neither to drive out the moisture nor to get rid of the excess bond, as the mica plate should not contain live bond which will squeeze out. They are heated above the maximum temperature to which they will be subjected in service so that the bond in the mica, which is hard when it is cold, will soften and conform or adjust itself to the irregularities of the bars. This allows the clamping ring to draw the individual bars into a tight arch-bound assembly under maximum temperature conditions to which it will be subjected in service. It is this adjusting quality of mica which makes the breathing action of a commutator possible when it passes through the alternate heating and cooling periods in operation. The use of mica plate, which does not have the bond seasoned, should be avoided for use as commutator strips, as the bond will squeeze out.

Heating softens the surface shellac, thus cementing the copper bars and mica strips into a solid body. This facilitates assembling when the banding wire is cut. This cementing action of the surface shellac on the mica strips also keeps the oil and moisture absorption at a minimum.

The Vs of the assembled segments must be machined with a machine tool held in a positive slide set for each angle. This insures that the 30-deg. and 3-deg. angles will always be symmetrical with the gage line, thus insuring absolute interchangeability and a tight-fitting job when the commutator is assembled. If the angles are not symmetrical, the 30-deg. angle may be 29 deg., thus making the 3-deg. angle 4 deg. It can be seen

Digitized by Google

that, with this condition, a space will be left between the 3-deg. angle of the copper and the mica V ring. When this happens, it is necessary to remove the V ring and build it up so as to make the commutator tight at this point, thus keeping the oil out.

The gage diameter of the assembled segments must be machined so as to relieve the arch-bound pressure between the bars sufficiently to permit a "V-bound" or "opened-up" commutator. This has been discussed in the preceding part of the article.

The machined Vs must be gaged with a permanent male bridge gage, while they are held by the steel clamping ring. The use of this gage has been discussed.

The 3-deg. angle of the assembled segments must be machined so that it will form a tight joint between the copper bars and the mica V ring, thus keeping the oil and moisture from penetrating the commutator.

All burrs and copper drag-overs from the machining operation in the Vs must be removed by running an engraving tool over the mica strip between the bars in the Vs. The machined Vs should be painted with a coat of thin shellac. This protects the Vs from dirt, oil and moisture while in storage.

The milled slots for the conductors should have the bottom corner at the rear of the slot rounded. If a sharp edge is allowed to remain at this point it may cause a nick in the armature coil lead, thereby increasing the possibility of broken leads.

The milled slots should be coated with pure resin flux to eliminate corrosion and to facilitate the soldering of the leads when winding the armature.

Where the assembled segments are to be used with a two-piece mica V ring, a duct must be machined in the bottom of the Vs for the clearance of the mica V ring. A 500-volt bar-to-bar test should be made to show up any possible short circuits. If any are found, they should be cleared before shipping.

Duisburg Installs Articulated Car

GERMAN street railways, like those in the United States, are experimenting with articulated cars, and the latest installation in that country is a two-body, three-truck car recently put in service by the Duisburg Street Railway. *Verkehrstechnik* declares the car is giving satisfaction, and the ability of passengers to transfer from one car body to the other has proved a great convenience over the former practice of running a motor car and trailer with no such facilities. The main dimensions of the car follow:

Length over all (exclusive of bumpers)	20,550 mm., or 67 ft. 5½ in.
Truck base (between the centers of adjoining pairs of trucks)	7.033 mm., or 23 ft. 1 in.
Wheel base of trucks	1,700 mm., or 5 ft. 6 in.
Outside width	2,200 mm., or 7 ft. 3 in.

On account of the narrowness of the car body, it is possible to install seats for only three persons across the car width, as shown in the plan. This practice, which is necessary in many German street cars on account of the narrowness of streets, cuts down the carrying capacity, which in this car is as follows:

Standing load on end platforms	12 passengers
Standing load on inside platforms	40 passengers
Standing load in aisles	4 passengers
Seated load	44 passengers
Total	100 passengers

The middle truck is built under the Jacobs patents, mentioned in connection with articulated cars in Berlin on page 259 of the issue of this paper for Feb. 14, 1925. The entire car has two motors, one on each of the end trucks. The vestibule is of the bellows type.

Building Up Worn Journals of Car Axles by Automatic Arc Welding in the Shops of the Worcester Consolidated Street Railway

Building Up Worn Surfaces by Welding*

This Is the Largest Field for the Welding Process in the Railway Shop—Worn Faces of Yokes, Brake Rigging, Brake Heads, Journal Boxes and All Truck Parts Can Be Built Up to Good Advantage—Motor Frames and Housings Offer Large Field for Economical Repairs

By W. L. Harwood

Engineer of Power and Equipment Springfield Street Railway and Worcester Consolidated Street Railway, Springfield, Mass.

SHOP welding was begun on the Worcester and Springfield electric railway properties, with which I am connected, in 1915, eleven years ago. At that time two Indianapolis resistance type welders were purchased. Besides using them for trackwork they were employed to repair broken motor cases, gear cases, and the like.

Since then we have purchased much more elaborate shop welding equipment. In 1916 two Lincoln bonding machines were bought for track bonding. They were used on both properties for electric shop welding. In 1917 we purchased two acetylene outfits, and in 1919 we installed the first motor-generator sets strictly for shop welding. In 1920 we purchased our first automatic welders, so we have had a very complete welding plant on both the Worcester and Springfield properties for more than six years.

In Springfield the plant consists of a conveniently located welding room with a 300-amp., constant-potential welding motor-generator set, a 175-amp., constant-potential set and automatic welding equipment with a specially equipped lathe for automatic welding.

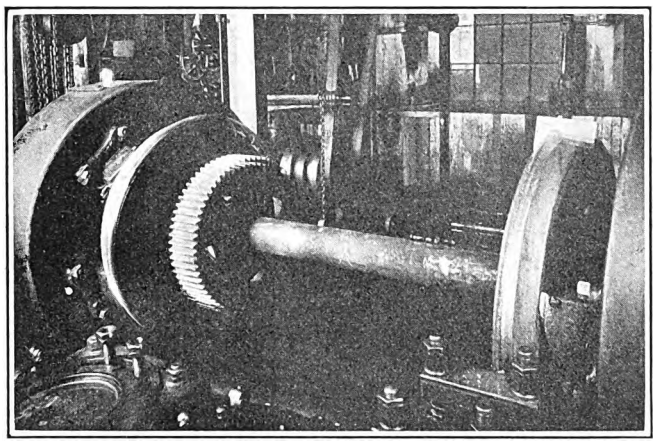
In Worcester the arrangement is somewhat different, the welding being done in a series of seven rooms that have corrugated iron partitions, the doors being protected by canvas curtains. Two of these rooms are for automatic welding and five are for manual welding. These booths are equipped with two 300-amp., constant-potential motor-generator sets, a 200-amp., constant-potential motor-generator set, a 175-amp., constant-current set, a type "W" dynamotor, which, although purchased originally for track welding, is at the present time being used by the shop, and two automatic welding equipments used in connection with lathes arranged for this class of work.

The welding force consists of two welders in Springfield and provision for five operators in Worcester. At the present time we have four operators. The welding rooms on both properties are served by a system of overhead trolleys with hoists to facilitate the handling of work as much as possible. The walls of the booths are painted with an ultra-violet protective paint.

*This article is based on material given in a paper before the New England Street Railway Club, Boston, Mass., Oct. 28, 1926.

Digitized by Google

There are many fields for electric welding, probably the largest being the manufacture of new equipment, but we do not believe that manufacturing is a field of the electric railway repair shop. During the war, also, when supplies were hard to get, the welding equipment was called upon to make repairs to parts when new parts could not be obtained and where otherwise it would have meant holding cars out of service. We have found that the largest field for electric welding in



Finished Pair of Wheels after Having Worn Flanges Built Up by Automatic Arc Welding

electric railway repair shops, at least in our shops, is to build up worn surfaces on all kinds of motor and truck parts.

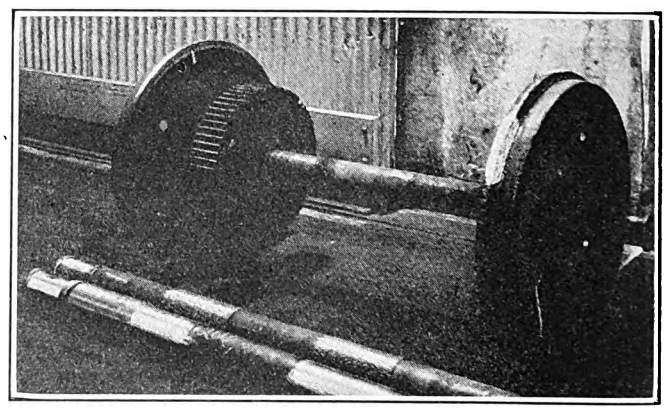
It is difficult to give a good idea of just what parts we reclaim. A list of the articles we weld would look very much like a parts catalog for truck and motor equipment. As the equipment goes through for overhauling, however, all parts with worn surfaces, bolt holes, etc., are filled up and redrilled. Worn surfaces such as on yokes, brake rigging, brake heads, journal boxes, etc., are built up and machined where necessary.

We have rebuilt some 611 motors, both of the older split-frame type and the later box-frame type. In the case of the split-frame motors, such as GE-67, GE-80 and GE-87, the axle and armature bearing housing surfaces are built up where they are worn. All bolt holes in the case are welded and the worn surfaces where the motor is split are built up by welding. When the case leaves the welding room it is practically a rough casting, the only machined surfaces being the pole-piece pads and the holes where the pole pieces are bolted on. These latter surfaces, of course, do not wear. The surfaces where the two halves of the frame are bolted together are then planed. We have this work done in an outside shop, as we found one which was glad to get this work at a reasonable price. The bolt holes are then drilled, using a drilling jig which bolts to the field pad surface. This jig insures correct location of holes in the case and also insures interchangeability.

The next operation is to rebore the axle and armature bearing housings. This work is done in a No. 31 Lucas horizontal boring and milling machine. We have a simple jig for setting up the motor in the machine, consisting of a drum of the proper diameter to fit inside of the pole-pad surfaces. It is simply necessary to set the casing on this drum and bolt it in place, using the bolt holes provided for fastening on the pole pieces. Westinghouse 101-B motors are treated in a similar manner, except that in the case of the No. 101-B we rebuilt the motor to make it into a No. 101-B-2. In redrilling the bolt holes we relocate them and drill them for 1¼-in. bolts in place of the 1-in. bolts used on the No. 101-B. We install a newer type of armature bearing housing and also change the brush-holders to the stud type.

In the case of box-frame motors, the wear is in the axle and armature bearing housings. These are built up in some cases without removing the field coils. The armature bearing housings are machined in a wheel boring mill and the axle bearing housings in the horizontal boring mill. Worn pinion fits on armature shafts are built up by electric welding, the old keyway being filled up, a new taper turned and a new keyway cut. This is the process used with carbon steel shafts. We understand, however, that this practice is not recommended for the heat-treated alloy steel shafts we are now using.

Six years ago we installed our first automatic welding equipment, and found that it was possible to do a class of welding not practicable with the hand process. For example, we had experimented more or less successfully with building up axles by hand welding. I remember especially the first axle we built up by this method in Springfield. It was a 6-in. axle and the job looked good, but when we put it in a lathe we found that it was very badly sprung. As we did not have a sufficiently powerful axle straightener at that time we had to call on the track department, which was able to do it with a rail straightener. The job was a success but expensive. We overcame the springing of the axle with hand welding, but the automatic process we find to be much cheaper and there is no comparison between hand and automatic welding as regards uniformity and quality of the work which can be produced. At the present time we are welding our axles entirely by the automatic process and are using a rod covered with a flux, outside of which is a sheath. We find that this rod gives a much cleaner weld, especially on axles



Car Wheels with Rebuilt Flanges and Axles with Bearing Surfaces Built Up

where there are axle-bearing and journal-bearing fits. By welding up our axles we are able to keep the axle and journal bearings well up to size, increasing the life of the journal and axle bearings. This likewise increases the life of gears and pinions, and, of course, reduces the expense for new axles.

Our first welding of steel wheels was with the automatic machine and was successful. We build up the flanges on all worn steel wheels before turning. In this way it is seldom necessary for us to touch the tread surface. This adds to the life of the wheel.

Digitized by Google

First, we get all the wear there is in the tread rather than turning it off to get stock enough to get a proper flange contour, and, second, it preserves the hard-rolled tread surface, which we believe wears longer than the newly turned surface. Our figures show that welding adds from 60,000 to 100,000 miles to the life of our steel wheels. As regards economy of this shop welding as compared with the purchase of new parts, we make it a general rule that no parts shall be reclaimed where the cost of reclaiming exceeds one-half the cost of a new part. It rarely costs us that much and often a few cents will reclaim an expensive part. However, all costs in an electric railway shop have to be carefully watched, and it is quite possible as a shop gets started in welding to become over-enthusiastic and weld parts which had better be replaced by new. A few average costs for this work are: for labor and material to weld one steel wheel, based on the average of a considerable number of wheels, $3.25, and labor and material to weld and re-machine one GE-67 motor based on the average of a number of motors, $28.62.

For a number of months we kept a record and made out weekly reports of all work done in the welding department, the cost of the work, cost of new parts, and saving. The saving ranged from 50 to 97 per cent, or, in other words, the welding cost from 3 to 50 per cent of the cost of new parts. A rough average would indicate a 75 per cent saving and that our cost of welding averages about 25 per cent of the cost of new parts. The actual dollars and cents saving varies, of course, with the class of work which is going through the shops. On running over the reports, I find one week in Worcester where this ran as high as $1,400. In any event, the saving is very noticeable in our equipment accounts and in the reduction of scrap accumulation.

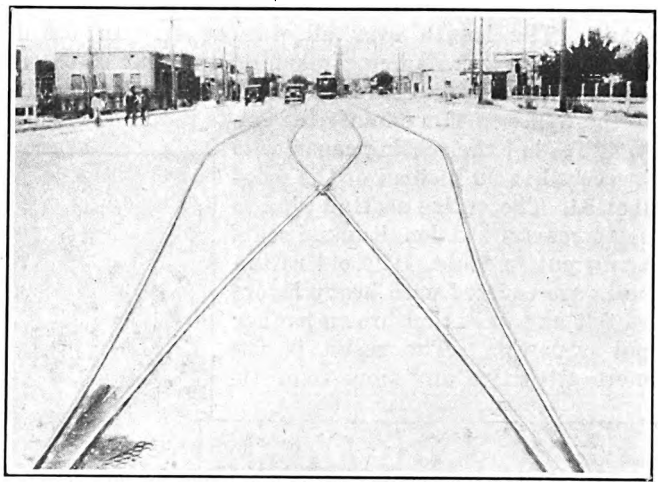
We are making a considerable saving by welding flanges of steel wheels and have been successful in this from the start. We have had but few failures and believe this is the experience of other roads which have tried the welding up of flanges.

In working up information, I endeavored to get complete records of new wheels which have been welded and finally worn out. I found it to be practically impossible as there were no welded wheels which had been worn out, although we found a great many welded wheels in service. The worn-out wheels had never been welded and had made from 105,000 to 155,000 miles, the average being around 125,000 miles. Wheels which have been welded make an initial mileage of from 60,000 to 100,000 and after welding we obtain about 60,000 to 70,000 additional car-miles before the wheels are welded again. We have some wheels which have been welded several times. The wheels which we have welded are principally 34-in. wheels, but we have done some 22-in. and 26-in. wheels.

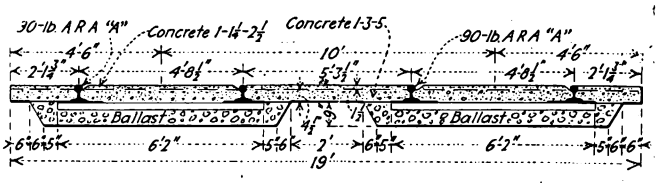
The question has come up a great many times as to the effect of welding of car axles on the strength of the steel. Our records indicate that there is no more breakage with welded axles than with axles which have not been welded. We thought at one time it might be advisable to heat treat old axles, especially after they are welded. This, I believe, is being done by other properties. We have some such axles under test at the present time and have photomicrographs which show the character of the weld and axle before and after heat treatment. So far, however, our experience has not shown that heat treatment is necessary.

Light Steel Tie Construction Used at El Paso

STANDARD section heavy T-rail, steel ties laid on a bed of stone ballast with a 6-in., two-course concrete pavement, is a type of track construction developed by the El Paso Electric Company. According to the brief presented by the company in competition for the Charles A. Coffin prize this year the original cost of this construction is approximately $1 per foot less than any



Track with Concrete Paving on a Stone Ballast Foundation on Alameda Avenue, El Paso



Standard Track Construction of the El Paso Electric Company Includes T-Rail Laid on Steel Ties on a Ballast Foundation. Paving Is a Two-Course, 6-in. Concrete

other equally satisfactory type. Moreover, it is easy on rolling stock, because of its resilience, and replacements and repairs, when these become necessary, are comparatively easy.

After an experience of six years the railway is convinced that concrete pavement is better for the track area than brick or asphalt, besides being cheaper. In this construction the concrete is used solely for paving and not in any way as a support for the track, although, incidentally, it serves to prevent water from getting into the foundation.

Two big jobs were completed during the past year where concrete pavement was used on ballasted track with wood ties. The use of a good grade of oak or pine ties untreated has further reduced the original construction cost and is fully justified on light traffic lines, the management believes. Rail sections were adapted to meet local conditions, both 90-lb. rail and 75-lb. rail being used with success.

In ballasting and tamping track the roadbed is thoroughly wet down and the ballast tamped pneumatically. Cars are allowed to operate over the track all the time to shake it down. During the concreting operations the constant passing of cars is thought to help to work down or tamp the concrete, and as laborers are on the job immediately ahead of the location where concrete is being poured they can watch for and make solid any loose ties.

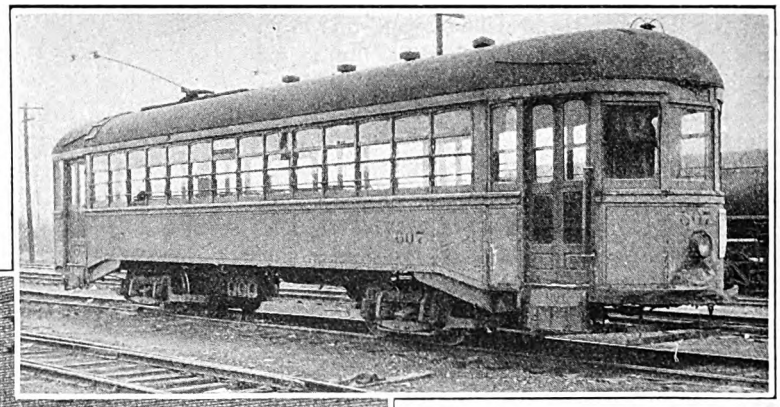
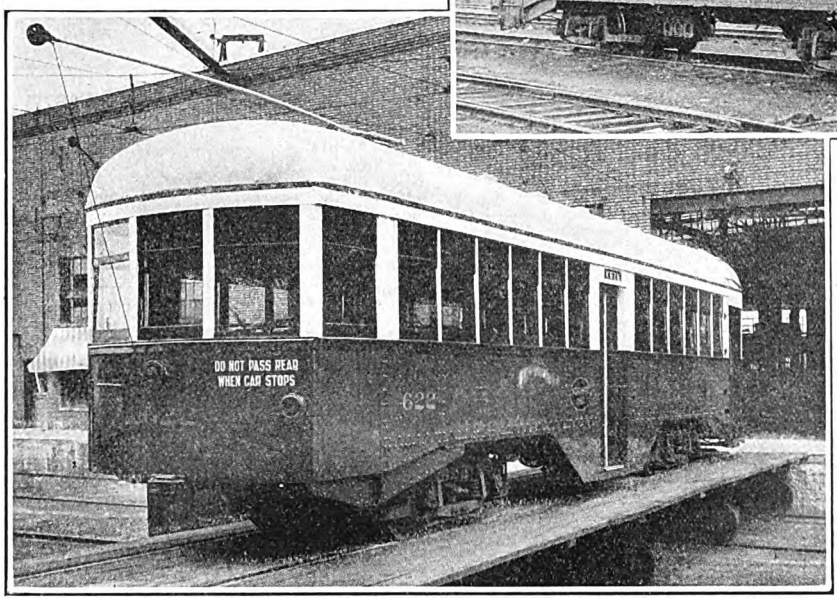
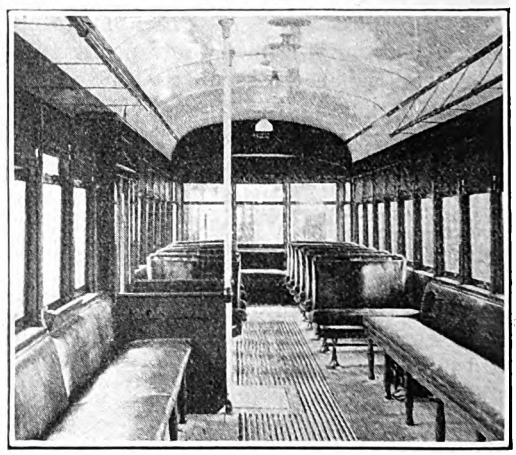
Northern Ohio Modernizes Cars

Both Interurban Equipment and Cars Used in Akron Have Been Rebuilt to Give Up-to-Date and Comfortable Service

FORTY-SIX cars of the so-called "600" type, constructed by the Kuhlman Car Company twelve years ago, are being rebuilt by the Northern Ohio Power & Light Company into cars for one-man operation. They are being patterned after the Peter Witt type of car. The cars were originally constructed for heavy peak loads. The length over all was 46 ft. In the reconstruction 2 ft. is being taken off the rear of the car and circular seats to care for seven passengers installed in the well. In this manner the car is reduced in length to 44 ft., but the seating capacity is increased to 58 instead of the original 54. The entire seating plan is being rearranged, longitudinal seats being put in front. The old rattan seats are covered with heavy layers of felt and imitation brown leather put over this. The result is far more attractive and more comfortable seats than the old ones. These seats, with the lower part of the car in mahogany and the upper in white, make for a car that is pleasing to the public and one that has brought words of praise from passengers.







Above, Old Akron Car Before Remodeling. At Left Exterior and at Right Interior of Remodeled Car

A center door, operated by a treadle, has been installed and the steel sheathing extended down to give the car the appearance of being low. It has been necessary to put in three steps. The steps are 9½ in., but the use of three has brought the first one nearer the ground than the steps of a Peter Witt car. Entrance to the car is at the front and exit is from the center doors.

All safety features are being installed for one-man operation and the cars will be used in Akron city service. Incidentally, all city lines in Akron, with the exception of two, are one-man operated.

One of the improved features from the standpoint of the public is the electric sign in front of the car, just behind the motorman, reading "Exit at Center." The sign lights when the brakes are applied. Another sign, on the rear of the cars for motorists, reads: "Do not pass Rear When Car Stops." The car also carries a stop sign that lights up when the brakes are applied.

The new company colors, red body, green stripe with cream top, are used instead of the former yellow.

It has not been necessary to change the motors. They are of the Westinghouse 307-V type. The car has speed, is of composite steel, easy riding, and is of the best type of construction. The reconstruction costs are comparatively low.

The cars used on the Canton-Akron-Cleveland interurban line are known as the 1500-type. Bought several years ago, they are of steel construction and are still in good physical condition. Some two years ago the company adopted the seat cover plan to add to cleanliness and this brought public approval. The covers were changed daily. Now the company has gone a step farther. The leather seats have been taken out and plush seats installed in the main compartment. New individual leather seats have been placed in the smoker. The Hale-Kilburn type seat is used.

In the changing process four seats are being lost. The interurban car formerly seated 54; it now seats but 50. This adds to the comfort of passengers and gives plenty of room for hand luggage, etc.

The old windows were removed and fourteen new windows 56 in. wide installed, using non-splinter plate glass. This gives passengers a clear view through the window. O. M. Edwards brass sash is also used.

The floors are covered with live rubber, the product of the Goodyear company. Toilet facilities have been added to and improved. As no excess fare is charged, the Ohmer register is retained.

The exterior of the car is the company's standard red. The interior woodwork is of gray to match the gray of plush seats, while the ceilings are in white. All work has been done in the company's shops in Kenmore.

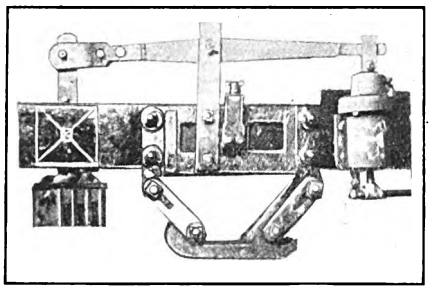
Maintenance Notes

Air-Operated Third Rail Sleet Scraper

SLEET scraper equipment for the third rail has been developed in the shop of the Lackawanna & Wyoming Valley Railroad, Scranton, Pa., and is now being installed on cars for winter service. It is air operated. The equipment consists of a 3½-in. x 4-in. air cylinder, scraper and connecting lever. The cylinder is bolted



Air-Operated Third Rail Sleet Scraper, Showing Scraper, Connecting Lever and Air Cylinder

to the shoe beam at the right and the scraper at the left of the third rail shoe, both being connected with a lever fulcrumed to the shoe beam. The scraper consists of a ½-in. x 2-in. steel shaft, steel scraper head and a set of scraper blades consisting of four ⅜-in. x 3½-in. x 6-in. steel plates set at an angle of 60 deg., spaced ½ in. apart and bolted securely to the head. A hole is provided in the shoe beam to permit of the free vertical movement of the scraper shaft. Pipe connections from the air cylinder to the motorman's cabs, with suitable operating valves, permit of operation when desired. When not in use a pin is inserted through the scraper shaft and rests upon the top of the shoe beam, preventing accidental operation.

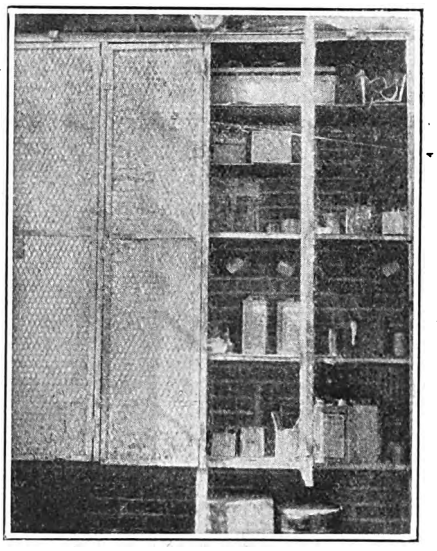
It is stated the scraper blades will give service of about 200 miles and prove a very effective method of removing ice and sleet from the third rail contact surface.

Preventing Vibration of Armature Coils

CONSIDERABLE trouble was experienced with open circuits in armature leads where they bend down to the commutator on type GE-70 armatures in service on cars of the Grand Rapids Railway, Grand Rapids, Mich. With the original method of winding these armatures, the leads were bent down into the end bell, which not only required a sharp bend in the lead, but also was often likely to leave these unsupported if the bends were straightened slightly. An accompanying illustration shows an armature with the old type of winding and also a coil at the top with the sharp bends in the armature leads. In order to overcome these troubles the sharp bends were done away with by bringing the leads down straight from the coil end to the point where they were soldered in the neck of the commutator. This straightening of the leads left a space underneath, which was filled in with asbestos rope. The leads and rope were painted with an insulating varnish so that when completed a firm support was provided. This has effectively prevented the trouble of open circuits.

Lockers Used for Storage of Paints

CARELESS storage of paints, oils and varnishes necessarily increases the fire hazard. To prevent this, James Brown, master mechanic of the Wilkes-Barre & Hazleton Railway, Hazleton, Pa., has devised a very simple but effective cabinet. This consists of four ordinary wire



Clothes Lockers Converted into Paint Storage Cabinet

mesh clothes lockers. The wire backs were removed, the ends and doors covered with sheet steel and suitable metal shelves were installed. These lockers were mounted against

With the New Method of Winding the Leads Are Brought Down Straight to the Commutator and Are Supported Underneath by a Winding of Asbestos Rope

Digitized by Google

a brick wall and fastened securely.

All paints, oils, brushes and varnishes are placed in this cabinet at the close of the day. This gives the shop a very neat appearance and at the same time decreases the possibility of fire.

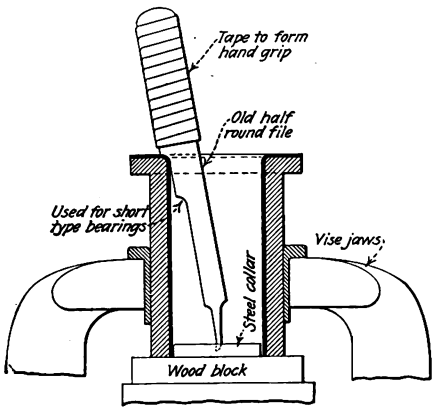
Reported "BO" bearings suggests "B"adly "O"iled.

Bearing Flanges Rounded Quickly

ARMATURE bearings are babbitted to size in the Harvard shops of the Cleveland Railway. The flanged ends are also brought back to standard thickness by applying a layer of babbitt. After being poured the bearings are passed to a finisher, who trims off the ragged edges and rounds the flanged ends of the bearing. The tool used for this operation consists of an old half-round file carefully ground so as to provide a cutting edge and accurate radius for the rounded portion. The top portion is wound with tape to form an easy grip for the hand. The bearing is placed in a vise with the unflanged end resting upon a special block. The top of this block has a steel collar that fits inside the bearing. This block has a hole in the center, into which the sharp end of the cutting file is placed. Then by rotating this around the inside of the bearing the flanged end is given the desired radius. This provides a quick method for rounding the inside of the flanged ends and the cutting tool is arranged with offsets at different heights, so that different length bearings can be rounded with the same tool.



A Half-Round File Accurately Ground with Cutting Edges Is Used for Rounding the Flanged Ends of Armature Bearings in the Harvard Shops of the Cleveland Railway

Dick Prescott Simplifies Maintenance

But Trouble Continues to Brew

PETE WELCHER, chief inspector in the Consolidated Railway & Light Company's shop, carefully nursed his grudge against Dick Prescott, newly appointed assistant superintendent. He lost no opportunity, in speaking with various workmen, to disparage Dick's ability by carefully guarded remarks suggesting contempt for the young executive. At the same time, his henchmen—"Slowfoot" Lewis, "Lefty" Kooms and "Shorty" Green—did their part in spreading the seed of discontent among the various workmen in the shop.

Totally unaware of this propaganda and the faint mutterings of trouble which it succeeded in arousing, Dick busied himself with the task of cutting out lost motion in the shop through proper planning of maintenance procedure. He spent considerable time in the storeroom and inspected carefully the requisitions received from various departments. He discussed these with the storekeeper and discovered many opportunities for eliminating confusion by reducing the number of different types and sizes of given parts ordered for replacement.

As this program continued, orders for new material were limited to certain selected standards and all other types and sizes formerly used were put on the obsolete list. As cars came through the shop for overhauling it became the practice to equip one or more of each series complete with new standard parts. The obsolete material removed was held for use in making individual repairs and replacements until the stock became exhausted, whereupon another overhaul car was stripped and equipped with standard parts.

Dick found that this gave an opportunity for materially improving the procedure followed in ordering spare parts from manufacturers. It had been customary to place many small orders for comparatively minor repair items as the need arose, with little effort at consolidation of such orders into reasonable commercial quantities. The wide variety of parts required, some of which were for use on very old equipment, still further aggravated this condition. As a result, many of these orders were unattractive to supply houses and manufacturers, although the costs of such parts were high and deliveries very uncertain. The policy of reducing variety in spare parts helped to relieve this situation. George Stewart, the storekeeper, who at first was skeptical of the new plan, soon became openly enthusiastic. As time went on he found that the reduction in the number of types automatically made it possible to consolidate items and to order parts in commercial quantities.

With opportunities thus opening on every hand for improvements in the shop, Dick was too intent and busy with the job to be aware of the activities of his enemies. But matters were coming rapidly to a serious situation. One day, as Dick passed the door to the little office of his friend Steve White, carpenter foreman, the latter hailed him and beckoned him inside. As Dick entered the little office, Steve carefully shut the door.

Overhauling Methods of the Pacific Electric Railway

BY F. E. GEIBEL
Assistant Superintendent of Equipment
Pacific Electric Railway, Los Angeles, Cal.

GENERAL overhauling and heavy repairs to electrical equipment operated by the Pacific Electric Railway are done at the general shops and running repairs and inspection at the division shops. The general shops are located at Torrance and were described in ELECTRIC RAILWAY JOURNAL for July 21, 1917, and Aug. 17, 1920. As an indication of the large volume of work done at these shops by the mechanical forces, this year's program includes the complete overhauling of 350 cars and 72 motor coaches. In addition to this, much work is done in making repairs necessary to restore to service equipment damaged by accidents.

Cars for general overhauling are brought into the shops on tracks adjacent to the scrub room. On these tracks the car is inspected and the necessary repairs are determined upon. The car is stripped of cushions and other trimmings of the body and is then moved to the scrub room, where it is cleaned thoroughly by a steam process. After this cleaning, the paint surface, if in good condition, is ready for repainting. It may be necessary, however, to remove the old varnish with ammonia or burn off the old paint before refinishing. Paint is removed from steel cars by sandblasting and a special room is provided for this work. After this work is done the car is moved to a track in the air room, where the trolley base and air compressor are removed and replaced with newly overhauled ones.

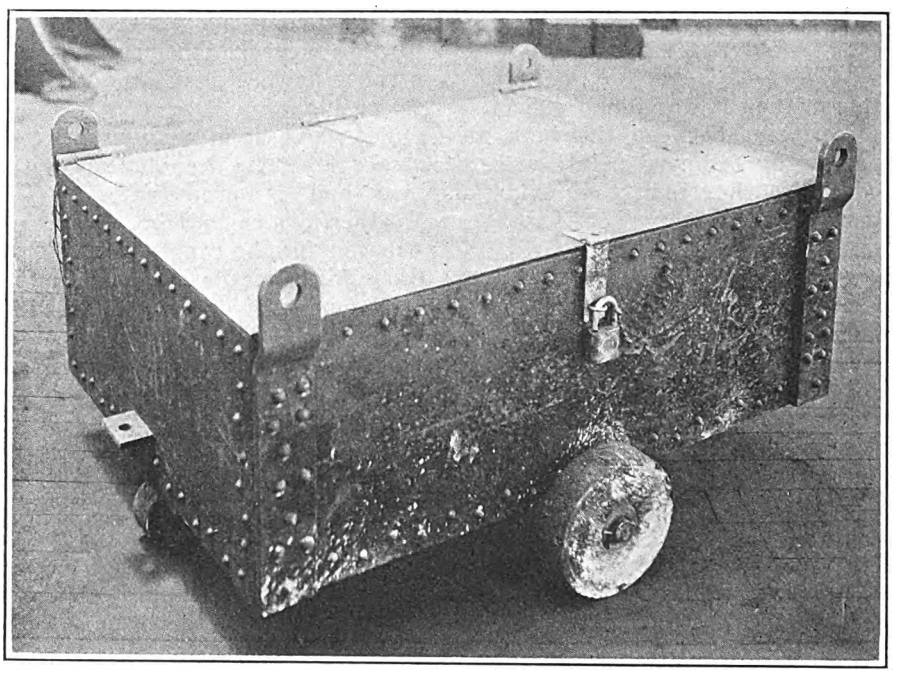
In the erecting shop the car is jacked up and placed on stands. The trucks are sent to the truck shop and air and electrical equipment needing repairs are removed and sent to the control and air rooms for this work. While the various equipment is being overhauled carpenters and cabinet makers make necessary repairs to the body, underframe, sash, doors, etc. After the equipment is repaired and replaced and pipemen and wiremen have cleaned, checked and adjusted both air and control equipment the car is again ready to be placed on trucks.

Sandblasting is used extensively in connection with truck overhauling, as this removes dirt and rust so that a close inspection can be made for defective parts. Wearing parts are renewed or built up by welding. Wheels are removed, renewed, turned or ground, as may be necessary. Armatures are removed from the motors and are cleaned and dipped in insulating varnish, after which they are baked. Equipment for this process has been installed but recently. Dipping and baking fill in the pores of the insulation and cement the coils solidly in the core slots. This prevents vibration and consequent wear of the insulation, which is one of the principal causes for grounds in armatures. After the fields have been renewed or repaired the entire motor case is painted inside with insulating paint and the motor is then assembled on the truck. In the interval, brush-holders and connections have been repaired or renewed. After a very thorough running test of the motors the trucks are sent back to the erecting shop.

With the car body again placed on its trucks the car is sent to the paint shop, where repairs or repainting are done. The process used by this railway is the color and varnish system, which so far has proved more satisfactory than either the enamel or lacquer systems. Removable parts, such as seats, gates, equipment boxes, trucks, etc., have the paint applied with a spray gun, but the brush system is used for painting the car body itself. After painting, air men and electricians complete any small adjustments and test out all equipment. The car is then trimmed, which consists of replacing all seats, curtains, sash, locks, signs, etc.

Locked Receptacle for Package Goods

TRANSPORTING loose parts and small package goods from the main storeroom to electric railway shops often constitutes quite a problem. This refers particularly to such material as screws, fuses, small commutators, small reels of copper wire, shunt wire, silk tape, brass brush-holder parts, etc. In order to provide a sturdy receptacle for such materials which can be handled easily and also to provide for locking so that the contents cannot be tampered with until the destination is reached the Brooklyn-Manhattan Transit Corporation uses what is called a "Tote" truck. Ordinarily these trucks are used in pairs, the one in the storeroom being loaded up while the one at the shop is exchanged for the loaded one each trip. These trucks are made of sheet iron and are 3 ft. x 4 ft. x 2 ft. high. The cover is hinged at one side, while at the other a clamp provided with a padlock keeps the receptacle closed. The padlock is provided with two keys, one of which is held by the storeroom and the other by the consignee. For rolling about the shop and storeroom two sturdy wheels are provided in the center on each side and a smaller wheel in the center at each end. Bails are provided for handling and pulling the truck. There are four on top, one at each corner, to make loading of the truck onto the supply car by means of a hoist or crane an easy performance.



Receptacle on Wheels Provides a Handy Method of Transporting Small Package Goods

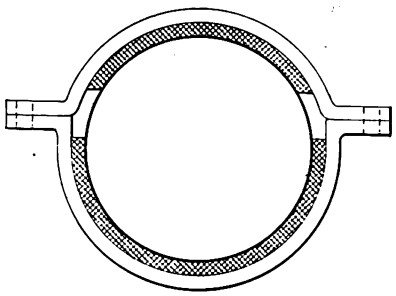
Preventing Oxidation of Air Tanks Under Hangers

INSTALLING a strip of canvas soaked in oil and white lead between the air tank and the tank hanger is preventing the oxidation of air tanks under hangers on the cars operated by the New York Railways.

Previous to the introduction of this method it was found difficult to force paint between the tank and hanger by ordinary painting methods, with the result that oxidation took place.



The Shaded Part Is Canvas Strip Soaked in Oil and Lead and Placed Between Air Tank and Hanger.

Systematic inspection and careful tests
Will keep you out of a "hellofa" mess.

Another Use for the Sand Blast

THE Indiana Service Corporation, Fort Wayne, Ind., had some wicker chairs which were used in buses. These chairs had been painted, and in overhauling them it was desirable to clean the old paint off. It was very hard to get under the reeds where they cross each other and the usual process of cleaning was quite tedious. Arthur Redderson, superintendent of motive power, conceived the idea of trying a sand blast for removing the paint. The air pressure was choked down to 45 lb. and particular care was used not to keep the blast on one place for too long a time as there might be danger of cutting the reeds. The method worked out well and much time and trouble were saved. This company has also used the sand blast for removing paint from canvas roofs where the painting has become badly alligatored. Mr. Redderson believes that the sand blast will work well for removing paint from cane seats with proper care.

New Equipment Available

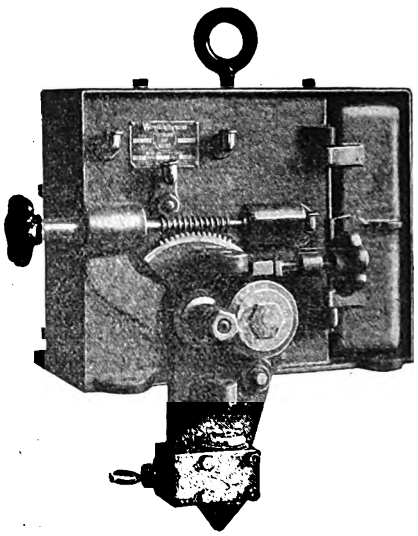
Motor-Driven Portable Air Compressor

SUFFICIENT air capacity to operate a hammer rock drill, a heavy-duty concrete breaker or two or three spades for digging clay is possessed by the Sullivan portable air compressor. The machine is driven by a direct-connected electric motor and has a capacity of 103 ft. of air per minute. The design embodies two vertical cylinders, single acting. These are splash lubricated with positive control of the amount of oil reaching the cylinders. Both the compressor and motor run at a uniform speed of 750 r.p.m., the even turning movement being insured by a heavy flywheel inside the compressor casing.

The whole rig is mounted on a cast-steel frame of a deep and heavy section and is protected from the weather by a canopy top. Water circulation for the compressor cylinder cooling is by means of a small centrifugal pump driven by a little pulley on the crankshaft. The machine may be mounted on steel wheels, or, if desired, on a Ford truck. It may also be mounted on a trail type truck with spring suspension and rubber-tired wheels, or on a timber skid. A similar unit of double the capacity has also been placed upon the market by the Sullivan Machinery Company. One of the units described was on exhibit at the American Electric Railway Association convention in Cleveland, being connected up so as to show actual operation on a track job.

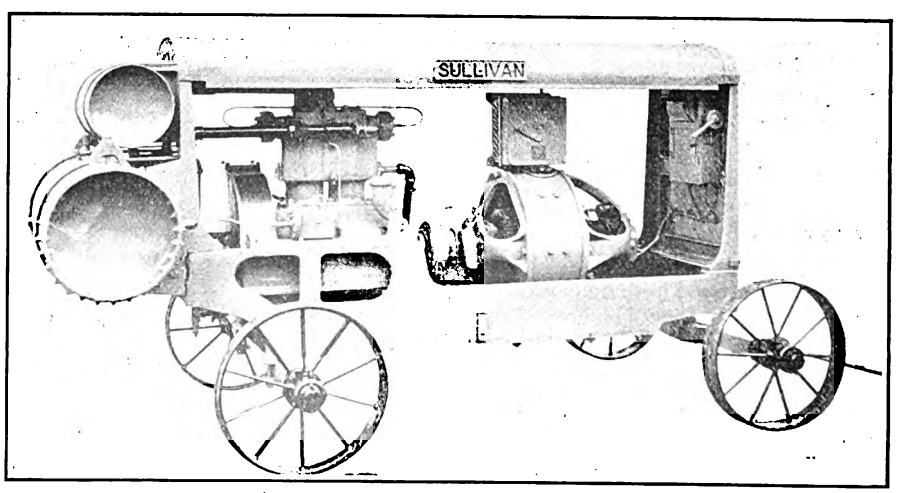
Automatic Feed Machine for Arc Welding

A MACHINE for automatically feeding a continuous welding wire to the work at any speed up to 3 ft. per minute, which is necessary to maintain a constant arc length and a constant arc voltage, has just been brought out by the Westinghouse Electric & Manufacturing Company. This machine strikes the arc automatically and if necessary will exert a pull of approximately 200 lb. in order to prevent fusion of the electrode wire to the work.



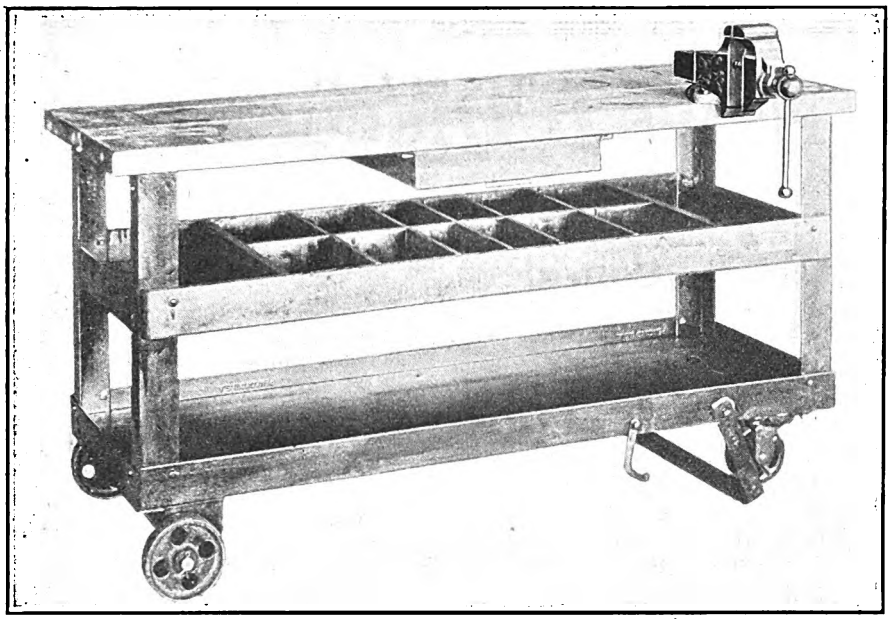
Arc for Welding Automatically

This device relieves the operator of the tiresome and exacting hand labor of maintaining the arc and feeding the welding wire, and, due to the electrical conditions of the arc remaining practically constant, it is



Compressed Air for Various Track Repairs Is Furnished Most Conveniently by a Motor-Driven Unit of This Character

Digitized by Google



Time and Energy of Workmen Are Saved by Use of a Portable Workbench

possible to secure a better weld and to deposit metal very much faster than can be done by hand welding. The arc length can be adjusted so that the arc can be maintained at an average value of from 15 to 20 volts and will remain almost constant at any given voltage. The ¼-hp. feed motor and the electromagnets do not obtain power from the arc circuit and are therefore selected large enough to feed any size wire up to ⅜ in.

This automatic arc welding equipment can be used to best advantage on work requiring the welding of long, continuous seams and also for some repair applications, such as building up worn surfaces. It is also applied in building up worn flanges for electric railway car wheels.

It has many advantages, including better fusion due to the use of a higher current, ease of operation, permitting an inexperienced operator to handle it; uniformity of deposit, making better quality work, and the reduction in costs due to the ability to use wire in continuous lengths and eliminating the necessity of straightening and cutting. Other features of this equipment are dirt-proof housing and ease of accessibility to parts.

Movable Workbench Saves Steps

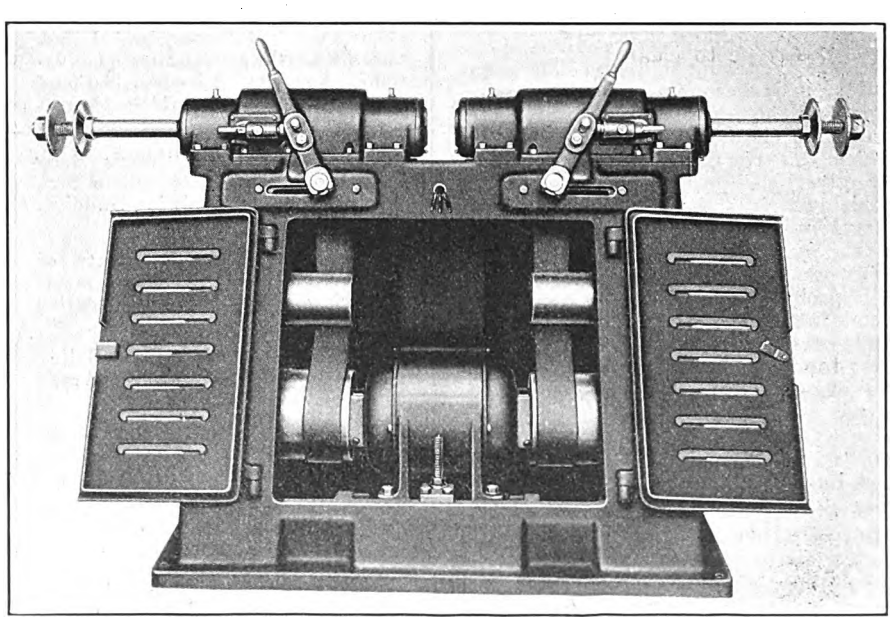
IN ELECTRIC railway repair shops stationary workbenches are most commonly built along the walls. Materials to be repaired must be removed from the cars or other equipment and carried to the bench. Many times the distance between cars and benches is considerable and much time is lost by workmen. To provide a portable bench which can be moved to a convenient location and thus save many steps and energy of workmen the Manley Manufacturing Company, York, Pa., has brought out one of somewhat novel type.

The entire workbench is of very substantial construction with a hardwood top, steel drawer, shelf partitions, roller bearing casters and provision for locking the wheels so that they will not roll about while the bench is in use. The bottom shelf of the bench provides a tray for large parts, and the intermediate shelf, with partitions, is conveniently arranged for the smaller parts. These portable workbenches are furnished in two sizes, one with a top 44 in. x 16 in. and the other with a top 64 in. x 20 in. These can be furnished without the shelf partitions if desired.

Portable Selective Speed Buffing Machine

BY MEANS of belt shifters in rear of both spindles it is possible to stop either spindle independently of the other, on a new portable selective speed buffer just placed on the market by the Hisey-Wolf Machine Company of Cincinnati, Ohio. Working in unison with the shifter an adjustable brake engages when the belt is shifted on the loose pulley, thereby holding the spindle stationary until the belt is again shifted. The belt tension can be easily regulated by means of the lever at either end of the machine. As the machine is mounted on a hinged platform equipped with screw adjustment, it is possible to get still further regulation than that obtained by means of belt tension levers.

Twelve over-size ball bearings are used in the machine and full provision is made for adequate lubrication. As in other Hisey products, a full safety automatic starter with push button control is standard equipment. Two large doors in the rear permit full view and access to the entire machine. Various spindle speeds can be furnished to meet special operating conditions. If desired the spindles can be provided with a different speed on either end. This machine is made in three sizes with 7½, 10 and 15-hp. motors.



Doors in Rear Are Open, Giving Access to Machine

Association News & Discussions

Utility Commissioners' Reports Consider Local Transportation Subjects

SEVERAL of the addresses and reports before the National Association of Railroad and Utilities Commissioners at its annual meeting in Asheville, N. C., Nov. 9-12, 1926, contain recommendations affecting the electric railway industry. A general report of the meeting was published in last week's issue of the JOURNAL. Below are given abstracts from those addresses and committee reports which contain suggestions or information of direct value to local transportation men.

In his annual address President A. G. Patterson referred to the situation of the various classes of public utilities with which state regulatory officials are concerned. Respecting motor vehicle transportation he spoke as follows:

"The growth and development of motor vehicle traffic, both passenger and freight, goes rapidly forward while regulation, at least from a national standpoint, is still inchoate and undefined. Many of the states, realizing their responsibility and mindful that "a stitch in time saves nine," have provided regulation for intrastate motor vehicle operations. Through the cooperative methods of this association, a considerable degree of uniformity in such regulation has been observed. The Interstate Commerce Commission has recently conducted hearings in a number of states for the purpose of assembling data and information upon which it will make a report and recommendations to Congress regarding regulation of this important and growing transportation business.

"Out of all the investigations and experience regarding motor vehicle regulation, it is becoming more and more apparent that existing local authorities should be employed as the agencies by which this regulation should be made effective. The peculiar nature of motor vehicle carriers, the fact that they must travel over highways provided largely by the states and counties and not over their own roadways, the fact that there will probably never be the same economic reasons for the ownership of such carriers or the operation thereof, to be consolidated or vested in one person, firm or corporation, operating across many states, and the manifest necessity for closer supervision than rail carriers require in order to protect the lives of the public and of passengers of such vehicles—these characteristics indicate not only that the states can best perform the task of regulating this traffic, but that effective regulation in this field is well-nigh impossible of performance by a single national body.

"The splendid work which has been accomplished by the committee of this association in preparing and presenting to Congress a bill providing practical regulation for interstate motor vehicle traffic furnishes further evidence of the great value of this organization to the public, and the bill so provided should, and we trust will, receive favorable action of the Congress. Until Congress does act, the states, of course, must confine their regulation wholly to intrastate operations.

"That state is an exception wherein the public welfare does not already demand that regulation be provided for intrastate traffic of this sort.

"State utility and railroad commissions and their staffs, as a rule, constitute the best equipped group of men in the state to formulate the basis and plan of regulation to be adopted by the Legislature. Such commissions can, and we think should, perform the service of submitting plans of such regulation to the legislative bodies. In devising such legislation the rights and interests of existing carriers by rail, or by boat, should of course not be ignored. But we think the position is sound that if, with improved systems of highways, the motor bus and the motor truck can furnish to the people a more convenient, efficient and economical method of transportation, the people should not be denied the benefits thereof because the granting of franchises and certificates to such motor vehicle carriers to carry on business will necessarily result in some loss to the rail carriers or boat lines. If such motor vehicle transportation can be carried on for the people at a lower cost than rail transportation and the difference in cost is sufficient to warrant consideration, then we think that alone might justify the granting of a certificate to a motor vehicle carrier, even if the rail carrier traversing the territory was already in a position to carry all the persons and goods offered to it, but for the rendition of such service demanded a substantially higher reward. If we say that motor vehicle transportation should be denied because the rail carrier in the territory can carry all the persons and goods offered and hence should not be injured by such competition, when such motor transportation will be more convenient, more satisfactory and more economical, by the same token we should forbid the sale of electric lights because to permit it will injure the manufacturers of candles and oil lamps.

"The people are entitled to the benefits that will accrue from improved highways and the development of the motor vehicle just the same as they are entitled to the benefits accruing out of the advancement of science in any other field. If the railroads are confronted with a new problem in the form of this motor vehicle competition, then it is their task to solve the problem so far as it affects them, not to ask the people to solve it by prohibiting or strangling the motor vehicle business, if that is found to be an improvement upon previously existing transportation agencies, but solve it by improving their own methods of transportation so as to minimize as far as possible the advantages existing in favor of motor vehicle transportation.

"The man is foolish who holds the view that regulation should ever be exercised in such a way as to deprive the people of any better, more convenient or more economical method of carrying on their affairs."

PEOPLE ARE ENTITLED TO BENEFIT OF NEW METHODS

The committee on express and other contract carriers by rail also touched on automotive transportation in connection with the effect of such competition on the existing carriers. It held to the following views regarding the situation:

"Coming to the question of changes involved in the progress of events and with especial reference to the competi-

tion entailed in motor vehicle transportation, it is the view of the committee that while, as expressed in previous reports, motor vehicle competition with carriage of persons and property by rail should be carefully controlled and limited with due regard to the rights of existing carriers which have invested large capital and developed business in good faith to the great benefit of the various communities through which their lines run, yet it is nevertheless true as a general proposition that the people of any particular community are entitled, under reasonable conditions and with due regard to the rights of all others, to the benefit of new modes of transportation and to a full utilization of the vast outlays that they have made, through the medium of taxes, in improved roads as a means for such new and different modes of transportation.

"The theory upon which this conclusion is based is twofold. One is, that it is the right of the people, with due regard to the proper safeguards for the rights of others, to enjoy new facilities, new inventions, and be the beneficiaries of the progress of the times. As the rail carriers enjoy the right of eminent domain by virtue of the right of the people to have private property appropriated to public service, so the people have the right to enjoy to the fullest extent consistent with the rights of others their investments in the construction and improvement of roads which correspond, as to motor vehicle carriage, to the rights-of-way appropriated and occupied by rail carriers.

"The other theory is, that the existing rail carrier must be subject to the economic necessity of meeting the competition of newer and more desirable modes of transportation and take its chance of having to succumb thereto."

Motor Vehicle Transportation Is Becoming Stabilized

A review of the problems brought up by the development of motor vehicles is covered in the report of the committee on motor vehicle transportation, which is printed in full below:

"The rapid progress in the building of good roads, engineering skill in the perfection of motor vehicles, the ever-present tendency of the American people to make immediate use of new modes of rapid transit, have combined to force to the forefront and to clothe with all-absorbing interest the question of motor vehicle common carrier service. The effect of this service is far reaching and touches nearly every phase of our business, social and economic life. It affects the relationship between the wholesale and retail merchant; the relation between the rural towns and commercial centers, the transportation and financial questions of traction, express and railway companies. So acute have been the problems due to this new transportation and the efforts to allocate it to its proper place in the transportation world that the best thought of the country has been employed in an attempt at a wise and sane solution.

"Commissions and regulatory bodies in practically every state in the Union have been swamped with the many perplexing and seemingly contradictory situations which have arisen. Inexperienced operators without seasoned judgment, promoters seizing an opportunity to exploit the business, selfish interests impelled by their own private financial motives, prejudice, jealousy, political exigencies and hysteria on the subject, have, at certain times, in certain places, almost imperiled the future of this new industry, destined as it is to play an important part in the future of this country. Time, however, and experience have been and doubtless will continue to be potential factors in solving the perplexing questions. In many places the problem of motor vehicle transportation is gradually adjusting itself and finding its place in the transportation needs of the communities in which it operates.

"Regulatory bodies are experiencing less difficulty in handling the questions which arise. This is due in part to the fact that operators are becoming familiar with transportation problems, and due in a large measure to the 'fly by night' operator, finding his business unremunerative, having quit the field. Another contributing factor toward solution of local operation is due to the change in attitude of the other forms of transportation toward motor vehicle operation and in the change of attitude of motor vehicle operation toward the former. At first the officials of electric and steam roads felt that this new transportation would so deplete their revenues as to threaten the value of their invested capital and that they owed a duty to those who had invested in their securities to make unremitting warfare against the new business. On the other hand, bus and truck operators were led to believe by propaganda put out by promoters and certain manufacturers that their business was in the near future destined to supplant the older forms of transportation and they should make every effort to enter into active competition with them at once. Fortunately for the transportation needs of the country these notions are quickly being dispelled and in their place a fine spirit of co-operation is being fostered. Co-operation will do more to simplify what was a complex situation than any other one factor.

"As the solution of local motor vehicle transportation approaches, the extension of the business into distant territory brings for settlement interstate problems. Again, the many conflicting and different interests suggest as many plans for solution as there are interests. Of course the only legislative body which can enact laws or provide regulation for interstate traffic is the federal Congress, as this right is denied the states by the Constitution of the United States.

"Whether Congress should enter the field of motor vehicle regulation, and if so the nature and extent of such regulation, is now one of the absorbing questions. At our convention last year at Washington we adopted a form of federal regulation and indorsed a tentative bill prepared by our general solicitor, Mr. Benton, and a committee that had been appointed for that purpose. The bill was introduced in the Senate as Senate Bill No. 1734, referred to the Senate committee on interstate commerce, and that committee

Resolution presented by

Mr. Gettle of Wisconsin before the

National Association of Railroad and Utilities Commissioners

Asheville, N. C., Nov. 9-12, 1926

***Whereas,* at the Annual Meeting of this Association held at Detroit in 1922, this Association adopted the following Resolution:**

Now Therefore, Resolved, that it is the sense of the National Association of Railroad and Utilities Commissioners that the principle of the indeterminate permit is economic, sound and should be adopted in the legislation of the various states relating to public utilities, and

Resolved Further, that this Association do and it does hereby urge the legislatures of the various states which have not yet adopted the principle of the indeterminate permit to enact legislation recognizing and putting such principles into effect.

***Therefore Be It Resolved,* that this Association renew its recommendation for the establishment of provisions authorizing the "indeterminate permit," and that we recommend that provision be made therefor in the proposed uniform law now under consideration by the National Conference of Commissioners on Uniform State laws; and be it further**

***Resolved,* that a copy of this resolution be transmitted to said conference.**

Digitized by Google

held hearings on said bill covering a period of several days. Much concern was manifested by many different interests and numerous views expressed and several amendments offered. In fact, before the hearings were concluded some one had made objection and offered amendments to at least every important part of the bill, and some truck organizations objected strenuously to any legislation at all on the subject. The bill has never been reported out of the committee.

Investigation by Interstate Commerce Commission

"Much interest has attached to the recent order of the Interstate Commerce Commission initiating a country-wide investigation of interstate motor vehicle transportation. Those who have followed the hearings in the various cities throughout the United States are aware that it is quite clearly developed that all are not of one accord on the question of federal regulation, but the prevailing sentiment disclosed by a preponderance of the evidence was for such regulation; it was also disclosed that the new transportation had made inroads on the revenues of steam roads in various parts of the country, and that steam and electric carriers in order to recoup their losses have taken over motor lines so as to control much of this transportation, and are operating them in conjunction with and as a part of their entire system, adjusting rates and fares and providing transfers and joint hauls to make the business attractive, convenient and lucrative, and are handling it with a fair degree of success. The hearings also developed that the most profitable lines are those giving service not reached by other established modes of transportation. In other words the records of the hearings seem to indicate that motor transportation will find its place; not in competition with steam and electric, but to supply a service not reached by either, and in co-operation with both.

"Experience has shown that motor transportation is not cheaper than steam and electric as first supposed, but on the contrary, more expensive; however, its lack of delay, flexibility and convenience of the service overcomes its expensive operation and serves to create and retain a demand for this kind of service.

"The history of the business up to the present time shows conclusively the need of public business regulation and also clearly demonstrates that for the business itself and the people who use it local regulation has been a success. Great care, sagacious thought, and sound judgment should be experienced in federal regulation lest this important industry be seriously crippled or handicapped. Such regulation, we maintain, must be made on the basis that motor vehicle transportation is primarily a local question, and only incidentally an interstate one. Its hauls are necessarily short hauls, and even a large per cent of its interstate operation is made up of transporting persons or property from the near border in one state just over the line in the adjoining state; in this respect its operations are not comparable with railroads and express companies which transport through several states or across the continent—so that the local aspect of the industry should not be forgotten in any regulation.

"Those living in a particular community are better acquainted with their transportation needs than those residing at a great distance. And another important consideration which must be kept constantly in mind is, that the states furnish the highways, the necessary instrumentalities which make the industry possible; each state, therefore, has something to say as to the nature of transportation on its highways; the width and weight of the vehicles used; the rate of speed they should travel; road regulations in the interest of safety; these and many more, are all local questions peculiarly within the jurisdiction of the states, and legislation on the subject to be not only just, but valid, must reckon with them.

"A splendid discussion of motor freight problems is found in the testimony of Thomas Snyder, secretary-treasurer of the Indiana Transfer and Warehouse Association, before the Interstate Commerce Commission at a hearing in Chicago; the suggestions are so pertinent and so well stated that we have made them an exhibit to this report so as to bring the same before the association.

"From a study of the motor vehicle industry, its local nature and character of its business, we do not believe it wise or prudent to place its regulation under the Interstate Commerce Commission. We, therefore, recommend that the passage of Senate Bill No. 1734, with such amendments as may be found necessary, be urged by this association."

A most constructive view regarding the relative importance of service and rate of fare for local transportation companies is expressed in the report of the committee on service of public utility companies. That part of the report dealing with this subject is printed below:

"The standards of service of street car companies are fairly well stabilized as is shown by the few new rules or changes in rules that have appeared in the past few years. The biggest service problem before the industry at the present time is that of modernizing its equipment. Cars which are more comfortable, more speedy and less noisy than ever before are being built, and with light weight and one-man operation they are frequently more economical to operate than the older types. The commissions can and should co-operate with the street car companies in this movement, because it is generally agreed that today good service is more important in street car regulation than cheap fares.

"Great improvement has been made in the last few years in the type of bus operating in this country, and this improvement continues to progress with rapidity. As the bus approaches in appearance the private limousine, the public demands an even greater reduction in noise and unpleasant odors due to gasoline and oil. Improvement in these lines together with increased attractiveness both within and without bring their own reward in increased revenues. Competition is still keen enough so that it is necessary only for the commission to encourage, without, except in rare cases, demanding continued progress.

"One decided advance recently made in service of local transportation is the de luxe or parlor car bus line running parallel with and controlled by the street car line. The characteristics of such operation are luxuriant buses, a high rate of fare, usually 25 cents, high speed and efficient and courteous service. Such a line has been established within the past year between Chevy Chase, a suburb of Washington, but within the District of Columbia, and the downtown section including the Union Station and the Capitol. Not only has this line made money, but also, according to the president of the Capital Traction Company, which operates it, it has been one of the best good will builders the company has found and apparently has actually helped increase the number of passengers on the car line. The local utilities commission gave permission to the car company to run this line parallel to its own tracks at a 25-cent fare, notwithstanding the fact that the then independent bus company petitioned for permission to operate a bus line at 10 cents. The commission was led to this decision partly because of the question of competition, but largely because it was felt that the type of service desired demanded a high rate of fare. As strange as it may seem, the citizens of Chevy Chase through their Citizens' Association threw the weight of their support to the higher fare."

Recommendations of the National Conference on Street and Highway Safety for the protection of dangerous grade crossings are indorsed by the committee on safety of railroad operation. Experience with a law of this type in the state of Minnesota is cited by the committee. That portion of the report on this subject follows:

"The Minnesota grade crossing law has now been in operation for about one year. This law authorizes the Railroad and Warehouse Commission to designate particularly dangerous crossings as 'stop' crossings, and requires all drivers to come to a full stop at such crossings under penalty.

"The commission has exercised great care in the selection of the crossings to be so designated, and only about 10 per cent of the crossings in the state are so marked.

"The enforcement of the law is in the hands of the local authorities, and results vary depending upon their activities. The placing of the signs and the publicity given them has accomplished great good, as the drivers who do not actually come to a dead stop, no

Digitized by Google

doubt do look and proceed over the crossing more carefully. This is shown by the reduction in the number of accidents, although the number of cars in use has greatly increased.

"The adoption by all states of a uniform law empowering the commissions to designate dangerous grade crossings at which drivers of automobiles and other vehicles must stop, as recommended by the National Conference on Street and Highway Safety, is highly desirable and should have the active support of this association.

"In Minnesota the State Highway Commission, in connection with its road-building program, is very active in the rerouting of the trunk highways in a manner so as to eliminate all grade crossings that it is possible to do away with. In such work it is meeting with much co-operation from the railroads, and where crossings are necessary the railroad and the commission are eliminating the grade crossing by the construction of overhead or underground crossings and sharing in the expense of such improvement. When the State Highway Commission took over the trunk highway system in Minnesota in November, 1920, there were approximately 932 grade crossings to be contended with in connection with the 7,000-mile trunk highway project. The highway department, by the end of the year 1926, expects to have eliminated 357 of this number. Of the 357 eliminated, 44 will have been by overhead structures, 80 by underpasses and 233 by relocation of the highways. Further crossings will be eliminated by one or the other of the above methods as the trunk highway projects are further extended. The policy of the State Highway Commission is one to be commended, and the good work has no doubt already saved the lives of many of our own citizens and citizens of other states.

"In connection with the operation of the new Minnesota grade crossing stop law, the city of Minneapolis and various other municipalities have passed ordinances requiring all motor vehicles to come to a full stop at all railroad grade crossings within their municipal limits, which have been designated stop crossings by the Minnesota commission under the provisions of the new law. The municipalities have the necessary traffic officers to enforce the law, and their ordinances will no doubt be quite rigidly enforced. The effect of such enforcement will be far reaching in commanding respect for and obeyance of the stop crossing law."

Regulation and Snow Fighting Discussed at Wisconsin Bus Meeting

STATE regulation of bus lines and the part bus companies should play in snow removal activities were the two most vital questions discussed by members of the Wisconsin Motor Coach Association at its first annual convention, held in Madison, Nov. 9 and 10. The organization includes several electric railways operating buses.

The association sponsored a bill for regulation of bus lines at the last session of the Legislature. It was passed by both houses, but was vetoed by Governor Blaine. The association plans to present a new bill at the next session.

C. N. Mauer, state traffic engineer with the Highway Commission, addressed the convention on traffic regulation from the highway official's viewpoint.

The two-day convention was arranged by M. H. Frank, Wisconsin Power & Light Company, Fond du Lac, president; John M. Cadby, newly appointed secretary of the association, and E. R. Fitzgerald, Royal Rapid Transit Company, treasurer.

The list of speakers included Mayor A. G. Schmedeman, Madison; L. C. Knapp, Wisconsin Power & Light Company, Manitowoc; President Frank; Edgar F. Zelle, president Minnnesota Motor Bus Association, St. Paul; Chester Moore, vice-president and secretary Illinois Motor Transportation Association; B. W. Arnold, Chicago, North Shore & Milwaukee Railroad; Dudley Montgomery, Madison Railways; Francis A. Cannon, Madison, secretary Wisconsin Good Roads Association; C. M. Larson, Madison, secretary Wisconsin Railroad Commission; Prof. W. C. Hewitt, Oshkosh Normal School; J. F. O'Neill, Madison, Wisconsin Motor Bus Lines; H. J. Underwood, Vacuum Oil Company; Mr. Fitzgerald; A. E. Clock, Chicago, North Shore & Milwaukee Railroad; Mr. Maurer; H. G. Monger, Milwaukee, Wisconsin Motor Bus Lines, and Edwin E. Witte, Madison, chief of the legislative reference library.

Officers of the association, who hold over until February, include Mr. Frank, president; Mr. Monger, first vice-president; Mr. Knapp, second vice-president, and Mr. Fitzgerald, treasurer. Directors include the above officers and B. W. Arnold, A. M. Schrum, Gray Transportation Company, Menominee, Mich., and A. E. Beaurline, Twin City & Southern Bus Company, St. Paul.

President Frank, in his opening address, advocated greater use of newspaper advertising space, of coupon mileage books good for transportation on any bus line connected with the association, group insurance for member companies, adoption of standard classification of accounts in order to make studies and comparisons of costs, and uniform methods for selection of drivers.

C. M. Larson, chief engineer of the Wisconsin Railroad Commission, said that if buses are to play a permanent part in the nation's transportation business, they must maintain service schedules during the entire year. He warned bus operators that if service is discontinued for several days or weeks at a time because of the expense of snow removal, bus operation is sure to lose some of its popularity.

A traffic regulation policy was outlined by J. T. Donaghey, chief engineer Wisconsin Highway Commission. This program included uniformity throughout the nation in both highway traffic laws and city ordinances governing traffic, education of motor vehicle operators in traffic laws and regulations, and acceleration of traffic on heavily traveled highways rather than retardation of it. This could be accomplished, he declared, by educating the slow, reckless driver as well as the fast, reckless driver. Mr. Donaghey prophesied that the time would come when there would be no maximum speed limit and the only cause for arrest will be reckless driving.

An outline of the maintenance methods of the Wisconsin Motor Bus Lines was presented by H. L. Debbink, superintendent of gasoline vehicles for the Milwaukee Electric Railway & Light Company.

Internationaler Strassenbahn und Kleinbahn Verein to Meet

ON THE invitation of the Copenhagen Street Railway System, the 1927 convention of the Internationaler Strassenbahn und Kleinbahn Verein will be held in Copenhagen, Denmark, on June 20 to 23. Business sessions will be held during the mornings of those days. The afternoons will be devoted to visits to various points of interest in and about the city.

A tentative list of some of the topics to be discussed follows: Improvements in Copenhagen rolling stock, particularly in the direction of methods of brake control and car painting; reduction in the maintenance-of-way expenses of the Copenhagen system through the application of the sorbitic process to rails; radio disturbances; the motor bus and the street railway; practical methods of increasing average schedule speed; simplified methods of exchange of freight between trunk lines and electric railways; general statistics.

American Association News

Coffin Award Committee Meets

PRELIMINARY plans for the Charles A. Coffin Prize competition in 1927 were made by the Coffin award committee at a meeting held at association headquarters in New York on Nov. 17. Letters to electric railway companies inviting participation and announcing the conditions of the 1927 competition are to be prepared and distributed at an early date. The committee felt that the Coffin award has been a large factor in stimulating enthusiasm and progress in the industry and that the advantages to be obtained by participation make it important that the preparation of briefs be started early in the year. For that reason it was considered desirable to announce the conditions for this year's competition as early as possible, and steps were taken to carry out this objective.

The committee also recommended publication of a 1926 issue of "Electric Railway Practices," this being a digest in book form of the developments by the various contestants, similar to that published in previous years. Those present at the meeting were President W. H. Sawyer, W. W. Trench, secretary Charles A. Coffin Foundation, and James H. McGraw.

The News of the Industry

$15,000,000 Railroad Extension

Preliminary Plans Completed for the Proposed New Line to Cover the Industrial Belt of Piedmont

Interest in the territory that will be affected centers in the talk of the extension of the Piedmont & Northern Railway from Charlotte to Durham, a distance of 150 miles, and from Gastonia to Spartanburg, S. C., a distance of 50 miles, making a total new trackage of more than 200 miles. The construction of the proposed new lines will involve an expenditure of about $15,000,000, but officials of the railway have declined to discuss the question of estimated costs.

Officers and directors of the railway have committed themselves by formal resolution to the early construction of the line to make a continuous route from Greenwood, S. C., to Durham, in accordance with the intention of the late James B. Duke and associates, at the time they organized the railway fifteen years ago. The extension of the North Carolina portion of the railroad will, in effect, give Charlotte and other towns touched a new trunk line railroad and bring the Atlantic Coast Line and the Pennsylvania Railroad into Charlotte by reason of the physical connections tapping these systems.

The intention of Mr. Duke and his associates at the time they organized the company is recalled in the first paragraph of the preamble to the resolutions adopted by the directors. It is stated that the company originally "intended that its main line of railway should extend through the Piedmont sections of the Carolinas from Greenwood, S. C., to Durham, N. C., with such additional lines as might be necessary or desirable for the development of the resources of this section."

MEETING SCHEDULED FOR DEC. 8

The resolutions state that the "preliminary plans" looking to the resumption of construction "have now been completed to the point where further construction work may be commenced." The resolutions adopted by the board of directors contain a call for a meeting of the stockholders to be held in Greensboro, S. C., on Dec. 8 to consider and pass upon the proposal of the board that the work of extension of the lines, as described by the board, be resumed. It is assumed that securing the assent of the stockholders to the program is a mere formality and that the program will be promptly approved by them and that shortly thereafter contracts for portions of the actual construction may be awarded.

The resolutions adopted do not mention a city or town to be touched between Charlotte and Durham and no further information on this point could be obtained from officials of the company. It is being recalled, however, that a campaign was waged by public-spirited citizens last year in Winston-Salem and other towns between there and Charlotte with a view to securing promises of business support for the extension, which at that time was generally described as to be from Charlotte to Winston-Salem. Nothing is known outside of Piedmont & Northern official circles as to just what route the proposed extension will take between Charlotte and Durham, but it is thought likely that it may touch one or two if not all of the "triangle" cities—Greensboro, Winston-Salem and High Point.

The proposed new line will traverse the great industrial belt of Piedmont along the line of what has been called "the workbench of the South." Like the portions of the Piedmont & Northern already constructed, the new lines will be electric, operated by power produced by the Southern Power Company, the major Duke enterprise of the section.

At Durham the Piedmont & Northern, when completed, will connect with the Norfolk & Western and with another Duke railroad, the Durham & Southern, which extends from Durham to Dunn, on the main line of the Atlantic Coast Line.

Fare Advance Sought in Los Angeles

The Los Angeles Railway, Los Angeles, Cal., has filed with the California Railroad Commission an application asking the commission to investigate its operations and its rates and to establish a new rate structure based on a 7-cent single fare with four tickets or tokens for 25 cents, including free transfer privileges. The company states that it is no longer able to operate on the present 5-cent fare and that for the last two years its railway service has been carried on at a loss. No dividend has been paid since 1913.

Illinois Inquiry Under Way

Bankers Favor State Control and the Terminable Permit at Legislative Committee Hearing—H. R. Riley Severe in His Criticism of Lisman Proposal—Receivership Talk Revived

STATE supervision of traction properties, as against local regulation, and the adoption of terminable permits are recommended by the nine Chicago bankers and industrialists who have so far appeared before the joint committee of the Illinois Senate and House appointed at the last session of the General Assembly to consider these problems. The committee opened hearings in Chicago on Nov. 8.

John J. Mitchell, chairman of the board of the Illinois Merchants Trust Company and the first witness to be called, stated that the twenty-year franchise by which Illinois companies are now limited by law is entirely too short a grant to permit effective financing. He said that people who have studied the question thoroughly consider an indeterminate franchise the most economical, satisfactory and up-to-date method of dealing with the subject. He was convinced that "there is a decided advantage in having utilities controlled and supervised by a state board. I believe such a board is better fitted, more disinterested and less tainted with politics."

George M. Reynolds, chairman of the Continental & Commercial National Bank, believed an indeterminate permit with proper safeguards would be helpful in raising the large sums necessary. He said that to avoid local politics members of a commission to control Chicago's local transportation agencies should be appointed by the Governor rather than being elected or appointed by the mayor.

With regard to the expiration of Chicago Surface Lines franchises and the maturing of some $150,000,000 of bonds on Feb. 1, Mr. Reynolds held that receivership was all but inevitable. He favored immediate construction of downtown subways, but pointed out certain disadvantages in the special assessment method of payment.

THIRD WITNESS OUTLINES IMPORTANT POINTS IN FRANCHISE QUESTION

Three things must be considered in the local franchise question, according to George T. Woodruff, president of the National Bank of the Republic, and the third witness. The first item he mentioned was statewide regulation of utilities; second, the renewal of the danger of local prejudice interfering with fair rate making and, third, that these two would result in larger units of operation safe for small investors.

Ralph Van Vechten, president of the State Bank of Chicago, said that rates, service and financing are the only questions to be considered. He predicted that any effort to refinance the Chicago Surface Lines on the present basis would be very difficult. Receiverships had been tremendously expensive and naturally the bondholders were gun shy.

Other bankers and business men went

Digitized by Google

on record for terminable permits and state control.

H. B. Riley, president of the Chicago Title & Trust Company, trustee for holders of the underlying securities of the Chicago Surface Lines, said he did not look for a receivership of the Chicago City Railway, but there seemed to be no hope of the Chicago Railways escaping this fate. He declared that the twenty-year ordinance of 1907 was excellently conceived in many respects, but the sponsors unfortunately could not look into the future and see that financial conditions would change. With the purchasing value of the dollar at only 65 cents, a 7-cent fare was not quite enough to take up the slack.

Much interest was taken in Mr. Riley's outspoken remarks about the recent proposal of the Lisman interests to take over the Surface Lines properties. He said in part:

> I don't believe that Lisman can put it over. He has the reputation in New York of being without a peer in railroad reorganization. But we have a different situation here. Our railway is not in such straits. It is a going concern, in continuous operation, paying its way. All it is asking is permission to go ahead under fair conditions.
>
> Mr. Lisman's proposition is to put in $50,000,000 cash for the purchase of a $165,000,000 property, when the contract with the city under the 1907 ordinance provides if the city buys the property it must pay cash for it. I don't think Mr. Lisman could get $165,000,000 cash, but, of course, if you were going to turn over these properties to him for $50,000,000 cash and the rest paper, he could walk down Wall Street and put it over in 24 hours. In my opinion the city will have to give the companies a license to continue operation when their franchises expire, either a franchise or just a permit. The city must do that or people couldn't get to their work.
>
> Chicago must stop getting people to put up money for its transportation service and then taking their property away from them.

Fear was expressed at a meeting of the local transportation committee of the City Council on Nov. 11 that the terminal permit investigation committee would be unduly prejudiced in its report to the Legislature by the sentiments of local bankers, who, almost to a man, are in favor of state control of public utilities.

Alderman Joseph McDonough, chairman of the committee, declared that some of the bankers who testified have sought to convey the impression to the legislators that there is a divided sentiment in Chicago for and against "home rule."

The Alderman said that on the contrary the investigating commission should be told that there is an overwhelming sentiment in favor of local supervision and control. He said that "a referendum on 'home rule' would soon convince them what percentage is for, and what against it."

The local transportation committee is almost unanimously agreed that Chicago voters would not countenance any other arrangement than home rule in a new traction ordinance, but the majority of its members have gone on record as favoring the terminable permit.

Mayor William E. Dever, Corporation Counsel Francis Busch and several Aldermen are to appear before the investigating committee in support of local regulation at its next session on Nov. 26.

Detroit Appointment Expected Soon

Mayor Smith of Detroit and the Street Railway Commission will meet on Nov. 30 to appoint a successor to Col. H. U. Wallace, manager of the municipal railway. Del A. Smith has been mentioned for the appointment, but no definite action will be taken until the Mayor returns to Detroit. Colonel Wallace tendered his resignation as general manager to become effective on Jan. 1. Press of private business including management of his 5,000-acre plantation in Georgia is his reason for resigning. There has been no dissension on the part of the general manager or the city administration during the term of his employment. Del Smith's salary has recently been raised from $7,000 to $9,000 a year.

It was in June a year ago that Colonel Wallace succeeded Ross Schram in charge of Detroit's municipal railway. He was selected for the post from a long list of candidates after Mr. Schram had been dismissed from office by Mayor Smith for "inexperience and inefficiency and for neglect to furnish me with reports which I have repeatedly requested." Counter accusations by Mr. Schram received short shrift.

City Officials at Odds Over "L" Lease Renewal

An array of facts and figures was presented on Nov. 18 to the Public Service Commission of Pennsylvania at the second hearing on the position of the city of Philadelphia and the Philadelphia Rapid Transit Company for approval of the 30-year extension of the Frankford Elevated lease.

The hearing was preceded by a controversy in the press between City Solicitor Gaffney and City Controller Hadley, the latter calling the amended lease "unnecessarily unfair" and pointing out that, on July 1, 1957, when the proposed 30-year lease would expire, the P.R.T. would owe the city $3,706,000. He offered a substitute amendment in which the payments in the last ten years are increased each year by an amount that will make up the $3,706,000. In this way, he declared, the city will actually have the excess due from the P.R.T. at the end of 1957.

Controller Hadley also maintained that the Frankford "L" is not unprofitable as the P.R.T. claims and declared that his "audits for 1923 and 1924 show the receipts were $2,031,534 and the direct expenses in the same years were $317,671."

Thereupon, City Solicitor Gaffney took issue with Mr. Hadley's pronouncement that the lease was "unnecessarily unfair," accepted his analysis of the proposed P.R.T. return and then pointed out that the aggregate, if correctly applied, meant $635,000 more to the city than would be due if the present rental scale was continued until 1957. He maintained that Mr. Hadley's substitute amendment would be unfair to the P.R.T. in that the company was entitled to use the money during the final ten-year period.

Mr. Hadley's attack on the amended lease, regarded in the city hall as a blow at the administration's plan speedily to execute the new lease so that borrowing capacity tied up in elevated bonds could be released, prompted Mayor Kendrick to declare that "Mr. Hadley's statement came as a surprise" to him and that he stood "solidly behind City Solicitor Gaffney and his legal advice."

Thus matters stood on the eve of the second Public Service Commission hearing.

Reference to the first hearing appeared in ELECTRIC RAILWAY JOURNAL, Nov. 6, 1926, page 858.

Interstate Free of Clause Limiting Profit to Fair Amount

The Interstate Public Service Company, operating an interurban electric railway from Louisville, Ky., to Indianapolis, Ind., was held not to be subject to the provisions of Section 15a of the interstate commerce act in a decision issued by the Interstate Commerce Commission on Nov. 16.

Section 15a provides that rates of railroads shall be made so as to produce "as nearly as may be" a specified percentage on fair return, on investment, and also provides for the recapture of half of any excess above 6 per cent.

The commission found that the interurban is an interurban electric railway not operated as a part of a general steam railroad system of transportation and not engaged in the general transportation of freight within the meaning of paragraph 1 of section 15a of the interstate commerce act; and that the respondent, in the operation of the interurban, is not a carrier within the meaning of that section and is not subject to the provisions thereof.

The opinion of the commission was that the interurban is not engaged in such general transportation of freight as to cause it to resemble steam roads in the performance of that function. Further the commission said that the differences between the freight service performed by it and that performed by steam roads generally are so great as to show that it does not belong to their class.

According to the commission the road has a larger share of interstate business than most interurban electric roads on account of its terminals being in different states, but the commission said that does not change the character of its operation. It also has greater facilities for and handles a larger percentage of freight than most interurban electric roads, but its characteristics in general are the same as those of most other interurban electrics, while the nature of its freight traffic, the character of its road and equipment, and its inability to interchange equipment with steam roads or to make through shipments in connection with them except to a very limited extent, its different scale of wages and its different passenger fares all distinguish it from steam roads and show that it is not to be grouped with the steam railroad system, for which, in the commission's view, section 15a was primarily intended.

Committee Appointed to Draw Jacksonville Franchise

The City Council of Jacksonville, Fla., on Nov. 4 appointed a citizens' committee to aid the laws and rules committee of the legislative body to prepare a franchise for the Jacksonville Traction Company.

The meeting at which the committee was appointed was the last of the public hearings to permit those interested in the proposed 30-year franchise for the company to state their case. No one took the floor against the franchise. The meeting was of short duration and adjourned after the citizens committee was appointed. About 40 persons attended the meeting.

The citizens' committee will call upon the laws and rules committee only when it needs advice. The recent discussion incident to the consideration of the matter of a new franchise for the railway was reviewed in the ELECTRIC RAILWAY JOURNAL for Nov. 13, page 901.

New Operating Deal in Norfolk

A revision of the public transportation system of Norfolk, Va., has been worked out by the city manager, the Norfolk Railway & Light Company and the business men of that city, all co-operating.

The plan eliminates a zone system of fares, changes, routings and co-ordinates services of all street cars and buses. It fixes the fare at three tokens for 25 cents or 10 cents cash, with school tickets in books of 24 for $1. It also includes a weekly pass entitling the bearer to ride over the system at will for $1.50 a week.

An investment of $1,000,000 of new money will be made by the transportation company to put the plan into effect. It will result in the replacement of property now in service to the amount of about $750,000.

Under the new plan of fares, rerouting and co-ordination the average of the fare increase is estimated to be 7 mills. It is expected, however, that this will be sufficient to enable the company to earn a return on its property value and to supply public transportation acceptable to the community, by trolley cars and buses under a single management operating efficiently.

Berlin Plan Advocated for St. Louis

C. E. Smith, consulting engineer for the city of St. Louis, Mo., speaking before the St. Louis Railway Club on Nov. 12 advocated the adoption of a rapid transit system similar to that in Berlin as a means for relieving traffic congestion in St. Louis. He admitted that his proposal was still intangible, but suggested that the city buy a half block right-of-way from street to alley along a residential route and make it into a parkway with double-tracked electric lines in the center, either on elevated or depressed tracks. He estimated that it would cost $1,000,000 a mile to build such a line compared with $5,000,000 a mile to construct a subway.

Mr. Smith took issue with city planners who advocate limiting the height of buildings to ten stories. He said the use of this system would build up secondary congested districts which would be almost as bad as a central congested district and infinitely more annoying.

$3,500,000 for Additions to San Francisco Municipal Railway

A special bond election to vote $3,500,000 in bonds to finance construction of extensions to the San Francisco Municipal Railway, San Francisco, Cal., and provide more shops and other equipment is planned by the Board of Supervisors, following a recommendation by City Engineer M. M. O'Shaughnessy. The date of the special election will probably be set by the city officials in charge of the matter for early next spring.

Mr. O'Shaughnessy's report to the committee includes suggestions for a car repair shop, additional buses for connections, a garage to house the buses, the Sunset line through the Duboce tunnel, the Excelsior line through Bernal cut, an extension of the Church Street line; the Balboa line; Taraval extension to the municipal swimming pool and an extension into the Marina tract.

The projects involve a total expenditure of $4,000,000, of which there has already been apropriated the sum of $500,000 for track construction in the Sunset district.

The details of the program are:

Car repair shops at Seventeenth and Hampshire Streets	$ 250,000
Motor buses	150,000
Garage	60,000
Marina tract line—Connecting new residential section from end of Chestnut Street line	94,000
Sunset line—Connecting down town district with beach via Duboce tunnel and Judah Street ($500,000 already appropriated for this line)	1,602,000
Excelsior line—Extension of Church Street line via Bernal cut, across Mission Street to Excelsior district	1,245,000
Balboa line—Connecting with Geary Street line at Masonic Avenue to Turk Street, thence west to 33d Avenue via Balboa Street	540,000
Taraval extension—To municipal swimming pool	150,000

Hitting the Nail on the Head

Tommy was asked by the teacher to write an essay on safety. It was a very good essay, indeed, and one sentence we take the liberty of quoting. Says Tommy:

"One of the many advantages of crossing crossings carefully is that you get to the other side."

We have been for five years or more teaching safety and preaching safety, and all we have said could be boiled down to Tommy's one sentence.

"To get to the other side." Traffic regulations were not made to keep policemen busy. They were made to protect you. If every one would look at them in that light they would not need any boosting. —*Ottawa Electric Railway News.*

Petitions Filed Calling for Kansas City Franchise Vote

Referendum petitions calling for a vote of the people on the twelve-year railways franchise extension ordinance in favor of the Kansas City Public Service Company, Kansas City, Mo., have been filed with the city clerk. Operation of the ordinance automatically is held up by the filing until the matter is voted on by the people or the ordinance is repealed by the Council.

The petitions demand that the Council call a special election. The Council vote on the call for a special election would have to be by two-thirds vote and the expense of the election would be borne by the railway.

If no special election is called the matter would go over to the next city or general election. There will be no city election until April, 1930, and no general election until November, 1928.

The ordinance which it is now proposed to submit to the public for approval would extend the present railway franchise twelve years, making the grant one of 30 years duration.

Negotiations for a new franchise now are before the Council.

Sunday Passes Prove Popular in Cincinnati

It is understood that the Cincinnati Street Railway, Cincinnati, Ohio, is well pleased with the first day's showing with the Sunday pass. A total of 7,000 25-cent passes were sold on Nov. 13, when the plan was formerly put into operation. The passes are good on any of the lines operated in Cincinnati. They are sold by the conductors and are good from 6 a.m. to midnight Sunday. The passes are not accepted on the motor coaches operated by the railway. The plan is identical with that adopted by the Pittsburgh Railways some time ago.

London, Ont., to Vote on Railway Settlement

Operation of the London Street Railway, London, Ont., by the city may be in prospect. At any rate, the City Council of London, at a special session on Nov. 5, concluded negotiations with the company to provide for a plebiscite at the municipal election to be held on Dec. 6 on two alternative propositions, namely:

1. Purchase of the system in its present condition at a price of $1,135,351.
2. Extension of the company's franchise, granting it exclusive right for cars and buses.

On the first of these proposals only the ratepayers will vote. On the second proposition, however, all municipal voters will be entitled to pass on the issue.

The franchise extension scheme, if approved by the people, will provide for a 5-cent fare for the first two years from March 1, 1927, after which period the company will be entitled to appeal to the Council if more is required to earn a 6 per cent return on the present capital stock of $637,480. If in the future the city desires to purchase the

Digitized by Google

property, six months notice may be given and the price fixed at the valuation now agreed upon, plus the cost of improvements, and minus depreciation. All capital expenditures must be approved by the city. If the company at any time suspends operations for a day, the City Council may authorize buses. The company property is to be exempt from all except school taxes. Real estate only shall be fully taxed. One-man cars will be operated when permitted by the City Council. The company has obligated itself to spend $500,000 on improvements over a three-year period.

Each Branch of Service Must Pay Its Way

Commission So Rules in Elmira Case, Although the Profit on Electric Division Exceeds Railway Deficit—If Railway Is Not Patronized More Liberally Newer Means of Travel Will Supersede It

THE Public Service Commission of New York decided on Nov. 15 the complaints made by the Mayor of Elmira against rates charged by the Elmira Water, Light & Railroad Company for gas and electricity and for street car fares.

Complaint against the gas rates is dismissed, the commission in the prevailing opinion finding that on a rate base established of $1,521,481 there is a return on the property used in giving gas service of 7.9 per cent. This return the commission finds reasonable.

The commission denies the petition of the city asking for an immediate reduction of the electric rates pending a study of certain optional rates filed by the company on April 8 and July 20 last. The company is directed to make a study of the results of these rates and submit it to the commission on or before Feb. 1, 1927, for its consideration with suggestions as to further adjustments of its electric rates, decision on these rates being reserved.

Memorandum on Fares

The commission holds that any change in fares should be held in abeyance until the final settlement of the electric rates after filing results of the study in the electrical department.

The majority memorandum of the commission was by Commissioner Van Namee, Chairman Prendergast and Commissioner Pooley concurring. After a detailed examination of the three departments of the company the memorandum says on fares:

> The number of fares on the car lines as shown in the annual report of the Elmira company is as follows: 1924, 6,572,189; 1925, 6,391,609; a decrease of 180,580. This figure is a decrease of approximately 2.75 per cent, and includes the results for seven months of the increase of fare in the city of Elmira from 6 to 7 cents.
>
> It is fair to assume that any increase now made would result in at least a 5 per cent decrease in passenger fares. The net deficiency of return as shown by the compilations is approximately $143,000. It is evident that any fare which could possibly be collected on the railroad would not make up this deficiency of return. The point is soon reached where the falling off in riders more than offsets the increase in fare. The commission believes that the highest rate of fare that is practicable in the city is a combination of token and straight fare of 10 cents. Deducting the 5 per cent, we assume that the number of revenue passengers will be approximately 6,100,000. If the company is given a straight increase from 7 to 9 cents on 6,100,000 riders, the 1925 revenue would be increased $112,456. Under a straight 10-cent fare the increase would be $173,456.
>
> Under the peculiar conditions existing in the city, the commission is of the opinion that any change in the fare should be held in abeyance until the final settlement of the rates of the electrical department after the filing of the results of the optional rates in that department on Feb. 1, 1927.

The majority memorandum by Commissioner Van Namee further says:

> The company contends that the Public Service Commission should view each public utility in the light of its peculiar situation in its particular community. If the convenience and welfare of the community are to be maintained by the commission only by consideration of the service utilities as a single entity, the commission has no higher duty than to effectuate such an arrangement.
>
> The circumstances in the case of the Elmira company are such that the consideration of the electric, gas and railroad utilities for rate-making purposes as separate companies might be to deprive the community of the railway. The city, in its briefs, concedes that the railway, by any valuation, does not earn a fair return. The patronage of the railway has been decreasing for a number of years, and there is a very definite point at which the loss of passengers will offset the increase in revenue derived from an increased fare.
>
> It is probable that a 10-cent fare would be the most the traffic would stand. Any higher rate than that would cause a loss in revenue, and even that fare will not give a reasonable return upon any value which could be placed on the railway property. If the revenues should be pooled, the losses of the railway would be approximately equal to the excess profits of the electrical department, thus enabling the company to maintain a utility which is essential to the welfare of the city.
>
> The city takes the position that each of the three utilities must stand upon its own feet and that it is unfair to the consumers of one utility to make them pay the losses sustained by another utility of which they may or may not be customers.
>
> The commission has heretofore held in matters connected with the city of Elmira that the above proposition was correct.
>
> If the citizens of Elmira do not by their patronage of the street railroad allow the utility to obtain a fair return upon the money invested we know of no way to compel them to do so, and if such situation continues, the utility will have to suffer the fate of other transportation companies which have been superseded by newer, more convenient and popular means of travel.
>
> We hold therefore, in this case, that each of these utilities must be considered separately, and to that end we proceed to an examination of the property of each, its operating revenues and expenses.
>
> The memorandum fixes the rate base, present-day value, in the electrical department, at $4,423,147, and says that after allowing operating expenses of $862,238 and an 8 per cent return upon the present-day value depreciated of the property used and useful in the public service, the company received, as excess earnings in 1925, $218,-131. This figure of excess earnings is further adjustable because of the lower federal income tax payable under new rates. The allowable return of $354,571 is determined by using the exact amount of the federal income tax as included in operating expenses for 1925 as estimated by the company, which amount appears reasonable. The taxes approximate $60,000. The amount of this tax would be lower were the company only earning its allowable revenue and not in addition thereto its excess revenue of $218,000. Under new rates, the company will not earn this excess revenue and so will not have to provide in its operating expense an amount to cover federal taxes on the same. This excess income tax we estimate at approximately $25,000, and to the excess revenue of the company should be added this amount to show the total excess revenue for 1925. This makes such excess revenue approximately $243,000.
>
> The rate base, gas department, present-day value, is fixed at $1,521,481. Operating revenues for 1925 are placed at $487,566; total operating expenses, $381,146; available for return, $121,533, or 7.9 per cent.
>
> The rate base railway department, Dec. 31, 1925, is fixed at $2,251,669. The operating revenues were $456,539 and the total operating expenses $401,-907, leaving $54,632 available for return. On the rate base allowed the deficiency in return is $125,501.
>
> The memorandum says that a further adjustment of federal income taxes is necessary in its railroad department. The total deficiency of return in this department is approximately $143,000.
>
> Commissioner Van Voorhis, in dissenting from the majority memorandum, held that the three complaints should be determined at the same time and that consideration should be given to the various departments of the company as a whole in determining reasonable and just rates.
>
> Commissioner Lunn concurs in the valuations found, but dissents on the ground that it appears that consideration is given only to reproduction cost new of the three properties. He was also of the opinion that determination of the matters should be held until Feb. 1, 1927.

More Moves in Springfield Modification Plan

By Jan. 1 it is expected all municipalities will have approved the proposed plan whereby the New York, New Haven & Hartford Railroad will control the Springfield Street Railway, Springfield, Mass. The City Council is going over the plan where it affects the city of Springfield. One of the important matters up for discussion concerns a preference between one-man and two-man cars.

President Clark V. Wood of the company has made it plain that this service with one-man cars is needed. One of the first steps in the rehabilitation of the Springfield lines will be the purchase of 50 new cars. The City Council is seeking to have them two-man cars.

Rerouting of lines to minimize rail traffic on Main Street is another feature of the rehabilitation plans. There is talk of having the Holyoke and Westfield lines terminate in a loop at Taylor Street. Other lines to be affected by rerouting include the Indian Orchard and Ludlow line and the Walnut Street and King Street line.

Fare Increase Likely on Florida Municipal Line

An increase in the fare from 5 to 7 cents is being considered by the committee on public utilities at St. Petersburg, Fla., to be charged by the local municipal railway.

According to the St. Petersburg *Independent* the chief reason assigned for the proposed increase, which also contemplates fixing the price of tokens at four for 25 cents, is that operating expenditures exceed those of last year, with the addition of the Shore Acres line and other improvements, while

Digitized by Google

receipts have fallen off and the budget allowance is insufficient to provide against any large decrease.

Director Ludwig, in charge of the railway, is reported to have said:

So far as I know it has not been definitely decided by the committee that an increased fare will be necessary. The bulk of tourist business is ahead of us, but if the decrease in receipts continues, some practical solution must be sought. If any change is made, it should be done before the beginning of the winter season. The fact must be faced that we cannot continue to make improvements out of operating expenses without showing a deficit on the budget allowance approved by the commission.

The decrease in receipts is directly traceable, it is said, to the falling off in real estate and building activities, and also to increasing automobile traffic.

The affairs of the railway were reviewed in an article in the ELECTRIC RAILWAY JOURNAL for Oct. 30, page 818.

Baltimore Busybodies Would Dictate to the Lord

The United Railways & Electric Company, Baltimore, Md., has notified the Maryland Public Service Commission that beginning Nov. 22 the skip-stop plan will be extended to include all lines during the morning and evening rush hours. The company has had the plan in operation on about ten lines during the last few months and reports that it has been decidedly successful. It is expected that the Public Service Commission will be called upon to hold a public hearing.

The announcement has stirred up considerable opposition and some organizations have asked the Maryland Public Service Commission to hold a hearing on the subject in order that their views can be expressed. However, one champion of the plan has not failed to let the commission know his views. He is Oregon Milton Dennis, one of Baltimore's leading lawyers. He sent this letter to the commission:

I believe we have the best railway system of any large city. My only criticism, however, was the frequent stops—at every corner. I have been riding almost daily on the Edmondson Avenue line (No. 4) for about twenty years. Since the skip-stop schedule was put into effect I get to Walbrook not only about seven minutes sooner, but the riding has been more pleasant.

There is a class of people who are always "against," and in many instances they are called "Improvement Associations." If the Lord came to Baltimore they would try to dictate to Him what side of the street He should walk on.

I believe the real busy people of Baltimore—the ones that contribute largely of their time to make it the great city that it is—are in favor of the proposed skip-stop schedule, and I hope your commission will give its sanction to it.

I am not a stockholder—directly or indirectly—in the United Railways.

Speedier Service for Wisconsin Interurbans

Patronage of the Milwaukee Electric Railway & Light Company's high-speed transit line placed in service this summer to connect Milwaukee with Waukesha and Watertown has again shown a substantial gain compared with the first month's operation. This is evidenced from the fact that during September, 1926, 66 per cent more persons used the line than during the similar month of last year.

Actual operation has established the fact that high speed and frequent service, coupled with the use of the latest car equipment, make it possible for an interurban successfully to cope with the private auto and bus for transportation business. The company is now directing its attention toward adopting similar measures with its Milwaukee-Racine and Kenosha line. The running time here will be shortened almost a half hour when plans now under way are completed. This line will be so readjusted that the business districts of Cudahy and South Milwaukee will be avoided by a cut-off.

Punctilious Employees Honored

Sixty-one motormen, conductors and bus operators employed by the East St. Louis Railway, East St. Louis, Ill., recently were honored and awarded cash for cleanliness and neatness of their person and vehicles.

In accordance with a custom established several years ago by W. H. Sawyer, head of the East St. Louis system, a housewife of the city recently rode the cars and buses to check up on the crews. This was done surreptitiously as it was desired to obtain a cross-section of the actual every-day conditions on the cars.

On each car the housewife carefully noted the appearance of the conductor, whether his face and hands were clean and the condition of his collar, tie, suit, shoes, etc. Then she gave the car the once over, and finally the motorman came in for a similar checking. Her reports were sent personally to Mr. Sawyer and when finally every man employed in the city service had been investigated the list of those who had passed muster was revealed.

Special Safety Drive in Pittsburgh

Thirty men from the Pittsburgh Railways, Pittsburgh, Pa., 25 of them motormen and conductors, attended the National Safety Council convention, held in Detroit recently.

The men, all operators on the cars of the railway, sought to bring back to the 3,000 trainmen at home the message and methods of safety, in the hope of reducing the number of accidents.

Each man made a personal report, which will go to the carhouse or division he represents. The men were elected to the convention by their own associates on the cars.

The Philadelphia Company group, including the railways, Duquesne Light Company, Equitable Gas, Motor Coach and others, is taking part this month in a no-accident drive. There were also representatives of this group at the Detroit conference. In line with this move the railway decided several months ago that a series of stories and talks on safety by operators of cars would have the effect of decreasing the number of accidents and making the streets safer. Trainmen in the various carhouses were asked to co-operate and elect their own representatives.

Thomas Fitzgerald, vice-president of the railway; W. H. Boyce, commercial manager and chairman of the central safety committee; W. G. Marshall, personnel director, and J. M. Loftis, superintendent, represented the officials.

Banker Sees Chicago Situation as Possible Black Eye to Industry

F. J. Lisman, of F. J. Lisman & Company, New York, says whether or not his traction plan for Chicago is accepted a receivership for the surface railways there seems inevitable. Under his plan a receivership would be a formal matter, he thinks, and would not involve operation of the properties by a receiver. Regarding the Chicago traction situation Mr. Lisman says:

Contrary to general belief, the Chicago traction situation is far from being a local problem. Unless prompt and definite action is taken on the plan which has been submitted, certain default will occur in $165,000,000 principal of bonds maturing on the first of February, next, and a default in interest on about $70,000,000 bonds. If that is permitted to occur, the effects will be far-reaching and felt beyond the limits of the city of Chicago. Less than one-third of the entire amount of these traction securities is held in Chicago—the balance being in the hands of estates, insurance companies and individuals all over the United States. It is not at all unlikely that the broadcasting of the default on such a large amount of securities would have a depressing effect on traction bonds in general and tend further to weaken the confidence of the public in this type of securities. It is, therefore, evident that the problem is something more than the solution of a local traction situation.

The $165,000,000 of bonds mature on Feb. 1 simultaneously with the expiration of the companies' twenty-year franchises which have not been extended. The existing companies are not asking for renewal because they claim they cannot do the financing necessary for the expansion of their system under a twenty-year franchise, and they are endeavoring now, as they have been doing for the last ten years, to get the Illinois Legislature to authorize a franchise for a longer period. In the meanwhile they are asking the bondholders to await the outcome of such legislation.

Under the franchise now about to expire, the city of Chicago has been receiving 55 per cent of the surplus earnings of the street railways and this method is to be continued. These surplus earnings which heretofore have been turned into the city traction fund, now amounting to $45,000,000 and carrying a very low rate of interest, are hereafter to be used as a sinking fund to redeem the company's first mortgage 5 per cent bonds at par or below. Similarly, a renewal and depreciation fund, amounting to 8 per cent of the annual gross earnings, which has been allowed to accumulate during the last twenty years until it now amounts to $21,500,000—all but $5,000,000 of which is lying in Chicago banks at 3 per cent interest—is to be used hereafter in part for the purpose of redeeming the first mortgage bonds, to be issued for expansion.

Changes Suggested at Elizabeth Under Consideration

At a conference between officials of the Public Service Railway, Newark, N. J., and the Board of Works of Elizabeth, held on Nov. 12, Matthew R. Boylan Public Service vice-president, accepted for consideration two sets of resolutions, one prepared by the Board of Works and the other by the Civic Council on Transportation. It was recommended, among other things, that existing railway schedules be enforced rigidly and that bus lines paralleling the electric railway be rerouted. Back of the movement is a desire for single-fare transportation service to link all sections of the city.

Recent Bus Developments

Tax of 4½ Per Cent Approved in California

Amendment No. 2 on the November ballot in California proposing a 4½ per cent tax upon the earnings of stage companies was passed at the recent election. Specifically the 4½ per cent gross earnings tax is established in lieu of other taxes except the gasoline tax. Its effect will be to relieve the operator of a multiplicity of state and local imports and levies. It will, for instance, exempt the stages hereafter from weight and license taxes and permit them to operate under a public service license, as is the case with the motor vehicles operated by other public utilities.

The *Motor Carrier*, the official organ of the Motor Carriers' Association of California, says that the advocacy of the legislation by the carriers was based not on the hope of reducing taxes, but of substituting certainty and system for uncertainty and lack of system.

The amendment goes into effect as soon as the result of the election is certified by the Secretary of State.

Among the advocates of the measure was Harvey M. Toy, chairman of the State Highway Commission. He put the matter clearly in one of his speeches in part as follows:

> This amendment will solve not only the problem of equitable taxation for the stage lines, but it will provide highway funds and put the stage lines on the same basis of tax relationship with the state as other public utilities. Two years ago I opposed a somewhat similar amendment proposing a 4 per ecnt tax on the earnings of the stage lines. My opposition then was based chiefly on the fact that the terms of that amendment provided the money derived should go to the general fund of the state instead of to the highway funds. The present amendment corrects that fault by requiring the use of stage taxes for highway purposes.
>
> I am informed that the stage lines regard the tax of 4½ per cent as somewhat excessive, particularly in view of the fact that they will be subject to the state gasoline tax, the revenues from which likewise go to state highway purposes. But, considering all the factors involved, I do not believe that the rate in the amendment is too high. Further, it should be borne in mind that the State Railroad Commission fixes the fares charged by the stage lines, and if at any time in the future the tax rate should be found too high or too low, the way is left open for its adjustment by a two-thirds vote of the Legislature.

More Buses for Lincoln

The Lincoln Traction Company, Lincoln, Neb., has ten buses in service. A half dozen more are to be put in service by Dec. 15. Most of these will be used in the suburbs. Some of the buses are being used for peak-load periods with success. Severer parking restrictions are being made for the downtown districts, and their enforcement is expected to result in increased traffic for the buses.

The Omaha, Lincoln & Beatrice Railway has a full complement of buses running between University Place and Lincoln. A competitive service has just been installed by the Traction company. The City Council has adopted the policy of full freedom of competition between the two railways for business in the downtown district, but is rigidly excluding all other forms of transportation for hire at rates comparable with those charged by the buses.

Columbia Case Unsettled

Jitneys, Buses and Trolleys All Still Furnishing Service in South Carolina Capital

The passenger transportation problem in Columbia, S. C., the capital of South Carolina, is still unsolved, but the three factors in the problem—the street cars, the 10-cent jitneys and the buses—are all in the field.

There is apparently no demand on the part of citizens for the restoration of railway service in sections recently abandoned by the Columbia Railway, Gas & Electric Company. That company is now operating only three trolley lines—these catering largely to the retail business district and the railroad station. Wires are up and the tracks in position in many other sections of the city, but no cars are being operated.

The bus line, however, is adding to its equipment; it is now serving many sections which the railway never reached and its patronage is growing steadily. Whether the price of cotton—on which the prosperity of this section depends to a certain degree—will have any bearing on the popularity of the bus lines remains to be seen. So far there has been little if any diminution in the sales of automobiles, even though cotton is selling below the cost of production.

The jitney is gradually being eliminated—not through action of the City Council—and indications are that it will soon disappear from the residential sections and confine its activities to the business district.

When the buses put on a fare of 5 cents for school children a number of jitneys emulated the example and on the windshields of the jitneys were displayed signs reading "School Children, 5 Cents." This competition, however, continued only about one week, when the jitneys removed their signs. The jitneys operate without regular schedule, are hard to locate in rainy weather and have many objectionable features, but they have not been outlawed by the City Council and so are competing on an even basis with the bus lines. Their regular fare is 10 cents to any point in the city limits.

The railway is now charging 10 cents for each passenger, as is the bus company, but interchangeable transfers are given between the trolleys and the buses without extra charge.

For a time the bus company sought to have the jitney competition regulated and once threatened to quit operations on some lines unless Council restrained the jitneys. Now the bus company is getting on its feet, is providing good schedules and is giving dependable service. The working agreement between the Carolina Transit Company, operating the buses, and the company operating the trolley lines indicates the community of interest that exists between these two corriers.

Would Operate Buses in Hudson

The Eastern New York Transportation Corporation, a subsidiary of the Eastern New York Utilities Corporation, Albany, N. Y., filed a petition with the Public Service Commission recently for permission to operate a bus line in the city of Hudson and the town of Greenport, Columbia County.

The company proposes to substitute buses for street cars in Hudson and to operate no fewer than three buses on the routes set forth in the consent of the city on a twelve-minute schedule between the hours of 6 a.m. and 11 p.m. The rate of fare for one continuous ride from one point to another on the route is to be 8 cents, with transfer privileges to and from interurban buses and interurban cars operated by the Eastern New York Utilities Corporation.

Holyoke Argument Heard

Power of states to require interstate bus companies to get licenses before operating within their limits was argued in the Supreme Court on Oct. 28 in a case from Massachusetts involving the Interstate Buses Corporation of Connecticut and the Holyoke Street Railway and others. The bus lines paralleled the railway a part of the distance from Hartford, Conn., to Greenfield, Mass., and the railway succeeded in the courts in Massachusetts in enjoining its operation and having fines and imprisonment imposed upon its operators. The bus company contended that the Massachusetts law was unconstitutional and in restraint of interstate commerce. Counsel for the railway based his argument largely upon the police power of the state to control the use of its highways.

New Feeder Service by Mesaba Railway

Bus service between Virginia Center and environs has been started by the Mesaba Railway Coach Company, Virginia, Minn., a subsidiary of the Mesaba Railway. James C. Chestnut, receiver, said the service, which would continue regularly until April 30, was instituted for the convenience of the public during the winter months. Buses will operate at regular intervals in accordance with time cards printed and distributed throughout the territory served.

Fare to the north and south side from Virginia Center will be 7 cents and between Virginia Center and West Virginia 10 cents, and also between the north side and south side. A 15-cent fare will be charged between West Virginia and the north side. Coupons, honored in this service, will tend to reduce fares about 10 per cent.

Financial and Corporate

$15,000,000 Berlin Issue Offered in American Market

Speyer & Company, Equitable Trust Company and Blyth, Witter & Company, New York, offered on Nov. 12 at 94½ and interest, to yield 6.95 per cent, $15,000,000 of Berlin Electric Elevated & Underground Railways 30-year first mortgage 6½ per cent sinking fund gold bonds. Of the issue $3,000,000 was withdrawn for sale in Holland by Hope & Company, Teixeira de Mattos Brothers and Deutsche Bank, Amsterdam.

The city of Berlin, which (directly or through a corporation wholly owned by the city) owns a majority of the company's stock, has entered an agreement with the company providing that fares will be maintained adequate to insure earnings which will cover operating expenses, interest and sinking fund on all loans and proper provision for depreciation and other necessary reserves and that if, for any reason, the fares should not be maintained at rates adequate to insure sufficient earnings available for such purposes, the city will provide the funds necessary therefor.

The bonds are part of a total authorized issue limited to $25,000,000 (or equivalent in reichsmarks). The remaining bonds may be issued under restrictions to be set forth in the indenture.

Proceeds of this issue will be used for betterments, additions and equipment, for the payment of floating debt incurred in construction of lines acquired from the city and of extensions recently placed in operation, for the redemption of 13,463,700 reichsmarks ($3,205,261) outstanding bonds and other obligations, and for other corporate purposes.

The company was organized in 1897 as a private corporation and began operation in 1902. It owns about 28.7 miles of elevated and underground lines and operates a total, including connecting lines, of about 33.1 miles. These lines constitute the entire electric rapid transit system now in operation in Berlin, third largest city of the world, with a population of about 4,000,000.

Offer to Exchange Norfolk Stock

In line with plans to simplify its corporate structure the Virginia Electric & Power Company, largest subsidiary of Engineers Public Service, has made an offer to the stockholders of the Norfolk Railway & Light Company for the purchase or exchange of their stock. Two alternative offers are made: $33 a share in cash, or one share of 6 per cent cumulative preferred stock of the Virginia company and $9 in cash for each three shares of the Norfolk company. The holders of a large proportion of the capital stock of the Norfolk company have already agreed to one or the other of the options.

One of the purposes of a special meeting of stockholders of the Virginia Company to be held on Nov. 23 is to reclassify the unissued 7 per cent preferred stock into a 6 per cent stock, which will then be available under the terms on the offer to the Norfolk company stockholders.

Stockholders of the Virginia company will also be asked to ratify an offer of an additional $9,000,000 first and refunding 5 per cent bonds.

Barre Property Passes to Foshay

The W. B. Foshay Company, Minneapolis, Minn., will increase the public utility holdings which it operates through the Peoples Light & Power Company by assuming control of the Montpelier & Barre Light & Power Company and its subsidiary, the Green Mountain Power Company of Vermont, on Jan. 15. Properties of the Montpelier company will be taken into the Peoples Hydro-Electric Corporation, which will own all the common stock of the Green Mountain Power Company. The Peoples Light & Power Company serves 144 cities and towns in twelve states with electricity, gas, water and railway service. Foshay utilities serve 170,000 people.

Another Excellent Year in Brooklyn

Company Operating Rapid Transit and Surface Lines Reports Net Income of $5,748,187 for Year, an Increase of $674,652—269,233,866 Surface Passengers and 623,099,695 Rapid Transit Riders

CONSOLIDATED net income of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., for the year ended June 30, 1926, was $5,748,187, an increase of $674,652 over the previous year. This and other facts concerning the operations of the company for the year were reported to the board of directors on Nov. 15. This is the third report of the company, which is the successor to the Brooklyn Rapid Transit Company.

During the last three years the expenditures for maintenance of way and structures and of equipment, including reserves for depreciation, have totaled $21,354,371, which is 24.22 per cent of the total operating revenues of $88,153.384 for the three years.

There were paid, for the fiscal year, on the outstanding preferred stock, four quarterly dividends, aggregating $1,496,808, and on the outstanding common stock, dividends of $2 per share for the period from the organization of the corporation to Sept. 30, 1925, and two quarterly dividends of $1 each, aggregating $3.079,644.

This shows that the increase in eight years in passengers on the rapid transit lines has been 134.7 per cent and the increase on the system 71.2 per cent. It also shows that the surface lines are carrying 30.1 per cent of the total traffic.

In discussing the rapid transit lines Gerhard M. Dahl, chairman, says:

> The city is now proceeding with the completion of the Fourteenth Street-Eastern line, with the construction of shops and storage tracks near Coney Island, and with the lengthening of certain station platforms to accommodate eight-car trains. In anticipation of requirements for additional equipment your rapid transit operating subsidiary, the New York Rapid Transit Corporation, during the preceding year had under construction twelve cars, comprising four units of articulated cars, designed to produce greater efficiency and safety in operation. They were completed and placed in operation on Aug. 31, 1925, and proved so satisfactory that contracts were placed for 201 additional cars, comprising 67 units of such articulated cars. Deliveries are expected to start in December. The work of assembling and equipping these cars will be undertaken at the Coney Island Shops.
>
> The city has not yet started work on the construction of the Nassau-Broad line. This line, with the added facilities mentioned above, would materially increase the capacity and efficiency of the rapid transit lines under contract No. 4.
>
> The city completed the Extension of the Fourth Avenue line from 86th Street to 95th Street, Brooklyn, and your corporation did the necessary equipment work and placed that extension in operation on Oct. 31, 1925.

The first annual report stated briefly the provisions of contract No. 4 as to the disposition of revenue arising from operations under the contract. The New York Rapid Transit Corporation is entitled to its operating and preferential deductions, including cumulative deficiencies thereof, ahead of any payments to the city. The accompanying table shows the order in which deductions are to be made from revenues and the application of revenues thereto, together with the cumulative deficiencies. It will be observed that the earn-

STATEMENT OF BROOKLYN OPERATION UNDER CONTRACT WITH CITY

	Year Ended June, 30 1926	Period Aug. 4, 1913, to June 30, 1926
Revenue	$32,418,173	$246,848,204
Operating deductions and corporation's first preferential	26,146,489	223,974,523
Balance available for return on new money invested under contract	6,271,684	22,873,681
Corporation's second preferential, representing interest and sinking fund on corporation's contribution to construction and equipment under contract	5,501,355	40,114,550
Balance above corporation's second preferential	770,328	.....
Deficiency representing amount by which revenue failed to equal interest and sinking fund on corporation's contribution to construction and equipment under contract	.....	*17,240,868*

PASSENGERS CARRIED

COMPARATIVE STATEMENT OF EARNINGS AND EXPENSES OF THE BROOKLYN-MANHATTAN TRANSIT SYSTEM FOR YEAR ENDED JUNE 30

	1926	1925
Revenue from Transportation:		
Passenger revenue	$42,803,047	$41,383,763
Freight revenue	672,689	675,183
Chartered car revenue	532	716
Miscellaneous transportation revenue	521	641
Chartered bus revenue	70,494	13,331
Total revenue from transportation	$43,547,284	$42,073,635
Other Street Railway Operating Revenues:		
Advertising	$656,000	$656,000
Other car and station privileges	387,925	381,941
Rent of buildings and other property	171,597	150,900
Rent of equipment	802	240
Rent of tracks and terminals	21,035	21,634
Miscellaneous receipts	56,322	28,065
Total other street railoperating revenues	$1,293,682	$1,238,781
Total street railway operating revenues	$44,840,967	$43,312,417
Operating Expenses:		
Maintenance of way and structures	$4,721,411	$4,474,266
Maintenance of equipment	6,071,133	6,087,560
Operation of power plant	3,263,338	3,240,270
Operation of cars—trainmen's wages	6,952,159	6,872,091
Operation of cars, other expenses	4,310,478	4,193,723
Damages	1,616,237	1,416,701
Legal expense in connection with damages	218,625	198,978
General law expenses	106,047	134,985
Other general expenses	1,492,075	1,309,152
Freight expenses	469,332	493,660
Total operating expenses	$29,220,839	$28,426,390
Net revenue from operation	$15,620,127	$14,886,026
Taxes accrued on operating properties	3,260,384	3,068,461
Operating income	$12,359,742	$11,817,564
Non-Operating Revenue:		
Rents accrued from lease of road	$62,703	$60,571
Miscellaneous rent revenues	156,535	287,276
Interest revenues	783,731	544,337
Dividend revenues	.....	666
Miscellaneous	179,841	192,558
Total non-operating revenues	$1,182,810	$1,085,408
Non-Operating Revenue Deductions:		
Rent expense	2,317	827
Net non-operating income	$1,180,492	$1,084,581
Gross income	$13,540,235	$12,902,146
Income Deductions:		
Interest deductions	$7,462,322	$7,475,760
Rent for lease of other road and equipment	25,000	25,000
Other rent deductions	286,770	309,677
Sinking fund accruals	658	658
Amortization	3,125	3,125
Total income deductions	$7,777,877	$7,814,221
Balance	$5,762,358	$5,087,925
Less—Accruing to minority interests	14,171	14,390
Net income	$5,748,187	$5,073,534

ings for the year showed an excess over the year's deductions, applicable to the cumulative deficiency, as did the earnings of last year, and that the cumulative deficiency now totals $17,240,868 as the result of determinations made by the Transit Commission under provisions of the contract, which disposed of undetermined items of cost up to June 30, 1925.

Mr. Dahl says that with a continuation of favorable operating conditions and particularly with the additional facilities that the city is obligated to provide, it is hoped that the net revenue will continue to increase so that the cumulative deficiency of full deductions may be gradually made good.

The accompanying condensed comparative summary gives the results of operations under the contract with the city for the year ended June 30, 1926, and also for the thirteen-year period from the commencement of operation under the contract, namely, Aug. 4, 1913, to June 30, 1926.

North Jersey Transit Deal Approved

The Board of Public Utility Commissioners of New Jersey has sanctioned the sale of the cars, franchises, right-of-way and other property of the North Jersey Rapid Transit Company to the Public Service Railway for $200,000. Confirmation of the transfer was asked by Henry H. Parmelee, receiver for the transit company, the sale already having been approved by the Court of Chancery. Reference to the proposed sale was made in the ELECTRIC RAILWAY JOURNAL for Nov. 6, page 864.

Approving of Refunding Operation Sought at Boston

The Boston Elevated Railway, Boston, Mass., has petitioned the Department of Public Utilities for authority to issue $4,656,000, par value, 30-year, 6 per cent bonds to refund two bond issues of the West End Street Railway assumed by Boston Elevated on the consolidation of the two companies. The West End issues are $2,700,000 maturing on Feb. 1, 1927, and $1,956,000 maturing on May 1, 1927.

Reasons Given for Geneva Receivership

Justice Benjamin B. Cunningham of the Supreme Court has appointed Lansing S. Hoskins and James M. Ryan, both of Geneva, N. Y., receivers of the Geneva, Seneca Falls & Auburn Railroad, operating 15 miles of electric railway between Geneva and Seneca Falls and buses in the city of Geneva.

As noted in the ELECTRIC RAILWAY JOURNAL for Oct. 30, page 827, this action came when the company was unable to pay interest on an issue of $507,000 of first mortgage 5 per cent gold bonds issued July 1, 1913, with the Chatham-Phœnix National Bank & Trust Company, New York, as trustee.

Lansing G. Hoskins, attorney for the railroad and father of one of the receivers, issued the following statement in explanation of the receivership:

This road has been unable to meet the interest charges on its bonds during the present year, although the rate of interest during the preceding year was reduced to 3 per cent, and necessarily the trustee under the mortgage was compelled to commence foreclosure.

The gross earnings of this company have steadily decreased, while taxes, special franchise taxes, gross earnings taxes and paving assessments continued to accrue. The number of passengers carried on the city line in 1924 was 212,947 and in 1925 was 159,379.

The number of passengers carried on the interurban line during 1924 was 537,717 and in 1925 was 463,375.

Owing to the fact that the operating expenses of the Geneva line exceeded its receipts, the company was forced to abandon this line and substitute buses for street cars.

The revenue of the road has been steadily declining for ten years. The situation, both as to decrease of revenue and, necessarily, of passengers carried, is due largely to private automobile operation and competition, while operating expenses, taxes and paving assessments have not materially decreased.

The complaint of Carter, Ledyard & Milburn, New York City, the attorneys for the plaintiff bank, sets forth that, in addition to the mortgage, the company owes city, county, state and school taxes for 1925 and 1926 to the city of Geneva, the town of Waterloo, village of Waterloo, town of Seneca Falls and village of Seneca Falls.

It is further alleged that the company owes the state for gross earnings tax for 1925 and 1926.

During pendency of the case, the interurban railway and the Geneva bus system will be operated as usual, receivers stated.

$380,424 Surplus in Denver in Nine Months

Total operating revenue of $3,399,975 and a balance of $380,424 for depreciation and surplus after payment of expenses, taxes, bond interest, dividends on 5 per cent preferred and other charges are shown in a statement of the Denver Tramway, Denver, Colo., for the nine months' period ended Sept. 30.

Total operating revenue	$3,399,957
Operating expenses (not including depreciation)	1,823,123
Taxes	413,664
Total operat. exp. and taxes	$2,236,787
Net operating income	1,163,170
Total miscellaneous income	41,555
Gross income less operating expenses and taxes	*$1,204,726
Interest on underlying bonds	190,280
Balance	†$1,014,446
Interest on general and refunding 5 per cent bonds	241,631
Balance	$772,814
Less net and loss charges (estimated)	1,775
Balance available for depreciation and for dividend requirements on 104,164 shares of preferred stock	$771,039
Five per cent dividend	390,615
Balance for deprec. and surp.	$380,424

* Equals 6.33 times interest on underlying bonds.
† Equals 4.20 times interest on general and refunding bonds.

Abandonment Hearing Before Commission

A further hearing was held before the Public Service Commission on Nov. 12 on petition of the Hudson Valley Railway for permission to abandon that portion of its line between the villages of Thomson and Greenwich and the village of Lake George and the Hamlet of Warrensburgh. At the beginning of the hearing Judge Kiley of Glen Falls applied for adjournment to a subsequent date to permit the town of Warrensburgh to submit to the people of that town the question of whether counsel should be employed by the town board to oppose the abandonment of the Lake George-Warrensburgh branch. The commissioner decided to continue the testimony relating to the Thomson-Greenwich branch and to continue the hearing on Dec. 7 as to the future of the Warrensburgh lines. Evidence was submitted at the hearing as to the earnings of the company and expendi-

Digitized by Google

tures required to keep these lines in satisfactory operating condition, also as to the number of passengers carried and general operating conditions in the territory served by these roads.

Bonds of Crawford County Railways Called

All of the outstanding first mortgage 40-year 6 per cent sinking fund gold bonds of the Crawford County Railways, Erie, Pa., dated July 1, 1921, have been called for payment on Jan. 1, 1927, at par and interest at the office of the Irving Bank & Trust Company, New York City. The Northwestern Electric Service Company of Pennsylvania, successor company, announces that it will purchase at any time before Jan. 1, 1927, any or all of the bonds presented at the principal office of the National Bank of Commerce, New York, at par and interest to the date of purchase. Holders have the option of exchanging their bonds into Associated Gas & Electric Company preferred stock.

American Foreign Buys Havana Stock

The stockholders of the American & Foreign Power Company at a special meeting on Nov. 13 approved the acquisition of the Electric Bond & Share Company's holdings of Havana Electric & Utilities Company.

They also authorized the issuance of 300,000 additional shares of common stock, which will be to pay for the Havana Electric stock.

Financial Structure of Brooklyn City to Be Changed

Stockholders of the Brooklyn City Railroad, Brooklyn, N. Y., will vote on Nov. 23 on a proposal to increase the authorized capital stock of the company from $16,000,000 to $18,500,000, each share to be of a par value of $10. At the same meeting the stockholders will vote on a proposal to approve an issue of convertible bonds to be issued in series. These proposals are being put before the stockholders as part of a plan which it is expected will result in the revamping of the financial structure, particularly with respect to creating an open end mortgage which will facilitate future financing.

Northern Cambria Road Sold

The Northern Cambria Railway, Johnstown, Pa., operating from Carrolltown through northern Cambria County towns to Barnesboro, has been abandoned and all articles of equipment disposed of at public auction to Roberts Brothers, Philadelphia, for $29,800. The Northern Cambria Bus Company, a subsidiary, was sold to Fred J. Fees, Ebensburg, for $4,100. The real estate of the railway, known as Sunset Park, Patton, was sold to Roberts Brothers and Joseph B. Broan, Philadelphia, for $4,000. Work on removing the tracks has been started. The sale of the line was under an order of the Ebensburg Trust Company, receiver. The system comprised 13 miles of line.

$14,553,437,951 Stock Value for Utilities

The fair value of the capital stock of all public utility corporations making returns in 1924 was $14,553,437,951, the bureau of internal revenue shows in statistics just made public. The subdivisions making up that total are: Steam railroads, $5,470,184,648; electric railroads, $462,973,378; all other railroads, $432,349,391; water transportation, $562,582,366; local transportation (cabs, delivery, etc.), $104,586,361; electric light and power companies, $1,580,465,582; gas companies, $909,056,432; telephone, telegraph and radio companies, $1,976,406,393; water works, $235,999,978; storage companies, $415,390,808; other public utilities, $2,319,330,273; lessor companies, steam and electric railroads, $32,595,542; lessors of public utilities, $51,516,799.

M. J. Ellis Gets Rockford Properties

The railway system centering at Rockford, Ill., was sold at auction on Nov. 15 to Milton J. Ellis, Beloit, for $550,000, subject to confirmation by the Circuit Court. This sale follows a court order entered recently by Judge E. D. Shurtleff in the Winnebago County Circuit Court calling for the sale of all properties of the Rockford City Traction Company, Rockford & Interurban Railway and Rockford, Beloit & Janesville Railway. The petition for the order for sale was presented by the Continental & Commercial Trust Company, Chicago, trustee representing holders of the first mortgage bonds.

Mr. Ellis, who bought the property, had recently acquired a majority of outstanding bonds at about 23 cents on the dollar.

Bondholders Take Utah Property

The Utah-Idaho Central Railroad, Ogden, Utah, was purchased on Nov. 5 at a receivers' sale by a committee of bondholders for $1,500,100. Acting under an order made by Judge Tillman D. Johnson of the United States District Court, P. H. Mulcahy, receiver and former general manager of the company, made the sale. James A. Howell, of counsel for the railroad, explained that the sale would be subject to rights which the Bamberger Electric lines had with the Utah-Idaho Central under a contract made Oct. 6, 1914.

The bid made by the representative of the bondholders was for two parcels of the company's assets. The first parcel included the stock of the Utah Rapid Transit Company. It brought $100. The second was all assets and stock of the Utah-Idaho Central, which brought $1,500,000. He said that bondholders of the Utah-Idaho Central Railroad owned all of the preferred and common stock of the railroad company and held about $300,000 in unpaid bond coupons.

The present Utah-Idaho Railroad is an outgrowth of the joining of the street railway systems of Ogden and Logan. The consolidation was made in 1914, when the company was building the present line which extends from Ogden to Preston, Idaho. When the company was formed it was known as the Ogden, Logan & Idaho Railroad. Early in 1919 the name was changed to Utah-Idaho Central Railroad. The change in name was made in order to avoid any confusion in the identity of this railroad and the Oregon Short Line by the common use of the initials of each road. With the increasing use of the automobile and truck, the business of the company diminished and led to the receivership, on Aug. 20 last. An action brought by the Westinghouse company in the federal court resulted in the appointment of Mr. Mulcahy as receiver. When the receiver was named, Judge Johnson ordered an investigation to determine if the receivership could not be worked out, but an adverse report was made, resulting in the order for the sale.

Attorneys for the railroad intended to go into the federal court on Nov. 15 to seek approval of the sale. It was said unofficially that a new company would be formed to operate the road.

Earnings at Minneapolis Increase

Earnings of the Twin City Rapid Transit Company, Minneapolis, Minn., for the third quarter and the first three quarters of the year show gains over 1925. Net income for the quarter was $178,639, compared with $56,387 in 1925; for the nine months $901,085, compared with $714,610. The comptroller's figures are as follows:

Third quarter	1926	1925
Gross revenues	$2,881,885	$2,847,326
Operating expense	2,161,170	2,253,774
Net revenue	$714,715	$593,522
Fixed charges, taxes	536,075	537,165
Net income	$178,639	$56,387
Nine months—		
Gross revenues	9,479,051	9,231,792
Operating expense	6,913,957	6,853,484
Net revenue	$2,565,094	$2,378,307
Fixed charges, taxes	1,664,008	1,663,696
	$901,085	$714,610

Coal Belt Line to Suspend.—The Coal Belt Electric Railway, Marion, Ill., operating from Marion to Herrin, Carterville and other points in Williamson County, Illinois, has been authorized by the Illinois Commerce Commission to discontinue service. No date for quitting has been set. The line had been leasing its rails to the Missouri Pacific Railroad. The cars of the electric railway were used mostly by coal miners in getting to and from work. The company operated 14 miles of line.

Loss in Youngstown in September.—Deficit resulting from operation of the Youngstown Municipal Railway, Youngstown, Ohio, during September was $7,808, which is $11,300 less than for a similar month last year, according to the monthly report of Traction Commissioner Engle. Though the income was higher this year, there was slightly more capital upon which to pay a return. Capital value in September, 1925, was $4,125,288 compared with $4,184,429 for September of this year. Other comparative figures for September of this year in relation to September, 1925, are: Increase of $10,240 in income from bus operation, and an increase of $2,520 in income from railway operation.

Personal Items

J. C. Johnson Superintendent of Shore Line Coach Company

Jasper C. Johnson has resigned as general superintendent of transportation for the Aurora, Elgin & Fox River Electric Company, to become superintendent of operation in charge of the main line division of the Shore Line Motor Coach Company, a subsidiary of the Chicago, South Shore & South Bend and the Gary Railways.

Mr. Johnson entered the service of the Aurora, Elgin & Fox River Electric, then known as the Aurora, Elgin & Chicago Railroad, as a conductor in 1910. He was subsequently made motorman, dispatcher, service inspector and finally, in 1920, was promoted to division superintendent. In addition to his duties with the railroad, where he also had charge of several auxiliary bus lines, Mr. Johnson has been a director of the Illinois Motor Transportation Association for a number of years.

With the Shore Line Motor Coach Company he will be responsible for the operation of all through routes, particularly the newly established service between Chicago, Ill., and Grand Rapids, Mich. For the time being his headquarters are to be located in Michigan City, Ind.

A. D. McWhorter, Jr., has become affiliated with the Carolina Power & Light Company in Raleigh, N. C. Mr. McWhorter is a son of the general superintendent of the Memphis Street Railway, Memphis, Tenn. He was graduated from the University of Tennessee. During last year he was associated with the General Electric Company of Schenectady and Erie.

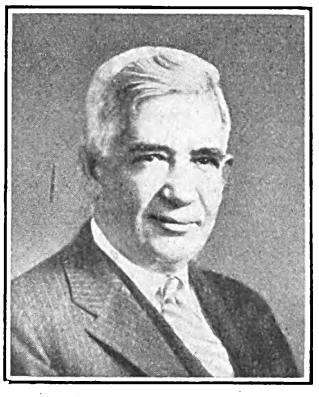
Arthur W. Thompson, president of the United Gas Improvement Company, Philadelphia, Pa., has succeeded Walton Clark, Philadelphia, as director of the subsidiary companies of the Public Service Corporation of New Jersey. Mr. Clark was elected a director of Public Service Corporation of New Jersey at the time of its organization on June 3, 1903, and a director of each of the underlying companies as it was organized. The companies the directorate of which he leaves include the Public Service Electric & Gas Company, Public Service Electric Power Company, Public Service Railway, Public Service Production Company, Public Service Transportation Company, Public Service Railroad and the Public Service Stock & Bond Company.

E. F. Hirsch, has resigned from the West Penn Railways, Pittsburgh, Pa., to take up his new work with Harper & Turner, investment bankers, in Philadelphia, Pa. Mr. Hirsch has been an employee since July, 1919, when he came with the company as an assistant to E. D. Dreyfus on appraisals and investigations. In the spring of 1922 he was made an assistant in Vice-President R. B. Keating's office and in August, 1924, he was promoted to the position which he held at the time of his resignation as assistant to Vice-President C. P. Billings. Mr. Hirsch was graduated from Carnegie Institute of Technology and attended night school at the University of Pittsburgh for five years, taking law and finance.

Colonel Wallace Leaves Detroit

Manager of Municipal Railway Tenders Resignation to Take Effect on Jan. 1

Col. H. U. Wallace, general manager of the Department of Street Railways at Detroit, Mich., tendered his resignation on Nov. 17 to the Street Railway Commission to take effect on Jan. 1. Colonel Wallace will take a much-needed rest before he announces his future plans.



Col. H. U. Wallace

Colonel Wallace took to his task at Detroit, upon which he entered in June, 1925, 30 years of engineering and railroading experience. Just before going to Detroit he was assistant general manager of the Knoxville Power & Light Company, with direction of all of that company's railway activities. In fact he supervised the reorganization of the railway department there.

Colonel Wallace was born in Rock Island, Ill., in 1872. He is the son of John Findley Wallace, chief engineer of the Panama Canal under President Roosevelt. He was graduated from Purdue University and in 1894 was engaged as assistant engineer for the Illinois Central Railway. During his years of service with that railroad, of which his father was general manager, he was resident engineer in charge of the Illinois Central's lake front improvements, roadmaster of the Chicago division, roadmaster and assistant superintendent of the Louisville division and superintendent of the Louisville and Freeport divisions.

From 1903 until 1906 he was chief engineer of the Illinois Central in charge of all maintenance and construction work. He resigned in 1906 to become third vice-president of J. G. White & Company, New York, in charge of construction work. He was later general manager of the Chicago, Lake Shore & South Bend Railway, which he operated for eighteen months. He resigned this position to go into business as consulting engineer in Chicago. His return to active railroading was as vice-president in charge of operation and reconstruction of the Fort Dodge, Des Moines & Southern Railway.

In 1912 Colonel Wallace inspected the holdings of the Northern Colorado Power Company. As a result of his work on this property and his recommendations a new company, the Western Light & Power Company, was organized.

During the World War he was commissioned as major of engineers and assigned to the construction division as supervising construction officer of a large number of important ordinance plants.

George A. Iler has resigned as chief electrical engineer of the Pennsylvania-Ohio Electric Company, Youngstown, Ohio, to look after his commercial interests. He will devote his time to the development of several articles he has patented. Just prior to his departure Mr. Iler was the guest of members of the Officers' Club at dinner at the Poland Country Club and at a similar affair by his associates in the engineering and line department.

Obituary

C. S. Cook

Charles S. Cook, vice-president and treasurer of the Kaestner & Hecht Elevator Company and formerly with the Westinghouse Electric & Manufacturing Company and the Duquesne Light Company, died in Pittsburgh on Nov. 15. Mr. Cook was widely known in electrical, manufacturing and business circles. He had been identified with the electrical industry since 1887 and was an outstanding figure in the electric light and power field, street and urban railway development and the electrification of street railways.

In 1904 he was made manager of the railway and lighting department of the Westinghouse company at East Pittsburgh. In 1917 he became general manager of the Duquesne Light Company and later vice-president. He had been with the Kaestner & Hecht Company since early in 1924. He was a native of Amherst, Mass., and was graduated from Worcester Polytechnic Institute.

C. E. Warren

Charles Edward Warren, long connected with the New York Railways and its predecessors and with the Interborough Rapid Transit Company, New York, died at New London, Conn., on Oct. 3. By reason of his close application to the various interests under his charge, he became fairly familiar with nearly every detail and feature of electric railway affairs, and possessed more than ordinary ability,

Digitized by Google

being fully qualified to speak with rare intelligence on most any subject connected with electric railway work.

Mr. Warren was born and educated in Philadelphia. He became identified with the Broadway & Seventh Avenue Railroad, New York City, in 1886 and a short time afterward was made secretary of that company. Later he became vice-president of the company as well as vice-president of the Metropolitan Street Railway. When the surface railways in the old city of New York were consolidated in 1894 he was also made an officer of the underlying or subsidiary company. This was before the formation of Greater New York. He was secretary of the New York City Railway and served in that capacity until the reorganization in December, 1911. He then became vice-president and transfer agent of the New York Railways and later vice-president of the Interborough Rapid Transit.

W. H. Long

W. H. Long, superintendent of power of the York Railways, York, Pa., and general superintendent of the Edison Light & Power Company, which is controlled by the railway and supplies power to it, is dead. The death of Mr. Long marked the passing of a man who has given 40 years of his life to public service in York. To his unusual resourcefulness and energy, judgment and decision is due very largely the successful development of the present extensive light system at York.

Mr. Long enlisted in public service when electric lighting was in its nascent state, served through the early years of progress of the art as engineer of the Edison power station, and rose to general superintendent of the Edison company at the beginning of the era of development of the electric power industry.

In that position he had full charge of the physical property of this public utility, from its power generating station to the point of use by the consumer, and the expansion of these facilities to meet public needs.

Hugh A. Heulings, sales representative of the J. G. Brill Company, Philadelphia, died on Nov. 12 at his home in Moylan, Pa., after an illness of several months. Mr. Heulings had been affiliated with the Brill organization since 1902, and with the exception of a few years when he was with the American Car Company, the Brill subsidiary in St. Louis, had been located at the Philadelphia plant. In recent years he devoted his attention mainly to bus body sales. Mr. Heulings was a brother of the late William H. Heulings, Jr., formerly vice-president and general manager of sales of the Brill company. He was 53 years old.

Walter H. Nelson, who represented the Ohmer Fare Register Company, Dayton, Ohio, for a number of years as an installing agent, died on Nov. 3. Mr. Nelson had a great many friends among electric railway men and his death will be a matter of sincere regret to those who knew him. He had been an employee of the Ohmer Fare Register Company for more than 25 years.

Compressor Mounting for Buses Discussed by Christensen

The seventh of an informative series of publications on bus brakes has been issued by the Christensen Air Brake Company, Cleveland, Ohio. It is called "Compressor Mountings and Drives." Other topics, namely, compressor cooling, control valve and maintenance on different types, will appear in the above order.

The latest of the series on the A B C's of bus brakes and braking systems states that there are three general types of compressor mountings. Front end: mounted on the front cover plate of the vehicle engine and driven direct from an eccentric on the main crankshaft. Side: mounted beside the vehicle engine and driven by gears, chains, belts, an auxiliary shaft, or some combination of these. Transmission: mounted beside the transmission and driven through gears from a special power take-off.

The side and transmission mounted compressors are not difficult to install and can be put on practically any vehicle. However, if the compressor is efficient, trouble usually develops in the drive, particularly on the side-mounted type. The pulsating compressor load wears gears, chains, and universals rapidly. Chains and universal renewals are common, and where the timer is driven from the same shaft timing trouble appears. The transmission-mounted compressor is less subject to drive trouble, as only gears are used and, of course, no timer or other trouble can develop from it. However, it is inclined to become noisy and is not the simplest or most satisfactory installation.

The front-end mounting and drive is by far the simplest and most rugged. When installed it is practically a part of the motor and not a piece of auxiliary apparatus. An eccentric on the main engine crankshaft drives it. There are no gears, chains or universals. The compressor hasn't even a crankshaft of its own. It has less than half the number of parts contained in any self-contained or auxiliary compressor. Vibration is reduced to the lowest possible point because the pulsations are absorbed by the main engine crankshaft and bearings—those designed for the heaviest duty.

Not all motors at present can take a front-end mounted compressor, but wherever possible it is much to be preferred from every standpoint—installation, operation and maintenance.

Warner Builds Freight Trailers and Removable Bodies

Six automatic detachable semi-trailers, to be operated with twenty removable bodies in extending freight business on a door-to-door basis, have been ordered by the Rockford & Interurban Electric Railway of Rockford, Ill., operating through Beloit, Wis., and surrounding towns. With this fleet of tractor-drawn trailers equipped with removable bodies, the railway company expects to eliminate four steps in freight handling, to do away with transit losses due to theft, breakage, etc., to cut the cost of receiving and delivering goods, increase its freight business in the territory served, and vastly enlarge its area. It expects to enlarge its freight business from 800 to 1,000 per cent.

L. P. Warner, vice-president of the Warner Manufacturing Company, which

Removable Body Is a Separate Unit and May Be Left with Shippers for Loading and Unloading

Digitized by Google

is building the trailers and bodies, stated that already six other electric railway companies have under consideration the adoption of similar installations recommended by committees of engineers which have examined the Rockford & Interurban trailer fleet.

The mechanical equipment that is responsible for this development in the Rockford & Interurban Company's freight handling consists of a fleet of Warner automatic detachable trailers—standard commercial semi-trailers with a 4-ton capacity—equipped with removable bodies that can be run on and off the trailers without difficulty. It is estimated that a single tractor can serve five trailers and 25 bodies.

When a shipper announces he has a shipment of merchandise the tractor couples to a trailer and goes to the shipper's door, where it drops the trailer and departs. The body is run into the shipper's warehouse, if desirable, and loaded at his convenience. It is then locked and run back on the trailer. The railway, when notified, dispatches the tractor to pick up the trailer, which is dropped again at the nearest rail terminal, where the body is run into a car direct from the trailer. The process is repeated at the delivery end and the body arrives under lock and key at the consignee's door. It is unloaded by him.

The trailers ordered by the Rockford & Interurban will be stationed in Rockford, Freeport, Beloit, Janesville and Belvidere. The bodies are 12 ft. long, 5 ft. 10 in. high, and 6 ft. wide. A railway flat car can accommodate three of them.

Electric Locomotive for Great Northern

Inspection Held at Plant of Westinghouse Company in Pittsburgh—F. H. Shepard Explains Features of New Equipment

THE world's largest motor-generator locomotive was inspected on Nov. 16 at Pittsburgh by prominent railway officials and members of the Railway Club of Pittsburgh. The locomotive is the first completed of those ordered by the Great Northern Railway for operation in mountain service over the Cascade Mountain grade in Washington. It will be used on all trains operating on the electrified division of the road, which runs from sea level to the Cascade Mountains and includes one of the longest and steepest mountain grades in America. The 24-mile section over which the locomotive will initially operate runs from Skykomish, Wash., to the eastern portal of the Cascade tunnel.

In discussing the locomotive, F. H. Shepard, director of heavy traction for the Westinghouse company, said:

This locomotive makes it possible to combine the principles of high-voltage alternating current, transmitted over great distances from great hydro-electric stations, and the direct-current motor, which is no more complicated than the street-car motor in use on a hundred thousand trolley cars in America. Power is drawn from an overhead trolley which carries an 11,000-volt alternating current. This is then passed through a transformer and motor-generator set by which it is converted into direct current for the traction motors. Having the facilities to convert power embodied in the locomotive eliminates the requirement of numerous substations for this purpose erected at intervals along the right-of-way Furthermore, the power is converted just as it is used by the locomotive.

The motor-generator locomotive is a development from the first of this type built in 1925 at the Ford plant in Detroit with equipment of the Westinghouse company and now in use on the Detroit, Toledo & Ironton, Henry Ford's railroad.

A wide range of operating speeds is available with this new engine; in the case of the Great Northern, full power at any speed from 2 to 35 m.p.h. can be obtained, while the ordinary direct-current motors have only a very limited number of running speeds.

In order to negotiate curves the locomotive is divided into two cabs. It has a total length of nearly 100 ft. and weighs 680,000 lb. It can exert 7,000 hp. under maximum conditions, which makes it rank with the most powerful electric locomotives ever built and far outranks any steam locomotive. The locomotive has a continuous rating of more than 3,500 hp. at a speed of 15 m.p.h., has eight driving motors and operates from an 11,500-volt, 25-cycle overhead trolley.

These huge locomotives are for the purpose of surmounting at double steam speed the heavy grades of the Cascade Mountains, rising abruptly from the Coast in Washington. The present line of the Great Northern crosses these mountains at an elevation of 3,385 ft.

An important feature of the new locomotives is the system of regenerative braking effective at all speeds by which the heavy trains can be taken down the mountain grades without the use of airbrakes. This is accomplished by utilizing the traction motors as generators. The descending train generates power which is fed back into the trolley and to the power system for any other trains or general power use, while at the same time controlling the speed of the train.

M. R. Runyon in New York for Bridgeport Brass

Mefford R. Runyon has been appointed district sales manager for the New York metropolitan district for the Bridgeport Brass Company, Bridgeport, Conn. He was born and reared in New Jersey and educated at Rutgers as a chemical engineer. The World War called him overseas for a period of eighteen months, during which time he had complete charge of medical supplies for a large base hospital. He returned to Rutgers and after he was graduated he started in the wholesale hardware business. For four years following this experience he traveled as a public accountant in South America, Panama and West Indies. His metallurgical leaning again asserted itself and he took up the work of reorganizing the Benson Rolling Mills, one of the oldest brass and bronze manufacturing mills outside of Connecticut. In this work he was associated with Mr. Benson, an expert on phosphor bronze, and G. J. Marcy, formerly superintendent of the Rome Brass & Copper Company.

A.C.F.-International Harvester Working Argreement

Negotiations looking toward a general working agreement between the American Car & Foundry Motors Company and International Harvester Company have reached an advanced stage, according to newspaper reports. These claim an agreement has virtually been reached under which International Harvester will buy its truck engines from A.C.F. Officials of the latter refuse to comment on the proposition.

ELECTRIC RAILWAY MATERIAL PRICES—NOV. 16, 1926

Metals—New York

Copper, electrolytic, cents per lb.	13.875
Lead, cents per lb.	8.00
Nickel, cents per lb.	55.00
Zinc, cents per lb.	7.60
Tin, Straits, cents per lb.	71.00
Aluminum, 98 to 99 per cent, cents per lb.	27.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	64.00
General service	32.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$9.00
Somerset mine run, Boston	3.25
Pittsburgh mine run, Pittsburgh	2.75
Franklin, Ill., screenings, Chicago	1.875
Central, Ill., screenings, Chicago	1.725
Kansas screenings, Kansas City	2.35

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, Pittsburgh base, cents per lb.	2.90
Tie plates (flat type), cents per lb.	2.30
Angle bars, cents per lb.	2.75
Rail bolts and nuts, Pittsburgh base, cents, lb.	4.20
Steel bars, cents per lb.	2.00
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.65
Sheet iron (24 gage), cents per lb.	3.00
Sheet iron, galvanized (24 gage), cents per lb.	3.85
Galvanized barbed wire, cents per lb.	3.35
Galvanized wire, ordinary, cents per lb.	2.50

Waste—New York

Waste, wool, cents per lb.	12–18
Waste, cotton (100 lb. bale), cents per lb.:	
White	13–17.50
Colored	10–14

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	11.40
White lead in oil (100 lb. keg), cents per lb.	15.25
Turpentine (bbl. lots), per gal.	$0.88
Car window glass, (single strength), first three brackets, A quality, discount*	84.0%
Car window glass, (single strength), first three brackets, B quality, discount*	86.0%
Car window glass, (double strength) all sizes, A quality, discount*	85.0%
Putty, 100 lb. tins, cents per lb.	5.25–5.50

* Prices f.o.b. works, boxing charges extra.

Wire—New York

Copper wire, cents per lb.	16.00
Rubber-covered wire, No. 14, per 1,000 ft.	$6.00
Weatherproof wire base, cents per lb.	17.50

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$147
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4 N.Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.94
Cement, Chicago consumers' net prices, without bags	2.10
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.50
Light copper, cents per lb.	9.50
Heavy brass, cents per lb.	7.00
Zinc, old scrap, cents per lb.	4.25
Lead, cents per lb. (heavy)	6.50
Steel car axles, Chicago, net ton	$17.25
Cast iron car wheels, Chicago, gross ton	14.75
Rails (short), Chicago, gross ton	16.50
Rails, (relaying), Chicago, gross ton	28.50
Machine turnings, Chicago, gross ton	6.75

Digitized by Google

President Alexander Legge of the Harvester company on Nov. 13 said:

"Our negotiations . . . have not progressed to the stage where any definite statements can be made. The most active discussion has centered around the proposition of using Hall-Scott motors in the heavier sizes of our trucks. . . . While other matters, such as the possible use of our service stations by buses and trucks manufactured by American Car & Foundry subsidiaries and co-operation in the motor business, have also been touched on they have not got beyond discussion. . . . Among other things we may arrange to round out bus orders by drawing from the bus subsidiary of American Car & Foundry."

Rolling Stock

Brooklyn City Railroad, Brooklyn, N. Y., it is understood, may be in the market soon for more cars, presumably of the front-entrance center-exit type.

San Diego Electric Railway, San Diego, Cal., received three street car type Fageol buses early in September. All of these units were equipped with air brakes.

Los Angeles Railway, Los Angeles, Cal., purchased two double-deck Fageol buses in September and two of the same type during the month of October.

Williamsport Traction Company, Williamsport, Pa., expects delivery in the near future of five light-weight one-man two-man safety cars, which are being built by the J. G. Brill Company, Philadelphia, Pa.

Boston & Worcester Street Railway, Framingham, Mass., has purchased five 29-passenger suburban Mack buses for operation between Framingham and Boston, a distance of 18 miles, and at a 50-cent fare. Fifteen trips daily will be made.

Detroit United Railway, Detroit, Mich., through its receiver, W. C. Dunbar, has been authorized to expend $29,706 in the purchase of four new buses from Fageol. The buses are to be used in interurban passenger service, it was said.

Track and Line

Reading Transit Company, Reading, Pa., has been actively engaged in thermit welding defective rail joints on Ninth, Tenth and Penn Streets during the past six months. Four miles of track has been gone over and 300 joints welded without any service interruption.

Des Moines City Railway, Des Moines, Iowa, will start service on the Sevastopol line to Park Avenue on Dec. 1. The extension line will be about 3,700 ft. The improvement will cost the company approximately $35,000.

Nashville Railway & Light Company, Nashville, Tenn., will complete shortly the laying of 1,600 ft. of rail to provide a double track on the Harding Road. The work will cost approximately $20,000. Work has been started on the laying of double track rails from a point near Craighead Avenue on the Harding Road, and extending west on Harding Road a distance of 1,600 ft. Laying of double tracks at this point is one of two steps taken by the company in improving service conditions on the West End line, it was pointed out. The company also is spending $8,250 as its part in widening the overhead railway bridge on Harding Road, which will, in turn, make room for widening Harding Road at that point.

Power Houses, Shops and Buildings

Los Angeles Railway, Los Angeles, Cal., has installed in its main shops a new motor-generator set for arc-welding process. The apparatus consists of a General Electric 600-amp., 60-volt arc-welding set, with 750-amp. overload rating for one hour. This capacity is sufficient to take care of the intermittent load on two metallic circuits or one carbon circuit. It will, in addition, handle the necessary load requisite for the present automatic welding head in use for building up car wheel flanges. The increased amount of work to be handled by arc-welding methods at the South Park shops will be taken care of by this new arc-welding process.

Trade Notes

J. D. Elsom has resigned as vice-president of the Economy Electric Devices Company, Chicago, Ill.

J. R. Brandt has joined the Cleveland office of the Bridgeport Brass Company as raw materials salesman in the Pittsburgh territory and parts of Ohio. Before joining the Bridgeport Brass Company Mr. Brandt had experience with the United States Copper Products Corporation, Rome Hollow Wire & Tube Company and the Hennig Nickel Rolling Mills.

Robert J. Anderson, Inc., Cincinnati, Ohio, has been formed to operate as a commercial testing laboratory, specializing in metals and alloys. The new laboratory is fully equipped for chemical analysis, mechanical testing, metallography, heat treatment and radiography.

Rollway Bearing Company, Inc., Syracuse, N. Y., announces the appointment of John Parker as New England representative. Mr. Parker's engineering experience includes eleven years with Brown & Sharpe and more than fifteen years with three manufacturers of heavy equipment.

F. W. Stockmar has been appointed assistant general manager of the Railway Audit & Inspection Company, Philadelphia, Pa. Mr. Stockmar will make his headquarters in St. Louis, Mo., and will divide his time between that city, the general offices at Philadelphia and all of the district offices located throughout the United States. Mr. Stockmar became associated with the Railway Audit & Inspection Company during the war, first spending some time at Philadelphia as representative and later going to St. Louis in 1917. He was made district manager of the district office in that city in March of 1918.

Advertising Literature

Consolidated Car Heating Company, Albany, N. Y., has issued a new bulletin, No. 13-C, covering "Thermostatic Control for Electric Heaters."

Templeton, Kenly & Co., Ltd., Chicago, Ill., has announced a new line of Simplex trench braces in its bulletin No. 1126. These braces are of value in all types of underground construction where loose soil is encountered, and they have further applications in building and construction operations.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has published a descriptive leaflet, No. 29,297, covering the type TC-2 railway control and reset switch developed recently. This switch represents a new type of single-pole, double-throw magnetic blowout switch, so designed that it is more accessible and simpler in action than older type control switches, as well as being 50 per cent lighter. This switch is for use with either standard HL or K type control.

Portland Cement Association has emphasized the tremendous economic wastes suffered by industry each year through fire losses and recommends the more extensive use of concrete for industrial construction in a bulletin which it has just published. With this bulletin, entitled, "Half a Million a Year," is included a small leaflet telling what the Portland Cement Association is attempting to do, its organization, research work and similar data of interest.

Lincoln Electric Company, Cleveland, Ohio, has issued a booklet on automatic arc welding with Lincoln "Stable-Arc" automatics. Information on various types of automatic welding equipment to meet different service requirements is given.

International Motor Company, New York, N. Y., has issued catalog No. 95, a recent revised edition of 56 pages on the Mack buses, containing many illustrations and diagrams of the exclusive Mack features. A list of the factory branches is included in this pamphlet. The company has also published its first catalog, No. 61, on the Mack six-cylinder bus. It is described as a heavy-duty Mack chassis. "It is on the market to stay, not to satisfy a temporary craze," in the words of the booklet.

Railway Steel Spring Company, New York, N. Y., has published a 56-page catalog covering its springs for locomotive, passenger and freight car service, as well as special springs for many purposes. In addition the catalog contains a section on steel-tired wheels and one on locomotive and car wheel tires. In the back of the catalog are tables for reference in ordering equipment; circumference and area tables are also given, and various supplementary data are included.

The 1927 Convention Goes to Cleveland

BY UNANIMOUS vote, the executive committee decided to hold the 1927 annual convention of the American Electric Railway Association in Cleveland provided that satisfactory arrangements can be made with the convention committee of that city. All signs indicate that such arrangements will be made, not the least of which is the fact that J. H. Alexander is the chairman of the Cleveland convention committee with an evident determination to meet the association more than half way in working out any details that may be necessary to the completion of the negotiations. That Colonel Alexander, together with the late Mr. Stanley and the Cleveland Railway, met the association and the industry more than half way last year is appreciated by every one who went to Cleveland.

Despite the heroic work of the Cleveland Railway and its organization, there were some criticisms of the arrangements and facilities during the last convention. These centered chiefly about the hotel accommodations, telephone service and location of meeting rooms. The committee on location put these facts squarely before the representatives from Cleveland in discussing the arrangements for next year. It was apparent that the Cleveland hotel men did not quite understand the caliber of the men who go to the American Electric Railway Association conventions and had not planned adequately for their accommodation.

But the temper of the Cleveland people is well illustrated by the fact that satisfactory arrangements to overcome the objections of the location committee were laid before the executive committee the very next day. Cleveland wanted the convention to return to the shores of Lake Erie, and was prepared to make every necessary concession to bring it there. This did not seem to be true of Atlantic City. Although the natural attractions of the famous seaside resort were considered superior to Cleveland, there seemed to be no satisfactory way of providing for an adequate car exhibit. The best that could have been done would have been to go through a laborious and expensive process of skidding cars into place on the boardwalk and stringing them along the rail from the Million Dollar Pier toward the inlet.

These and many other factors connected with the two convention locations were considered. The newspapers in Cleveland gave a degree of co-operation seldom experienced during a convention of the association, both as regards the local space devoted to the convention activity, and the amount of material sent out to the country over press association wires. The greatest car exhibit which the industry has ever held was made possible only because of the prominent place given to the exhibit in the center of convention activity, to the space available for the cars and to the wholehearted co-operation of the Cleveland committee in urging both manufacturers and operators to send cars to the show.

Every one who went to Cleveland seems agreed that the evidence of car progress shown there stimulated new interest and enthusiasm throughout the industry. There was likewise a feeling that this was only the beginning of a momentus development in the direction of improved car facilities and better electric railway service. This showing of car improvements, combined with the records of accomplishment on the properties which have succeeded in building revenue and reducing costs through the use of modern equipment, carried new hope and inspiration to every property in the country.

Thus in capitalizing on this new spirit and setting out to exceed the showing of the last convention by providing the facilities for an even bigger and better car exhibit the executive committee has acted wisely in again selecting Cleveland for the 1927 convention.

Mr. Insull Fixes Responsibility for Transportation Difficulties

A FRANK statement of the effect which political manhandling has had on the development of transportation in Chicago was made by Samuel Insull in an address before the Electric Association of Chicago on Nov. 18. Coming as it does from the man who has had as much to do with the establishment of utility financing on a basis to command public confidence as any single individual in the country, Mr. Insull's direct indictment of local politics on the score of destroying the investor's confidence in transportation securities was supported by figures which tell their own story.

Various branches of the electrical industry in Chicago attracted for development and extension $137,500,000 during the year ending June 30, 1926. Of this amount only $14,000,000, or approximately 10 per cent of the total, was expended for the improvement of electric railways, although the electric transportation investment in the Chicago district exceeds by $50,000,000 that of any other group of electrical enterprises. Even this comparatively small proportion of new money was divided between the various transportation systems almost in direct proportion to their susceptibility to political interference.

Chicago is not the only city in which the transportation system has been a political football. Automotive competition, high taxes, paving charges and many other difficulties may be contributing factors to the investors' coolness toward electric railway securities. But the primary agent in driving money away from the development of transportation facilities has been the unscrupulous politician who while shouting about

Digitized by Google

"traction barons" has destroyed the value of securities into which the savings of millions have been invested in good faith and has held back transportation development in practically every city in the country.

Chicago today presents the ultimate spectacle of what political chicanery can do to sound utility investments. In the case of the Surface Lines properties, whose franchises expire in February, 1927, there can be no question of management. Here for once in transportation history the issue becomes clear cut. Even the politicians themselves admit the efficiency of the operations, and the public has been given the utmost in service, despite the pending critical financial situation. In the face of severe franchise requirements which include all the objectionable indirect taxes on the car rider that could be devised in the form of street cleaning, paving, etc., 55 per cent of the net receipts of the property has been needlessly taken out of the pockets of car riders to build up a fund in the city coffers. Despite all this, and with a comparatively low rate of fare and the most liberal transfer privileges of any city in the country, the operations make a favorable financial showing.

Measured on the basis of the company's showing as a business enterprise, investment in Chicago transportation securities should be sound. But this is not the fact. All signs point to a receivership when the present bonds become due, because of the impossibility of refinancing under existing conditions. When this comes it might well be termed a political receivership.

Bad as is the Chicago situation from the investor's standpoint, it may prove to be not an unmixed evil in the long run. There is promise in this situation that the part played by political meddling in the retardation of transportation development will be forcefully brought home to the public at large. In that event it may prove to be the means of awakening the public mind to the changed conditions which have come about in local transportation and definitely fixing the responsibility for failure of transportation facilities where it belongs—on the shoulders of politicians who talk much and know little about the subject.

The Metropolitan Section Takes a Forward Step

AT ITS recent meeting in New York the Metropolitan Section of the American Electric Railway Association took a long step forward in stimulating co-operation between various factors in the industry by the election of T. R. Langan of the Westinghouse Electric & Manufacturing Company to its presidency.

This is a decided break with precedent in the conduct of electric railway association affairs. In few industries does the manufacturer play so important and intimate a part as is the case in the electric railway industry. When the operator is in difficulty he does not hesitate to call in his manufacturer friends. Nor do they hesitate to lend a degree of helpfulness which exceeds by a wide margin the limits of ordinary commercial service.

In association activity the manufacturers have played an important and helpful part. Does some new association activity call for the raising of additional money, the manufacturers are always ready to do more than their share. Does a program require a speaker who is a specialist and an expert on a given subject, a manufacturer's representative may be counted on to prepare a suitable paper. Does it become necessary to make arrangements for a meeting and to prepare an appropriate entertainment program, a committee of manufacturers is always willing and glad to give the time and effort necessary to work out the details.

Recognition of the good work done for the Metropolitan Section by Mr. Langan is very fittingly expressed by his election to the post of president. It is to be hoped that this is the beginning of a more general recognition by the industry of the aid extended by its manufacturers, and that other bodies will likewise give consideration to this auspicious move in opening wider the doors of association office.

The Least of Many Evils Is a Poor Decision at Best

FOOD for much thought is contained in the remarks of Thorne Brown before the banquet meeting of the Iowa Electric Railway Association held recently at Omaha. He apparently reflects the discouragement that engulfs this section of the country at the present time. From his background as chairman of the Nebraska State Railway Commission Mr. Brown is in position to know of the dwindling revenues and of the serious condition of many of Nebraska's railways. He paid high tribute to the Omaha system, and yet pointed out that through lack of public understanding this city has but recently refused the company a new franchise even though the present franchise expires in 1928 at the same time the principal bond issues become due.

The statement made by Mr. Brown that perhaps municipal ownership was the way out was a sad commentary on the business sense of Omaha and of those in control of its political life. Mr. Brown is not a municipal ownership enthusiast. He frankly states that one of the prices that Omaha or any other city will have to pay under municipal ownership will be poorer service and less courtesy. He suggested this plan only because he has exhausted in his mind all other possibilities and comes at last to government ownership as perhaps the only port left in a bad storm.

Certainly Mr. Brown realizes the need for adequate transportation in Omaha. He realized it as a member of the state commission, but the need has been even more forcefully borne in upon him as industrial commissioner of the Omaha Chamber of Commerce, to which post he was recently appointed. Omaha is ambitious. It is not content to stand still industrially. It wants new industries. Omaha, however, must first care for its present industries before it can expect to attract new ones. Omaha can hardly extend the glad hand of welcome to other industries at the same time that its railway bespeaks in its physical aspects the niggardly policy that has characterized its dealings with its street railway. Omaha is to be congratulated on its aspiration, but it is hardly to be congratulated on its acts—at least its acts in so far as they affect its street railway. If Omaha would escape the fate of municipal ownership that Mr. Brown appears to see ahead for it, then the responsible business interest of the city should set about the task of freeing the railway situation from political bickering. That cannot be accomplished until the communities involved realize that it is part of their responsibility to see that the utility is so treated that it may become a community asset.

Insurance Committee Deserves Support of the Industry, Based on Past Performance

CAREFUL perusal of the last insurance committee report of the A.E.R.A. gives the impression that the information contained is of more than ordinary significance. In the first place, embodied in the report is a two-year history of the fire insurance experience representing two-thirds of the capitalization of the industry—perhaps the most complete analysis that has ever been made of this important element of operating expense.

Secondly, it is observed that an average of 31.92 cents was paid for every $100 of the $670,000,000 of insurance carried by the 304 reporting companies. The premiums paid are the sizable total of $2,140,000 annually. Prorating this for the entire industry it is safe to say that at least $3,000,000 is paid out each year to safeguard investment against loss from fire. An interesting sidelight is that the premiums of individual reporting companies ranged between the limits of 10 cents and 60 cents per $100.

In 1924 the average rate was 35.05 cents per $100, so that the reduction of 3.13 cents obtained in 1925 represents something more than $200,000 saved in premiums. But is this enough? Of the $2,304,000 paid out in premiums in 1924 by 304 companies, $1,312,000 or 56.93 per cent was recovered in fire losses. Compare this with the $2,140,000 premium in 1925, out of which only $607,000 or 28.38 per cent was reported as recovered through fire loss. What has happened? It certainly does not take more than 70 per cent to do insurance business.

What stands out as of greatest significance is that in 1925 the fire loss was less than half that of 1924. Evidently the combined efforts of committees and insurance companies have resulted in improved construction and lessened fire hazards.

There is, perhaps no class of fire risks that should be better than electric railways. Many factories, office buildings, and similar fire risks are vacant the greater part of the day as well as on holidays, watched over during these periods only by poorly-paid and oftentimes pensioned employees. Contrast this with the electric railway properties that are actively working at all hours, actually performing a major service eighteen hours a day and often 24 hours a day for 365 days a year. This very situation keeps many employees constantly on the premises where they are always available to report or fight fires. It is almost inconceivable that a sizable fire could gain great headway unnoticed.

Then, also, is the question of exposure, one of the greatest elements of fire hazard. By virtue of necessity the major fire risks of railway properties are located at points remote with respect to the congested areas.

Insurance at best can only cover the capital invested. Payment in full for a loss due to a major conflagration would be poor compensation to a public depending on an essential service, just as it would be to the company that would have to wait from three to five months for replacement equipment.

All of these arguments are combining to make the fire hazard less and less. The committee has done a notable work in obtaining the data and setting forth the facts. Its work this year will be commendable if only another year is added to this enlightening history.

Co-operation of companies is needed. Why did the missing third hold out the information last year? Was it through shame, fear or just a desire for blissful ignorance? Ultimate good is the only net result that can accrue through a statement of facts, and the insurance committee has proved itself deserving of painstaking efforts on the part of companies in the prompt reporting of insurance experience.

Constant Turmoil Accomplishes Little Good

ONE is sometimes led to wonder whether a few railway managers are not so carried away with a determination to prevail in their position on a disputed question, as to lose sight of the ultimate objective for which the cudgels were taken up—the best interests of the security holders. In the case of a certain railway property whose affairs have long been a source of bitter contention, nothing short of a 10-cent cash fare would seem to be acceptable. This management has not lost sight of the coveted goal for an instant in recent years. In line with this policy, a value five times as great as that fixed by the Public Service Commission for rate-making purposes is claimed for the railway property. Although the bonds outstanding exceed the commission value only by one-seventh in amount, and although the outstanding capital stock is only about two-thirds the amount of the bonds, the company seems to recognize nothing anomalous in its attitude. In support of its avowed demands, it has evoked the aid of the courts. But it has effectively alienated the regard of the public and the representatives of the public elected to office.

There is apparently no likelihood of default in bond interest. Still, some of the bond issues farthest removed from being a direct lien on tangible property are selling at a discount which approximates quotations for similar securities either in actual or technical default. This, of course, is a reflection of the insecurity of the company's present public position. It would no doubt be difficult and it might even be impossible to bring about a voluntary readjustment and a scaling down of capitalization more nearly in keeping with the proved earning capacity of the property in recent years. Perhaps that is not necessary, but it does appear to be the height of folly to insist upon a predetermined rate of fare under conditions that make it extremely unlikely that any increase in gross earnings would result. It is, of course, always distasteful to surrender as a matter of expediency rights to which one justly feels entitled; but it often happens that rights to which one thinks he is entitled are merely the shadows of the real thing and are obligations rather than assets.

The case here cited is not a supposititious one, but it is an isolated one. Problems no less difficult than those that beset this company are being successfully surmounted in other communities. There is ample reason for believing that the energy expended by this management in battling for what it construes as its rights would, if directed to the development of the system and the sale of service to the public, have won for the company respect that is now almost totally lacking, and even the coveted 10-cent fare, if that really proved to be necessary and desirable. This company has for too many years been a public storm center. It could, perhaps, achieve its ends better by being more persuasive and less pugnacious. A public utility may, through unforeseen and unavoidable circumstances, fall into temporary difficulty; but there is something wrong with a utility that is in constant disrepute.

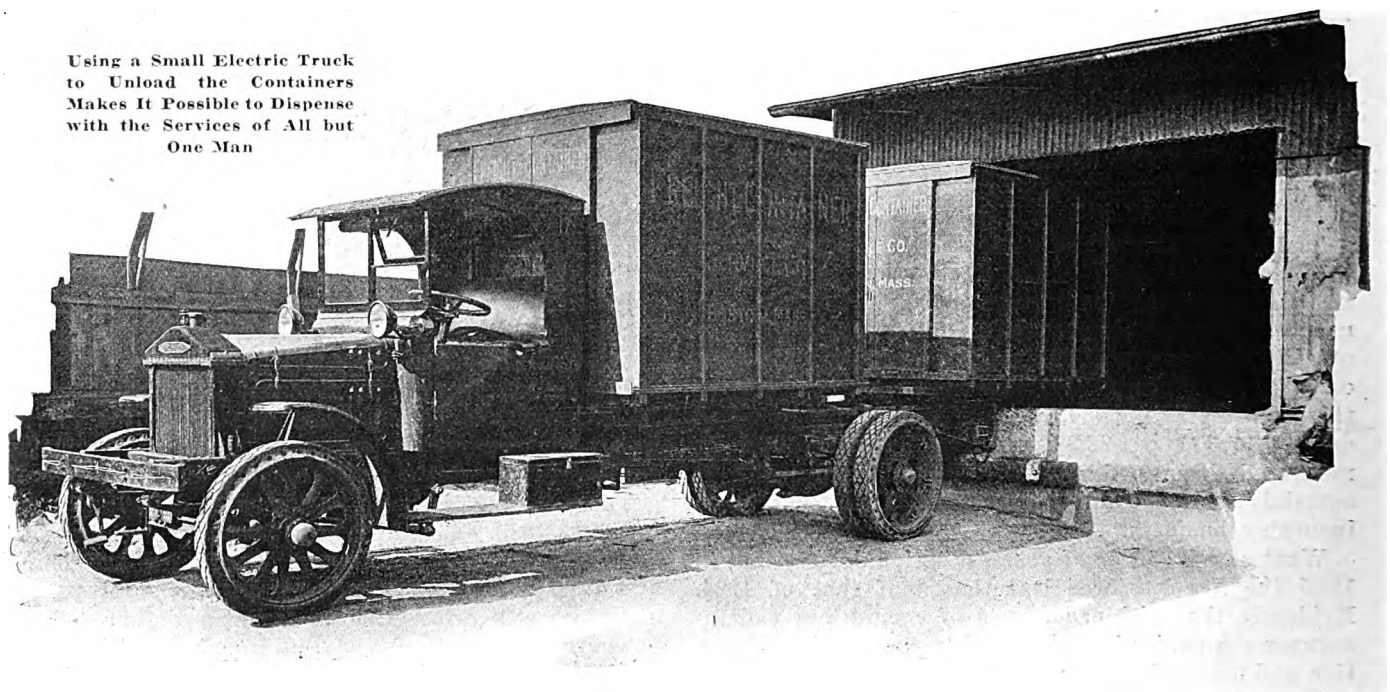
Making Profitable Electric Freight Service a Reality

Freight Containers Have Been Adopted by the Boston & Worcester and the Springfield Street Railways for Less-than-Carload Shipments to and from Boston—Shipments in Both Directions Are Now Practically Balanced—Overnight Service Is Given



Using a Small Electric Truck to Unload the Containers Makes It Possible to Dispense with the Services of All but One Man

SHORT-HAUL, pick-up-and-delivery service for assorted freight in small lots, generally classified as l.c.l. shipments is unprofitable from the viewpoint of carriers of the greater portion of the country's tonnage, the steam railroads. The conditions that preclude the possibility of profit to the steam lines do not hold in equal degree with the interurbans. The items mentioned, together with guarantee in transit and rapid delivery, do, however, impose on the electric lines the task of devising methods and practices that will enable the business to be handled on a profitable basis.

That it is possible to work out a satisfactory system is shown by the experience of the Boston & Worcester Street Railway and the Springfield Street Railway in establishing a profitable through freight service connecting Boston and Worcester and Springfield. This has been accomplished by dint of an intensive campaign carried on among distributors in Boston and producers in the territories surrounding the two cities farther west to sell the transportation services of the electric railways in connection with the use of freight containers.

The total distance between Boston and Springfield is approximately 100 miles, this mileage being divided about evenly between the two companies. It has been found by these railways, after their experiences with the handling of the containers, that short-haul electric freight service has reasonable possibilities of profit, provided that freight carrying by all forms of public transportation with particular reference to trucking companies, be regulated as to schedules, tariffs and responsibility on a basis similar to the provisions under which the railway must operate.

Beginning on July 1 sixty standard freight containers leased from the Freight Container Company of Boston, were adopted by the two railway companies, with a view to promoting their use for shipments in less-than-carload lots. It was felt that with these containers it would be possible to eliminate many of the non-productive factors which have hitherto rendered electric freight haulage an unprofitable venture.

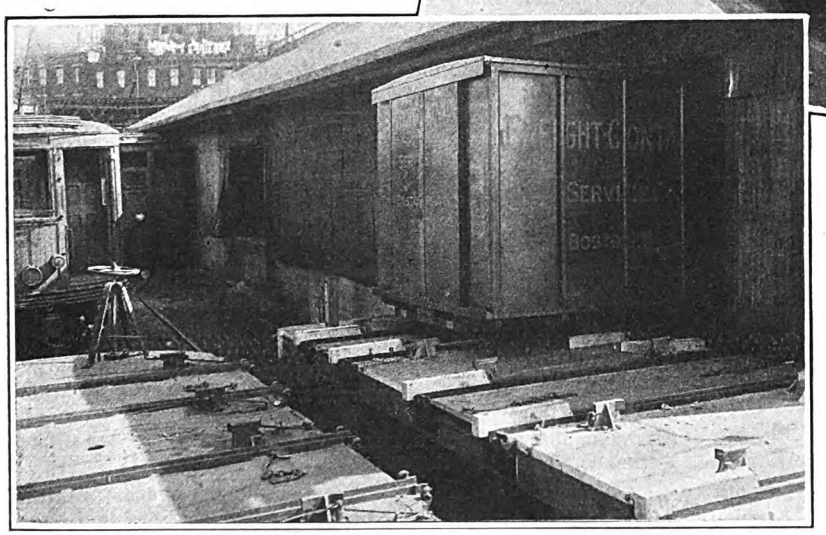
The containers are moisture-proof, strong, portable boxes, equipped with either refrigerating or heating equipment, according to the requirements of the shipper. They are 8 ft. long, 7 ft. wide and 6 ft. high and each one is capable of holding 5 tons of freight. They may be easily manipulated into place, it being possible for two men to push them on or off a car, but the companies have found it economical to use a small motor truck for shifting as this practice eliminates one man. The containers slide into place on a standard flat car, five to a car.

Actually, the railway companies do not undertake to pick up or deliver the containers. The Freight Container Company, through its agents in the various cities served, handles this entire phase of the work, the containers only coming under the care and responsibility of the railways when they are delivered to the freight

Digitized by Google

sheds in Boston, Springfield and Worcester. The shipper packs the containers on his own platform at his plant and they are then picked up by the Freight Container trucks and transported to the freight depots. The railways simply are responsible for the containers and their contents to the extent of loading them onto their flat cars, transporting them from city to city and unloading them at the other terminals.

Since Boston is the natural distributing center for both Springfield and Worcester, as well as for the smaller communities near those two cities, it might be assumed that difficulty would be experienced in finding return shipments for the empty containers, after they have carried loads from Boston to the outlying points. The railways state, however, that a practical balance is being maintained in both directions. During the first few weeks of the newly inaugurated service there was about a 20 per cent return of empties to Boston. A large increase in through shipments in an eastward direction soon developed as a result of the intensive campaign carried on by agents of both the railways and the Freight Container Company. At the present time about 60 per cent of the entire tonnage is carried through between Boston and Springfield over the lines of the two electric railways. Overnight service between Boston and either Springfield or Worcester is given.

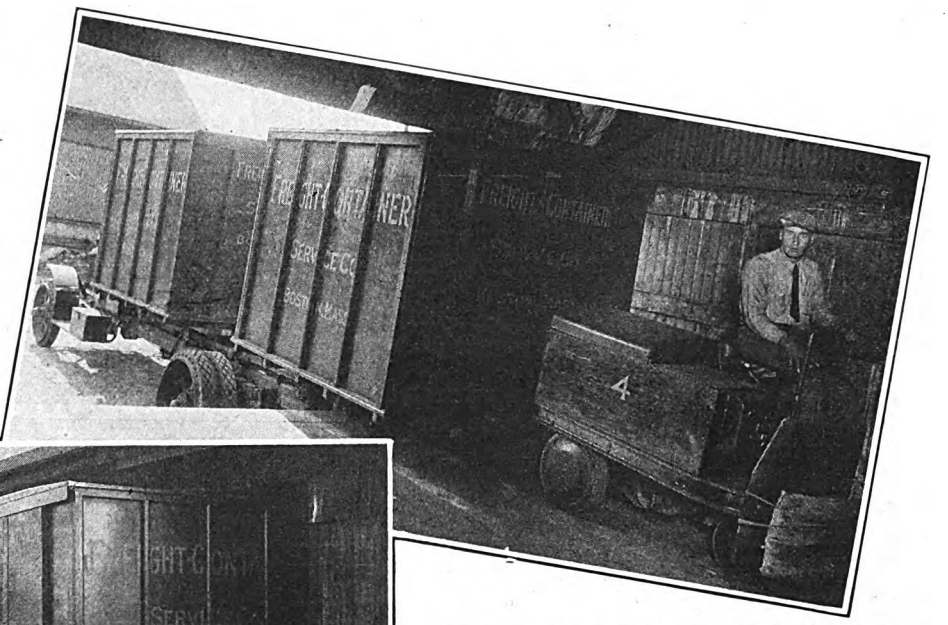


The Containers Are Run Directly Onto Rails on the Top of the Flat Car, Where They Are Securely Locked Into Place

Shippers Interested in Containers

Contributing to the balance of east and west shipments, solicitors have been able to interest a number of regular and heavy shippers in the container idea. Accordingly it has been possible to set up against this kind of steady traffic enough in the opposite direction to balance the exchange of containers. Thus, freight agents have had definite figures in mind, in canvassing their prospects, with respect to the exact amount of traffic needed to maintain this balance. It has been necessary, occasionally, actually to reject shipments in the westward direction in order to cause a topheavy balance of shipments out of Boston. A little less than eight weeks was required to build up the eastbound service from practically nothing to its present status, where it virtually is equal to that in the westbound direction.

At times the Freight Container Company has been hard put to it to provide enough containers to care for a sudden increase in haulage requirements. Shipments have been rejected on this ground more than once, but in general the business has grown with a fair degree of steadiness, so that the container company and the railways have been able to predict for future requirements in the matter of equipment prior to the dates on which that equipment was needed. Care has been taken to keep the containers moving as rapidly as possible, so that none will become inadvertently sidetracked at either end of the line.



Containers Are Brought to the Freight Sheds on Trucks of the Freight Container Company

The direct result of the use of the containers for electric freight service is striking. More than 100 shippers have specified a preference for this method of transporting commodities. During the first month, July, container shipments between Boston and Worcester, both ways, reached 1,200,000 tons; during the next month the total recorded was 1,500,000, and in September the month's total was approximately 4,000,000 tons.

Such encouraging results present a strong argument for freight containers. In addition, the advantage in their use is further attested by a résumé of the type of commodities shipped, as well as the standing of the shippers. For example, each week one chain store company ships 250 tons in containers packed, sealed and delivered to the terminal; also, one paper manufacturing company ships weekly from Holyoke to Boston 200 tons of paper, largely envelopes and gummed wrappers. Others shipping in small lots, classed as l.c.l., according to standard freight classification, and who would not benefit from door-to-door practice under ordinary railway service are manufacturers of various kinds of perishable or easily contaminated products, among which may be noted soap, candy, groceries, gummed materials, paints, knit goods, coffee, tea, metal products sensitive to corrosion and supplies for 5 and 10-cent chain stores.

Since freight containers have been introduced not only do they offer to shippers an improved means

Digitized by Google

for handling products as compared with bulk shipments loaded loose in standard freight cars, but also from the standpoint of the carrier as they eliminate terminal charges and give a number of incidental advantages.

Short hauls make a profit only on full carloads, based on transportation costs; terminal charges, if included, nullify any profit and damage claims further reduce the favorable margin. By the use of containers, the carrier becomes solely a transportation agent whose business it is to carry freight and, in the majority of cases, not to handle it. In this practice the shipper assumes the responsibility of cartage and delivery as well as packing and hands over the containers, sealed, to the freight agent at the terminal, who merely places the boxes on the cars. This practice is a solution of the problem of haulage overhead.

Handling Details Simplified

The time required to load a standard freight car is estimated at from 1½ to two hours; the time required for sorting and trucking in terminals is equally as much. Compared with these items, the container loading charge is practically nil for the carrier, as it requires in all, for booking, placing and loading, not more than fifteen minutes per car. In addition, all tracer and claim costs are eliminated, according to the officials of the Boston & Worcester company. The freight agent's duty is, in consequence, a simple matter of routing containers instead of, as is true under ordinary freight practice, routing numerous assorted commodities. For this work a multiform shipping leaflet is used which is quite adequate for the purpose.

The rates quoted for container shipments are: Boston to Worcester, a distance of approximately 45 miles, 25 cents per hundredweight; Boston to Springfield, approximately 100 miles, 35 to 40 cents per hundredweight. With practically all non-transit charges cut down to a low figure, direct electric freight service offers, from these companies' experience, an encouraging prospect. It is further enhanced by a decided increase in inquiries for the container service on the part of shippers.

Record of Five Years of Enterprise in Toronto

FIVE years ago the city of Toronto, Ont., took over the local railway lines. As September marked the birthday month of the activities of the Toronto Transportation Commission, that body deemed it fitting to review the major accomplishments during the last five years. This it did in the *Coupler* for September. Here is the summary:

Cars—Purchased 575 modern steel cars necessary to replace 482 of the 830 Toronto Railway cars which had many years ago become obsolete, many of which were originally horse cars.

Entirely rebuilt the remaining 348 Toronto Railway cars to modern types, such as the one-man treadle cars and six-motor two-car trains.

The total number of cars for service is approximately 1,000.

Trackwork—Extended the trackage of the former systems to the extent of 44 miles. Entirely rebuilt 54 miles of track which was quite unfit from the standpoint of safety and efficiency for street car operation.

Partially rehabilitated 55 miles of track which had sufficient useful life remaining in it to justify the expenditure, yet which was in a very much run-down condition. The commission now operates 244 miles of track.

Coaches and Buses—Inaugurated motor transportation as feeders for street cars; special fare Hill route, racetrack, exhibition, Sunnyside Beach service, sightseeing, chartered work, etc.

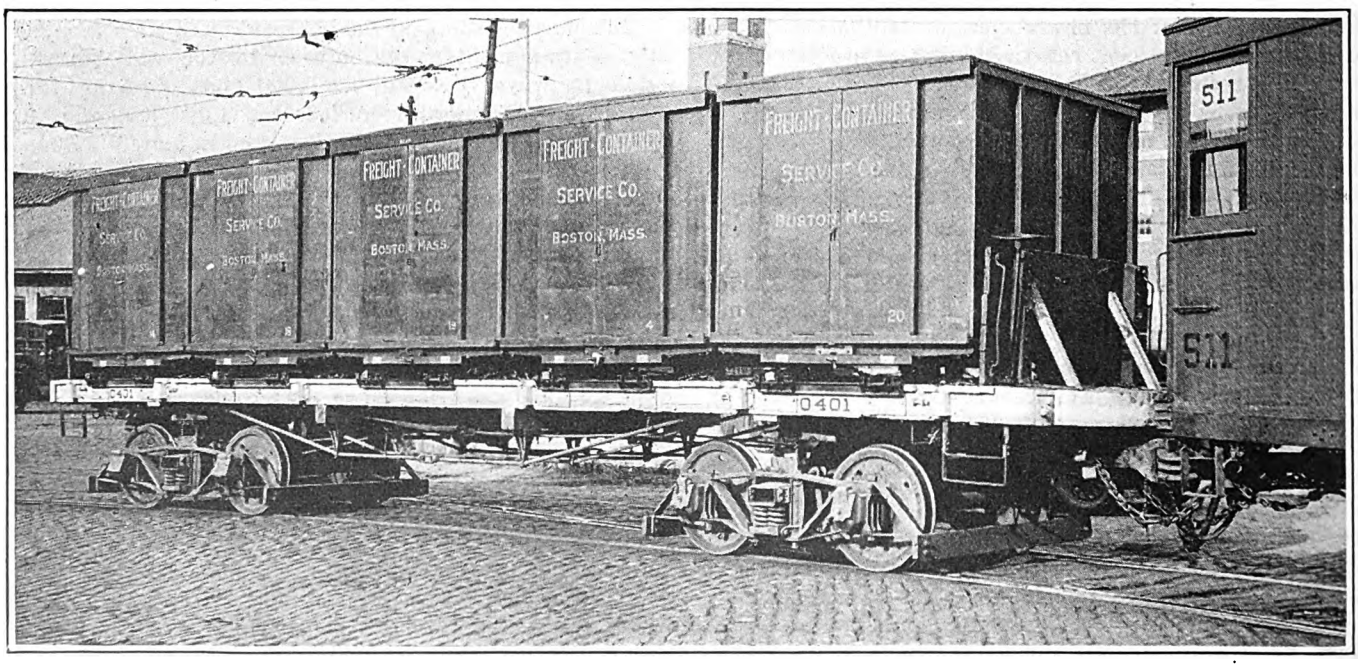
The commission has 75 vehicles for use on this work.

Buildings—Purchased old Board of Trade building and completely rebuilt this to serve as a head office building.

Rebuilt and enlarged four of the existing carhouses and constructed a new one.

Built new repair shops, the best street railway shops on the continent, by which savings are effected in reduced cost of rolling stock maintenance sufficient to meet all carrying charges and to pay for the cost of the buildings well within their lifetime.

Public Relations—Lastly, but by no means least in importance, the commission has reasons to feel confident that through the willing co-operative spirit of the men, and by means of the fair, impartial and unbiased policy of those to whom the matters of transportation have been intrusted, the confidence and support of Toronto's citizens has been finally regained.



Five Containers in All May Be Loaded on Each Flat Car, Thus Giving the Railway the Benefit of Full Car Load Haulage

Measuring One of the Main Surface Survey Lines, from Which the Center Lines of the Tunnels Were Calculated. Metal Plugs Were Fixed in the Pavement to Mark the Ends of the Survey Lines. This Work Was Carried Out at Night

London Subway Extended by Tunneling

Five-Mile Addition to Underground System Built in Ten Sections—Accurate Surveys Required to Insure Proper Alignment—In Hard Ground Shields Were Driven Forward by Hydraulic Rams, While in Soft Ground Rotary Excavators Were Used

CONSTRUCTION of the extension of the London Underground from Clapham to Morden, which was begun in 1923, was completed during the present year. Practically all of the new line is tube construction. In hard ground the tunnel was advanced by means of the Greathead shield, while in softer ground a rotary excavator was used. Methods adopted for the layout and execution of this work are typical of the latest British practice, and differ in many respects from those usually followed in this country. The story of the work as told by the London Underground is therefore of particular interest.

From Clapham to Morden is a distance of 5 miles. Except for the last half mile, where the extension runs in the open, the line is of standard tube design, with tunnels of 11 ft. 8¼ in. diameter, located at an average depth of 40 ft. below the surface. Between the stations the tunnels are an average distance of 5 ft. apart. At the stations, where the tunnels are of 21 ft. 2½ in. diameter and the lower portion of an escalator shaft comes between them, they are considerably farther apart.

On leaving a station each tunnel has a declivity of 1 in 30 for about 300 ft., while on approaching a station it has a rise of 1 in 60 for about 600 ft. Thus the tunnels are at the same level for a considerable distance between the stations, but they rise and fall at different angles in the sections immediately adjoining them. This switchback principle, applied wherever practicable, promotes acceleration of the trains as they depart from the stations and retards speed as they approach stations, making for economy and energy consumption and reducing wear and tear on the brakes. Preliminary to construction a route survey was made. First, the course to be followed was laid down approximately on large-scale maps. A detailed survey of the route was then carried out. The chief consideration was to select an easy route, making the curves as flat as possible, and to insure that the tunnels would not encroach on private property except where this was unavoidable. The levels of the highway were taken and all available data collected with respect to underground works, sewers, gas and water mains, etc.

Except for one short stretch, it was found practicable to lay out curves of such long radius that the tunnels could be of the standard 11 ft. 8¼ in. diameter throughout. At one point, however, the northbound tunnel had to be made of 12 ft. diameter. In general the curves of the Underground tunnels previously built are of larger diameter than are the tangents.

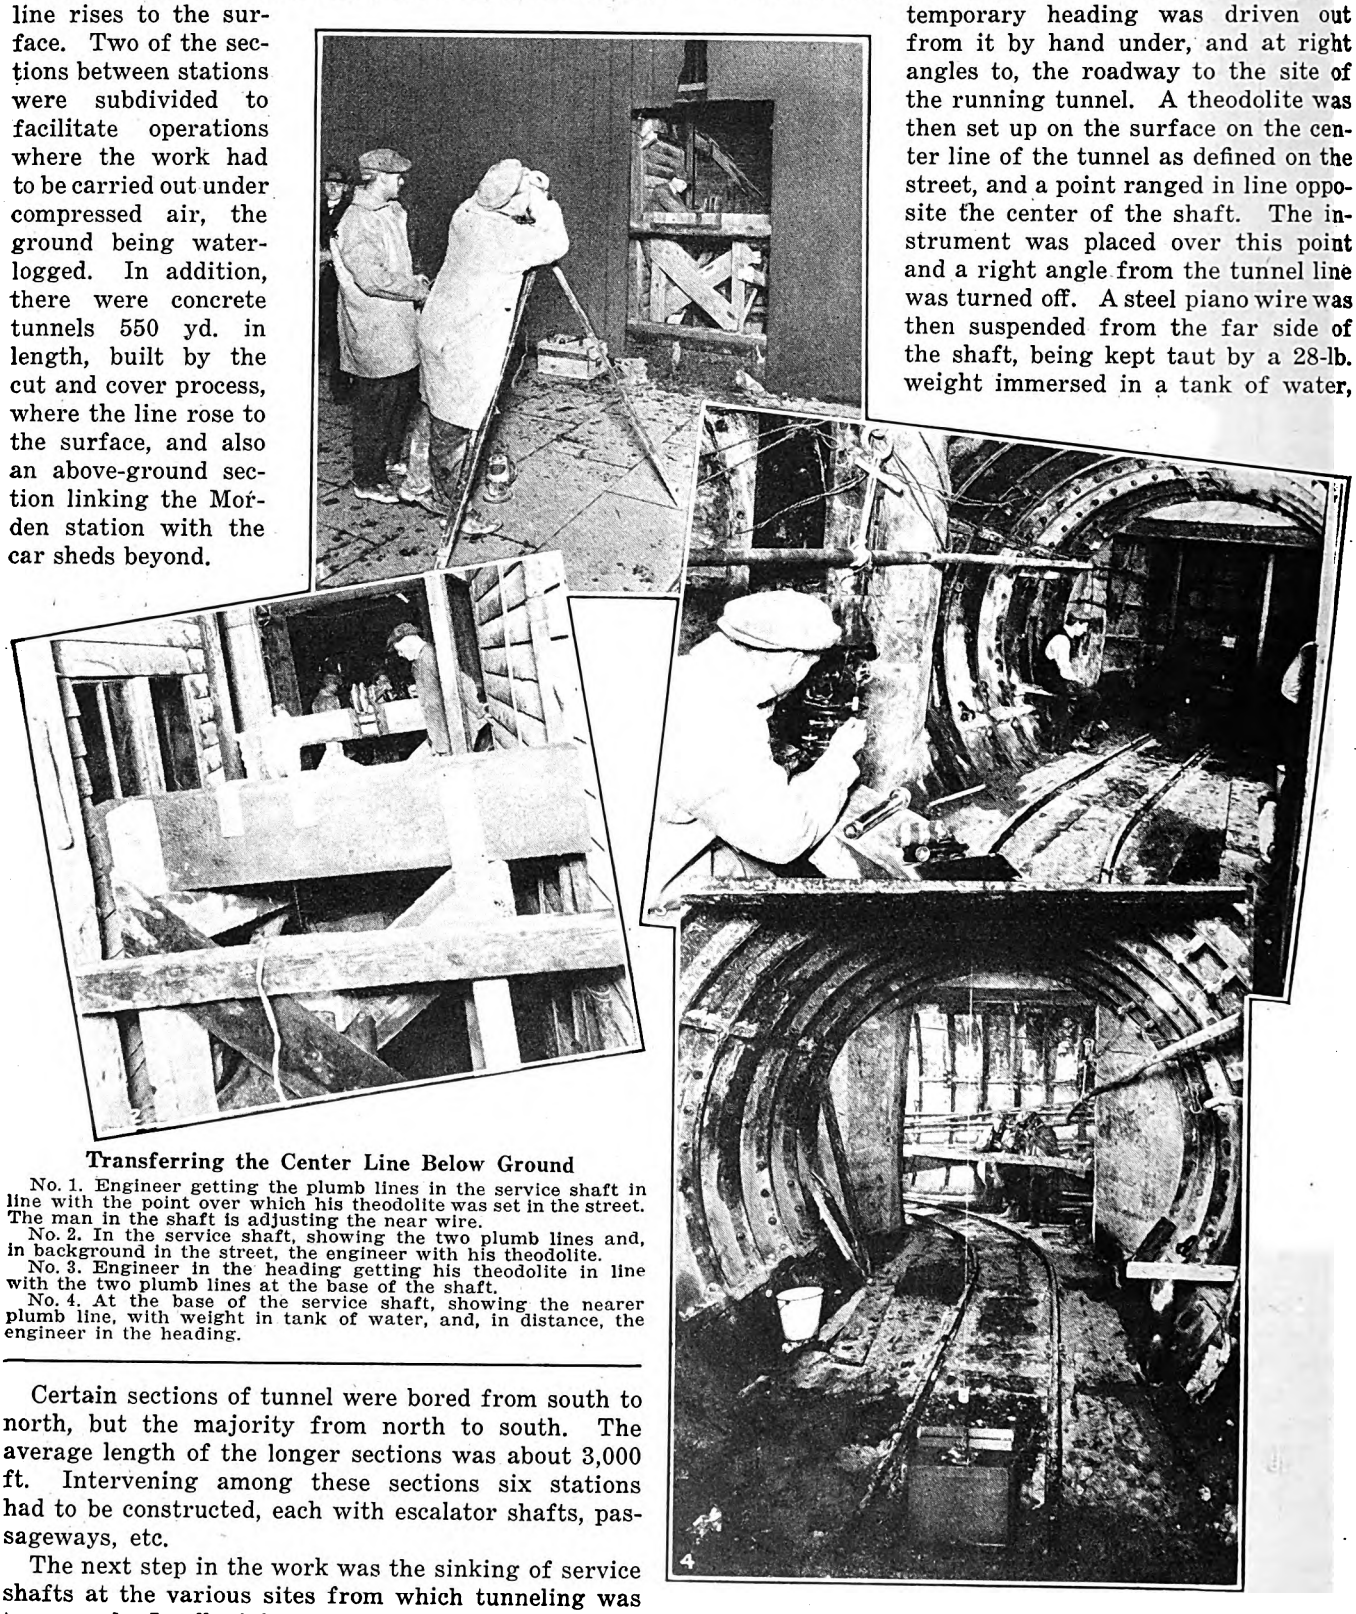
Arbitrary lines from which the center lines of the tunnels could be calculated were laid out on the street. This process is shown in an accompanying illustration. All places where the tunnels approached close to the building line were carefully checked with a theodolite, to make sure that there would be no encroachment on private property.

TEN SECTIONS IN 5 MILES

Having arrived at a satisfactory layout, the next step was to decide the general scheme of construction. Boring the tube from one point only would have been an extremely protracted undertaking. It is estimated that under such circumstances the Morden extension

Digitized by Google

would have taken about fifteen years to complete. Work was arranged, therefore, in ten sections, five of which represent the distances between stations and another the section from the last station to the point where the line rises to the surface. Two of the sections between stations were subdivided to facilitate operations where the work had to be carried out under compressed air, the ground being waterlogged. In addition, there were concrete tunnels 550 yd. in length, built by the cut and cover process, where the line rose to the surface, and also an above-ground section linking the Morden station with the car sheds beyond.



Transferring the Center Line Below Ground

No. 1. Engineer getting the plumb lines in the service shaft in line with the point over which his theodolite was set in the street. The man in the shaft is adjusting the near wire.
No. 2. In the service shaft, showing the two plumb lines and, in background in the street, the engineer with his theodolite.
No. 3. Engineer in the heading getting his theodolite in line with the two plumb lines at the base of the shaft.
No. 4. At the base of the service shaft, showing the nearer plumb line, with weight in tank of water, and, in distance, the engineer in the heading.

Certain sections of tunnel were bored from south to north, but the majority from north to south. The average length of the longer sections was about 3,000 ft. Intervening among these sections six stations had to be constructed, each with escalator shafts, passageways, etc.

The next step in the work was the sinking of service shafts at the various sites from which tunneling was to proceed. In all, eighteen shafts were sunk. While in the construction of the older tube railways of London these shafts were from 16 ft. to 30 ft. in diameter, on the Morden extension they were only 10 ft. 6 in. in diameter. In previous construction it was customary to install elevators and emergency staircases for the stations in the shafts after the completion of tunneling. On the Morden line, however, the stations have escalators and the temporary shafts were made of small diameter for reasons of economy.

A shaft having been sunk to the requisite depth, a temporary heading was driven out from it by hand under, and at right angles to, the roadway to the site of the running tunnel. A theodolite was then set up on the surface on the center line of the tunnel as defined on the street, and a point ranged in line opposite the center of the shaft. The instrument was placed over this point and a right angle from the tunnel line was turned off. A steel piano wire was then suspended from the far side of the shaft, being kept taut by a 28-lb. weight immersed in a tank of water, great care being taken to insure that the wire hung perfectly clear. This wire was then adjusted across the field of view until it exactly bisected the cross-hairs of the telescope. A similar wire, hung from an adjusting screw, was suspended from the near side of the shaft, the two wires being as far apart as the shaft would allow. By means of the adjusting screw the second

Checking Horizontal Location of the Shield by Means of the Plumb Lines

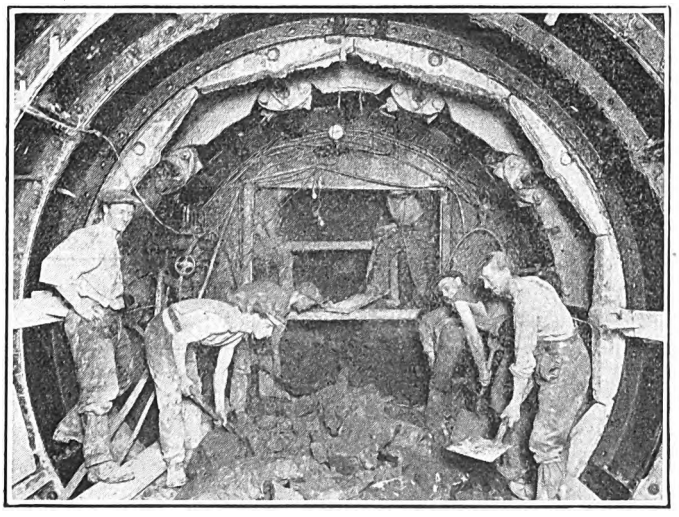
Checking the Level of the Shield by Sighting Over Suspended T Rods

wire was then traversed across the field of view until it coincided with the first wire. The two wires were thus on a true line at right angles to the center line of the tunnel. The distance from the instrument to the nearest wire was next measured.

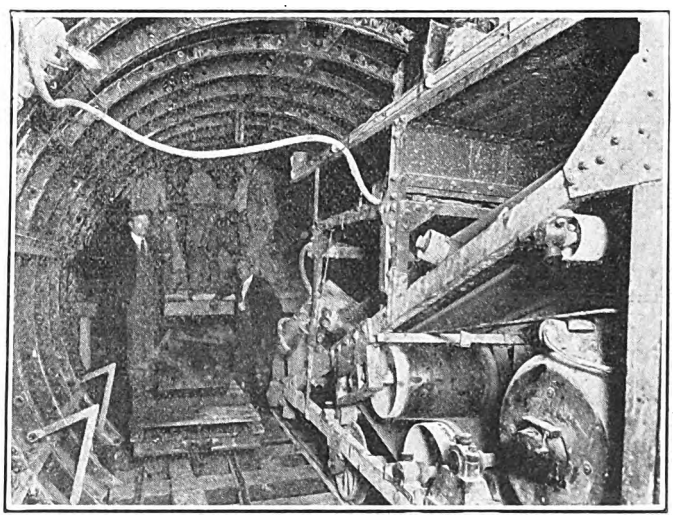
To transfer the center line to the heading, the theodolite was set up in the heading at the same distance from the near wire as was the case on the surface. The wires were again sighted and the instrument moved on its sliding plates until the two wires appeared as one. When this had been done the instrument was plumb under the point at which it had been set on the street above. With this as a base, the center line of the tunnel was determined by turning off a right angle. The operation was repeated from time to time as the tunnel increased in length until the engineer was assured that the center line had been established with sufficient accuracy to be used to the end of the drive.

Excavation Done by Two Methods

The base line below ground having been established, tunneling began. A chamber 15 ft. in diameter was cut at right angles to the heading. The shield was then built up into the chamber, and the correctness of its position and direction having been verified by repeated checkings with the base line data, the task of excavating the tube began in earnest.



Digging the Tunnel by Means of the Greathead Shield. This View Shows the Work South of Camden Town



Rotary Excavator in Use When the Tube Was Pushed Through Soft Material

Digitized by Google

The shield was driven forward by means of hydraulic rams around the periphery, pressing against the iron lining segments of the tunnel already constructed. By regulating the force exerted by the various rams, a straight tunnel, a curving tunnel, a downward slope or an upward slope were made as occasion demanded. An exigency that had to be taken constantly into consideration was that owing to the weight of the shield there was a tendency for the nose to go downward when uniform pressure was exerted by all the rams.

Operations began on one tunnel only, work on the other not being undertaken until the first tunnel had been driven some little distance ahead. Two shields, therefore, were never working alongside each other.

The skin was carried forward as the shield went ahead and the space that it occupied was then grouted through holes in the lining segments. At the end of a drive, when the shield could be projected no farther, the skin was necessarily left in place between the segments and the earth.

Each cast-iron ring with which the tunnel is lined consists of six segments and a key piece, the latter being inserted in the top of the ring. Where the diameter of the tunnel is increased to 21 ft. 2½ in. at the station platform, twelve segments and a key piece are used. The segments were placed in position and bolted together at the flanges after each advance of the shield, the forward movement being 1 ft. 8 in. for the standard tunnel and 1 ft. 6 in. for the large diameter tubes.

Two types of shields were used, the Greathead and the rotary excavator. In the case of the Greathead shield, men work inside the shield and dig out the earth at the face, as it is broken down by the forward movement. This method was used where the ground was firm. With the rotary excavator the digging is performed by rotating cutters and the earth is thrown back mechanically. The rotary excavator was used only for tunneling through clay when expeditious work was necessary.

Strata Carefully Investigated

Trial bores were made of the ground through which the tunnel was to be driven. While such borings afforded a general idea of the nature of the strata in which operations were to proceed, they did not, of course, indicate every peculiarity of the lower levels throughout the course of the line. Borings were made from the surface and also horizontally ahead of the shields. This was done with a long-handled carpenter's augur with sufficient length to penetrate for several feet through the earth to be excavated. When work was proceeding under normal conditions, this was done as a precaution against suddenly encountering water-bearing or other bad ground. When operations were being carried out in compressed air, it was necessary also as a precaution against running unexpectedly into some outlet for the air. The wisdom of these precautionary measures was demonstrated several times during the course of the construction.

In water-logged ground below the surface compressed air was used. An airtight compartment was built in the tunnel between the shaft and the tunnel face. In some cases it was a section of the tunnel itself, from 10 ft. to 20 ft. or more in length, closed by stout bulkhead walls of brick or concrete, each wall having an airtight steel door for the passage of men and materials. In other cases the air lock was a horizontal steel cylinder with a bulkhead wall and steel door at each end. Sometimes the pressure used was as low as 5 lb. per square inch. In exceptional cases it was as high as 25 lb., or even higher. The average was approximately 10 lb. per square inch. When work was proceeding under a river the pressure had to be adjusted in conformity with the ebb and flow of the tide, which caused a fluctuation in the weight on the clay above the tunnel.

Direction and Level Checked Frequently

During the process of tunneling, checks on the position of the shield and the direction of drive were taken periodically. As the tunnel was bored iron dogs were fixed in the roof about 35 ft. apart. From them plumb lines were suspended. These dogs were set by an engineer and the plumb lines were placed in exact line with the theodolite. When necessary to check the position of a shield, a bar called a fiddle was placed across the horizontal diameter of the shield. The top of the fiddle was at axis level and had a notch in the middle denoting the center of the shield. A small piece of wood having a slit illuminated by a candle was then placed on the fiddle and shifted back and forth until the slit coincided with the plumb lines. It was then noted how much the notch on the fiddle was to the right or left of the center line of the tunnel and the error in position determined.

For testing the level of the shield, hangers were bolted to the roof of the tunnel on which adjustable pins had been set by the engineer to an exact level. From these pins T-shaped rods were suspended, the crosshead representing the true axis level of the tunnel. The piece of wood was then placed against the face of the fiddle with the slit horizontal and raised or lowered until it coincided with the line of sight of the crossheads. The position of the top of the fiddle was then noted in relation to the slit and any necessary adjustment of the shield was made by variation in the force exerted by the rams.

For further guidance, square lines were set out at right angles to the center line of the tunnel, and trailing rods divided into feet and inches were attached to each side of the shield. If the shield was proceeding square with the center line, readings were equal on the scales of the trailing rods. When the readings were unequal it indicated that the shield would soon be out of line.

For boring curves the engineer furnished the foreman with a list showing for every foot the shield advanced how much to the right or left of the center line it should be. When sighting on the fiddle the foreman could therefore ascertain his position by referring to the list. Trailing rods with different scales were provided for curves. While the rod for the inside of the curve was divided into feet and inches, on the outer rod the divisions, although marked as feet and inches, were "stretched" to correspond with the lengths on the inside. Vertical lines also were established by the engineer and it was thus possible to ascertain from the readings on the trailing rods whether or not the nose of the shield was being kept to the correct line of the curve. The maximum deviation from level or center allowed in a shield was 1¼ in.

When the construction of the Morden extension was at its height, eighteen shields were in operation simultaneously on various parts of the line. Twelve were at work on the running tunnels and six of extra large size on the platform tunnels of the stations.

Large Crowds Were Interested in the Exhibit of the New York State Railways at the Rochester Industrial Exposition

Seeing What the Motorman Sees

Motion Picture Displayed by the New York State Railways at the Rochester Industrial Exposition Attracted Large Crowds—Taken from the Front Vestibule of a Moving Car, It Showed the Many Hazards of Operation Through Congested Streets

By L. R. Brown
New York State Railways, Rochester, N. Y.

FOR the first time in several years the New York State Railways was represented this year at the Rochester Industrial Exposition. The company rented three adjoining booths on the center isle in the building housing the industrial exhibits and combined them. The space was arranged as a miniature motion picture theater resembling the interior of a street car. The front vestibule of a car was built to actual size facing one of the aisles. Behind this were seats arranged in the same way as in a street car. At the back was a booth housing motion picture and lantern slide machines. The screen was inside the front vestibule in the position of the motorman's window and the surrounding woodwork painted black.

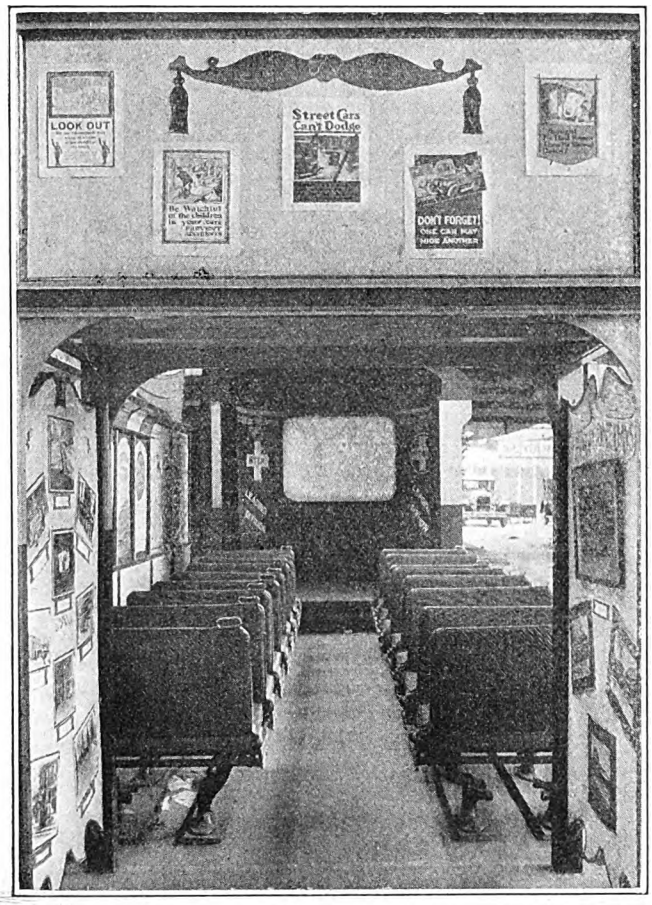
The back wall of the booth was arranged to represent the side windows of a street car, except that, in place of

Posters Took the Place of Glass in the Side Windows

Digitized by Google

glass, posters were displayed telling the value of street car service to the community. Posters carrying facts about the street railway in Rochester were placed in the space above the windows ordinarily used for advertising merchandise. The walls supporting the projection room were used to advertise the electric railway industry.

These street car seats accommodated 32 people and



The Railway Booth Was Arranged to Resemble a Car Interior

afforded about the only opportunity inside the exposition buildings for people to sit down and rest. On one of the front windows of the car and on one of the panels in the rear were painted these words, "Rest Here and Enjoy Street Car Comfort."

"What the Motorman Sees" was one of the principal motion pictures shown to the audience. It was taken in Rochester by a local motion picture man, under the supervision of the safety director, from the front vestibule of a street car. When looking at this picture displayed on the screen one got the effect of riding in a street car and seeing what the motorman sees.

Five different incidents were displayed. One was an automobile "cutting in" in front of a street car without warning. Another was a street car being delayed by a slow-moving vehicle refusing to turn out and give the right of way. The third consisted of boys playing in the streets. One of them darted suddenly out in front of an oncoming car to retrieve a fumbled ball. A fourth scene depicted a boy catching a ride on the rear of a street car and getting a bad fall by jumping off in front of an oncoming car. The fifth showed a man alighting from a street car and walking around the rear onto the other track in front of an oncoming automobile.

In addition, other pictures taken by the railway in Rochester were shown. One was entitled "Traffic Conditions in Rochester" and showed a number of violations of the law by automobilists which endangered street car traffic. Another was "The Gap in the Line" and showed the efforts of the railway to take care of the service when a blockade occurs. Lantern slides from the National Safety Council were used also to interest the crowds in the dangerous practices in which street car patrons often indulge.

It was necessary at all times to have two or more men present at the exhibit to operate the motion picture and lantern slide machines and keep a continuous attraction before the people. Two motion picture machines of the bulb type and one lantern slide machine were used. At first the pictures did not show up so very well in the daytime as all the artificial lights in the building kept burning and there was considerable reflection on the screen. This was to a great extent overcome by constructing a canopy of black oilcloth to shade the screen.

From the opening of the exhibit at 10 o'clock Monday morning until its closing at 11 o'clock Saturday night the exhibit was an unqualified success in attracting crowds. The seats were filled at nearly all times and many times the people were crowded four and five deep in the standing space outside the booth. Even when no pictures were being shown many people occupied the seats just for the purpose of rest and relaxation. When so doing they, of course, were gazing around and reading the messages painted on the walls for their benefit. The crowd was constantly changing and owing to the

Full-Size Front Vestibule at One End of the Exhibit

booth's prominent location nearly every one who visited the exposition passed the booth and all who passed paused for a moment to read the messages or watch the pictures. Children were especially interested in the exhibit and a parent with a child had difficulty in getting by without stopping to see the pictures. A comedy motion picture was displayed occasionally to attract the crowd and the safety slides and film were shown between the scenes of comedy.

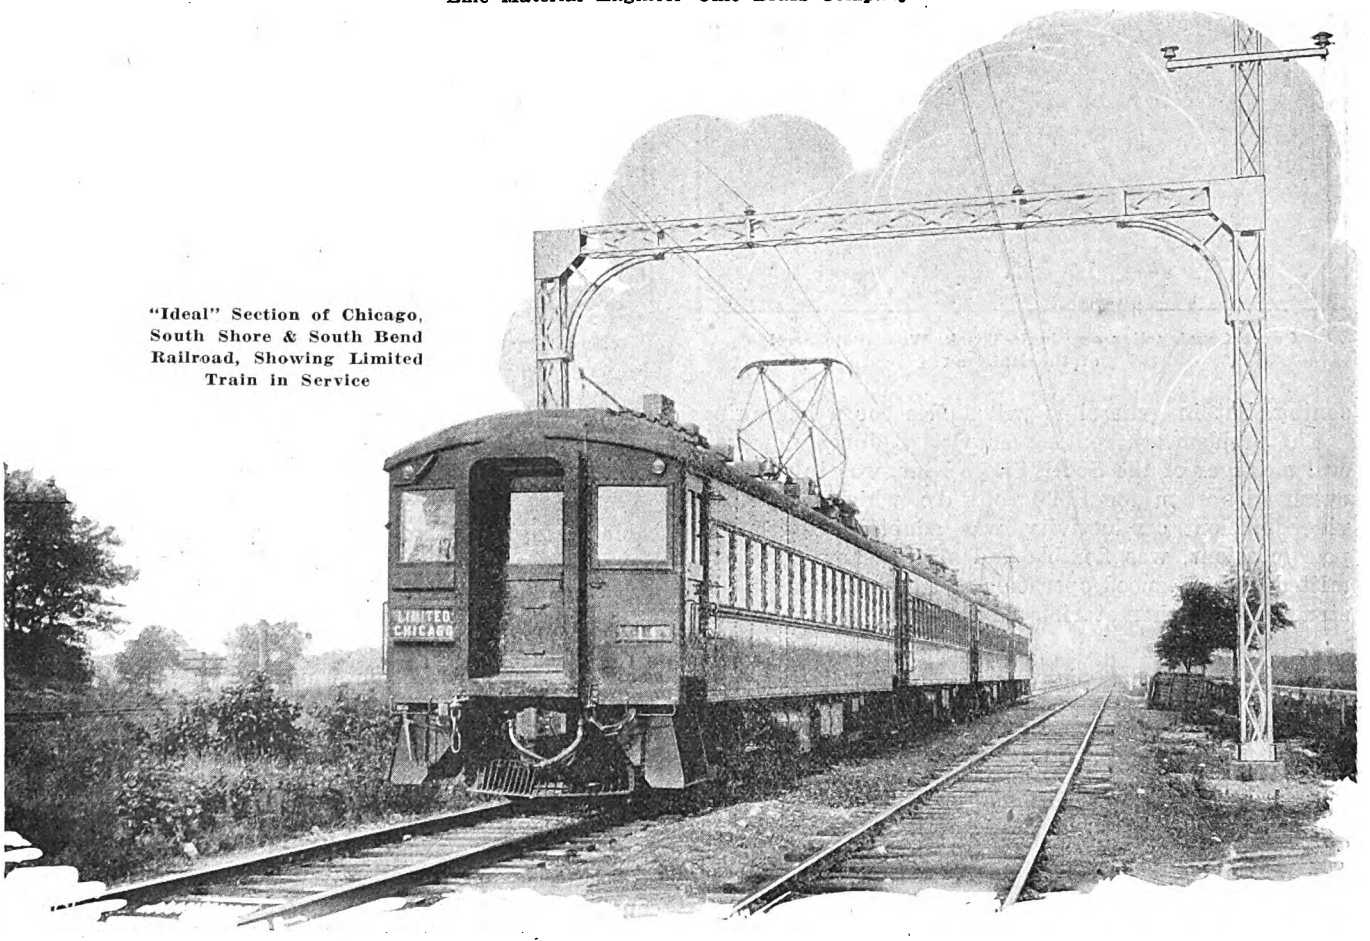
High Current Capacity with Exceptional Flexibility Feature of Catenary

New Overhead of Chicago, South Shore & South Bend Railroad Gives Uniform Load of 0.7 Lb. per Foot on Pantograph—Maximum Life Assured by Use of All Non-Ferrous Materials

By L. W. Birch
Line Material Engineer Ohio Brass Company



"Ideal" Section of Chicago, South Shore & South Bend Railroad, Showing Limited Train in Service

SLIGHTLY more than a year ago the Insull interests purchased the Chicago, Lake Shore & South Bend Railway and, after renaming it the Chicago, South Shore & South Bend Railroad, proceeded to spend an aggregate of $3,615,000 for new equipment and rehabilitation of the right-of-way. Of this amount, $1,330,000 was spent for new equipment and $1,428,000 for the rebuilding of overhead, structures and roadway. In addition, the Northern Indiana Public Service Company has spent $857,000 for substation equipment and high-tension lines. Twenty-five new steel motor passenger cars and four locomotives have been placed in service. In addition to these, there will be delivered later two dining cars and two parlor-observation cars. The overhead system is being completely rebuilt and a 1,500-volt d.c. system has replaced the old 6,600-volt a.c. system. Eight new substations and interconnecting high-tension lines have been added and many waiting rooms and stations rebuilt. New 100-lb. rail and ballast are replacing the old. In other words, a new railroad has been built on an old right-of-way.

For the past few years it has been recognized that there are two ways to design an overhead system, either of which could be considered as good design, even though it be selected without consideration of current requirements and cost. One method is to build a light overhead collection system with separate feeder for conductivity and the other is to construct an overhead system in which all conductivity is placed in the contact and supporting messenger wires. With the former design the advantage of light-weight overhead is obtained, thus diminishing the size and weight of structures, hardware and fittings. With the latter, owing to larger cables resulting, a system employing long pole spacing, heavier structures and a single insulated set of conductors is possible. By comparing the cost of one system with that of the other for some given railroad it is fairly easy to determine which system is preferable. Considerable economy will show for one of the systems. This method of selecting an overhead system should not be decisive. There are innumerable jokers which may creep in and upset this line of rea-

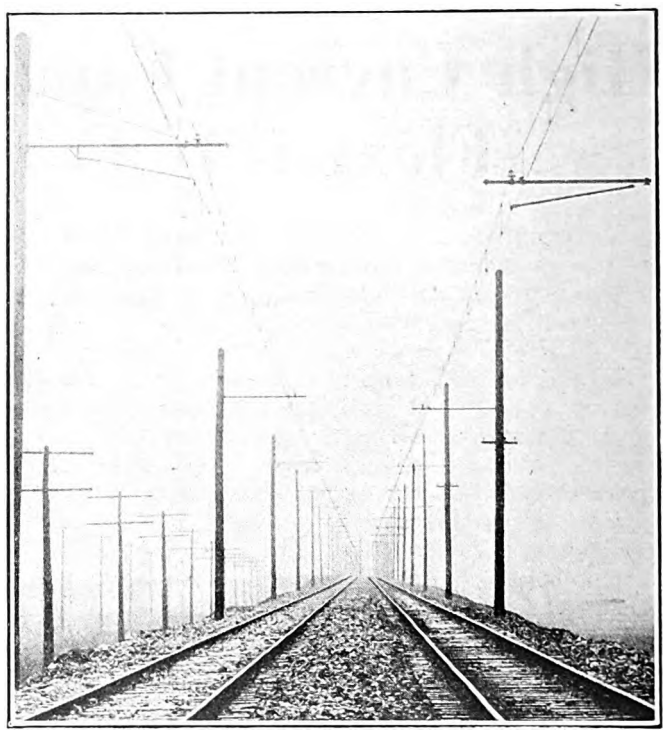
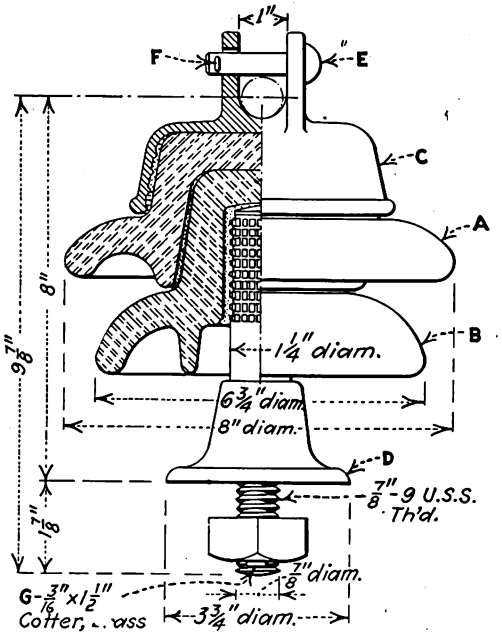
Curve Construction on Single-Track, Wood-Pole Section of the Railroad



Original Installation of Overhead, Chicago, South Shore & South Bend Railroad, Kensington Division

soning, but in general it will suffice for a beginning.

The problem confronting Charles H. Jones, now general manager of the South Shore Line, was to select an overhead system for 1,500 volts d.c. which would provide sufficient conductivity, was adaptable to the old pole locations, was flexible and at the same time permitted of high-speed operation. It should also be constructed of such materials as to insure maximum life



Messenger-Supporting Insulator Used on Ideal Section

under existing smoke and atmospheric conditions and should be cheapest from the standpoint of dollars per ampere-mile. The answer to the problem was a system embodying supporting cable, feeder and contact wires in the same grouping. In brief, the additional copper necessary to provide sufficient feeder capacity for the contact wires was not hung separately from the structures, but became a part of the overhead system. This was accomplished by proportioning the copper between contact wires and messenger wires in the catenary make-up. A skillful division of copper and steel in the main messenger wire made possible the selection of a cable of higher ultimate strength, with less sag to be considered and, as a result, a saving in hanger lengths, particularly on curves.

The original overhead system as built some eighteen years ago consisted of a ½-in. Siemens-Martin steel cable with a No. 0000 copper intermediate wire and No. 0000 steel contact or slipper wire. Rigid hangers of the "sister hook" type connected the main messenger with the intermediate wire, while the intermediate wire and steel contact wire were connected with cast bronze duplex clips. The latter were spaced equidistant between hangers and provided flexibility as well as a feeder connection. This system operated remarkably well, considering the speeds which were attained at the start of operation. However, as the railroad progressed and every one learned more concerning current collection and the problems of overhead maintenance a great difficulty became apparent. This appeared in the steel contact wire. It was not working out satisfactorily. Motormen complained of rust-stained windows and the shop men of too rapidly wearing contact shoes on the pantographs. The overhead man suddenly noticed an unusual amount of arcing and burning. This condition, however, continued until eliminated by the substitution of copper contact wire during the present rehabilitation. A like substitution was made by a number of Eastern roads about the same time. This combination continued in operation until recently, when it was replaced by the new overhead.

New Overhead System

Owing to the soundness of the wood poles and the added expense of resetting for greater pole spacing, the old poles were considered adequate for most of the new construction. Having been previously reset in concrete, they were sufficiently secure to withstand the loads im-

Digitized by Google

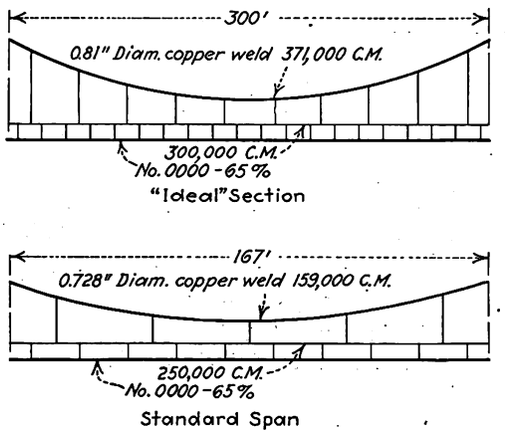
posed by the new catenary. Hence, only a certain amount of straightening was necessary before the pole job was considered complete. Bates steel trusses were attached to these old poles to span the two tracks and support the catenary. Suspension insulators were attached to these trusses by a clamping device which permitted of alignment with track centers after the messenger had been strung. Along the single-track section an adjustable type of galvanized bracket arm was used on each pole.

It is interesting to note that the original bracket arms, which were of T section and plain, were almost entirely eaten away with rust when removed. The new galvanized brackets will not be subject to this condition. The pole spacing on the old work was 167 ft. on tangents, consequently this became the normal span for the new work, with the exception of that portion of the track paralleling the New York Central Railroad, known as the Ideal section. This section has 300-ft. tower spacing and employs built-up galvanized Bates bridges. The general span design, however, is identical with that chosen for the replacement on 167-ft. spans.

In order to incorporate conductivity and strength in the same combination, a span design was selected as shown in the line diagram. The main messenger or supporting catenary wire was connected to the intermediate wire by means of a rigid hanger, while the contact wire was supported from the intermediate wire with a flexible hanger. The rigid hanger provided good electrical conductivity between main messenger and intermediate messenger, while the flexible hanger provided a relief from the "hard spots" during pantograph passage along the wire. Frequent feeder connections or bonds were placed between intermediate wire and contact wire to aid further in increasing the current-carrying characteristics of the line. A similar arrangement for inclined hanger construction was designed for the curve work, the plan of using short flexible hangers being continued through the curve.

In addition to good collection characteristics, this form of catenary gave a very pleasing span as far as appearance was concerned and provided a uniform load of 0.7 lb. per foot on the pantograph.

This particular type of span design, in addition to providing good conductivity and mechanical strength, lends itself admirably to the replacement of the contact wire. With pantograph operation, the new contact wire may be strung while the old one is in service. This may be accomplished by suspending the new wire with the short flexible hangers alongside the old one. The old wire and hangers may then be removed after the new wire is properly sagged. It is even possible by a slight change in curve hanger design and a resagging of main messenger wire to add a second contact wire in case load conditions materially increase.



At Top, Ideal Section Span. Below, Standard Span

Insulation on the bracket arms was similar to many other existing 1,500-volt d.c. lines. However, the insulation on the steel towers in the Ideal section was of a somewhat new design. This insulator, which has had a long field record, was of the two-piece design and provided a good factor of safety in case of breakage of one part or in case of an extremely high inductive voltage from the adjacent high-tension line. A saddle casting formed the cap and the main messenger rested in this saddle. Messenger anchorages were placed at approximately 1-mile intervals. The arrangement used was that of dead-ending direct to the steel truss of a bridge through high-strength ball-socket insulators.

Maintenance Notes

Effective Means of Supporting Armature Coils

WHILE insulating armature coils on taping machines the operator should have coil hangers on both sides. Those on one side support the coils before they are taped and those on the other hold the finished coils. A convenient arrangement of hangers, which can be shoved under the table out of the way when not in use, is incorporated in the equipment of the new electrical repair shop of the Brooklyn-Manhattan Transit Corporation. As shown in the accompanying illustration, the hangers consist of 3-ft. lengths of 1¼-in. iron pipe fastened to the underside of the table on each side of the operator. Into each length of the supporting pipe is a piece of ¾-in. pipe on which the coils are hung. The ends of the small pipe which support the coils are provided with bushings, so that there are no sharp edges, and in order to prevent the pulling out of the pipe entirely the larger pipe is fitted with a bushing which closes in the end opening sufficiently that the bushing on the end of the ¾-in. pipe cannot pass through.

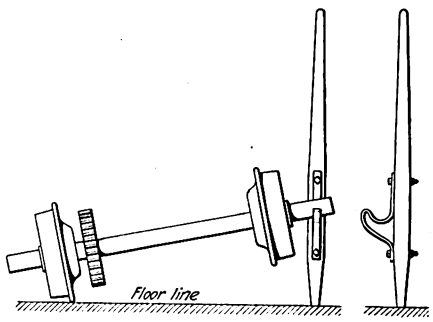
In a shop like this, all of the appointments of which are cement or metal, this construction will harmonize particularly to bring out a pleasing appearance and also provide a most convenient arrangement.

"A.E.R.A."
"A"dvocates "E"xpert, "R"egular "A"ttention—to all details in the upkeep of your equipment.

Benches on Which Taping Machines Are Operated in the Shops of the Brooklyn-Manhattan Transit Corporation Have Pipe Supports on Each Side for the Armature Coils That Can be Shoved Underneath When Not in Use

Handling Wheels by a Wheel Stick

MOVING a pair of wheels from one location to another is very easily accomplished by means of a wheel stick as used by the New York Railways. This stick is made of a piece of 3-in. x 4-in. oak about 4½ ft. long upon which is mounted a bearing made of ⅜-in. x 2½-in. flat iron.



Moving Pair of Wheels with Wheel Stick. At Right, Side View of Wheel Stick

The center of this bearing is located so that when placed under the journal end of the axle it will raise one wheel about ½ in. off the floor, thus permitting the wheels to be swung to any desired angle.

From the bottom of the bearing bracket the stick is tapered down to about 2 in. x 2 in. and from the top of the bracket it is rounded and tapered to permit of a good hand grip.

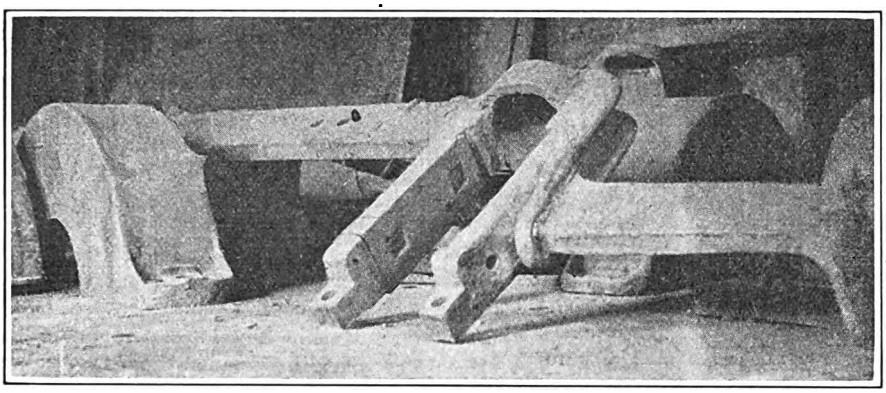
This stick will prove a very useful tool where a pair of wheels are to be moved about the floor and no immediate lifting facilities are available.

"All's well that's oiled well"
Is the tale your bearings tell.

Round Soft Steel for Truck Repairs

FAILURES in truck members are now repaired in the shops of the Portland Railroad, Portland, Me., with round soft steel rod. Diameters of ⅞ in. or ⅞ in. are frequently used for this purpose. The round lengths are electrically welded to the metal of the truck following the welding of

Digitized by Google



Using Soft Steel in Repairing Truck Failures

the actual section which had failed. Thus the new metal assists in holding the members in position and absorbs much of the shock which would otherwise be transmitted to the repaired part.

Kinks from Decatur, Ill.

Earnest Efforts and Modern Methods Bring Satisfactory Savings on the I.T.S.

CAMPAIGNING in the direction of systematizing and correlating work in the shops of the Illinois Traction System, coupled with effort to select shopmen carefully and provide them with pleasant working conditions, has been bringing results, according to the brief of the company in the 1926 Coffin Award contest. Time-saving devices used in the shop include such innovations as intercommunicating telephone systems and development of special machinery and devices in the air brake, blacksmith, electric and painting departments. In addition to cutting down the time required for the several operations of car maintenance and construction there has been an intensive study of reclamation.

By the use of a mechanical separator in the foundry, bits of iron and steel which are removed from brass borings and which were formerly sold at from 3 to 4 cents a pound are now used over again. The resulting saving amounts per pound to from 4 to 5 cents. Compressor heads which formerly were junked are now repaired at a cost of 40 cents by the use of special tools. This results in a saving of $14 for each compressor head thus salvaged. Slides for Miller trolley shoes are built up for 43 cents, as compared with the previous cost of $1.75 for a new slide. Cast steel wheels formerly considered too hard for turning are now turned in the company's shop, and wheels once scrapped for flat spots are now again made available for service.

Car axles which have become worn at the journal are built up by the welder and used again. Gear cases costing $48 each and frame heads costing $50 are saved from the scrap pile by a special method recently developed. Car axles worn to condemning limits but showing no structural flaws are treated and turned down to smaller sizes.

A system of ventilation for the GE-73 motor has been worked out by means of which the capacity of the motor has been increased 66 per cent. The capacity of trolley poles and trolley bases has been increased by running heavy cable in shunt with these parts.

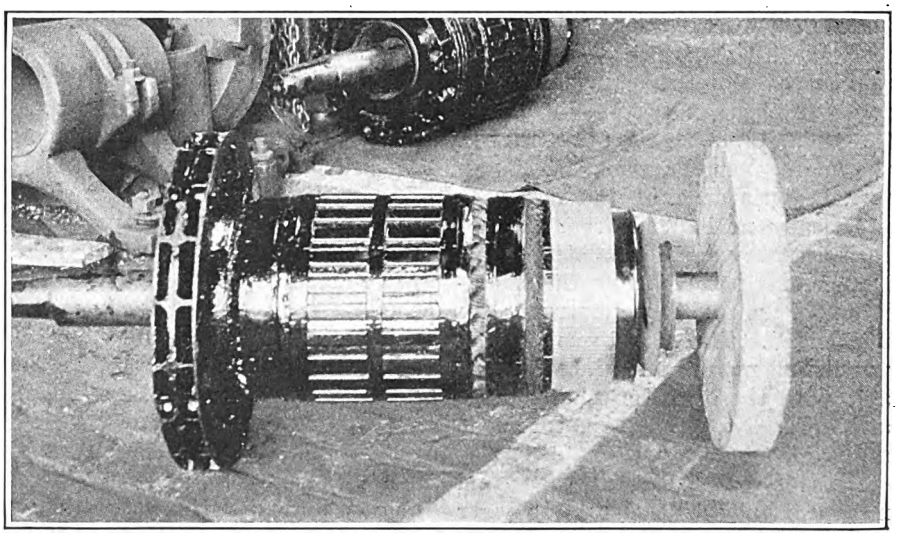
Pull rods and equalizer bars are now made from one piece of metal. No welding is permitted in these pieces and the breakage of these parts has been practically eliminated. Headlight switches have been given a uniform location and so placed that the motorman need not take his eyes off the right-of-way to operate the switch. Large lights of opalescent glass in the top outside sash have been split and a metal mullion has been inserted. This has meant that the number of lights of this kind which have been broken has been greatly reduced.

The composite result of this campaign is shown by the following comparison: During the twelve months ended April 30, 1926, there was a total of only 391 car failures on the main division for 6,148,240 car-miles, or an average of one car failure for 15,720 car-miles. This compares with an average of one failure for 13,016 car-miles for the previous three years, and of one car failure for 8,804 car-miles for 1920—five years ago. Incidentally, during the past eighteen months all of the regularly operated passenger equipment and 800 of the freight cars have been put through the paint shop.

End Block Used to Protect Armatures from Injury

ARMATURES with a construction as used with the GE-264 or Westinghouse 508 motors have a ventilating fan at the end. As this housing is of considerably larger diameter than the armature core there is danger of damaging the commutator or small end in handling.

In order to keep the small end of such armatures off the floor, Ernest Lunda, master mechanic of the Grand Rapids Railway, fits these types of armatures with a circular wooden block. The diameter of this block is 1 in. less than that of the ventilated end housing, so that in



Keeping the Small End of Armatures Off the Floor by Use of a Wooden Block Support

Digitized by Google

rolling the shaft has a tendency to work into the block rather than out of it. The blocks are 2 in. thick.

New Equipment Available

Dust Kept from Carbon Brushes of Railway Motors

WHEN self-ventilation was incorporated in railway motor design some years ago it resulted in a somewhat shorter life of the brushes, brush-holders and commutators than in the totally inclosed types, due to additional wear caused by dirt. Although this condition was considered undesirable, it was accepted by railway operators because of the advantages of reduced weight per horsepower and the increased ratings possible with a ventilated motor of specified dimensions.

Several improvements have been devised by engineers of the Westinghouse Electric & Manufacturing Company in order to overcome the disadvantages. The closed front brush-holder and, later, the dust cap holder, which totally inclosed the carbon except the contact surface, were brought out. Further study and experimentation have resulted in the conception of a dual ventilation scheme. An experimental type motor, No. 508, with dual ventilation, was placed in service, and as a result of the satisfactory operation this dual ventilation will soon become a feature of all standard motors of 25 and 35 hp. rating.

Dual ventilation is obtained by having a baffle inside the frame which separates the commutating mechanism from the coils in the main portion of the frame. The air is taken in through two inlets, one in the commutator housing, the other in the main frame casting. The external appearance of the motor is practically unchanged from that of the ordinary self-ventilated type. Dimensions pertaining to the installation of the motor on car trucks are unchanged. The armatures of dual ventilated motors are interchangeable with those in the other motors as before. No special armature coils are required.

Records of brush mileage and measurements of commutator wear in the motor under test indicate that the life of these parts as affected by wear due to dirt is four times the life of similar parts in the ordinary self-ventilated motor of the same type.

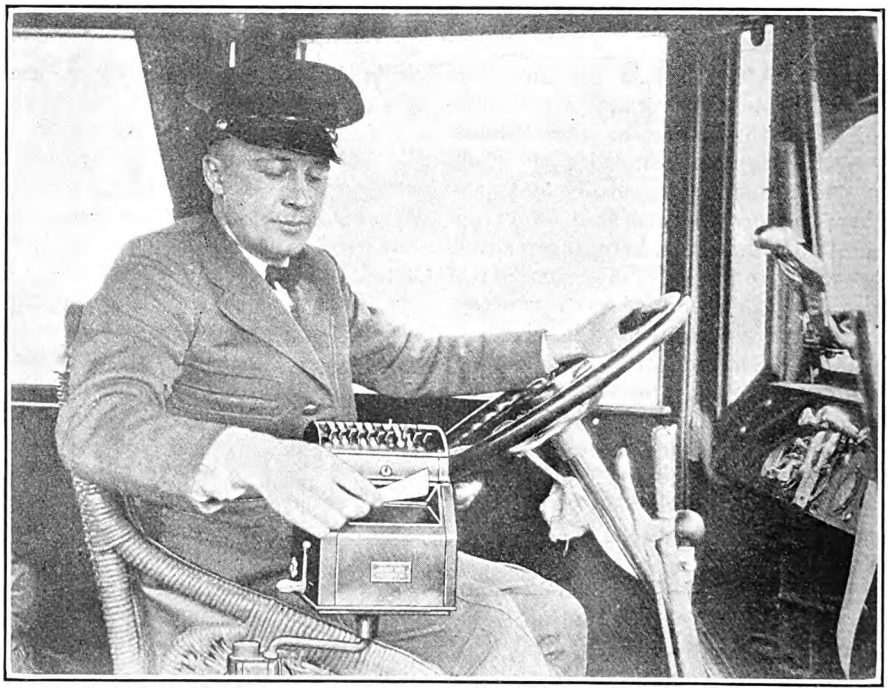
Ticket Printing and Registering Machine

FROM 1 cent up to $99.99 any amount may be registered by the No. 79 Ohmer ticket printing and auditing machine which has recently been announced by the Ohmer Fare Register Company of Dayton, Ohio. A ticket is printed and issued for the amount desired and at the same time a duplicate record of the data which are printed on the ticket is also printed on the day's report within the machine. The machine may be mounted upon a bracket or may be carried by the operator by means of a belt and shoulder support. It weighs but 10 lb. and measures 6½ in. x 6½ in. x 8 in. high.

An earlier form of this machine was illustrated in this paper for Dec. 19, 1925, page 1079.

The machine was designed to give complete protection against manipulation and the usual losses due to carelessness and dishonesty. Ticket fares, transfers, interline tickets, mileage and all paper fare mediums receive the same protection as do cash fares. It is also possible to issue round-trip tickets with the machine, one ticket being issued to the passenger for the immediate ride and being taken up as the passenger leaves the car, while the second ticket, marked R.T., is given to the passenger for collection by the return operator.

When taking his car or bus the operator must place his identification key in the machine before he can operate it. This prints his number on the daily report opposite the record of each ticket issued. Pulling out this key locks the machine. The operator issues the first ticket to himself with fare designation in blank and holds this ticket. All tickets are lifted as passengers leave the car or bus and are turned in to the office with the day's collection, which should balance with them. An inspector entering the car may examine any ticket to see whether the consecutive number is higher than that issued by the conductor to himself, thus determining whether the ticket is one that has been picked up from the floor or one that has been held out from a previous settlement with the office.



Each Ticket Issued by the Conductor Bears Complete Data Printed on Its Face While the Same Information Is Listed on the Day's Record Inside the Machine

The No. 79 Ohmer ticket printing and auditing machine is made in four types as follows:

79-O—To record up to nine zones and with a maximum cash capacity of 99 cents.

79-A—To record up to 99 zones and $9.99.

79-B—To record up to 999 zones and $9.99.

79-C—To record up to 999 zones and $99.99.

Association News & Discussions

Iowa Railway Operators Convene

Interspersed with Shop Talks and More General Subjects Was the Annual Convention of the Operators' Section—Talks on Grand Rapids and an Actual Demonstration of Motor Bus Oil Dilution Were Features

WELL thought out papers and addresses followed by a lively discussion constituted the serious side of the two-day convention at Omaha of the Operators' Section of the Iowa Electric Railway Association held Nov. 17 and 18. The banquet on the evening of the first day was both of a serious and entertaining nature. Thorne Brown delivered an address that depicted the railway situation viewed from his recent years as railway commissioner of Nebraska. The entertainment following the address was produced by songs and other music by some of the talent known to the radio world through stations WOAW, Omaha, and WOC, Davenport.

The entire program was well up to the standard expected by Chairman John Sutherland. After "good" Mayor James Dahlman presented an address of welcome at the opening session, the meetings were turned over to regular business.

L. J. DeLamarter, president and general manager Grand Rapids Railway, Grand Rapids, Mich., prepared a paper which was read by J. W. Knecht, general superintendent of the same company. In this paper were set forth some of the facts of the recent Grand Rapids success with new cars. An abstract will appear in a future issue. Mr. Knecht added much information to show that increased revenue as well as reduced expenses have followed the steps of progress taken by the Grand Rapids company in recent years. On lines equipped with the 27 new cars recently purchased an increase in gross revenue of 2.93 per cent has been experienced as against a decrease of 1.22 per cent for the same period on lines having old cars. Total operating expenses for the property month by month since the new cars started have been reduced this year from last as shown in the table on page 972. -The results were analyzed to show that these reductions were obtained in maintenance, power, and other departments as well. Old cars average about 3.22 kw.-hr. as against 2.10 kw.-hr. per car-mile for the new cars. The first three sample cars weighed about 25,000 lb. each. The new lot of 27 weigh 29,500 lb. apiece.

In discussion Mr. Knecht spoke of the continued advertising done in papers, talks, special stunts and the company paper, *Trolley Topics*.

P. G. Swars, Westinghouse Electric & Manufacturing Company, in discussion stated that marked improvement could be made on many systems by closer attention to maintenance. In particular the noise arising from the overhead trolley could be reduced to the great advantage of the car operation. C. M. Feist, master mechanic Sioux City Service Company, told of a shock absorber that he had built for one of the Sioux City cars that has greatly improved its riding qualities.

Leonard C. Donohoe, chief clerk motor carrier department, Board of Railroad Commissioners of Iowa, in a paper on the regulation and development of motor carriers in Iowa, gave much data which present an excellent picture of the bus situation in Iowa from the standpoint of the railway commission.

The first Iowa motor carrier law was enacted by the 40th General Assembly and became effective on July 4, 1923. It lived less than two years, but during that time several changes were made that formed the background for the present law. This latter was passed by the 41st General Assembly and became effective on April 17, 1925, and is still in effect. It provides for the assessing of taxes and penalties against motor carriers and for the collection and distribution of them. The tax provided is 0.25 cent per ton-mile for vehicles equipped with pneumatic tires and 0.50 cent per ton-mile for motor vehicles equipped with solid tires. Although the rate of taxation as provided by the present law is twice the rate provided by the old law, the present law requires motor carriers to pay the tax only on the actual operations, whereas the old law, in providing the manner of assessing the tax against passenger motor carriers, provided that "In no event, however, shall the number of miles operated be considered as less than the number of miles required to be operated to maintain its filed schedules."

Twenty per cent of all moneys collected is for the use of the board in administering and enforcing the provisions of the law and the regulation of motor carriers, and 80 per cent of such moneys is allocated each month to the various counties in the proportion that the number of ton-miles of travel in the respective counties bears to the total number of ton-miles of travel within the state. The money allocated to the counties is for the use of the county boards of supervisors in maintaining and repairing the highways used by motor carriers.

The board is given power to fix or approve rates, fares, charges, classifications, and regulations pertaining thereto; to regulate and supervise the accounts, schedules, service and safety of operations of each motor carrier; to prescribe a uniform system and classification of accounts; to require the filing of annual and other reports, and to supervise and regulate motor carriers in all other matters affecting the relationship between such carriers and the traveling and shipping public.

It is also declared unlawful for any motor carrier to operate without first having obtained a certificate of convenience and necessity. Before such a certificate can be issued, the board is required to hold a public hearing and make a finding that the service proposed will promote the public convenience and necessity.

What the railway industry is doing to meet changed conditions was the subject discussed in a paper by E. W. Miller, general superintendent Des Moines City Railway. The several subjects discussed by Mr. Miller will be abstracted in a future issue. It was brought out that there had been a special wheel designed in Des Moines that would chip or scoop ice and snow that had become packed in the rail slots.

Standard for Pull-ins Needed

All through the meetings the question of pull-in records were discussed. The figures offered by different properties varied over a very wide range from 4,000-5,000 car-miles per pull-in up to 20,000 car-miles per pull-in reported by Des Moines. It was pointed out that no standard for pull-ins had ever been determined and hence relative figures meant nothing. Reference was made to figures reported this spring as high as 98,000 car-miles per pull-in for a Southern property.

Much valuable information pertaining to motor bus lubrication was given in a talk by Major Parker of the Standard Oil Company, who differentiated between "road" and "shop" troubles of lubrication. Most road troubles arise from excessive oil consumption, generally resulting in dilution of the crankcase oil.

Thinning out of oil becomes more noticeable with distance traveled and generally increases with improper combustion of the gasoline used; too rich a mixture, often caused by excessive use of choke; operation at too cool a temperature; and poor fuel having too large a component that will not vaporize below 450 deg. F. Engines operate most efficiently at about 180 deg. temperature of cooling water and should never be allowed to drop below 130 deg. Less dilution will result in operation at temperatures near 180 deg. than at lower points.

Major Parker demonstrated the Sleigh dilution testing method. From a 100-c.c. sample of oil removed from a motor truck after 800 miles of running about 15 c.c. of gasoline was removed, after heating and condensing the gas boiled off. Then by mixing

Digitized by Google

some Fuller's earth with the remaining oil the mass was filtered and clear oil was recovered.

ELECTRIC RAILWAYS FROM THE ECONOMIC STANDPOINT

Thorne Brown faced frankly the electric railway situation as he sees it in relation to other utilities. For years he has been on the Nebraska State Railway Commission and for a considerable part of this time its chairman. At present Mr. Brown is industrial commissioner of the Omaha Chamber of Commerce.

The telephone industry, according to Mr. Brown, is the only natural monopoly, as every user adds to the potential service possible to every other user. The telephone service does not begin to cost what it is worth. Likewise the gas rates of $1.10 to $1.25 per thousand cubic feet are not up to what the traffic will bear. The electric light and power companies have always had potential competition in the formation of public or municipally-owned systems, and fortunately because of the growth of this industry it has been possible to offset the dwindling purchasing power of a dollar.

Electric railways, however, are facing the ever-increasing use of private transportation and are, according to the speaker, a semi-decadent and semi-obsolete business. With the exchequer constantly decreasing it becomes economically impossible to increase fares to offset the declining net revenues. The reason for this seems beyond the control of operators since they cannot cut overhead to a great extent and likewise cannot reduce the service.

While the parking problem and street congestion in cities of 500,000 population and over seem to have checked the dwindling revenues to some extent, this is not true of smaller communities. The picking up habit of many drivers in small cities is not a hostile act against the railways.

Mr. Brown stated that the transportation system of cities was necessary and that in his opinion buses were not the answer. The facts boiled down to the statement that the railways had not successfully sold their service. They have not reached rates as yet to equal the value of the service, but an economic limit apparently exists beyond which increased rates will not produce proportionate increased revenue.

City fathers have generally failed to grasp the situation and still insist on unreasonable taxes and burdens for no reason except that they once existed.

Reluctantly Mr. Brown advanced a theory that public ownership was the solution, not because he favors government operation, but only through that channel can municipal authorities be brought to realize the problems of the transportation companies. He states frankly that poorer service will ensue, less courtesy will be shown under municipal operation; but this is the price that the public will have to pay for the apparent inability to create conditions of fairness and common sense that will permit private capital to continue to finance and operate city transportation.

At the outset Mr. Brown said he would not give a frivolous address, since he saw no frivolity in the business. It takes courage to operate a railway today. A railway operator is like a farmer in many respects, but even the farmer has the sympathy of the people.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Dec. 2-3—Highway Research Board—Division Engineering and Industrial Research, annual meeting. National Academy of Sciences—National Research Council Building, Washington, D. C.

Dec. 3—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.

Dec. 6-9—American Society of Mechanical Engineers, annual meeting, New York City, Engineering Societies Building.

Jan. 6-7—Midwest Electric Railway Association, midwinter meeting, Mayo Hotel, Tulsa, Okla.

Jan. 10-14—American Road Builders' Association, convention and road show, Coliseum, Chicago, Ill.

Jan. 25—New York Electric Railway Association, winter meeting. Hotel Commodore, New York City.

Jan. 26-28—Association of Equipment Men—Southern Properties—Memphis, Tenn.

Feb. 3-4—Central Electric Railway Association, winter meeting, Toledo, O., Commodore Perry Hotel.

STOREKEEPER PLAYS IMPORTANT PART

Frank McDonald, superintendent of purchases Waterloo, Cedar Falls & Northern Railway, gave an excellent analysis of the good that can arise from proper co-operation between department heads and the purchasing agent. Extensive work planned by the company should be brought to the purchasing agent's attention so that he may have adequate time to locate proper materials and wisely to plan their purchase. The purchasing agent who buys on price without regard to quality or the use to which the materials will be put does an injustice to his company and the manufacturer as well.

When materials require extensive labor in their installation it oftentimes proves more economical to use a high grade of material when longer life can be obtained.

According to John Duncan, master mechanic of the Fort Dodge, Des Moines & Southern Railroad, his is one of three roads in Iowa to be living up to the rules of the bureau of locomotive inspection. The bureau requires very rigid inspection of air-brake equipment.

Frosting of windows in the locomotive cabs has been troublesome in winter. This difficulty has been corrected by allowing air to blow against the inside of the window through a small 1/64 in. opening. This small current of air prevents frost forming and likewise sleet or snow and is even successful in breaking up large drops of rain so that a clear vision is obtained.

William G. Brooks, Westinghouse Electric & Manufacturing Company, decried the practice of manufacturing carried on in many repair shops. He advised the use of labor-saving tools and equipment such as bearing presses, car-body jacks and chucks designed for centering bearings. Mr. Brooks called attention to the fact that maintaining is 30 per cent material and 70 per cent labor and that it made for far greater success to perform more work in the maintenance shop than to wait until the equipment broke down and went to the repair shop. He commented favorably on the maintenance methods of the Omaha & Council Bluffs Street Railway and stated that it was maintaining cars for 2.23 cents, whereas the average for twenty roads of similar size has been reported as 3.78 cents per car-mile.

Unfortunately Henry Cordell, master mechanic Chicago, North Shore & Milwaukee Railroad, because of sickness, was unable to attend the meeting and deliver the paper for which he was scheduled.

The meetings were attended by 101 delegates and several guests. Fifty-three of the delegates were operating men from the Iowa and Nebraska properties and 48 were manufacturers' representatives.

Maurice Welch, superintendent and traffic manager Waterloo, Cedar Falls & Northern Railway, was named chairman of the executive committee, with directors as follows: R. W. Herrick, superintendent Sioux City Service Company; F. S. Welty, assistant general manager Omaha & Council Bluffs Street Railway; E. W. Miller, superintendent of transportation Des Moines City Railway; A. H. Smith, Dubuque Electric Company. Manufacturing representatives on the executive committees are: W. F. Weil, sales representative American Brake Shoe & Foundry Company, Chicago; H. R. Sampson, district sales manager Ohio Brass Company, Chicago; K. A. Hills, manager Davenport office General Electric Company; G. J. Hart, sales engineer Westinghouse Electric & Manufacturing Company, Des Moines.

John Sutherland, master mechanic Tri-City Railway, was re-elected for his fourth term as chairman of the convention.

SAVINGS IN OPERATING COST WITH NEW CARS ON GRAND RAPIDS RAILWAY

	Reduction, 1926 below 1925			
	July	August	September	October
Maintenance	$1,474	$2,784	$5,883	$4,881
Power	767	1,102	1,217	1,480
Total operating saving	4,295	9,143	10,046	13,450

Midwest Annual Meeting in Tulsa Jan. 6-7

DATES for the midwinter meeting of the Midwest Electric Railway Association have been set for Jan. 6 and 7 by the executive committee. The meeting will be held at the Mayo Hotel, Tulsa, Okla. The banquet will be on Thursday evening, the first day of the meeting.

Digitized by Google

New York Railroad Club Holds Electrical Night

ELECTION of officers and other business of the annual meeting of the New York Railroad Club was taken care of Friday night, Nov. 19, in connection with the club's electrical night. The general topic for discussion was "The Relation of Transportation to Electrical Development." W. S. Jones, president of the club, presided and the subject was discussed from different viewpoints by F. Darlington, assistant vice-president Westinghouse Electric & Manufacturing Company, by J. P. Jackson, assistant vice-president New York Edison Company, and by J. C. Parker, vice-president in charge of engineering Brooklyn Edison Company.

Motion pictures furnished by the General Electric Company were presented to illustrate the various stages of manufacture of Mazda lamps and to illustrate what a single drop of water contains.

The new officers elected were: President, William G. Gove, superintendent of equipment Brooklyn-Manhattan Transit Corporation; first vice-president, Eliot Sumner, superintendent of motive power Pennsylvania Railroad System; second vice-president, George Le Boutillier, vice-president Long Island Railroad; third vice-president, J. M. Davis, president Lackawanna Railroad; treasurer, David W. Pye, president Tuco Products Corporation; executive member for three years, Colonel Charles Hine, consulting railroad expert, New York City; member of finance committee for three years, George T. Cooke, president American Railway Products Company; Arthur N. Dugan, vice-president Bronze Metal Company, was elected to fill out the unexpired one-year term of John T. Neff, who resigned as a member of the finance committee.

Industry Organizes for Corporation Tax Relief

REPRESENTATIVES from a large number of national manufacturing, transportation and commercial organizations in various lines of industry met in conference in Washington, D. C., on Nov. 10 to consider the formulation of a definite program for corporate tax relief to be requested of the incoming Congress. This conference was called by a committee on tax co-operation composed of the following: James A. Emery, counsel National Association of Manufacturers, chairman; R. P. Hazzard representing National Association of Boot and Shoe Manufacturers, James Craig Peacock representing American Cotton Manufacturers Association, Harry L. Gandy of the National Coal Association, William S. Bennet representing the National Lumber Manufacturers' Association, McKinley W. Kriegh of the American Mining Congress, and Fayette B. Dow of the National Petroleum Association. C. S. Duncan, economist Association of Railway Executives, was also added to the permanent committee organization to represent the transportation industry. Leslie Vickers, economist, attended the conference for the electric railway industry.

A presentation of the history and facts of corporate income taxation was made by James A. Emery, Counsel National Association of Manufacturers, who was elected chairman of the conference. By invitation, the under-secretary of the Treasury, Garrard B. Winston, made an informal statement of the Treasury viewpoint on taxation.

Thereafter the session was devoted to a discussion of corporate tax relief in the light of existing information and the conditions to be anticipated in a short session of the Congress. On motion of William Bennet of Chicago the following declaration was adopted:

That the present corporation income tax rate represents an invidious and inequitable discrimination against that form of business as distinguished from the individual and the partnership. The rate has been increased where all other rates have been reduced. The chairman is directed, on behalf of the conference and all co-operating associations:

1. To petition the ways and means committee for a public hearing before the meeting of Congress on the subject of corporate income tax relief.
2. That Congress be urged to repeal in the short session:
   (a) The additional one-half of 1 per cent levied on corporate income and becoming effective in the calendar year 1926.
   (b) Repeal the additional one-half of 1 per cent made effective for the calendar year 1925, since, from the public statement of the Treasury, one-half of 1 per cent additional for 1925 is unnecessary and the additional revenue to be derived from the further one-half of 1 per cent in 1926 will not be required.
3. That, in addition to this obviously justified permanent relief, Congress be asked to afford such further temporary and permanent relief as the fiscal circumstance of the Treasury may justify.
4. That the conference, through its executive committee, present to the joint congressional tax committee created by the revenue act of 1926 further proposals for reform of the present inequitable system of corporate taxation.

The conference requested the present National Committee on Tax Co-operation to become a permanent committee and act as the executive committee for the execution of the policies of the conference. That committee was further directed to extend an invitation to all interested organizations to join in the execution of the policy adopted.

Automotive and Rail Men Stage Transportation Meeting

Co-ordination of Highway Freight and Passenger Traffic with Existing Rail Carriers Discussed—Design and Maintenance Problems Receive Attention

SUBJECTS of common interest to rail and highway transportation men occupied the attention of approximately 400 members and guests of the Society of Automotive Engineers at its National Transportation and Service meeting held in Boston Nov. 16-18. A full program of papers covering in general the subjects of terminal freight handling, use of containers, co-ordination of rail and highway traffic, and including a discussion of design and maintenance problems incident to the development and operation of both freight and passenger highway vehicles, occupied attention during the meetings.

A resolution was adopted recognizing the necessity of general agreement by transportation men on the fundamentals of the relationship between highway and rail transport facilities. To define these fundamentals a joint committee was proposed, consisting of representatives from the Society of Automotive Engineers, the National Automobile Chamber of Commerce and the Railroad Motor Transport Conference.

Exception to the popular conception of the term co-ordination was taken by Prof. Lloyd Wilson of the Wharton School of Finance and Commerce, Philadelphia. There is no valid basis, his paper held, for the current belief that co-ordination involves the ownership or domination of the motor by the older instrumentalities of transportation—the steam and electric rail lines.

Practical features of bus operation were outlined by Arthur P. Russell, president New England Transportation Company. In working out its policy of protecting the passenger business of the New York, New Haven & Hartford Railroad, the bus business has been built up until the present total of rail-bus traffic equals that carried on the rails in 1923 plus the normal expectation of increase. Mr. Russell said that about 265,000 passengers were now being carried each month, and 475,000 bus-miles operated. The cost of operation averages 29 to 30 cents a mile for the first nine months of this year. For maintenance about 10 cents a mile is spent, and for tires, 1.5 cents a mile. Fuel consumption is 5.7 miles to the gallon, and 56 miles is obtained to the quart of oil. These figures are for a fleet of 168 buses, all parlor cars except 27, which are semi-de luxe type.

The development of motor transport was compared with that of the steam railroads in the main banquet address, made by Prof. W. J. Cunningham, now of the Harvard School of Business Administration, but formerly an active railroad official. He urged as an essential of co-ordination a statesmanlike attitude by both automotive and rail groups, with a subordination of their private interest to those of the public. The competition of the motor vehicle was a healthy tonic, which has led the railroads to improve their service and equipment. Professor Cunningham said the bus operation of the Boston & Maine, New York, New Haven & Hartford, and the Great Northern Railroads was a move in the right direction. He believed the rails should take over bus service in their territory, under wise regulation.

Control of interstate motor carriers was discussed by Hon. David I. Walsh, recently elected to the United States Senate from Massachusetts. If convinced of its necessity, he promised to work for fair legislation. He pledged himself to promote the extension of the federal highway system and to help in removing the 3 per cent excise tax on automobiles which has hung over from the recent war.

Digitized by Google

Standardization on one type of bus for each class of service was recommended in a paper by G. T. Seeley, general manager Chicago Motor Coach Company, which in his absence was presented by F. C. Horner of the General Motors Corporation. Non-standardization has a far-reaching effect, according to Mr. Seeley's paper. Not only costs of maintenance and operation, but efficiency of maintenance, efficiency in service rendered and passenger revenue are influenced when many different makes are used. In discussing this paper the possibilities of a small bus, ten to fifteen passengers capacity, were brought out by C. D. Smith, general manager Beaver Valley Traction Company. This could be operated at an adequate fare to give private automobile comfort and make house-to-house solicitation of passengers. Edward F. Loomis, National Automobile Chamber of Commerce, disagreed with a statement by Mr. Seeley that at present there are few locations in which new bus installations can be made. There are many opportunities in the South as more good roads are built, also on routes where rail service is too expensive. Very few cities have given an intelligent trial to bus transportation and many more vehicles can be used as its place is better appreciated.

New Officers for Pennsylvania Association

AT A MEETING of the executive committee of the Pennsylvania Street Railway Association held in Philadelphia on Nov. 19, the resignations of Frank Phillips as president and William Bell as vice-president were received and accepted. To fill the vacancies thus created new officers were elected, as follows:

President, Jilson J. Coleman, vice-president and general manager Scranton Railway; vice-president, H. L. Mitchell, vice-president West Penn Railways; members of executive committee, T. Fitzgerald, vice-president Pittsburgh Railways, and H. F. Dicke, vice-president Lehigh Valley Transit Company.

Safety Council Elects Officers

MORE than 5,000 people drawn from twenty industries attended the fifteenth annual congress of the National Safety Council, held in Detroit Oct. 25 to 29. The electric railway section was represented by a large delegation. Many constructive methods were suggested and plans for future activities formulated. The following men were elected to hold office in the electric railway section during the ensuing business year:

Chairman, R. W. Emerson, vice-president general manager Cleveland Railway.

First vice-chairman, in charge of motor bus operation, A. W. Koehler, superintendent of accident prevention the Milwaukee Electric Railway & Light Company.

Second vice-chairman, in charge of interurban transportation problems, H. K. Bennett, safety manager United Electric Railways, Providence, R. I.

Third vice-chairman, in charge of urban transportation problems, E. K. Eastham, safety director United Railways of St. Louis, St. Louis, Mo.

Secretary, J. J. Connors, safety director Georgia Railway & Power Company, Atlanta, Ga.

American Association News

Cleveland Gets 1927 Convention

American Electric Railway Association Executive Committee Votes Unanimously to Return to Cleveland—Adequate Car Exhibit Considered of Vital Importance to Industry

BY UNANIMOUS vote, the executive committee of the American Electric Railway Association decided to return to Cleveland for the 1927 convention, provided satisfactory arrangements can be made with the Cleveland convention committee. The date was fixed for the week of Oct. 3-7. This action followed a report made by H. B. Potter, chairman of the committee on convention location, after a careful study had been made of the facilities offered by Atlantic City and Cleveland.

The advantages offered by Cleveland from the standpoint of insuring an adequate and representative car exhibit were a large factor in this decision on convention location. The opinion was strongly expressed that a large and representative car exhibit is of utmost importance to the industry at this time and overshadows any other single element in determining the location for next year's meeting. Both the executive committee and the location committee made their decision after a very exhaustive study of the situation. J. H. Alexander, president Cleveland Railway and also chairman of the Cleveland convention committee, was invited to appear before the executive committee to explain the additional facilities that would be made available at Cleveland for the coming year. He explained that a new north wing is to be added to the Cleveland Auditorium. This will be an addition to the main auditorium building, and will be equipped with meeting rooms of various sizes, sufficient to handle all of the meetings during the convention. Entrance to this new wing will be by the grand staircase leading down from the arena floor so that exhibit space in the exhibit hall below will thereby be made more desirable. Construction of the new wing will permit taking the American Association meeting room out of the west wing, where the bus exhibit was held. It is also expected that the west wing itself will be further enlarged.

New Hotel Buildings to Be Available

Three new hotel buildings are expected to be available before next October. These consist of an addition to the Hollenden, and the new Allerton and Auditorium Hotels. The latter will be located directly across the street from the Public Auditorium. Arrangements have also been made by the Cleveland convention committee to provide improved telephone facilities and a more satisfactory arrangement for hotel room reservations than was carried out this year.

Lack of proper facilities for adequately displaying electric railway cars at Atlantic City was one of the conditions which militated against that location for the next convention.

President Sawyer announced for the Charles A. Coffin prize committee that the award will be continued for 1927 and details of the competition announced at an early date. He reported a strong desire on the part of the committee in favor of recognition of more than one company by the Coffin award. The American Electric Railway Association committee is to meet with a similar committee of the National Electric Light Association and representatives of the Coffin Foundation to discuss this subject. The executive committee adopted a motion recommending that recognition be extended to more than one company in future contests.

J. N. Shannahan, national councillor representing the association on the United States Chamber of Commerce, strongly recommended an affirmative vote by the association on the various questions in Referendum No. 49 of the United States chamber on its taxation program. The secretary was instructed to communicate with electric railway member companies to urge that they use their influence in local chambers of commerce to assure affirmative votes on the questions in this referendum.

Management and Operation Committee to Broaden Functions

A letter from George H. Clifford regarding the work of the committee on management and operation was discussed. Mr. Clifford made certain suggestions for broadening the scope of this committee's activities, which received the hearty approval of the executive committee. It was decided to request Mr. Clifford to present his ideas personally to the Advisory Council at its next meeting in order that the cooperation of that body may be enlisted in working out the program suggested.

Leslie Vickers, reporting on the subject of taxation, announced that this committee is scheduled to hold a meeting on Dec. 10 at association headquarters. An advisory group of 40 members has been appointed to maintain contact with the progress of taxation legislation in various states. Mr. Vickers pointed out that local and state taxation are the primary points of attack for the committee since national taxation is a minor element in the load carried by electric railways. Mr Vickers also gave a brief outline of the activities of the National Association of Manufacturers, which held a meeting recently in Washington to organize a

Digitized by Google

program for placing the subject of corporation tax relief before the ways and means committee in the coming session of Congress.

MANUFACTURERS PLAN BROADER CO-OPERATION

For the committee on co-operation of manufacturers, M. B. Lambert, vice-chairman, reported in the absence of Mr. Wickwire. Tentative plans contemplate broadening the scope of this committee's activities to include promotion of the development of electric railway cars and the stimulation of interest on the part of the industry in the advantages of modernized equipment. The committee also plans broadening its work so as to reflect more clearly the collective views of the manufacturers as a whole regarding current subjects before the industry.

Although the personnel of all committees has not been completed, a list of chairmen of the principal American Association committees was announced. The list, together with the tentative committee personnel of American and affiliated associations, is published later on this and following pages.

The next meeting was set for Friday afternoon, Feb. 4, in Toledo, Ohio, at the time of the annual meeting of the Central Electric Railway Association. Those present at the meeting included the following members and guests:

President, W. H. Sawyer, J. P. Barnes, J. H. Hanna, Barron Collier, E. P. Waller, M. B. Lambert, T. W. Casey, L. E. Lippitt, C. B. Proctor, H. L. Brown, S. J. Cotsworth, E. B. Meissner, G. A. Richardson, C. E. Morgan, B. A. Hegeman, Jr., Harry Reid, Thomas Finigan, C. R. Ellicott, T. A. Kenney, Edward Dana (representing J. V. Sullivan), J. W. Welsh, C. L. Henry, C. D. Emmons, J. N. Shannahan, F. R. Coates, J. H. Alexander, Thomas Langan, Charles Gordon, H. B. Potter, H. V. Bozell, Leslie Vickers, F. C. J. Dell, G. C. Hecker, J. W. Colton, Labert St. Clair.

Committee Appointments Announced

American and Affiliated Associations Make Selections for Handling the Work During Coming Year—Additional Appointments Will Be Announced Later

ORGANIZATION of committees of American Electric Railway Association and the affiliated Accountants', Claims, Engineering and Transportation & Traffic Associations is progressing rapidly. The Engineering Association committees are virtually all completed, save for a few acceptances which have not yet been received. Several of the American Association committees are complete and have organized, while invitations for the remainder are still being sent out. The same is true of the other associations.

A list of the committee members who have been chosen and who have accepted their appointments is given below. As indicated, in a number of instances additional appointments may be announced. More complete lists will published as the information becomes available.

American Association

CHARLES A. COFFIN PRIZE

W. H. Sawyer, president American Electric Railway Association, care of East St. Louis & Suburban Railway, East St. Louis, Ill., chairman.
James H. McGraw, New York, N. Y.
R. P. Stevens, New York, N. Y.

CONVENTION LOCATION

H. B. Potter, general manager United Railways & Electric Company, Baltimore, Md., chairman.
C. E. Morgan, New York, N. Y.
J. H. Alexander, Cleveland, Ohio.
G. B. Anderson, Los Angeles, Cal.
F. G. Buffe, Kansas City, Mo.
G. H. Clifford, Houston, Tex.
Edward Dana, Boston, Mass.
B. J. Fallon, Chicago, Ill.
H. B. Flowers, New Orleans, La.
Charles Gordon, New York, N. Y.
J. P. Griffin, Dallas, Tex.
D. W. Harvey, Toronto, Ont.
C. S. Hawley, Albany, N. Y.
A. L. Kasemeier, Winton Place, Ohio.
H. J. Kenfield, Chicago, Ill.
G. L. Kippenberger, St. Louis, Mo.
S. P. McGough, Chicago, Ill.
J. C. McQuiston, East Pittsburgh, Pa.
A. L. Price, Mansfield, Ohio.
A. J. Purinton, Atlantic City, N. J.
J. A. Ritchie, Chicago, Ill.
A. M. Robinson, Philadelphia, Pa.
L. W. Shugg, Schenectady, N. Y.
D. W. Snyder, Jr., Springfield, Ill.
S. B. Way, Milwaukee, Wis.
E. A. West, Salt Lake City, Utah.
Walter White, Cleveland, Ohio.

CO-OPERATION WITH MANUFACTURERS

E. F. Wickwire, vice-president Ohio Brass Company, Mansfield, Ohio, chairman.
M. B. Lambert, New York, N. Y., vice-chairman.
W. H. Boyce, Pittsburgh, Pa.
H. B. Doyle, New York, N. Y.
H. J. Kenfield, Chicago, Ill.
E. B. Meissner, St. Louis, Mo.
G. R. Rowland, New York, N. Y.
J. P. Sloan, New York, N. Y.
L. F. Stoll, New York, N. Y.
E. P. Waller, Schenectady, N. Y.

CO-OPERATION WITH MOTOR VEHICLE INDUSTRY

Lucius S. Storrs, managing director American Electric Railway Association, New York, N. Y., chairman.
R. P. Stevens, New York, N. Y., vice-chairman.
A. W. Brady, Anderson, Ind.
C. D. Emmons, Baltimore, Md.
E. W. Wakelee, Newark, N. J.

CO-OPERATION WITH STATE AND SECTIONAL ASSOCIATIONS

F. R. Coates, Henry L. Doherty & Company, New York., N. Y., chairman.
Complete personnel to be announced later.

DEPRECIATION

J. H. Hanna, president Capital Traction Company, Washington, D. C., chairman.
L. R. Nash, Boston, Mass., vice-chairman.
A. W. Brady, Anderson, Ind.
William Chamberlain, Cedar Rapids, Iowa.
F. W. Doolittle, New York, N. Y.
W. F. Ham, Washington, D. C.
A. S. Richey, Worcester, Mass.
C. E. Thompson, Highwood, Ill.

EDUCATION

Edward Dana, general manager Boston Elevated Railway, Boston, Mass., chairman.
J. S. Hyatt, Chicago, Ill., vice-chairman.
H. H. Adams, Chicago, Ill.
G. B. Anderson, Los Angeles, Cal.
A. H. Armstrong, Schenectady, N. Y.
W. H. Boyce, Pittsburgh, Pa.
W. H. Burke, Fort Worth, Tex.
J. A. Dewhurst, New York, N. Y.
M. B. Lambert, New York, N. Y.
R. J. Lockwood, St. Louis, Mo.
M. McCants, San Francisco, Cal.
F. H. Miller, Louisville, Ky.
H. H. Norris, Boston, Mass.
A. J. Rowland, Milwaukee, Wis.

FINANCE*

C. E. Morgan, vice-president and general manager Brooklyn City Railroad, Brooklyn, N. Y., chairman.
B. A. Hegeman, Jr., New York, N. Y., vice-chairman.
F. W. Doolittle, New York, N. Y.
T. A. Kenney, New York, N. Y.
*Personnel not complete.

HOOVER CONFERENCE

J. P. Barnes, president Louisville Railway, Chairman.
Complete personnel to be announced later.

INSURANCE*

P. E. Wilson, vice-president and secretary Cleveland Railway, Cleveland, Ohio, chairman.
H. B. Potter, Baltimore, Md., vice-chairman.
O. H. Bernd, Des Moines, Iowa.
A. C. Blinn, Akron, Ohio.
G. H. Bourne, New York, N. Y.
C. E. Brown, Napa, Cal.
W. C. Campbell, Chattanooga, Tenn.
N. H. Daniels, Boston, Mass.
F. M. Hamilton, Chicago, Ill.
A. D. Knox, New Haven, Conn.
F. H. Miller, Louisville, Ky.
J. H. Moran, Boston, Mass.
A. B. Paterson, New Orleans, La.
B. L. Tomes, Philadelphia, Pa.
F. J. Petura, New York, N. Y.
E. A. West, Salt Lake City, Utah.
*Personnel not complete.

MANAGEMENT AND OPERATION

G. H. Clifford, Southwestern district manager Stone & Webster, Houston, Tex., chairman.
Complete personnel to be announced later.

MEMBERSHIP

C. R. Ellicott, Eastern manager Westinghouse Traction Brake Company, New York, N. Y., chairman.
Complete personnel to be announced later.

MOTOR BUS DEPRECIATION

L. H. Palmer, vice-president and general manager Fifth Avenue Coach Company, New York, N. Y., chairman.
R. H. Pinkley, Milwaukee, Wis., vice-chairman.
M. W. Glover, Pittsburgh, Pa.
F. C. Horner, New York, N. Y.

Paul Shoup, San Francisco, Cal.
R. P. Stevens, New York, N. Y.

SUBJECTS AND MEETINGS

H. L. Brown, secretary the Ohio Brass Company, Mansfield, Ohio, chairman.

Complete personnel to be announced later.

TAXATION

A. T. Davison, general counsel Third Avenue Railway System, New York, N. Y., chairman.
E. W. Wakelee, Newark, N. J., vice-chairman.
C. H. Allen, Chicago, Ill.
H. L. Geisse, Wausau, Wis.
J. P. Griffin, Dallas, Tex.
W. A. Jackson, Milwaukee, Wis.
D. J. Hennessey, Pittsburgh, Pa.
H. A. Mitchell, Oakland, Cal.
L. R. Nash, Boston, Mass.
B. J. Strouse, Minneapolis, Minn.
C. L. S. Tingley, New York, N. Y.
A. C. Watt, New York, N. Y.
P. E. Wilson, Cleveland, Ohio.

Representatives of the Association on Other National Organizations

AMERICAN COMMITTEE ON INDUCTIVE CO-ORDINATION

R. P. Stevens, president Penn-Ohio Edison Company, New York, N. Y., chairman.

Complete personnel to be announced later.

NATIONAL INDUSTRIAL CONFERENCE BOARD

F. R. Coates, Henry L. Doherty & Company, New York, N. Y.
J. N. Shannahan, care of Old Dominion Land Company, Newport News, Va.

UNITED STATES CHAMBER OF COMMERCE

J. N. Shannahan, care of Old Dominion Land Company, Newport News, Va., national councillor.
J. H. Hanna, president the Capital Traction Company, Washington, D. C., substitute national councillor.

Accountants' Association

Complete personnel of all committees in this association to be announced later.

BUS ACCOUNTING

M. W. Glover, general auditor West Penn Railways, Pittsburgh, Pa., chairman.

CONVENTION PROGRAM

E. H. Reed, auditor Brooklyn City Railroad, Brooklyn, N. Y., chairman.

ENGINEERING ACCOUNTING

T. B. McRae, general auditor Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., co-chairman.

FARE COLLECTION

E. A. Tuson, general auditor Public Service Railway, Newark, N. J., chairman.

FREIGHT ACCOUNTING

O. H. Bernd, secretary Des Moines City Railway, Des Moines, Iowa, chairman.

REVIEW OF PROCEEDINGS

J. E. Heberle, secretary Capital Traction Company, Washington, D. C., chairman.

STANDARD CLASSIFICATION OF ACCOUNTS

M. W. Glover, general auditor West Penn Railways, Pittsburgh, Pa., chairman.

STORES ACCOUNTING

Claims Association

BONUS AND AWARD SYSTEM

G. T. Hellmuth, general claims attorney Chicago, North Shore & Milwaukee Railroad, Chicago, Ill., chairman.
B. D. Haskins, Chattanooga, Tenn.
A. W. Koehler, Milwaukee, Wis.

MEDICAL AND SURGICAL WORK

Personnel of this committee to be announced later.

EMPLOYMENT

Personnel of this committee to be announced later.

JOINT COMMITTEE ON TRAFFIC AND SAFETY*

H. K. Bennett, safety manager United Electric Railways, Providence, R. I., co-chairman.
Seth Baldwin, New Haven, Conn.
A. G. Jack, Wilmington, Del.
V. T. Noonan, Chicago, Ill.
E. J. Paige, Baltimore, Md.
J. J. Reynolds, Boston, Mass.
J. J. Sharkey, Rochester, N. Y.
R. A. Sears, Boston, Mass., sponsor.
*Personnel not complete.

Engineering Association

ENGINEERING SYMBOLS

Co-operate with association's representatives on the A.E.S.C. sectional committee on engineering symbols and abbreviations.

H. W. Codding, assistant engineer Public Service Production Company, Newark, N. J., chairman.
G. H. Haldeman, Newark, N. J.
J. D. Kent, New York, N. Y.
W. J. Quinn, New York, N. Y.
C. W. Squier, New York, N. Y.

PURCHASES AND STORES

1. Review existing purchases and stores sections of the Manual for revisions and corrections.
2. Continue study of and make recommendations regarding the disposal of unused inactive material.
3. Make a further study of routine methods to be followed in the purchases and

Digitized by Google

stores departments recommending that a report be made on a uniform method of distributing materials by supply trains or trucks.

4. Recommend that a uniform practice of testing or inspecting materials be adopted by testing or inspecting materials on receipt or at factory.

J. Fleming, assistant secretary and purchasing agent the Capital Traction Company, Washington, D. C., chairman.
J. Y. Bayliss, Richmond, Va.
A. S. Duncan, East Pittsburgh, Pa.
A. L. Fischer, Cincinnati, Ohio.
B. W. Forkner, Mansfield, Ohio.
A. E. Hatton, Pittsburgh, Pa.
F. A. Jordan, Atlanta, Ga.
P. F. McCall, Highwood, Ill.
T. H. McGarry, Boston, Mass.
A. A. Ordway, Boston, Mass.
W. E. Scott, Philadelphia, Pa.
C. Thorburn, Los Angeles, Cal.
W. J. Walker, Schenectady, N. Y.
P. V. C. See, Akron, Ohio, sponsor.

POWER TRANSMISSION AND DISTRIBUTION

1. Review existing Manual sections; in particular keep in touch with the work of the A.E.S.C. sectional committees on the National Electrical Safety Code and on overhead line materials.
2. Continue the study of specifications for material for catenary construction.
3. Continue study of trolley wire wear and breaks.
4. Continue to confer with the A.S.T.M. in an effort to improve the specification for bronze trolley wire.
5. Continue the investigation of radio interference.
6. Continue the study of inductive coordination.
7. Study the proper design of the distribution layout for automatic substations.
8. Consider the advisability and possibility of establishing a standard by which various methods of operating and maintaining overhead lines may be compared.
9. Study subject of standardization of trolley wire reels.

F. McVittie, electrical engineer New York State Railways, Rochester, N. Y., chairman.
J. W. Allen, Boston, Mass.
S. H. Anderson, Los Angeles, Cal.
W. H. Bassett, Waterbury, Conn.
M. W. Cooke, Pittsburgh, Pa.
J. H. Drew, Mansfield, Ohio.
D. D. Ewing, Lafayette, Ind.
C. L. Hancock, New York, N. Y.
S. S. Hertz, New York, N. Y.
K. J. Keith, Des Moines, Iowa.
A. J. Klatte, Chicago, Ill.
John Leisenring, Springfield, Ill.
H. S. Murphy, Philadelphia, Pa.
J. F. Neild, Toronto, Ont.
W. J. Quinn, New York, N. Y.
M. B. Rosevear, Camden, N. J.
W. Schaake, East Pittsburgh, Pa.
A. Schlesinger, Indianapolis, Ind.
D. L. Smith, Chicago, Ill.
R. E. Wade, Schenectady, N. Y.
G. F. Wennagel, Baltimore, Md.
C. H. Jones, Michigan City, Ind., sponsor.

HEAVY ELECTRIC TRACTION

1. Review existing Manual sections.
2. Continue study of track and third rail bonds.
3. Bibliography of heavy electric traction and electrification data; bring up to date if publication is approved.
4. Continue study and collection of data on branch line electrification and self-propelled cars.
5. Continue study of train operation with particular reference to articulated trains.
6. Study train make-up and terminal switching with multiple-unit cars.

H. F. Brown, assistant electrical engineer New York, New Haven & Hartford Railroad, New Haven, Conn., chairman.
A. H. Armstrong, Schenectady, N. Y.
J. M. Bosenbury, Springfield, Ill., vice-chairman.
Morris Buck, New York, N. Y.
H. W. Cope, East Pittsburgh, Pa.
A. H. Daus, Chicago, Ill.
J. C. Davidson, Schenectady, N. Y.
J. H. Davis, Baltimore, Md.
J. V. B. Duer, Altoona, Pa.
J. T. Hamilton, New York, N. Y.
E. C. Johnson, Los Angeles, Cal.
J. O. Madison, New York, N. Y.
M. W. Manz, Mansfield, Ohio.
L. S. Wells, New York, N. Y.
A. H. Woollen, Chicago, Ill.
F. H. Miller, Louisville, Ky., sponsor.

ENGINEERING ACCOUNTING

Review the standard classification of accounts for electric railways and make such suggestions for changes as seem desirable to the committee on standard classification of accounts of the Accountants' Association.

E. D. Dreyfus, advisory engineer West Penn Railways, Pittsburgh, Pa., chairman.
E. J. Dickson, Providence, R. I.
C. R. Harte, New Haven, Conn.
R. B. Rifenberick, Detroit, Mich.

UNIFICATION OF CAR DESIGN

Study report of committee on essential features of modern cars and review comments on that report with the view of continuing the work of that committee.

H. H. Adams, superintendent of shops and equipment Chicago Surface Lines, Chicago, Ill., chairman.
Complete personnel of this committee to be announced later.

WOOD PRESERVATION

1. Review existing Manual sections for revision and correction.
2. Study of treatment of poles and timber in place.
3. Study actual economies obtained by operating utilities through the use of treated timbers.
4. Study methods and forms of keeping continuous records of treated timber.
5. Study wood preservatives other than creosote and zinc chloride.

C. A. Smith, superintendent of roadway, Georgia Railway & Power Company, Atlanta, Ga., chairman.
M. J. Curtin, Charlestown, Mass.
T. H. David, Indianapolis, Ind.
J. L. Fritsch, Pittsburgh, Pa.
W. H. Fulweiler, Philadelphia, Pa.
E. F. Hartmen, Kenilworth, N. J.
W. L. Harwood, Springfield, Mass.
L. P. Scanlan, Newark, N. J.
F. H. Swayze, New York, N. Y.
A. P. Way, Philadelphia, Pa.
R. H. White, Jr., Atlanta, Ga.
W. F. Graves, Indianapolis, Ind., sponsor.

POWER GENERATION AND CONVERSION

1. Review existing Manual sections.
2. Continue study of ventilation of automatic substations.
3. Continue study of mercury arc power rectifiers.
4. Economical trolley potential to be supplied for congested districts of urban systems.

W. E. Bryan, superintendent of power United Railways of St. Louis, St. Louis, Mo., chairman.
C. E. Bennett, Atlanta, Ga.
C. A. Butcher, East Pittsburgh, Pa.
H. W. Codding, Newark, N. J.
H. A. Kidder, New York, N. Y.
N. R. Love, Denver, Col.
H. W. McRobbie, Connellsville, Pa.
F. W. Peters, Schenectady, N. Y.
W. S. Richhart, Fort Wayne, Ind.
G. W. Saathoff, New York, N. Y.
L. J. Turley, Los Angeles, Cal.
R. L. Weber, Boston, Mass.
R. G. Winans, New York, N. Y.
G. I. Wright, Chicago, Ill.
L. D. Bale, Cleveland, Ohio, sponsor.

ENGINEERING MANUAL

R. H. Dalgleish, chief engineer the Capital Traction Company, Washington, D. C., chairman.
W. F. Graves, Indianapolis, Ind.
C. H. Jones, Michigan City, Ind.
F. H. Miller, Louisville, Ky.

SUBJECTS

F. H. Miller, vice-president and general manager Louisville Railway, Louisville, Ky., chairman.
Morris Buck, New York, N. Y.
W. F. Graves, Indianapolis, Ind.
C. H. Jones, Michigan City, Ind.
P. V. C. See, Akron, Ohio.

REVISION OF RULES AND PROCEDURE

A special committee on the revision of rules for the preparation of committee reports and specifications and also the procedure for the adoption of standards.

F. H. Miller, vice-president and general manager Louisville Railway, Louisville, Ky., chairman.
L. D. Bale, Cleveland, Ohio.
P. V. C. See, Akron, Ohio.
H. H. George, Newark, N. J.
A. T. Clark, Baltimore, Md.

STANDARDS

This committee will pass on standards proposed by committees other than those in the equipment division and the way and structures division, which are passed on by the standing committees on those subjects.

C. R. Harte, construction engineer the Connecticut Company, New Haven, Conn., chairman.
L. D. Bale, Cleveland, Ohio.
C. C. Beck, Mansfield, Ohio.
L. C. Datz, St. Louis, Mo.
C. M. Davis, Schenectady, N. Y.
F. C. Hanker, East Pittsburgh, Pa.
C. H. Jones, Michigan City, Ind.
C. G. Keen, New York, N. Y.
M. B. Rosevear, Camden, N. J.
J. M. Waldron, New York, N. Y.

Rolling Stock Division

STANDING COMMITTEE

A. T. Clark, superintendent rolling stock and shops United Railways & Electric Company of Baltimore, Baltimore, Md., chairman.
J. A. Brooks, Philadelphia, Pa.
W. W. Brown, Brooklyn, N. Y.
R. S. Bull, Pittsburgh, Pa., vice-chairman.
M. R. Hanna, Schenectady, N. Y.
J. M. Hipple, East Pittsburgh, Pa.
J. S. McWhirter, New York, N. Y.
A. D. McWhorter, Memphis, Tenn.
T. H. Nicholl, Anderson, Ind.
R. B. Smyth, Boston, Mass.
W. G. Stuck, Lexington, Ky.
H. S. Williams, Detroit, Mich.

1—MANUAL REVIEW

Review existing Manual sections on rolling stock for revision and correction.

C. W. Squier, associate editor ELECTRIC RAILWAY JOURNAL, New York, N. Y., chairman.
W. S. Adams, Philadelphia, Pa.
T. H. Nicholl, Anderson, Ind.
H. S. Williams, Detroit, Mich.

2—MOTOR COACHES*

1. Continue study of motor coach design and consider motor coach standardization.

Digitized by Google

2. Investigate maintenance methods and inspection schedules in motor coach operation.

V. W. Berry, assistant general manager of railways Virginia Electric & Power Company, Richmond, Va., chairman.
H. L. Debbink, Milwaukee, Wis.
W. D. Downey, Philadelphia, Pa.
C. W. Stocks, New York, N. Y.

*Personnel not complete.

3—Car Equipment

Continue study of car equipment with special reference to appearance, comfort and convenience.

H. S. Williams, assistant superintendent of equipment Department of Street Railways, Detroit, Mich., chairman.
O. H. Basquin, Chicago, Ill.
J. A. Dewhurst, New York, N. Y.
F. J. Foote, Springfield, Ohio.
H. J. Jonas, Cincinnati, Ohio.
G. L. Kippenberger, St. Louis, Mo.
C. R. McMahon, Des Moines, Iowa.
W. R. McRae, Toronto, Ont.

4—Lighting

Continue study of car lighting.

R. W. Cost, Illumination Bureau, Westinghouse Lamp Company, New York, N. Y., chairman.
A. L. Broe, Harrison, N. J.
W. W. Brown, Brooklyn, N. Y.
H. F. Deininger, Philadelphia, Pa.
H. A. Otis, Chicago, Ill.
J. P. Staples, Charleroi, Pa.

5—Bearings*

Study results being obtained with roller bearings for journals.

W. C. Bolt, superintendent rolling stock and shops Eastern Massachusetts Street Railway, Chelsea, Mass., chairman.
V. N. DeLamater, Newark, N. J.
E. M. Lunda, Grand Rapids, Mich.
W. C. Sanders, Canton, Ohio.

*Personnel not complete.

6—Lubrication

Study methods of gear lubrication.

W. G. Stuck, superintendent of equipment Kentucky Traction & Terminal Company, Lexington, Ky., chairman.
A. A. Green, New York, N. Y.
L. W. Jacques, East St. Louis, Ill.
J. F. Lamb, New York, N. Y.
J. H. Lucas, Milwaukee, Wis.

7—Air Compressors

Investigate suction strainers for air compressors.

J. C. McCune, assistant director of engineering, Westinghouse Air Brake Company, New York, N. Y., chairman.
C. A. Ives, Erie, Pa.
A. F. Rexroth, Harrisburg, Pa.
P. J. Wood, Erie, Pa.

8—Motor Brushes

Investigate side wear on brushes of ventilated motors.

R. A. Hutchins, General Electric Company, Schenectady, N. Y., chairman.
F. T. McCann, Syracuse, N. Y.
F. W. McCloskey, East Pittsburgh, Pa.
R. D. Voshall, Washington, D. C.

9—Noise Reduction

Continue study of reduction of noise in car operation.

H. S. Williams, assistant superintendent of equipment Department of Street Railways, Detroit, Mich., chairman.
C. Bethel, East Pittsburgh, Pa.
L. J. Davis, Brooklyn, N. Y.
C. J. Ellis, Winton Place, Ohio.
M. Guynes, Schenectady, N. Y.
F. L. Hinman, Philadelphia, Pa.
T. H. Minary, Louisville, Ky.
R. M. O'Brien, New Orleans, La.
H. L. Rogers, Cincinnati, Ohio.

10—Gear

Study helical and spur gearing including long and short addendum teeth together with the entire subject of gearing.
Personnel of this committee will be announced later.

11—Current Collecting Devices

Study overhead collecting devices and recommend standards for trolley wheels.

Hugh Savage, superintendent of equipment the Brooklyn City Railroad, Brooklyn, N. Y., chairman.
W. C. Klein, Allentown, Pa.
H. S. Murphy, Philadelphia, Pa.
D. L. Smith, Chicago, Ill.

Way and Structures Division

Standing Committee

H. H. George, assistant to chief engineer Public Service Production Company, Newark, N. J., chairman.
C. A. Alden, Steelton, Pa.
E. B. Entwistle, Johnstown, Pa.
W. G. Hulbert, Easton, Pa.
J. R. McKay, Fort Wayne, Ind.
E. J. McIlraith, Chicago, Ill.
H. F. Merker, Brooklyn, N. Y.
E. M. T. Ryder, New York, N. Y., vice-chairman.
C. A. Smith, Atlanta, Ga.
A. T. Spencer, Toronto, Ont.
H. M. Steward, Boston, Mass.
W. W. Wysor, Baltimore, Md.

1—Manual Review

Review existing Manual sections on way and structures for revision and correction.

W. R. Dunham, Jr., executive engineer Department of Street Railways, Detroit, Mich., chairman.
D. J. Graham, Youngstown, Ohio.
J. S. Mahan, Chicago, Ill.
D. H. Walker, Indianapolis, Ind.
T. H. Davis, Indianapolis, Ind.

2—Switch Tongues and Hard Centers

1. Continue study of design of switch tongues and hard centers for special trackwork.
2. Co-operate with way and structures committee No. 5.

E. M. T. Ryder, way engineer Third Avenue Railway, New York, N. Y., chairman.
C. A. Alden, Steelton, Pa.
R. B. Fisher, Harvey, Ill.
H. F. Heyl, Easton, Pa.
G. A. Peabody, Cleveland, Ohio.
W. W. Wysor, Baltimore, Md.

3—Rails

Investigate relative advantages of 7-in. and 9-in. girder rails for track construction in paved streets.

H. F. Merker, chief engineer way and structures Brooklyn City Railroad, Brooklyn, N. Y., chairman.
J. U. Bragg, Baltimore, Md.
G. H. Haldeman, Newark, N. J.
R. M. Hannaford, Montreal, Que.
E. S. Meyers, New Orleans, La.
J. F. Rodgers, Philadelphia, Pa.
Oscar Williams, Pittsburgh, Pa.

4—Track Ballast and Drainage

1. Study matter of type of ballast for track construction in paved streets to determine the relative advantages of each type with special conditions of sub-soil, car loadings, etc.
2. Investigate the use of vitrified or tile pipe auxiliary drains in connection with track construction in paved streets.

S. Clay Baker, engineer maintenance of way East St. Louis & Suburban Railway, East St. Louis, Ill., chairman.
E. J. Archambault, Milwaukee, Wis.
L. T. Botto, San Antonio, Tex.
A. C. Eddy, Vancouver, B. C.
C. L. Hawkins, St. Louis, Mo.
J. H. Haylow, Memphis, Tenn.

5—Special Trackwork

1. Review specifications for castings in ironbound, hard center special trackwork, with a view to possible revision of requirements for depth of casting and general design.
2. Co-operate with way and structures committee No. 2.

E. P. Roundey, engineer way and structures New York State Railways, Utica, N. Y., chairman.
C. A. Alden, Steelton, Pa.
J. U. Bragg, Baltimore, Md.
E. B. Entwistle, Johnstown, Pa.
W. G. Hulbert, Easton, Pa.
M. M. Johnston, New Haven, Conn.
D. R. Payne, Hoboken, N. J.

6—Arc Welding

1. Study arc welding processes for repairs to rails and manganese steel.
2. Prepare welding wire specifications.

Chester F. Gailor, consulting engineer, New York, N. Y., chairman.
H. E. Bean, Syracuse, N. Y.
H. H. Dartt, Scranton, Pa.
A. L. Donnelly, New Haven, Conn.
R. B. Fehr, Cleveland, Ohio.
E. L. Lockman, Boston, Mass.
I. C. Newman, Norfolk, Va.
W. M. Raiguel, Philadelphia, Pa.
Jonathan Wolfe, Chicago, Ill.

7—Alloy Steels Other than Manganese

Investigate the possibilities from the use of other alloy steels than manganese for special trackwork purposes.

A. T. Spencer, assistant to general manager Toronto Transportation Commission, Toronto, Ont., chairman.
R. B. Fehr, Cleveland, Ohio.
F. G. Hibbard, Milwaukee, Wis.
E. F. Kenney, Bethlehem, Pa.
P. A. Kerwin, Detroit, Mich.
B. P. Legare, San Francisco, Cal.
R. H. Noderer, Johnstown, Pa.
O. C. Rehfuss, Montreal, Que.
F. B. Walker, Boston, Mass.

8—Pavement

Study the effect of the increasing use of rubber-tired vehicles on the type of pavement required for track in paved streets to meet heavy vehicular traffic conditions.

A. E. Harvey, superintendent way and structures Kansas City Public Service Company, Kansas City, Mo., chairman.
N. R. Alexander, Chicago, Ill.
C. W. Burke, Brooklyn, N. Y.
W. O. Matthews, Denver, Col.
J. M. Sundmaker, Cincinnati, Ohio.
W. L. Wilson, Des Moines, Iowa.

9—Bus Garage Design

1. Study the effect of garage design on insurance rates including such items as (a) types of heating plants; (b) design of inspection pits; (c) gas, oil and water servicing facilities for buses; (d) floor drain-

Digitized by Google

age; (e) ventilation; (f) fire extinguishing apparatus including automatic sprinklers.
2. Study of door design.
3. Study of maximum floor grades.
4. Study of illumination, both natural and artificial.
5. Study bus washing facilities.
6. Study provisions for compressed air lines for inflating tires.

J. R. McKay, chief engineer Indiana Service Corporation, Fort Wayne, Ind., chairman.
A. J. Blackburn, Boston, Mass.
G. H. Haldeman, Newark, N. J.
Adrian Hughes, Jr., Baltimore, Md.
L. F. Parlette, Philadelphia, Pa.
W. W. Wise, New York, N. Y.

10—CARHOUSE AND SHOP CONSTRUCTION AND WIRING

Co-operate with the National Fire Protection Association if any revision of the existing rules for carhouses or the formulation of a similar set of rules for car shops is undertaken by that association.

H. E. Bachman, superintendent of distribution Public Service Railway, Newark, N. J., chairman.
E. P. Goucher, Washington, D. C.
J. D. Kent, New York, N. Y.

11—TRACK CONSTRUCTION

Co-operate with A.S.M.E. in the consideration of any changes in the track construction specifications which may be proposed by either organization.

C. L. Hawkins, engineer way and structures United Railways of St. Louis, St. Louis, Mo., chairman.
W. R. Dunham, Jr., Detroit, Mich.
H. H. George, Newark, N. J.
E. M. T. Ryder, New York, N. Y.
W. W. Wysor, Baltimore, Md.

12—RAIL CORRUGATION

Continue study of rail corrugation.

W. W. Wysor, chief engineer United Railways & Electric Company, Baltimore, Md., chairman.
C. H. Clark, Cleveland, Ohio.
E. B. Entwistle, Johnstown, Pa.
D. D. Ewing, Lafayette, Ind.
R. B. Fehr, Cleveland, Ohio.
H. F. Flowers, Findlay, Ohio.
C. R. Kinnear, Toronto, Ont.
T. J. Lavan, Cleveland, Ohio.
E. L. Lockman, Boston, Mass.
A. M. Nardini, Philadelphia, Pa.
J. Ormondroyd, East Pittsburgh, Pa.
H. J. Tippet, New Haven, Conn.
C. L. Van Auken, Chicago, Ill.
H. S. Williams, Detroit, Mich, vice-chairman.

13—DESIGN OF JOINT RAILWAY AND BUS TERMINALS*

Study design of joint railway and bus terminals.

C. W. Gifford, general superintendent Gary Railways, Gary, Ind., chairman.
E. D. Eckroad, Akron, Ohio.
*Personnel not complete.

14—LIGHT SECTION RAIL*

Investigate need for a lighter section than the present 7-in. grooved girder rail.

C. A. Alden, chief engineer frog and switch division Bethlehem Steel Company, Bethlehem, Pa., chairman.
C. G. Keen, New York, N. Y.
*Personnel not complete.

15—TRACK GAGE

Prepare a design of gage for checking gage of track.

C. H. Clark, engineer maintenance of way the Cleveland Railway, Cleveland, Ohio, chairman.

Complete personnel of this committee to be announced later.

Transportation & Traffic Association

SERVICE BETTERMENT*

S. E. Emmons, assistant general manager United Railways & Electric Company of Baltimore, chairman.
C. D. Smith, New Brighton, Pa., vice-chairman.
F. J. Denney, Detroit, Mich.
J. A. Dewhurst, New York, N. Y.
C. H. Evenson, Chicago, Ill.
W. J. Flickinger, New Haven, Conn.
A. L. Hodges, Brooklyn, N. Y.
E. A. Palmer, East Pittsburgh, Pa.
A. E. Potter, Providence, R. I.
A. C. Spurr, Wheeling, W. Va.
J. C. Thirlwall, Schenectady, N. Y.
W. E. Thompson, New York, N. Y.
G. B. Anderson, Los Angeles, Cal., sponsor.
Edward Dana, Boston, Mass, sponsor.
*Personnel not complete.

BUS OPERATION

R. N. Graham, manager of railways the Pennsylvania-Ohio Electric Company, Youngstown, Ohio, chairman.
E. D. Dreyfus, Pittsburgh, Pa.
B. W. Arnold, Milwaukee, Wis., vice-chairman.
C. H. Chapman, Waterbury, Conn.
D. L. Fennell, Kansas City, Mo.
S. W. Greenland, St. Louis, Mo.
M. L. Harry, Decatur, Ill.
Adrian Hughes, Jr., Baltimore, Md.
D. A. Scanlan, Akron, Ohio.
Alexander Shapiro, Washington, D. C.
A. T. Warner, Newark, N. J.
H. M. Bollum, Minneapolis, Minn.
Thomas Noonan, Pittsburgh, Pa.
J. L. Alexander, Houston, Tex.
D. W. Harvey, Toronto, Ont.
E. S. Pardoe, Washington, D. C.
A. R. Myers, Erie, Pa., sponsor.
P. E. Wilson, Cleveland, Ohio, sponsor.

JOINT COMMITTEE ON TRAFFIC AND SAFETY

Personnel of this committee to be announced later.

SUBJECTS AND PROGRAM

W. F. Weh, superintendent accident department the Cleveland Railway, Cleveland, Ohio, chairman.
H. V. Drown, Newark, N. J.
W. H. Renaud, Jr., New Orleans, La.

Revision of Constitution and By-Laws

AN ORGANIZATION meeting of the committee on revision of the constitution and by-laws of the American Electric Railway Association was held at association headquarters on Nov. 18, with the following members present: C. D. Emmons, chairman; James H. McGraw, vice-chairman; E. P. Waller, Harry Reid, Harold V. Bozell, M. B. Lambert, G. A. Richardson, H. L. Brown, L. H. Palmer and President W. H. Sawyer.

Several questions came before the committee regarding the constitution of the association. These include the rate and distribution of dues, membership of bus operating companies, membership of municipally owned properties, name of the association, titles and designations of association staff members, together with such other changes in the constitution as may be suggested by careful study of changed conditions in the industry since its last revision.

The subject of the association name was referred to a sub-committee consisting of H. V. Bozell, Harry Reid, M. B. Lambert, L. H. Palmer and G. A. Richardson. Another sub-committee including James H. McGraw, chairman; E. P. Waller, L. H. Palmer, Harlow Clark, R. P. Stevens and F. W. Doolittle was delegated to study the subject of dues with a view to making the income of the association cover all activities, including the expense of the Advisory Council, without resorting to special assessments or contributions. This work is to be carried on in co-operation with the finance committee. H. L. Brown was made chairman of a sub-committee to review carefully the entire wording of the present constitution and to suggest necessary changes. H. V. Bozell and M. B. Lambert were also named to this sub-committee.

Bus Operation

AN ORGANIZATION meeting of the committee on bus operation was held at association headquarters on Nov. 18 and various suggestions for the year's work were reviewed. Subject assignments were made to various sub-committees who are to prepare preliminary reports for presentation at the next meeting of the committee, which is to be held in Toledo, Ohio, at the time of the Central Electric Railway Association annual meeting on Feb. 3.

Subject No. 1—*Bus Operating Rules and Instructions to Personnel.* Assigned to A. Shapiro with instructions to collaborate with E. S. Pardoe and Adrian Hughes, Jr. This assignment includes the revision of the bus operating rules prepared in 1924 and revised in 1926, together with the preparation of instructions to personnel. The inspection rules prepared by the 1926 equipment committee of the Engineering Association are to be reviewed.

Subject No. 2—*Equipment.* This is to be a study of sizes and types and their application to various classes of service including equipment used in chartered coach service. The assignment was made to B. W. Arnold with instruction to collaborate with D. L. Fennell, Thomas Noonan, D. A. Scanlon, J. L. Smith and R. H. Pinkley.

Subject No. 3—*Fares and Methods of Fare Collection.* Assigned to E. D. Dreyfus with instructions to collaborate with D. A. Scanlon.

Subject No. 4—*Methods, Practices and Economics.* This study to include chartered coach and bus operation, package and express business (including mail), and cost analyses of operation.

It was agreed that the data for this year's report are to be obtained from a group of fifty predetermined companies which are to be divided among various members of the committee for the collection of data.

Those present at the meeting included the following: Sponsors Paul E. Wilson and A. R. Myers, Chairman R. N. Graham, Vice-Chairman B. W. Arnold, C. H. Chapman, E. D. Dreyfus, J. L. Smith (representing D. W. Harvey), Adrian Hughes, Jr., Thomas Noonan, E. S. Pardoe, H. B. Whitman (representing A. T. Warner).

The News of the Industry

7 Per Cent Return Allowed

United States Supreme Court Fixes "Spot" Reproduction Cost — The Decision May Affect Tractions

The United States Supreme Court on Nov. 22 virtually held that a public utility corporation was entitled to charge rates which would permit it to earn 7 per cent on its "spot reproduction value." With Justice Brandeis dissenting, chiefly because of the difficulties of determining what the "spot reproduction value" is, the court handed down an opinion upholding an injunction restraining the Public Service Commission of Indiana from ordering a reduction of the Indianapolis Water Company rates. The injunction, issued by Federal District Judge Geiger, was based on his finding that the valuation of the company's property was too low and the rates proposed confiscatory.

In fixing the value of the water company's property the Public Service Commission arrived at a total of $16,455,000, including among the items cost of reproduction, less depreciation, on the basis of average level of labor and material prices for a ten-year period, including also material and supplies, capital additions, going value and water rights and existing working cash capital.

In its opinion, upholding the lower court, the majority of the court held that the "spot" reproduction cost of the property is "a fair measure of the value of the physical elements of the property" and "a reasonable rate of return is not less than 7 per cent."

Judge Geiger in his injunction writ accepted the arguments of various experts that the reproduction value of the company's property was approximately $17,000,000 and affirmed the addition to the value of the physical property items covering water rights, going value and cash working capital, bringing the total to approximately $19,000,000. The Supreme Court said:

> It is true that if the tendency or trend of prices is not definitely upward or downward and it does not appear probable that there will be a substantial change of prices, then the present value of land plus the present cost of construction of plant, less depreciation, if any, is a fair measure of the value of the physical elements of the property. The validity of the rates in questions depends on property value Jan. 1, 1924, and for a reasonable time following.
>
> And we are satisfied that the decree is right. A reasonable rate of return is not less than 7 per cent. In his decision the district judge plainly intimated that he was of the opinion that probable net earnings for 1924 were not sufficient to pay more than 5 per cent on $19,000,000. The amount of net earnings in 1924, as estimated by appellants, is only sufficient to pay 7 per cent on $16,022,145. The evidence requires the finding that, exclusive of items classified as non-operative, the value is much more than that amount.

Justice Brandeis, dissenting from the opinion of his colleagues, declared that "'spot' reproduction would be impossible of accomplishment without the aid of Aladdin's lamp." He held that any estimate of a "spot" reproduction would be delusive if based on "spot" prices of labor, materials and money where the plant had required years for completion.

The case was argued before the Supreme Court last April. A decision had been eagerly awaited, because the issues of law closely paralleled most of those involved in the other rate cases, notably that of the Consolidated Gas Company, New York, argued before the Supreme Court Oct. 18 and 19. Moreover, the Indianapolis case had been argued for the company by ex-Justice William L. Ransom of New York City, who was one of the counsel who argued before the Supreme Court the similar issues in the New York gas rate cases.

Politics Blamed by Mr. Insull

Draws Deadly Parallel Between Railways and Other Utilities to Show How Refinancing Has Been Blocked—Investment of New Money in Tractions Almost Nil

RESPONSIBILITY for the failure of transportation companies in Chicago to obtain adequate funds for refinancing, extensions or improvements was placed squarely on local politics on Nov. 18 by Samuel Insull in an address before the Electric Association of Chicago.

Mr. Insull declared that the electric industry in Chicago required $137,500,000 in new capital in the year ended June 30, 1926, of which $82,000,000 was for electric supply companies, $21,000,000 for telephone and telegraph companies, $20,000,000 for manufacturers and only $14,000,000, or less than 10 per cent of the total, for electric railways, although their total investment in the district is larger by $50,000,000 than that of any other group of electrical enterprises.

Mr. Insull said these figures suggested a momentary digression from the topic of his principal theme. The capital investment of the electricity supply companies in the Chicago district has been practically doubled in ten years; that of the telephone and telegraph companies a little more than doubled. The investment in electrical manufacturing is now probably about six times that of ten years ago.

During the same ten years the investment in the electric transportation of the district has been increased less than 10 per cent, and the preponderant portion of this has gone into suburban lines and the elevated lines of Chicago.

Mr. Insull said there must be a reason for this small increase in the electric railway investment. No public utility service is developed and extended without new capital investment. The need of increased public utility facilities here has not been confined to the electricity supply and telephone services. Surely there has been need of transportation development somewhat in proportion to other development. Why has it not come?

According to Mr. Insull, the correct answer is unmistakable. He said:

> Electric transportation has been the football of local politics. The electricity supply and telephone services have been under strict regulation, but have been comparatively free from local harassment. They have, therefore, been able to look ahead and to work out consistent and comprehensive development plans and put them into effect.
>
> The seat of obstruction to transportation development is revealed the more clearly when you recall that the preponderant portion of what little new capital has been put into transportation development has been applied to those transportation agencies which are least affected by local politics, namely, the suburban electric and the elevated lines.
>
> The local transportation business here is afflicted with a lot of economic absurdities as well as political agitation. Just think of making a fixed investment under a franchise grant that is subject to termination at the end of a few years, without making any provision in rates or otherwise for amortization of the investment. That is an economic absurdity.
>
> The transportation business in Chicago, apart from the elevated and suburban lines is run on the theory that you can pick up all of the property used in it after a few years—that is, at the end of the franchise term—and carry it away, with its value and usefulness unimpaired. But the rates for

The local transportation business in Chicago is afflicted with a lot of economic absurdities as well as political agitation. Just think of making a fixed investment under a franchise grant that is subject to termination at the end of a few years, without making any provision in rates or otherwise for amortization of the investment! That is an economic absurdity.

I mention this because the correction of it is in part your problem as citizens of Chicago. Men of your character—men of activity and standing in the community—must take hold of this situation and give it serious attention if it is to be corrected before the city is harmed beyond repair.—SAMUEL INSULL.

Digitized by Google

service are based on the assumption of a continual right to use the streets for all time.

I mention this absurdity because the correction of it is in part your problem as citizens of Chicago. Men of your character—men of activity and standing in the community—must take hold of this situation and give it serious attention if it is to be corrected before the city is harmed beyond repair.

In the belief that it would serve to stave off a receivership, Mayor William E. Dever on Nov. 23 brought forward a proposal to extend the franchise of the Chicago Surface Lines for six months after their expiration next February. As a result of the Mayor's proposal, a resolution was presented to the City Council directing the transportation committee to consider the matter at once.

No Early Vote in Kansas City

The referendum petitions calling for a general vote of the public in the matter of the twelve-year extension of the local railway franchise, at Kansas City, Mo., were filed with the city clerk on Nov. 13. The petitions contained 13,213 signatures. The law required that 10 per cent of the last mayoralty vote, or 11,460 signatures, be appended to the petition to assure a referendum vote. The petition demanded that the Council call a special election, but such a procedure would entail a two-thirds vote of the City Council. The expense of the election would be borne by the Kansas City Public Service Company. Some of these facts were brought out in an item in the ELECTRIC RAILWAY JOURNAL for Nov. 20.

At the same time, minority leaders of the Council are said to have stated they would not seek an early vote in the matter pending the outcome of the current hearing which the special council committee and the Kansas City Public Service Company are holding in an effort to draft a new franchise for the railway.

No city election is to be held until April, 1930, and no general election until November, 1928. This fact would apparently assure the validity of the recently voted extension of the old franchise until such time as present negotiations for a new franchise are completed, nullifying the need for any referendum vote in the matter.

On Nov. 15 Judge McElroy ordered a check of the 13,213 names on the petition. Should the investigation disclose that not enough names, legally signed, appear on the petition, the bill providing for a twelve-year extension of the old franchise would become a law.

Seattle Contemplates Free Rides

Shoppers of Seattle, Wash., may soon enjoy free rides downtown on the Seattle Municipal Street Railway on week-day forenoons, except Saturday. A plan whereby a group of merchants will pay the street railway a lump sum daily for use of the cars during certain forenoon hours is being worked out by Grant A. Stevens, market master at the Pike Place Public Market. In a communication to the City Council, Clark R. Jackson, superintendent of public utilities, expressed the opinion that the plan would materially increase street railway revenues during off-peak hours.

Fare Case at St. Louis Closed

Missouri Commission Takes Under Advisement Plea of United Railways, Now in Receivership, to Advance Fares at Once—City a Protestant

FINAL testimony was taken on Nov. 17 by the Missouri Public Service Commission at Jefferson City, Mo., on the application of Receiver Rolla Wells of the United Railways, St. Louis, for an immediate temporary increase in fares. Neither the city nor the company will file briefs, but the matter has been left open for ten days to give the St. Louis County municipalities an opportunity to file briefs if they so desire. An order on the application probably will not issue for several weeks.

In its original application for an increase filed last June the company asked the rate on adult fares be raised from 7 cents to 8 cents or two tokens for 15 cents. Action on that was suspended pending an audit of the company's books demanded by city officials.

City Counselor Muench of St. Louis contended that the city riders should not be compelled to make up losses sustained by the company on St. Louis county business, and that greater economy could be effected by the company in its operating departments, especially the claim department. He also said that the fixed charges for depreciation reserve are too high.

At the session on Nov. 16 Col. Albert T. Perkins, general manager for Receiver Rolla Wells, testified that the company is earning less than a reasonable return upon the valuation of $51,781,348 fixed by the commission as of Jan. 1, 1919, without considering $5,014,443 spent for additions and betterments since that time. He testified that the gross income of $2,685,246 available for return in 1925 offered only 5.19 per cent return and that the income to Sept. 30, 1926, would give only a 5.26 per cent return.

BLAME FIXED FOR FALLING OFF IN BUSINESS

Col. Perkins blamed the competition of independently operated bus lines and private automobiles and service cars for the falling off in revenue, explaining that in October receipts were $30,000 behind the similar month last year. He declared that the gross income of $2,156,599 for 1926 up to Oct. 31 failed by $90,523 to pay interest, fixed charges and miscellaneous deductions included in the amount allowed for return. He brought out that great reductions in operating costs have been effected since the receivership.

Chairman Brown of the commission interrupted Col. Perkins to ask whether he thought the receivership was cheaper than private management. Col. Perkins replied that he believed it was in many ways, under this particular receivership, but that it was not true of all receiverships of property. He presented an exhibit to show that if the 8-cent base fare or two tokens for 15 cents is granted the revenues of the company would be increased $1,381,792 a year based upon the present traffic.

Gross revenue for the year ended Sept. 30, last, was $18,623,643, averaging 6.9 cents per passenger. The proposed fare would produce $20,005,435 a year, it was estimated. The average fare, considering the straight fare, tokens and 3-cents child fare, would be 7.41 cents.

City Counselor Muench sought to show that the St. Louis Public Service Company, which proposes to take over the system when it emerges from receivership, was connected with the application of Receiver Wells for higher fares. Col. Perkins declared that the new company had no direct connection with the application but had raised no objections to it. He admitted that the company had an indirect interest in the proceedings in the event that it takes over the electric railways because of the effect of a fare increase on the revenues of the properties. Receiver Wells would do anything he could to expedite the work of reorganization.

Among other things the city charged that lack of managerial foresight and failure to make extensions, which provided a fertile field for bus competition, cannot now be fairly placed on the car riders, who should not be expected to free the company from the consequences of its inefficiency.

Salt Lake & Utah Transcontinental Status

The Interstate Commerce Commission at Washington, D. C., will reopen on Dec. 3 the transcontinental rate case of the Salt Lake & Utah Railroad, Salt Lake City, Utah, for argument. The case involves the right of the local line to participate in transcontinental freight traffic, both east and westbound, a matter which is said to be of vital importance to the railroad.

Upon application of the Union Pacific system in 1924 to eliminate the Salt Lake & Utah Railroad from participation in the westbound business in connection with its lines, division three of the Interstate Commerce Commission decided against the Orem road.

The present action of the commission in reopening the case results from the petition filed by the receivers immediately after the handing down of the last-named decision. The denial of the freight agreement privilege to the Salt Lake & Utah was referred to in the ELECTRIC RAILWAY JOURNAL issue for Sept. 18, 1926, page 470.

One-Man Operation on Albany-Hudson Line

Public Service Commissioner Lunn recently heard the petition of the Eastern New York Utilities Company for the consent of the commission to the operation of one-man cars on the entire railroad line of the company, which operates between Albany and Hudson, N. Y. Testimony was offered by the railroad to show that even though certain economies of management and operation had been introduced, it was still conducting its railway line at a loss and after certain investigations of other

Digitized by Google

lines of a similar character, it was felt that with the use of one-man cars, this deficit could be overcome. The company proposes to use a new standard type light-weight car with up-to-date electric track break equipment, "dead man's buttons" and other modern safety devices in place of its present heavy type cars. The city of Hudson has recently consented to the operation of buses by this company in place of trolley cars and these one-man cars are to be used on the suburban lines and to the terminals in Albany and Hudson. There was no opposition to the petition.

No Successor Named to Mr. Wallace

No successor has as yet been appointed to H. U. Wallace, whose resignation as general manager of the Department of Street Railways, Detroit, Mich., was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 20, page 949. Mr. Wallace's resignation was accepted at a meeting of the Street Railway Commission held on Nov. 23, and a resolution adopted expressing to Mr. Wallace the commission's appreciation of the valuable services rendered by him to the Department of Street Railways and its regret that he should find it necessary to relinquish his position.

Facts on Los Angeles Situation Laid Bare

In its application for a new rate structure, referred to in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 20, page 940, the Los Angeles Railway, Los Angeles, Cal., states that it is giving the city the best possible transportation service at or below the lowest possible cost, and that it is its intention to continue the finest possible service in the future. H. E. Huntington, the principal owner in the company, had always made it his policy to put back into the property the earnings of the system. The necessity for increased service, particularly the extension of bus lines, had resulted in a steady increase in operating costs and this increase had gone forward faster than the increase in traffic.

The company states that it is now faced with additional capital expenditures of more than $6,000,000 during the next three years, and with additional increased operating costs, resulting from such capital increases, the taxes of the company were also increasing, amounting to $850,000 in 1925. The company is seeking to establish a rate structure based on the 7-cent single fare with four tickets or tokens for 25 cents, including free transfer.

The petition refers to the value of its railway used in the service of the public, which is at the lowest estimate $45,000,000, and that under the rates asked the company would earn, after operating expenses, less than 7 per cent on the value of its property. The company is asking the commission, the city of Los Angeles and the other communities to co-operate so the commission may arrive at an early decision.

George J. Kuhrts, the general manager of the company, stated that the railway was alive to the importance of providing an adequate railway transportation system and that the inability to give such a service under the present 5-cent fare was one of the principal reasons for making the application. An increase in fare, such as had been in effect in all other large cities in the United States, would have been justified to the Los Angeles Railway several years ago, and it was only because of the unusual policy pursued by Mr. Huntington that the city of Los Angeles has been able to enjoy the benefit of this exceptionally low fare.

New Transit Plan Advanced in New York

Pooling of Present and New Subways Proposed Under Plan Suggested by Transit Commissioner Delaney—Adequate Return Admitted Necessary with City Participation in Private Company

JOHN H. DELANEY, chairman of the Board of Transportation of New York, speaking with authority for the Mayor, made public on Nov. 24 the outstanding features of a reorganization scheme for transit which is still in the formative stage.

Chairman Delaney would create a quasi-public corporation, with earnings limited probably to 6 per cent, to take over not only the existing subways but also the new system now under construction. On the board of directors of the new corporation the city and the private transit interests would be represented, with the city maintaining at least 50 per cent control. The financing scheme would involve a gradual amortization of the private interests so that at the end of perhaps 40 years the public corporation, with the private interests eliminated, would have complete ownership of the properties.

This reorganization would involve the ditching of the dual contracts, so called, under which the subways are now operated, and the making of new contracts in which the 5-cent fare, according to Chairman Delaney, would not be a primary consideration.

The administration has firmly in mind the fact that the new subways are being constructed at a cost greatly in excess of the cost of the existing lines. It also has in mind the fact that the municipal subways, under the terms of the law permitting the city to borrow money for their construction, must be self-sustaining. This situation seemingly makes a continuance of the 5-cent fare on the new subways impossible.

But, says Chairman Delaney, the question of whether or not the 5-cent fare can be continued depends entirely on the method of financing, and he is by no means willing to admit that under the proposed reorganization scheme the fare will necessarily be raised. So far as possible he would refrain from borrowing to pay the cost of construction. The new subway will increase the value of the property along the route and consequently should greatly increase assessments. The increased revenues in realty created by the new subway, he argues, will reduce the amount of money which the city must borrow and on which it must pay interest. On the matter of finance he said:

> The manner in which the city finances the subways will determine what the rate of fare will be. The Board of Transportation declared in May, 1924, that under municipal operation the fare would be 8 to 10 cents unless the subways were financed in a manner to reduce the burden of interest on the 50-year bonds. The present cost of operating the existing subways is 3 cents a passenger. The present cost of interest on the money is 3 cents a passenger. It is not fair to the rider to charge him 3 cents for his ride and 5 to 7 cents additional as the cost of an extravagant financial policy.

The question therefore of whether the 5-cent fare can be continued after the unification of the system and the formation of the quasi-public corporation will depend upon the ability of the roads to earn the proposed maximum of 6 per cent. If the roads can not do so it will be necessary to increase the fare to a point at which they can.

He said further:

> The prospects of a 5-cent fare are better under this scheme than they would be under municipal operation. The existing contracts under which the old subways are operated provide for a 5-cent fare. They will endure for 40 years. But the law provides that the new subway must pay for the cost of operation and interest on the borrowed money and of amortization.

There is no hope of maintaining a reasonably low fare on the new subways, supporters of the administration declare, unless the old subways and the new subways are in some way pooled. To pool them the dual contracts must be abrogated and new contracts entered into with the transit companies. That is what the proposed reorganization is largely about. Mr. Delaney said:

> I believe the people will approve the right kind of reorganization that will make the subway self-sustaining, protect the city and the private investors, eliminate any profits over 6 per cent on private capital, and will insure that the city will control, that service will be increased and that new subways will be constructed as fast as the plans are prepared.

The reorganization plan was conceived, Mr. Delaney said, during a conference between him, Dwight W. Morrow of the J. P. Morgan firm, James L. Quackenbush of the Interborough line and other officials of the transit lines, called to consider the financing of lengthening of station platforms. At this time it was suggested that the private investment in the transit corporations be evaluated in order to provide eventually for the retirement of the private securities and the formation of the quasi public corporation.

The B.-M. T corporation is "always ready to co-operate in full measure with the municipal authorities in any constructive movement for more subways and other rapid transit facilities; to bring about unification plans for improvement of transit conditions," according to that company.

On Nov. 25 Mr. Delaney was quoted to the effect that there was one error in the previous report. He was reported to have said that the quasi-public corporation should include surface trolley lines and buses, as well as all subway and elevated lines. That, he declared, was a misunderstanding. What he meant to say was that, while some persons thought such a consolidation ought to include street cars and buses, he was opposed to such inclusion.

Boston Bandits Must Die

The last hope of the young carhouse holdup men of escaping their sentences of electrocution for the murder of James H. Ferneau during the Waltham carhouse holdup was lost on Nov. 10 by a decision from the full bench of the Supreme Court. The court found there was no error in the denial of new trial and that the executive council of the Governor could not be forced to take action on a petition for respite of sentences. John J. Levereaux, John J. McLaughlin and Edward J. Heinlein were convicted of murdering the aged watchman after robbing the carhouse of $1,300.

How Much Does Your Automobile Cost You?

An automobile expense card with 31 rulings for daily total expenditures has been printed by the Beaver Valley Traction Company, New Brighton, Pa. The speedometer readings for the first day, last day and total mileage for the month are to be noted at the top of the card. For the information of the owner, he is told that liability, fire, theft and collision insurance cost should be listed monthly at 1/12 of insurance cost; finance charges should be listed monthly at 1/12 of cost; depreciation should be listed monthly at 1/36 of price paid. The card is so ruled that at a glance one can see the expenses for tires, gas, oil, parts, labor, tubes, parking and washing. In size, 9x4 in., the card can be hung conveniently by means of the cord attached. A year's supply of these cards will be furnished upon request and should prove of great value to an owner who is interested in seeing just how much of his income goes to the upkeep of his automobile.

Tokens in Indianapolis

Metal tokens will replace tickets on the Indianapolis Street Railway, Indianapolis, Ind., early in January. The company has signed a contract for 370 registering fare boxes and 1,000,000 of the metal tokens to put the new system into effect. The boxes will be placed on the rear platforms of the two-man cars and at the front door of the one-man cars. The metal disk adopted for Indianapolis has a design of the Soldiers' and Sailors' Monument, with the large letter I on one side and the name of the company and a facsimile of President Todd's signature on the other. Conductors will sell the tokens on the cars as tickets now are sold.

"Open House" Week in Milwaukee

Through the medium of "open-house week," the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., showed its patrons how its electric and transportation services are supplied. During the week of Nov. 8 to 13 more than 65,000 people inspected the seventeen different operating properties of the company. There was a central exhibit consisting of all manner of electric power and railway equipment, from insulators to street cars, showing how the company has kept pace with the rapid development of both industries. An added feature of the show was the daily exhibition of the five-reel movie entitled "Where Jimmie Works," a romance of the transportation business filmed on the company's properties.

New High Record for Chicago Surface Lines

The steady increase in riding on the Chicago Surface Lines during the year reached a climax in October with more rides than during any previous month in the history of the system. Total rides for the month were 135,878,579, an increase of 3,363,261 over the corresponding month last year.

The highest previous month in the history of the system was December, 1925. The October figures exceeded this by 2,929,063. As the peak of the year always comes in December, due to Christmas riding, Surface Lines officials are anticipating a phenomenal business during the coming December.

During December a year ago 99.8 per cent of all equipment—all but seven cars—was in daily service. One hundred new cars have been added to the service since that time and the maintenance schedule has been so arranged as to provide for the use of practically all cars during the coming season.

New Public Service Department in New York Jan. 1

In preparation for the consolidation of state departments, which goes into effect in New York on Jan. 1, the legislative budget committee has started a series of meetings and the legislative reorganization commission will meet soon.

A new Public Service Department is created to be headed by the chairman of the present Public Service Commission. It is to take over the public service and transit commissions.

Atlanta Company Scores Free Rides

A cessation of the free ride is urged by the Georgia Railway & Power Company, Atlanta, Ga., in its publication, *Two Bells*, as follows:

When you come driving to town in the morning in your automobile you see little groups of people congregated at street intersections where are located car stop signs. They aren't gathered there by accident. You know they are waiting for the street car. You pick up one or two or maybe three of them. You do it, of course, in a friendly spirit. You aren't deliberately trying to take 7, 14 or 21 cents away from the railway, or to save that money for the people you pick up.

Yet when you do this friendly act you unconsciously harm not only the railway, but the riders themselves. You take away from the company the only thing that it has to sell. The railway hasn't anything to sell but street car rides. When these rides aren't bought the revenue decreases, and as a consequence the railway suffers. Unless its rides are bought it cannot continue to build more lines, buy more cars and operate them more rapidly. The rides you present to persons waiting for the street car mean little or nothing to them. They do not count the 7 cents saved and the chances are that they get to the office ahead of their schedule because they planned their arrival by the street car.

It may be a friendly act on your part to pick up persons waiting for the street car. But it is also an act of unfair competition with the railway.

A New Visitor Appears in Westchester

There's a new face at the door in Westchester County, New York, in the person of "Aunty J. Walker," the foreboding policewoman whose warnings to "jaywalkers" are well known in New York City. Her visit was ushered in on announcement cards which appeared Nov. 10 on the highways and byways, in shop windows and on street corners.

It is because the records of Westchester County show that its proportion of deaths and injuries resulting from street accidents is far greater than that of either the State of New York or the entire United States that Barron Collier, president of Barron G. Collier, Inc., was urged to accept the chairmanship of the Westchester Public Safety Bureau. Col. Carl F. Hartmann, the Public Safety Bureau Director, will assist in the crusade for saving human lives. His efforts will be spent in educating the people in the matter of individual personal safety. Four specific groups will be concentrated upon, namely, the pedestrian, the automobilist, the parent and the child. According to his plan, the mayors, the chiefs of police and the superintendents and teachers in public and parochial schools will have active constructive parts in Westchester's safety campaign.

"Aunty J. Walker" was created by Barron Collier at the time he served as organizer and director of the Bureau of Public Safety of the New York Police Department. In that campaign, through her constructive criticisms and her cautions, a decided drop was noted in the number of street accidents in New York City.

Would Link City and Interurban System in Cincinnati

Entrance to the heart of Cincinnati, Ohio, with its interurban cars through utilization of the rapid transit loop is sought by the Cincinnati, Hamilton & Dayton Traction Company in an application which has been filed with the City Council. Samuel I. Lipp, attorney for the interurban company, who filed the application, explained that his company was co-operating with the Cincinnati Street Railway in the matter of third rails on Hamilton Avenue and that he could see no reason why the same spirit could not be extended to the use of the subway. The Cincinnati terminal of the interurban company is located on Spring Grove Avenue, about 6 miles from the heart of the city. The equipment of the interurban company is of standard gage and would link up with that operated by the Cincinnati Street Railway. Mr. Lipp said that he felt confident his company could reach an agreement with the Cincinnati Street Railway for utilization of the subway from Cumminsville to the heart of Cincinnati, because it was anticipated that the latter company would be lessee of the rapid transit system when completed. The application of the Cincinnati, Hamilton & Dayton Traction Company has been referred to the transportation committee of the Council for consideration.

News Notes

Eighth Route for One-Man Cars Opened.—One-man car service was introduced on another line in Milwaukee, Wis., on Nov. 14 by the Milwaukee Electric Railway & Light Company. This service was substituted on the Oakland-Delaware line, running through a densely populated residence section into the downtown section. Addition of this line marks the eighth route on which the company is now supplying one-man car service.

Dead Line on Track Repairs Set.—Unless the International Railway, Buffalo, N. Y., repairs pavement between its tracks on various streets in the city of Buffalo before Dec. 15, the City Council has threatened to revoke the company's franchise. The franchise in Grant Street from Forest Avenue to Military Road already has been revoked, but the company continues to operate cars on the line at a speed not in excess of 5 m.p.h. The ultimatum of the municipal authorities was served on the traction company when the International filed its equity action in United States District Court seeking to restrain the city and the New York Public Service Commission from interfering with the collection of the proposed new tariff of fares.

Date of One-Man Car Hearing Fixed. — The Ontario Railway and Municipal Board has fixed Dec. 13 as the date on which it will hear the city's application for an investigation of the one-man car as operated on the lines of the Toronto Municipal Railway. The application is the result of a resolution presented by Comptroller MacGregor and passed by the Board of Control.

Popular Cars Put Back on Line.—The Monongahela West Penn Public Service Company has re-established its local interurbans between Fairmont and Clarksburg, W. Va., following a request made to Manager R. W. Spofford. When the limited runs made by the "West Virginia" were started it was the general opinion that there would be little demand for the half-hour cars that operated from Fairmont at practically the same time as the limited. However, it was soon realized that patrons were being inconvenienced, especially students and teachers.

Resolution Condemns One-Man Cars.—A movement to abolish the one-man street cars now being installed by the Georgia Railway & Power Company has just been launched by the Fifth Ward Civic League, which has passed a resolution condemning the present one-man system. In addition to the resolution the league is preparing and will circulate petitions throughout the ward to be signed by leading citizens and presented to the Public Service Commission in the near future. It is charged in the resolution and in the petitions to be circulated that the one-man street cars are "inefficient and dangerous to traffic." Practically all of the new cars secured by the company are of the one-man type.

New Line Opened.—The Miami Beach Railway, Miami Beach, Fla., has opened up its newest railway extension, the North West Seventh Avenue lines, with operation from Fifth Street to 38th Street. The extension was completed some time ago but paving and other operations had to be completed before service could be started. The original plan of the city was to run the line only as far as 36th Street, but petitions by property owners brought a two-block extension. The extension will serve a heavily populated section of the city.

Dr. Hyland on the Mend.—Dr. Robert F. Hyland, chief surgeon in charge of the medical department, Employees' Mutual Benefit Association, United Railways, St. Louis, Mo., broke his right leg recently when he was run down and hit by a taxicab. He has been confined in St. John's Hospital for some time, but it is expected he will be back at his desk soon.

Would Reduce Children's Tickets.—The Santa Barbara & Suburban Railway, Santa Barbara, Cal., has applied to the Railroad Commission for authority to place in effect reduced school children's commutation tickets of 40 rides for $2, applicable to children up to eighteen years of age. The present tickets call for 40 rides for $1, applicable to school children up to twelve years of age.

Short Subway for Pittsburgh.—The Council of Pittsburgh has affirmed an ordinance authorizing a subway intended for street cars under Fifth Avenue and Sixth Street from Chatham Street to Duquesne Way. The ordinance was sponsored by the City Transit Commission. It is designed to effect the first step in a proposal pending since 1919 when the people authorized $6,000,000 for a subway in the First and Second Wards. There would be two stations connected with the proposed subway, one running from William Penn Place to Wylie Avenue and the other running from Liberty Avenue to Penn Avenue. The Pittsburgh Railways would presumably operate its cars in the subway.

Council Against One-Man Cars in Montreal.—By a unanimous vote the City Council of Montreal, Que., has registered its opposition to the use of the one-man car in Montreal. An amendment that action on the motion be deferred for a while, so as to give the Montreal Tramways further opportunity of testing the utility of these cars, was defeated by a vote of 27 to 6, after which the main motion was accepted without opposition. Among the arguments set forth in support of the motion was that a car in Montreal should be supplied with a conductor, not only for the collection of tickets, but also to aid, when necessary, women and children to enter and alight.

Discuss Operation at Round Table.—A weekly luncheon for officials and department heads of the Waterloo, Cedar Falls & Northern Railway, Waterloo, Iowa, has been started as a round-table discussion. Subjects will be submitted by department heads looking toward a more efficient and economical operation of cars and interurban trains. The conference plan was instituted by C. M. Cheney, president.

Foreign News

Delegation Returns to Berlin

A committee from Berlin which has been studying electric railway and bus operation in this country returned on the *Deutschland* on Nov. 10. The committee consisted of Dr. Friedrich Lademann, director of the Berlin Street Railways and Herman Amberg and Friedrich Lange, members of the advisory board of the transit system. In speaking of its plans before leaving New York Dr. Lademann said:

> The committee was formed to study outstanding traffic problems in London, Paris and the American cities visited, particularly as they related to the operation of cars and buses. There has been some agitation by a city official in Berlin for the substitution of buses for street cars in the downtown section.
>
> Our investigations here and abroad have convinced us that such a substitution is not feasible. The principal objections to it are that the cost of carrying passengers is higher on buses and the vehicles also occupy more street space a passenger than the surface car. In Berlin we seek both to make transportation service profitable and to conserve street space. There is no doubt that the surface car accomplishes these results better than the bus.
>
> One feature of American operation which has impressed us greatly is the tremendous accident cost to which your transportation lines are subjected. We have found that some companies are paying as much as 10 per cent of their gross in accident claims. Our accident payments are much lower than this, due in part, no doubt, to the fact that we have fewer automobiles.

Service Speeded Up for Cricket Match.—Three hundred and ninety cars of the London County Council Tramways, with a seating capacity of 28,000, passed the cricket grounds in an hour's time during the final match held recently at Kensington Oval, London.

Tramway Pageant in Manchester.—Birth and growth of Manchester's Tramway Department was recently exemplified in the tramway pageant, a feature of the civic festival, which lasted for seven days during the early part of October. Nearly 1,000,000 passengers are carried each day on these cars. Models of the first electric car as contrasted with the type used now were demonstrated in the procession, which was led by an original one-horse car and followed by a three-horse bus and a motor bus.

Third Rail to Replace Trolley on Southern Railway System in England.—Gradual abolition of the overhead trolley and adoption of the third rail is occurring on the lines of the Southern Railway in England. Together with the extension of the electrification on 105 single track miles, this program will cost almost $19,000,000. The annual number of train miles of the present service which will be affected is 4,416,529, of which 2,038,556 train miles is now steam operated and 2,377,973 train miles operated by overhead electric trolley. About 800 additional coaches will be needed, and these, too, will be converted from the old steam equipment. It is said that completion of the changes in the existing system will probably take until the latter part of 1928.

Recent Bus Developments

New South Side Bus Route in Chicago

As a result of a recent order from the Illinois Commerce Commission, in which a petition of the Chicago Motor Coach Company was sanctioned, a new bus service was started on South Park Avenue as far south as 79th Street, Chicago, on Nov. 21.

The new route will serve a portion of the city where transportation facilities have been inadequate for some time. The petition was filed at the instance of a number of south side civic organizations. These organizations are now urging the Chicago Plan Commission to recommend that South Park Avenue be widened to 200 ft. from 55th Street south to 130th Street.

Another Minneapolis Bus Line

The Twin City Rapid Transit Company, Minneapolis, Minn., will begin operation at once of an extra service bus line from the heart of the city out Nicollet, La Salle and Hennepin Avenues to 36th Street. This line is made possible for extension later by permit of the Park Board, which has decided to allow bus lines to utilize park highways under certain restrictions and license fees. The fare will be 10 cents and will serve a district off the car lines. The next move is to establish a bus line around Cedar Lake over parkways. The Hennepin Avenue line will utilize new gas-electric buses.

Commission Refuses to Reconsider Pasadena Matter

The Railroad Commission of California has denied petitions of the city of Pasadena for a rehearing of the application of the Pacific Electric Railway for an increase of fares on its motor coach lines in that city and of the Pacific Electric Railway to operate motor coach lines in Pasadena and the commission's investigation into the entire subject of motor coach operation in Pasadena.

Santa Cruz Operation Too Costly

The Union Traction Company, operating buses from Santa Cruz and Capitola, Santa Cruz and Twin Lakes and intermediate points, has applied to the California Railroad Commission for authority to assign its certificate for such operation to the Auto Transit Company, and the latter company has requested permission to operate the same. The Union Traction Company sets forth in its application that it has sustained a loss through the operation of said bus lines ever since it was authorized to operate them in lieu of certain street railway operations heretofore conducted; further, that the Auto Transit Company can operate the bus lines to much better advantage in connection with its present operations, extending from San Francisco to Monterey, Hollister and Salinas by way of Santa Cruz and Watsonville. It has been agreed to retain the transfer privileges between Santa Cruz-Capitola and Santa Cruz-Twin Lakes lines, and the west side lines of the Union Traction Company shall as long as they are operated continue as heretofore, and the apportionment of fares shall be fixed by the Railroad Commission.

Independent May Operate

The Pennsylvania Public Service Commission has decided that John Collins, the holder of a certificate of public convenience to supply bus service, did not violate his contract as complained by the Lehigh Traction Company, Hazleton, Pa. Mr. Collins was granted a certificate to operate buses as a common carrier between the city of Hazleton and Mountain Scenery Hotel, Luzerne County, through the villages of Milnesville and Hollywood; from Mountain Scenery Hotel to Lattimer No. 2 and Scotch Hill; also between Hazleton House, in the city of Hazleton, and the State Hospital in said city. In May, 1924, a complaint was filed by the Lehigh Traction Company contending that when the respondent was authorized to operate he did not aver any intentions of supplying service to the villages through which he passed, and thereby had no such right. The commission decided that this construction of the certificate granted was entirely too narrow and not in accord with the general understanding of the language of the certificate. It ordered that the respondent was in no way violating the terms of his certificate and therefore refused the prayer of the complainant for revocation of his certificate or for a restraining order.

More Omaha Lines Opened

The Omaha & Council Bluffs Street Railway, Omaha, Neb., has put two more bus lines into service. The new routes are from 32d Avenue and Arbor Street west to 40th and Marinda and from 50th Street and Underwood Avenue to 52d and Franklin Streets. Fifteen-minute service is maintained. Other routes are from 24th and Kansas north, from 42d and Leavenworth to 45th and Center, from 36th and Q Street south on 36th to Harrison and from 33d and Parker west to 40th and Maple.

Developments in Seattle Bus Territory

Because of the growth of the bus business in the southwestern district of the Puget Sound Power & Light Company, Seattle, Wash., a new department has been set up to manage all motor coach transportation. This department is in charge of Col. M. D. Mills, with the title of general superintendent of motor transportation.

The new department will manage the Park Auto Transportation Company, whose name has been changed to North Coast Transportation Company; the stages of the Puget Sound Electric Railway from Tacoma to Olympia, the City Transportation Company, which operates suburban service around Tacoma, and the Portland-Seattle Stage Company, which operates the through parlor car line from Seattle to Portland. These lines will be called the North Coast Lines.

A new terminal is being constructed at Auburn, arrangements have been made for a new terminal at Kent, improvements are being planned in terminal facilities in Tacoma, Olympia, Chehalis, Kelso and Longview. The plan is to have a considerable amount of new equipment on these runs early next year.

When the North Coast Transportation Company began operations in October it was desirable to have a trademark or emblem to be used on coaches, stationery and caps of motor coach operators. A contest was put on among all of the employees of the southwestern district for the best design for this purpose. More than 200 designs were submitted. The prize was a trip to Portland and $25 in cash.

School Service Increased.—A second bus line to serve students in the Girls' High School, Atlanta, Ga., was put in operation on Nov. 1 by the Georgia Railway & Power Company. The service, which is similar to that put in operation at the opening of the school term between Morningside and the Girls' High School, is being installed to serve patrons in the west end section of the city. Double-deck coaches similar in structure and design to those used on the Morningside line have been installed. The line is being advertised by the company as the "New Beauty Special." This special bus service to and from Girls' High School has in a large measure overcome the difficulties encountered in the isolated location of this school.

Will Apply for Bus Permit. — The East St. Louis & Suburban Railway has filed notice with the Madison County Board of Supervisors at Edwardsville, Ill., that an application will be made to the Illinois Commerce Commission for a permit of convenience and necessity to operate a bus line between Glen Carbon and Edwardsville, Ill. Recently the railway company obtained an injunction which forced F. W. Herzog, Edwardsville, Ill., to suspend a bus line run by him for several years. Mr. Herzog operated without a state permit.

Bus Service Authorized in Binghamton.—The Public Service Commission on Nov. 16 granted the petition of the Binghamton Railway Bus Lines, Inc., Binghamton, N. Y., for a certificate permitting the operation of bus lines in that city. The Binghamton Railway Bus Lines, Inc., is a subsidiary company of the Birmingham Railway. The certificates cover the Seminary Avenue and Riverside Drive lines and are subject to the franchise by the city of Binghamton. The petition of the company looking forward to bus operation was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 2, page 592.

Financial and Corporate

Massachusetts Deal Approved

Cities and Towns in Which Worcester and Springfield Lines Operate Consent to New Haven Control

The acquisition of the Worcester Consolidated Street Railway, Worcester, Mass., and the Springfield Street Railway, Springfield, Mass., has actually been accomplished by the New York, New Haven & Hartford Railroad. Three-quarters of the cities and towns served by the electric railways have approved the control by the New Haven to make it an established fact.

Senator George D. Chamberlain, representing the interests of the city of Springfield, has assured those interested that the voice of the city has not been taken away and despite the fact Springfield and Worcester did not approve the agreement entirely the Public Utilities Commission is pledged to protect their interests. The commission finds that the Worcester-Springfield opposition does not prevent the New Haven from taking over the ownership of the railways. As to its own jurisdiction in requiring the fulfillment of promises to Springfield and Worcester by the New Haven, it had no explanation to offer. The fact remains that enacted Legislation makes the two cities dependent on informal agreements in spite of the fact that 80-90 per cent of the railway business is carried on in Worcester and Springfield.

The bill as originally drawn provided for acceptance by the two principal cities. Changes were proposed by Governor Fuller and in two places, respectively, where the wording was: "The City Council of the city of Worcester" and "the City Council of the city of Springfield"; it was reworded to read "the City Councils of the cities and the selectmen of the towns in which the Worcester Consolidated (Springfield) Street Railway operates."

Clark V. Wood, president of the Worcester and Springfield companies, in reviewing the situation said:

> Personally I am confident that none of our citizens need be disturbed over the New Haven's plan of taking control of the trolleys under Chapter 371 of the Acts and Resolves of 1926, as I am sure their interests will be properly safeguarded.
>
> While it may be a fact that the acceptance of the act by three-fourths of the cities and towns in which the Springfield and Worcester systems operates would technically constitute authority for exercising the privilege of control, E. G. Buckland, vice-president of the New Haven Railroad, has stated positively, both in public and privately, that even though this condition exists, he would not act without the assent of Springfield and Worcester.

A statement from Mr. Buckland to Mr. Wood regarding the matter is worded as follows:

> Above all things do away with any idea that, even if we should get the assents of the outside towns, we would endeavor to act under the law without the assents of Springfield and Worcester. We must start with the cordial help of the two cities based upon the idea that only by working together can a railway system be made satisfactory to the people and profitable to ourselves.

A letter is expected from Mr. Buckland to directors of the New Haven road in which all conditions of the ownership, which will include rehabilitation plans in Springfield and Worcester, will be set forth for approval. The contents of this missive will constitute a contract to the cities involved.

Letter to Chicago Bondholders

Bankers Warn Owners of Securities of Chicago Railways of Impending Traction Receivership

A definite assertion that the Chicago Surface Lines will be forced into receivership at the expiration of the franchises next February is made in a letter sent to the 10,000 first mortgage bondholders of the Chicago Railways by executives of seven large Loop banks, who compose the bondholders' protective committee.

The committee first intimated the probability of a foreclosure early last summer. It declares that foreclosure of the first mortgage will be necessary, and legal proceedings to that end may be started shortly after Feb. 1.

Heretofore it had been thought by the committee that the City Council might reach a settlement in time to forestall a receivership, but apparently the members of the committee now hold out faint hope for this and are preparing to go into the courts. It is stated:

> We believe that none of the $94,634,437 of outstanding Chicago Railways bonds will be paid at maturity. Prompt and united action by the holders of the first mortgage bonds is the only efficient means by which their rights can be protected. This requires organized action through a committee working in the interests of all the bondholders.

The letter also outlines the negotiations now pending with city officials for a new unified transportation ordinance and describes the various legislative enactments necessary to the adoption of such a franchise. It warns that no plan is practical, however, without the co-operation of the security holders and urges that all bonds be deposited with the committee at once.

Publication of the bankers' letter provoked much interest in City Council circles, where it was felt that the appointment of a receiver for the Surface Lines next February would mean the end of city control in local transportation matters. There seems to be no doubt in the minds of the Aldermen that the Illinois Commerce Commission will immediately issue a certificate of convenience and necessity that would permit the lines to continue operation despite the expiration of their franchises. With uninterrupted operation thus assured and relieved of the obligation to expend moneys for improvements and extensions, they believe that the Surface Lines would be in a position to force the city to accept practically any compromise.

Members of the staff of the corporation counsel contended, however, that although extensive litigation might ensue, and in spite of the granting of a permit from the state commission, the constitutional provision that no street railway can be operated without the permission of the city would be ample protection for the city. This permission, granted in the 1907 ordinance, they point out, will expire on Jan. 31. 1927.

Warrant Basis in Seattle

The Seattle Municipal Street Railway, Seattle, Wash., will go on a warrant basis on Dec. 10 and the Seattle Clearing House Association has been asked to have its banks cash the warrants. The railway, the city comptroller's figures show, must make payments totaling $1,150,865 by March 1. The principal items are an $833,000 payment on the railway purchase bonds and $275,875 interest on the balance due. The railway will be unable to make these payments without going on a warrant basis. In past instances where the line has gone on warrants the city has always been able to redeem its warrants.

Puget Sound Property Must Use Railway Fund

The United States Circuit Court of Appeals at San Francisco has rendered an opinion to the effect that the 1919 tax on the railway properties of Seattle, Wash., must be paid by the city, but cannot be collected from the general fund. In effect, this means that the Puget Sound Power & Light Company, which sold the city the railway system, must look to the city railway fund for payment of the major portion of the tax for the year when the transfer was made. The tax, with penalties and interest, amounts to $545,370, and city officials are agreed that the city will pay this sum in railway utility warrants, as there are no funds available to make payment in cash. Corporation Counsel T. J. L. Kennedy characterized the decision as a "substantial victory" for the city on the ground that the court held payment could not be made from the city's general fund. He stated that the city will contest any appeal by the company.

United Railways to Dissolve

The directors of the United Railways Investment Company, New York. at a special meeting of stockholders called for Nov. 23, voted on a proposal to dissolve the company. United Railways Investment Company formerly was the holding organization which controlled Philadelphia Company and allied organizations, including Duquesne Light, but its holdings of common stock were subsequently acquired by the Pittsburgh Utilities Corporation.

Standard Gas & Electric Company having acquired control of United, an offer to minority shareholders of the latter was made, providing for the exchange of United for Standard Gas.

Digitized by Google

In excess of 97 per cent of the total outstanding common and preferred stock of the United Company has already been exchanged for Standard Gas stock. Practically the only source of income of United Railways this year has been dividends received on stock owned in Pittsburgh Utilities.

The United Railways directors have declared a dividend of 15 per cent on the preferred stock, payable on Nov. 22 to stock of record the same date.

Hears Abandonment Petitions for New York State

Public Service Commissioner George R. Lunn held three public hearings on Nov. 23 on applications of the United Traction Company for abandonment of certain portions of its lines in the cities of Albany and Rensselaer, N. Y. The first application asked for the approval of a declaration of abandonment of the South Ferry Street line from the corner of South Pearl Street to Broadway, Albany. This line has not been in use for several years, with the consent of the city.

The two other petitions related to the lines in the city of Rensselaer, one known as the Aiken Avenue line and the other the Third Street line. The former has not been operated since the substitution of bus service in 1924 by the Capitol City Transportation Company, Inc., whose buses are being operated over practically the same territory as the old car line.

Testimony was offered by the traction company to show that the Third Avenue line is being operated at a loss with street cars and that it is proposed to substitute a bus line therefor with better results in earnings and service to be rendered and to abandon the use of the street railroad.

Norwich Property Sold

P. Leroy Harwood, a member of a bondholders' committee of the Groton & Stonington Traction Company, Norwich, Conn., on Nov. 22 purchased the Groton & Stonington Street Railway and all its accoutrements for $50,000. He was acting as agent of the committee at an auction sale of the property. The sale followed a foreclosure action brought by the bondholders' committee, which secured a judgment in Superior Court. The Groton & Stonington Traction Company, which runs cars from the ferry line in Groton across the Thames River drawbridge to New London, practically controlled the Groton & Stonington Street Railway. The latter's line extended from the ferry line to Westerly. The status of both the Groton & Stonington Street Railway and the Groton & Stonington Traction Company was explained in the ELECTRIC RAILWAY JOURNAL, issue of March 13, 1926, page 464.

Charleston Properties to Pass to Southeastern

The merging of the companies controlling the railway, lighting and gas facilities at Charleston, S. C., was agreed upon at a meeting of the directors of the companies on Nov. 16. The four companies, merged into one, will be known as the South Carolina Power Company. The purpose is to clear the way for the Southeastern Power & Light Company to take over the properties. A meeting of the stockholders of the four companies has been called for Dec. 17, when the sale of the properties will be ratified.

At the meeting on Nov. 16 Philip H. Gadsden, president of the four companies, resigned. Stuart Cooper was elected president of the Charleston Consolidated Railway & Light Company. B. A. Hagood was elected president of the three other companies. They are the Charleston Consolidated Railway, Gas & Electric Company, the Charleston Gas Light Company founded in 1846, and the Charleston-Edison Light & Power Company.

Preferred Claim by J. J. Heim Against Kaw Valley Disallowed

An end appears to have been put to the litigation between Harry C. Jobes, receiver of the Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan., and Joseph J. Heim. The action was brought against Mr. Heim to set aside a contract entered into between the company and him, under which $224,000 of first mortgage bonds were delivered to Mr. Heim in exchange for $212,000 of second mortgage bonds and $47,565 of defaulted second mortgage interest coupons, and for the recovery of $6,720 of interest paid to Mr. Heim on such first mortgage bonds.

In its decree the United States Circuit Court of Appeals sustained the finding of the lower court ordering Mr. Heim to return to the treasury of the company the $224,000 in principal amount of the first mortgage bonds issued to him shortly before the appointment of a receiver for the company in 1924. A petition for rehearing has been denied, and the protective committee for the bonds announces that counsel for the defendant has signified that nothing further will be done, thus definitely settling the matter. With the return of the $224,000 of bonds to the company treasury, the outstanding amount has been reduced to $846,000, of which $812,600 has been deposited with the bondholders' protective committee.

Holland Line Abandoned

Service on the Grand Rapids, Holland & Chicago Railway, a 43-mile line extending between Grand Rapids and Saugatuck, Mich., was abandoned on Nov. 15. The line, which constitutes the northwestern division of the Michigan Electric Railway, was in operation for the past quarter century. It is said that many residents in the vicinity are unable to believe that some measures will not be adopted looking toward its preservation. Heavy inroads by the motor truck and passenger bus into this once important artery in transportation have been partly responsible for the shutting down of the railway. One year ago the company established one-man car operation, but still the cost of service far exceeded the revenues.

The Consumers Power Company purchased the right-of-way of the line recently from the Heyman-Michael Company, Chicago, which obtained it at the foreclosure sale in federal court.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 137 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Included in the foreclosure sale were ten passenger and four freight cars. The equipment, it is expected, will be sold piecemeal. The financial affairs of the company were reviewed in the issue of the ELECTRIC RAILWAY JOURNAL for Oct. 30, page 825.

Slight Gains Shown by Detroit Municipal Railway

The balance for October, 1926, reported by the Detroit Municipal Railway, Detroit, Mich., was $48,663, compared with $47,871 for the similar month in 1925. For the year ended Oct. 31, 1926, the balance was $635,119, compared with $548,227 for the year ended Oct. 31, 1925. The statement of earnings covering the periods mentioned is contained in the accompanying tabular presentation.

INCOME AND STATISTICAL STATEMENT OF THE DEPARTMENT OF STREET RAILWAYS, CITY OF DETROIT

Income	Month of October, 1926	Month of October, 1925	Year Ended Oct. 31, 1926	Year Ended Oct. 31, 1925
Operating Revenue:				
Railway operating revenue	$1,849,526	$1,977,316	$22,936,219	$21,983,553

Tennessee Companies Protest Separate Valuation

The East Tennessee Electric Company and the Johnson City Traction Company recently filed a petition before the State Railroad and Public Utilities Commission protesting the commission's order of Sept. 23 which permitted an increase in Johnson City, Tenn., fares from 5 to 7 cents but also refused to consider the value of the companies as one unit.

The petition, called attention to the statement of the commission in the certiorari case pending in the Circuit Court of Davidson County in which it was stated that the combined value of the property had not been fixed: the two petitioners being separate and distinct corporations, the value of the Tennessee Eastern Electric Company being $2,500,000 and the value of the property of the Johnson City Traction company being $225,000. Another statement says the value will be considered separately.

The attorneys said the company has not availed itself of the opportunity to increase rates because it feels that great injury has been done in the same order which refused to consider the value of the companies together.

Special Master Considers Denver & Interurban Case

When the case of the Denver & Interurban Railroad, electric subsidiary of the Colorado & Southern Railroad, came before Judge J. Foster Symes in the Federal District Court at Denver recently he appointed John H. Gabriel, a Denver attorney, special master in chancery to confer with William H. Edmunds, the receiver, and report his findings.

The road operates between Denver and Boulder and the court informed representatives of the intermediate cities that it would permit them to renew their pleas of intervention, but that none of the cities, with the exception of Boulder, had any contract with the company which guaranteed service to them by the railroad.

The Guaranty Trust Company, New York, trustee under the mortgage securing an issue of $1,079,663 of first mortgage 6 per cent gold bonds, is seeking to foreclose that lien.

New Directors Elected. — Two new directors were elected at a recent meeting of the Key System Transit Company, Oakland, Cal. The new men are F. Bruce Maiden, Oakland real estate operator, and Herbert E. Clayburg of J. Barth & Company, bond house of San Francisco. Mr. Maiden replaces Joseph F. Carlston and Mr. Clayburg takes the place of Miles Standish.

Line Earns $19,000.—The net earnings of the Municipal Railway of South Jacksonville, Fla., for the fiscal year 1925-1926 were $19,000. An announcement to this effect was made recently by City Clerk Holsonback upon receipt of the report of September the final period of the year. The earnings for the year are nearly three times the total of the fiscal year previous. It is said that the success of the South Jacksonville project has led to the discussion of plans for its further extension and installation of a bus system.

Cincinnati Reports Surplus.—After deducting operating expenses and all fixed charges for the month of October, the Cincinnati Street Railway, Cincinnati, Ohio, accrued a surplus of $6,987 in a report submitted to Edgar Dow Gilman, Director of Street Railroads and Motor Buses. The surplus for October with that for September, which amounted to $6,093, will be allotted to the fare surplus fund. In a statement accompanying the report Mr. Draper said that the report for October would compare more favorably with that for September except for the fact that a further increase in the rate of pay of the company's employees became effective Oct. 1, thus adding $10,-

Digitized by Google

000 to the operating expenses for the month. Losses from motor buses during October were $13,913, which is approximately $1,500 less than the loss in September. The loss would have been smaller were it not for an increase in pay to motor coach operators, effective on Oct. 1.

Would Abandon Service. — With operating expenses of its passenger department for the past two years $2,000 in excess of revenues, the Chicago, Harvard & Geneva Lake Railway, operating for the past 28 years between Harvard, Ill., and Lake Geneva, Wis., has asked the Wisconsin Railroad Commission and Illinois Commerce Commission for permission to abandon service because of lack of patronage. Freight service, however, would be continued, according to the company's petition. The line extends 13 miles.

No Action on Brooklyn Proposal.— Action by the Brooklyn City Railroad, Brooklyn, N. Y., toward authorizing the changes in capital structure to which reference was made in the JOURNAL for Nov. 20 was put over until Dec. 7.

Messrs. Hadley, Winthrop and Fletcher on Engineers Board. — Dr. Arthur T. Hadley, president emeritus of Yale University; Beekman Winthrop, of Robert Winthrop & Company, and Andrew Fletcher, Jr., of W. & A. Fletcher Company, have been elected to the board of the Engineers' Public Service Company, thus filling the vacancy caused by the death of C. Chauncey Stillman and increasing the board's membership from thirteen to fifteen. This company was sponsored by Stone & Webster and controls among other properties the Virginia Electric & Power Company, Key West Electric Company, Eastern Texas Electric Company, El Paso Electric Company, Savannah Electric & Power Company, and the Baton Rouge Electric Company.

Service Ceases.—The Coal Belt Electric Railway, operating from Marion to Herrin and Carterville, Ill., as a passenger and freight line, quit business at midnight on Nov. 15. The Illinois Commerce Commission had approved the cessation. The Coal Belt is a 14-mile line.

Greater Deficit on I. R. T.—For the three months ended Sept. 30, 1926, the total revenue from all sources of the Interborough Rapid Transit Company, New York, N. Y., was $13,345,856, a decrease of $875,675 over the corresponding period of last year. Expenditures for operating and maintaining the property increased $540,507. Taxes payable to the city, state and the United States increased $91,191.34. Rentals and other income deductions increased $31,553. The net result for the three months was a deficit of $2,212,658. This is $1,538,928 greater than the deficit for the corresponding period of last year. The comparison with last year is influenced by the strike during the month of July of this year, as well as the fact that in July of last year there was a lump sum payment of $770,000 on account of the new advertising contract, against which there was no similar payment this year.

Personal Items

J. F. Shaughnessy Heads Commissioners

Chairman of Nevada Body Elected at Asheville to Be the President of National Regulatory Body

John F. Shaughnessy, an active participant in the work of the National Association of Railroad and Utilities Commissioners and chairman of the committee on railway rates of that association from 1920 to 1924, was elected president of that body at the meeting in Asheville, N. C., Nov. 9-12. He was formerly first vice-president of the association and before that, at the meeting in Phoenix, Ariz., in 1924, was made second vice-president of that body.

Mr. Shaughnessy is chairman of the Public Service Commission of Nevada. He has been a strong proponent of state jurisdiction on the principle that it is beneficial to the utility to keep regulation close to the community served. He appreciates the limitations imposed on busy operating officials and the difficulties encountered in considering state lines, but has consistently maintained that, in the formation of general policies, executives and attorneys of operating companies must consider the problems of the individual states served and must recognize state lines to the extent of so forming general policies as to take into consideration the interests and problems of the individual states served.

© Bachrach.

J. F. Shaughnessy

Mr. Shaughnessy was born in Oshkosh, Wis., in 1874. He attended public and high schools at Poynett, Wis. He entered railway service as brakeman on the Chicago, Milwaukee & St. Paul Railway on the La Crosse Division in 1891, continued as a brakeman in the train service 1½ years and then went to Santa Fé in train service between Chicago and Fort Madison, Iowa. In 1894 he left the Santa Fé to go to Fort Worth, Tex., with the Fort Worth & Texas Railrcad. There he served as brakeman, conductor, trainmaster and division superintendent, respectively. For a while he was responsible for construction work on his division, in charge of more than 450 miles of the railroad between Fort Worth and Texline. He continued in this capacity until 1903, when he went to the Southern Pacific as assistant superintendent on the division from Ogden, Utah, to Sparks, Nev. There he remained for three years. In March, 1907, he was appointed to be Public Service Commissioner of the state and since 1918 has served as chairman of that commission.

F. W. Funk Chief Electrical Engineer at Youngstown

Frank W. Funk has been appointed chief electrical engineer of the Pennsylvania-Ohio Electric Company, Youngstown, Ohio, to fill the vacancy caused by the resignation of George A. Iler. The office now assumed by Mr. Funk is in addition to his duties as assistant to General Manager McCalla.

Mr. Funk became connected with the company at Youngstown as electrical engineer early in 1914 and continued in that capacity for three years, when he was appointed resident engineer for the Republic Engineers, Inc. Two years later, with C. I. Crippen, he formed the firm of Crippen & Funk, consulting engineers, and continued in that work till his return to Youngstown a year ago.

He was graduated from Ohio State University in 1908 and joined the engineering forces of the West Penn Power Company at Connellsville and later the development staff of the Westinghouse Electric & Manufacturing Company. After many interesting engineering jobs with Westinghouse, Mr. Funk in 1912 returned to the utility field as assistant electrical engineer of the Northern Ohio Traction & Light Company, where he participated in the design and construction of the Gorge power station. He continued with the N.O.T., as the Akron property is known, till he went to Youngstown in 1914.

Personnel of Puget Sound Bus Companies

Col. M. D. Mills has been placed in charge of the motor coach lines in the southwestern district affiliated with the Puget Sound Power & Light Company, Seattle, Wash., with the title of general superintendent of motor transportation. He had charge of motor transport work in the A. E. F. The new superintendent became connected with the Puget Sound companies in 1923. Since that time he has been with the Yellow Manufacturing Salaes Corporation of Chicago.

The operation has been divided into two divisions—a southern division, in charge of H. R. Leigh, and a northern division, in charge of Joseph H. Lyons.

Digitized by Google

The maintenance of the stages will be operated by a third division of this department in charge of B. H. Steeg, who will be superintendent of equipment, with headquarters at Tacoma, and who will have charge of the shops and garages. Mr. Steeg is a newcomer, having previously been with the White and Yellow Coach Companies. William L. McCredie, formerly engineer for the Puget Sound Electric Railway and Tacoma Railway & Power Company, has been made assistant to the general superintendent of motor transportation.

Mr. Gadsden Withdraws from Charleston Company

Philip H. Gadsden has resigned as president of the Charleston Consolidated Railway & Lighting Company, Charleston, S. C., as part of a plan under which control of the company there will pass to the Southeastern Power & Light Company. Mr. Gadsden is vice-president of the United Gas Improvement Company and former president of the American Electric Railway Association. He was born at Charleston in 1867, was admitted to the bar in 1890 and practiced law in that city for more than fifteen years before he entered the public utility field. The United Gas Improvement Company, to the affairs of which Mr. Gadsden has lately been giving much of his time, was a large holder of stock of the company at Charleston.

L. F. Loree Awarded Holland Society Medal

L. F. Loree, president of the Delaware & Hudson Company, the United Traction Company, Albany, N. Y.; the Hudson Valley Railway, Glens Falls, N. Y.; the Troy & New England Railroad and a director and officer of many other corporations, is the recipient of the 1926 medal of the Holland Society of New York, awarded annually to the person who, in the estimation of the society, has done most to promote the welfare of mankind in his own particular field.

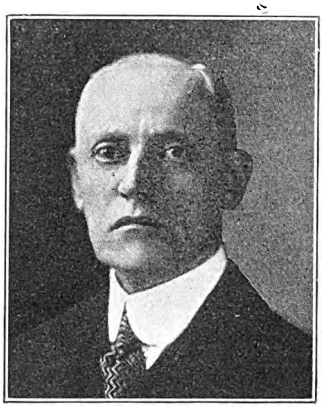
S. M. Cooper New Charleston Head

Stuart M. Cooper has been elected president of the Charleston Consolidated Railway & Lighting Company, Charleston, S. C., to succeed Philip H. Gadsden under a plan by which ownership of the property at Charleston will pass to the Southeastern Power & Light Company. He has been first vice-president at Charleston. Mr. Cooper was graduated from Syracuse University as an electrical engineer. Early in his professional career he served as assistant engineer of the Syracuse Lighting Company. Later he was in turn assistant construction engineer, statistician and distribution engineer of the New York & Queens Electric Light & Power Company, operating on Long Island. He next became engineer of distribution of the Counties Gas & Electric Company, Norristown, Pa., and later assistant to the electrical engineer of the United Gas Improvement Company.

J. J. Coleman Honored Again

Another honor has been conferred upon Jilson J. Coleman, vice-president and general manager of the Scranton Railway, Scranton, Pa., and one of the oldest living executives in point of service in the street railway systems of the United States. At the Nov. 19 meeting of the executive committee of the Pennsylvania Street Railway Association, held at Philadelphia, Mr. Coleman was unanimously elected president to succeed Frank Phillips, resigned.

Prior to 1920 Mr. Coleman's activities in the railway field escaped fairly well the limelight, but in that year he became the general manager at Scranton, and then his long and varied career was flashed as if in kaleidoscopic view before the railway world. The new general manager had just spent two years as district engineer of the passenger transportation division of the United



J. J. Coleman

States Shipping Board, Emergency Fleet Corporation, under A. Merritt Taylor, former traffic commissioner of Philadelphia. In this position he was responsible for providing adequate transportation for shipworkers in the territory extending from Boston to Houston.

Forty-four years ago, when horse cars and mule cars were the order of the day, a young man became railway clerk in Louisville, Ky., in the Central Passenger Railway. With the fire in him to succeed, he worked his way up to chief clerk and then managed the lines in New Albany, Ind. When he later moved to Cleveland, Ohio, the stage was set for his association with Tom L. Johnson, a romantic figure of that city, whom he assisted in the electrifying of the horse car lines there. Mr. Coleman later, with the co-operation of some of his own clan and that of the Johnsons, built the lines from Allentown to South Bethlehem and from Allentown to Catasauqua, now included in the system of the Lehigh Valley Transit Company. The company at Allentown, which was financed by R. T. Wilson & Company, purchased the lines from Allentown to Bethlehem and consolidated the two companies. They next rehabilitated the Yonkers system, and in 1895 started the Nassau Electric Railroad, Brooklyn, N. Y., now included in the Brooklyn-Manhattan Transit System.

Such activity might have sufficed for the output of ordinary men, but Mr. Coleman had never really been a member of that class. He next managed the consolidation of the St. Louis and Washington systems for Brown Brothers, bankers of New York, and then constructed the line of the New Jersey & Pennsylvania Traction Company between Trenton and Princeton, which had been started by Albert L. Johnson. In addition he investigated the railway properties of Pittsburgh, St. Louis, Washington, San Francisco, Indianapolis and Baltimore.

Something of the appreciation felt for Mr. Coleman was noted in the spring of last year, when he was promoted to the position of operating vice-president by A. E. Fitkin, who, under the General Engineering & Management Corporation, purchased the Scranton Railway. Mr. Coleman at that time was retained to continue his duties as general manager. In this post he has charge of a system of railway lines 83 miles in extent and a co-ordinated bus system operating in the heart of the hard coal district of Pennsylvania.

E. B. Williams Advanced

E. Bryan Williams has been appointed associate superintendent of transportation of the first division of the United Railways, St. Louis, Mo., with headquarters at Newstead Station. This appointment brought to light the short but ambitious career of a young man from a Missouri village who made his own way through Washington University, was recommended for a trip to the laboratories at Schenectady, engaged in research work for the Union Electric Company, St. Louis, and later became affiliated with the United Railways in the auditing and accounting department. He has also worked in the power and transportation departments.

W. O. Haymond has been made manager of the Muncie district of the Indiana Service Company, supplying electric light, power and railway service to that city. He succeeds Roy L. Thurman, resigned. Mr. Haymond has been in the service of the Indiana company 23 years.

John W. Campbell is to be appointed by Gov. Sam A. Baker of Missouri secretary of the State Public Service Commission to succeed State Senator Larry Brunk, Aurora, who has been nemed secretary of the newly formed Workmen's Compensation Commission for Missouri. Mr. Campbell will assume his new duties on Jan. 1, but until that time will be employed by the commission in some other capacity.

B. H. Kroger, banker and chain store merchant, has been nominated by Mayor Seasongood of Cincinnati to be a member of the Cincinnati Rapid Transit Commission. It was understood that the Mayor had consulted the members of Council privately before announcing the appointment. Mr. Kroger will take the place of E. H. Dornette, whose term has expired. Mr. Kroger will be the first member of the commission to serve under the law without receiving a salary.

for Discussion of Manufacturing and Sales Matters

Self-Regulation of Business Object of Chicago Meeting

Plans for carrying out the national program for the elimination of costly trade abuses and unethical business practices, which has for its object the eventual complete self-regulation of American business, will be outlined at a meeting of the National Trade Relations Committee of the United States Chamber of Commerce to be held in Chicago on Dec. 3.

Encouraged by the progress reported at a meeting held a few weeks ago, attended by representatives of 29 trade associations, the committee is preparing to extend its activities by working out a specific course of action. To this end, a detailed plan of procedure will be submitted by A. Lincoln Filene, Boston, the chairman of the committee.

The plan proposes practical methods for the formation within the various trades of joint trade relations committees composed of manufacturers, wholesalers and retailers.

Conditions which suggest the need for such trade relations committees to take the lead in adjusting controversies in the individual trades and in establishing business standards will be discussed by members of the national committee with representatives of trade associations with headquarters in the central states.

As a further step toward organizing its activities, a resolution defining the scope of its program has been prepared as a guide for the work of the committee. The resolution emphasizes particularly that "the purposes and efforts of the National Trade Relations Committee and Joint Trade Relations Committee shall be confined to the abatement of such unethical practices as are not contemplated by the Federal Trade Commission and as are not generally regarded as illegal."

New Rectifier Substation Opened by Gary Railways
